User’s Guide

CHAPTER

ONE

INTRODUCTION

Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB®[1] graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn't need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB's deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real experience with computer graphics, I decided to emulate MATLAB's plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer's perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.

The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by `matplotlib.pylab` which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The *Matplotlib frontend* or *Matplotlib API* is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends: PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

---

[1] MATLAB is a registered trademark of The MathWorks, Inc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows™. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

CHAPTER

TWO

INSTALLING

There are many different ways to install matplotlib, and the best way depends on what operating system you are using, what you already have installed, and how you want to use it. To avoid wading through all the details (and potential complications) on this page, there are several convenient options.

2.1 Installing pre-built packages

2.1.1 Most platforms : scientific Python distributions

The first option is to use one of the pre-packaged python distributions that already provide matplotlib built-in. The Continuum.io Python distribution (Anaconda or miniconda) and the Enthought distribution (Canopy) are both excellent choices that "just work" out of the box for Windows, OSX and common Linux platforms. Both of these distributions include matplotlib and *lots* of other useful tools.

2.1.2 Linux : using your package manager

If you are on Linux, you might prefer to use your package manager. matplotlib is packaged for almost every major Linux distribution.

- Debian / Ubuntu : `sudo apt-get install python-matplotlib`
- Fedora / Redhat : `sudo yum install python-matplotlib`

2.1.3 Mac OSX : using pip

If you are on Mac OSX you can probably install matplotlib binaries using the standard Python installation program pip. See *Installing OSX binary wheels*.

2.1.4 Windows

If you don't already have Python installed, we recommend using one of the scipy-stack compatible Python distributions such as WinPython, Python(x,y), Enthought Canopy, or Continuum Anaconda, which have matplotlib and many of its dependencies, plus other useful packages, preinstalled.

For standard Python installations, install matplotlib using pip:

```
python -m pip install -U pip setuptools
python -m pip install matplotlib
```

In case Python 2.7 or 3.4 are not installed for all users, the Microsoft Visual C++ 2008 (64 bit or 32 bit for Python 2.7) or Microsoft Visual C++ 2010 (64 bit or 32 bit for Python 3.4) redistributable packages need to be installed.

Matplotlib depends on Pillow for reading and saving JPEG, BMP, and TIFF image files. Matplotlib requires MiKTeX and GhostScript for rendering text with LaTeX. FFmpeg, avconv, mencoder, or ImageMagick are required for the animation module.

The following backends should work out of the box: agg, tkagg, ps, pdf and svg. For other backends you may need to install pycairo, PyQt4, PyQt5, PySide, wxPython, PyGTK, Tornado, or GhostScript.

TkAgg is probably the best backend for interactive use from the standard Python shell or IPython. It is enabled as the default backend for the official binaries. GTK3 is not supported on Windows.

The Windows wheels (`*.whl`) on the PyPI download page do not contain test data or example code. If you want to try the many demos that come in the matplotlib source distribution, download the `*.tar.gz` file and look in the `examples` subdirectory. To run the test suite, copy the `lib\matplotlib\tests` and `lib\mpl_toolkits\tests` directories from the source distribution to `sys.prefix\Lib\site-packages\matplotlib` and `sys.prefix\Lib\site-packages\mpl_toolkits` respectively, and install nose, mock, Pillow, MiKTeX, GhostScript, ffmpeg, avconv, mencoder, ImageMagick, and Inkscape.

2.2 Installing from source

If you are interested in contributing to matplotlib development, running the latest source code, or just like to build everything yourself, it is not difficult to build matplotlib from source. Grab the latest *tar.gz* release file from the PyPI files page, or if you want to develop matplotlib or just need the latest bugfixed version, grab the latest git version *Source install from git*.

The standard environment variables `CC`, `CXX`, `PKG_CONFIG` are respected. This means you can set them if your toolchain is prefixed. This may be used for cross compiling.

```
export CC=x86_64-pc-linux-gnu-gcc
export CXX=x86_64-pc-linux-gnu-g++
export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config
```

Once you have satisfied the requirements detailed below (mainly python, numpy, libpng and freetype), you can build matplotlib.

```
cd matplotlib
python setup.py build
python setup.py install
```

We provide a setup.cfg file that goes with `setup.py` which you can use to customize the build process. For example, which default backend to use, whether some of the optional libraries that matplotlib ships with are installed, and so on. This file will be particularly useful to those packaging matplotlib.

If you have installed prerequisites to nonstandard places and need to inform matplotlib where they are, edit `setupext.py` and add the base dirs to the `basedir` dictionary entry for your `sys.platform`. e.g., if the header to some required library is in `/some/path/include/someheader.h`, put `/some/path` in the `basedir` list for your platform.

2.2.1 Build requirements

These are external packages which you will need to install before installing matplotlib. If you are building on OSX, see *Building on OSX*. If you are building on Windows, see *Building on Windows*. If you are installing dependencies with a package manager on Linux, you may need to install the development packages (look for a "-dev" postfix) in addition to the libraries themselves.

Required Dependencies

python **2.7, 3.4, 3.5 or 3.6** Download python.

numpy **1.7.1 (or later)** array support for python (download numpy)

setuptools Setuptools provides extensions for python package installation.

dateutil **1.1 or later** Provides extensions to python datetime handling. If using pip, easy_install or installing from source, the installer will attempt to download and install `python_dateutil` from PyPI.

pyparsing Required for matplotlib's mathtext math rendering support. If using pip, easy_install or installing from source, the installer will attempt to download and install `pyparsing` from PyPI.

libpng 1.2 (or later) library for loading and saving *PNG* files (download). libpng requires zlib.

pytz Used to manipulate time-zone aware datetimes. https://pypi.python.org/pypi/pytz

FreeType **2.3 or later** Library for reading true type font files. If using pip, easy_install or installing from source, the installer will attempt to locate FreeType in expected locations. If it cannot, try installing pkg-config, a tool used to find required non-python libraries.

cycler 0.10.0 or later Composable cycle class used for constructing style-cycles

six Required for compatibility between python 2 and python 3

Dependencies for python 2

functools32 Required for compatibility if running on Python 2.7.

subprocess32 Optional, unix only. Backport of the subprocess standard library from 3.2+ for Python 2.7. It provides better error messages and timeout support.

Optional GUI framework

These are optional packages which you may want to install to use matplotlib with a user interface toolkit. See *What is a backend?* for more details on the optional matplotlib backends and the capabilities they provide.

***tk* 8.3 or later, not 8.6.0 or 8.6.1** The TCL/Tk widgets library used by the TkAgg backend.

Versions 8.6.0 and 8.6.1 are known to have issues that may result in segfaults when closing multiple windows in the wrong order.

***pyqt* 4.4 or later** The Qt4 widgets library python wrappers for the Qt4Agg backend

***pygtk* 2.4 or later** The python wrappers for the GTK widgets library for use with the GTK or GTKAgg backend

***wxpython* 2.8 or later** The python wrappers for the wx widgets library for use with the WX or WXAgg backend

Optional external programs

ffmpeg/avconv or mencoder Required for the animation module to be save out put to movie formats.

ImageMagick Required for the animation module to be able to save to animated gif.

Optional dependencies

Pillow If Pillow is installed, matplotlib can read and write a larger selection of image file formats.

pkg-config A tool used to find required non-python libraries. This is not strictly required, but can make installation go more smoothly if the libraries and headers are not in the expected locations.

Required libraries that ship with matplotlib

***agg* 2.4** The antigrain C++ rendering engine. matplotlib links against the agg template source statically, so it will not affect anything on your system outside of matplotlib.

`qhull` 2012.1 A library for computing Delaunay triangulations.

`ttconv` truetype font utility

2.2.2 Building on Linux

It is easiest to use your system package manager to install the dependencies.

If you are on Debian/Ubuntu, you can get all the dependencies required to build matplotlib with:

```
sudo apt-get build-dep python-matplotlib
```

If you are on Fedora/RedHat, you can get all the dependencies required to build matplotlib by first installing `yum-builddep` and then running:

```
su -c "yum-builddep python-matplotlib"
```

This does not build matplotlib, but it does get the install the build dependencies, which will make building from source easier.

2.2.3 Building on OSX

The build situation on OSX is complicated by the various places one can get the libpng and freetype requirements (darwinports, fink, /usr/X11R6) and the different architectures (e.g., x86, ppc, universal) and the different OSX version (e.g., 10.4 and 10.5). We recommend that you build the way we do for the OSX release: get the source from the tarball or the git repository and follow the instruction in `README.osx`.

2.2.4 Building on Windows

The Python shipped from https://www.python.org is compiled with Visual Studio 2008 for versions before 3.3, Visual Studio 2010 for 3.3 and 3.4, and Visual Studio 2015 for 3.5 and 3.6. Python extensions are recommended to be compiled with the same compiler.

Since there is no canonical Windows package manager, the methods for building freetype, zlib, and libpng from source code are documented as a build script at matplotlib-winbuild.

CHAPTER

THREE

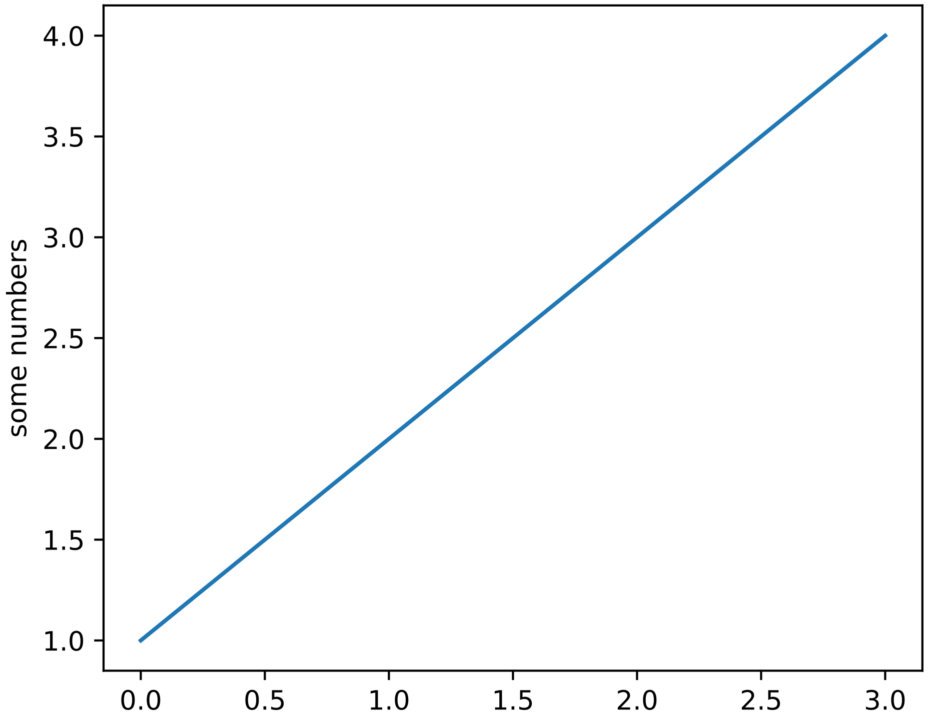
TUTORIALS

3.1 Introductory

3.1.1 Pyplot tutorial

`matplotlib.pyplot` is a collection of command style functions that make matplotlib work like MATLAB. Each `pyplot` function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc. In *`matplotlib.pyplot`* various states are preserved across function calls, so that it keeps track of things like the current figure and plotting area, and the plotting functions are directed to the current axes (please note that “axes” here and in most places in the documentation refers to the *axes* part of a figure and not the strict mathematical term for more than one axis).

```
import matplotlib.pyplot as plt
plt.plot([1,2,3,4])
plt.ylabel('some numbers')
plt.show()
```



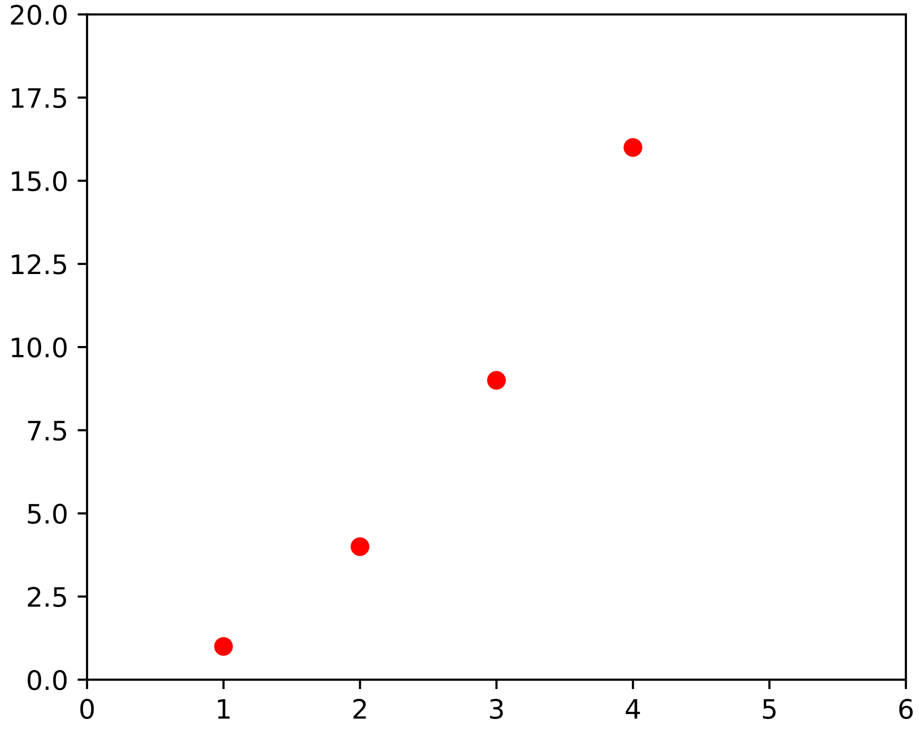
You may be wondering why the x-axis ranges from 0-3 and the y-axis from 1-4. If you provide a single list or array to the *`plot()`* command, matplotlib assumes it is a sequence of y values, and automatically generates the x values for you. Since python ranges start with 0, the default x vector has the same length as y but starts with 0. Hence the x data are `[0,1,2,3]`.

`plot()` is a versatile command, and will take an arbitrary number of arguments. For example, to plot x versus y, you can issue the command:

```
plt.plot([1, 2, 3, 4], [1, 4, 9, 16])
```

For every x, y pair of arguments, there is an optional third argument which is the format string that indicates the color and line type of the plot. The letters and symbols of the format string are from MATLAB, and you concatenate a color string with a line style string. The default format string is ‘b-‘, which is a solid blue line. For example, to plot the above with red circles, you would issue

```
import matplotlib.pyplot as plt
plt.plot([1,2,3,4], [1,4,9,16], 'ro')
plt.axis([0, 6, 0, 20])
plt.show()
```



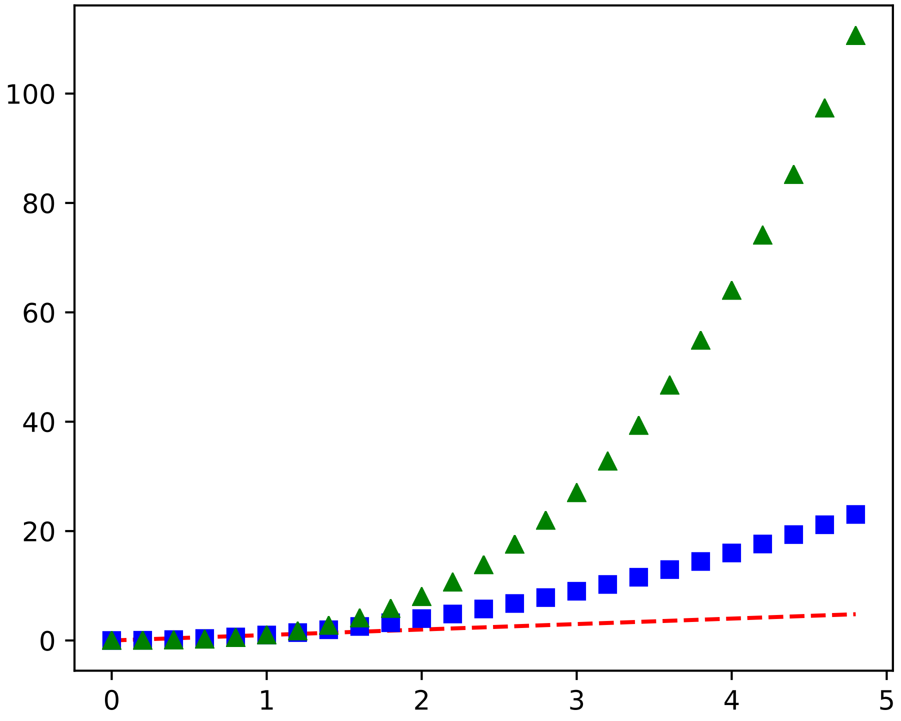
See the `plot()` documentation for a complete list of line styles and format strings. The `axis()` command in the example above takes a list of `[xmin, xmax, ymin, ymax]` and specifies the viewport of the axes.

If matplotlib were limited to working with lists, it would be fairly useless for numeric processing. Generally, you will use numpy arrays. In fact, all sequences are converted to numpy arrays internally. The example below illustrates a plotting several lines with different format styles in one command using arrays.

```
import numpy as np
import matplotlib.pyplot as plt

# evenly sampled time at 200ms intervals
t = np.arange(0., 5., 0.2)

# red dashes, blue squares and green triangles
plt.plot(t, t, 'r--', t, t**2, 'bs', t, t**3, 'g^')
plt.show()
```



Controlling line properties

Lines have many attributes that you can set: linewidth, dash style, antialiased, etc; see *`matplotlib.lines.Line2D`*. There are several ways to set line properties

- Use keyword args:

```
plt.plot(x, y, linewidth=2.0)
```

- Use the setter methods of a `Line2D` instance. `plot` returns a list of `Line2D` objects; e.g., `line1, line2 = plot(x1, y1, x2, y2)`. In the code below we will suppose that we have only one line so that the list returned is of length 1. We use tuple unpacking with `line,` to get the first element of that list:

```
line, = plt.plot(x, y, '-')
line.set_antialiased(False) # turn off antialising
```

- Use the *`setp()`* command. The example below uses a MATLAB-style command to set multiple properties on a list of lines. `setp` works transparently with a list of objects or a single object. You can either use python keyword arguments or MATLAB-style string/value pairs:

```
lines = plt.plot(x1, y1, x2, y2)
# use keyword args
plt.setp(lines, color='r', linewidth=2.0)
```

```
# or MATLAB style string value pairs
plt.setp(lines, 'color', 'r', 'linewidth', 2.0)
```

Here are the available `Line2D` properties.

Property	Value Type
alpha	float
animated	[True | False]
antialiased or aa	[True | False]
clip_box	a matplotlib.transform.Bbox instance
clip_on	[True | False]
clip_path	a Path instance and a Transform instance, a Patch
color or c	any matplotlib color
contains	the hit testing function
dash_capstyle	[`'butt'` | `'round'` | `'projecting'`]
dash_joinstyle	[`'miter'` | `'round'` | `'bevel'`]
dashes	sequence of on/off ink in points
data	(np.array xdata, np.array ydata)
figure	a matplotlib.figure.Figure instance
label	any string
linestyle or ls	[`'-'` | `'--'` | `'-.'` | `':'` | `'steps'` | ...]
linewidth or lw	float value in points
lod	[True | False]
marker	[`'+'` | `','` | `'.'` | `'1'` | `'2'` | `'3'` | `'4'`]
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markersize or ms	float
markevery	[None | integer | (startind, stride)]
picker	used in interactive line selection
pickradius	the line pick selection radius
solid_capstyle	[`'butt'` | `'round'` | `'projecting'`]
solid_joinstyle	[`'miter'` | `'round'` | `'bevel'`]
transform	a matplotlib.transforms.Transform instance
visible	[True | False]
xdata	np.array
ydata	np.array
zorder	any number

To get a list of settable line properties, call the `setp()` function with a line or lines as argument

```
In [69]: lines = plt.plot([1, 2, 3])

In [70]: plt.setp(lines)
  alpha: float
  animated: [True | False]
  antialiased or aa: [True | False]
```

```
...snip
```

Working with multiple figures and axes

MATLAB, and `pyplot`, have the concept of the current figure and the current axes. All plotting commands apply to the current axes. The function `gca()` returns the current axes (a `matplotlib.axes.Axes` instance), and `gcf()` returns the current figure (`matplotlib.figure.Figure` instance). Normally, you don't have to worry about this, because it is all taken care of behind the scenes. Below is a script to create two subplots.

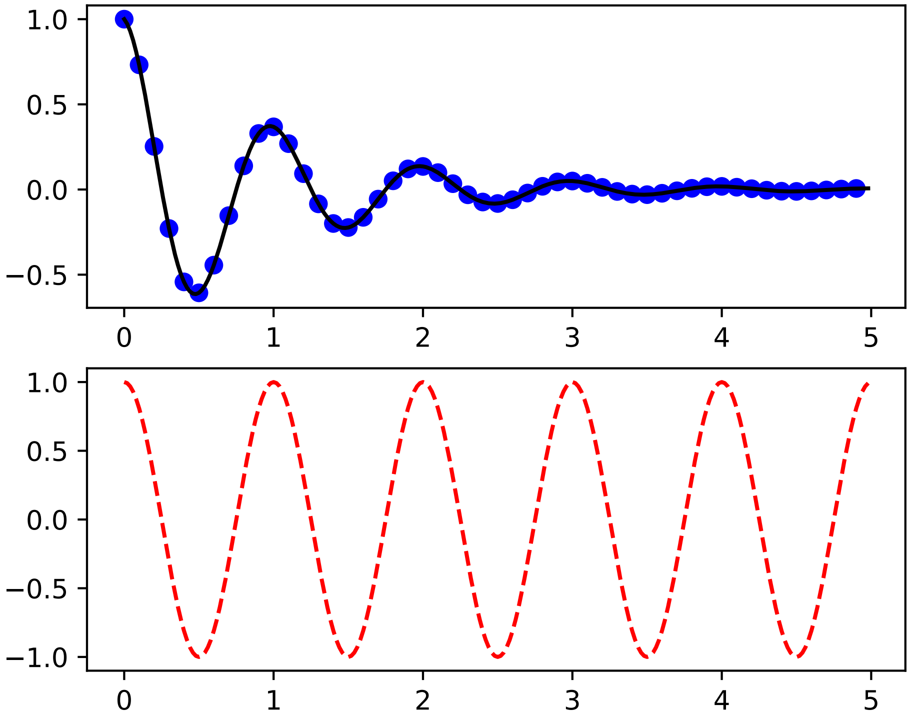
```
import numpy as np
import matplotlib.pyplot as plt

def f(t):
    return np.exp(-t) * np.cos(2*np.pi*t)

t1 = np.arange(0.0, 5.0, 0.1)
t2 = np.arange(0.0, 5.0, 0.02)

plt.figure(1)
plt.subplot(211)
plt.plot(t1, f(t1), 'bo', t2, f(t2), 'k')

plt.subplot(212)
plt.plot(t2, np.cos(2*np.pi*t2), 'r--')
plt.show()
```



The *figure()* command here is optional because `figure(1)` will be created by default, just as a `subplot(111)` will be created by default if you don't manually specify any axes. The *subplot()* command specifies `numrows, numcols, fignum` where `fignum` ranges from 1 to `numrows*numcols`. The commas in the `subplot` command are optional if `numrows*numcols<10`. So `subplot(211)` is identical to `subplot(2, 1, 1)`. You can create an arbitrary number of subplots and axes. If you want to place an axes manually, i.e., not on a rectangular grid, use the *axes()* command, which allows you to specify the location as `axes([left, bottom, width, height])` where all values are in fractional (0 to 1) coordinates. See *pylab_examples example code: axes_demo.py* for an example of placing axes manually and *pylab_examples example code: subplots_demo.py* for an example with lots of subplots.

You can create multiple figures by using multiple *figure()* calls with an increasing figure number. Of course, each figure can contain as many axes and subplots as your heart desires:

```
import matplotlib.pyplot as plt
plt.figure(1)                # the first figure
plt.subplot(211)             # the first subplot in the first figure
plt.plot([1, 2, 3])
plt.subplot(212)             # the second subplot in the first figure
plt.plot([4, 5, 6])

plt.figure(2)                # a second figure
plt.plot([4, 5, 6])          # creates a subplot(111) by default

plt.figure(1)                # figure 1 current; subplot(212) still current
plt.subplot(211)             # make subplot(211) in figure1 current
plt.title('Easy as 1, 2, 3') # subplot 211 title
```

You can clear the current figure with `clf()` and the current axes with `cla()`. If you find it annoying that states (specifically the current image, figure and axes) are being maintained for you behind the scenes, don't despair: this is just a thin stateful wrapper around an object oriented API, which you can use instead (see *Artist tutorial*)

If you are making lots of figures, you need to be aware of one more thing: the memory required for a figure is not completely released until the figure is explicitly closed with `close()`. Deleting all references to the figure, and/or using the window manager to kill the window in which the figure appears on the screen, is not enough, because pyplot maintains internal references until `close()` is called.

Working with text

The `text()` command can be used to add text in an arbitrary location, and the `xlabel()`, `ylabel()` and `title()` are used to add text in the indicated locations (see *Text introduction* for a more detailed example)

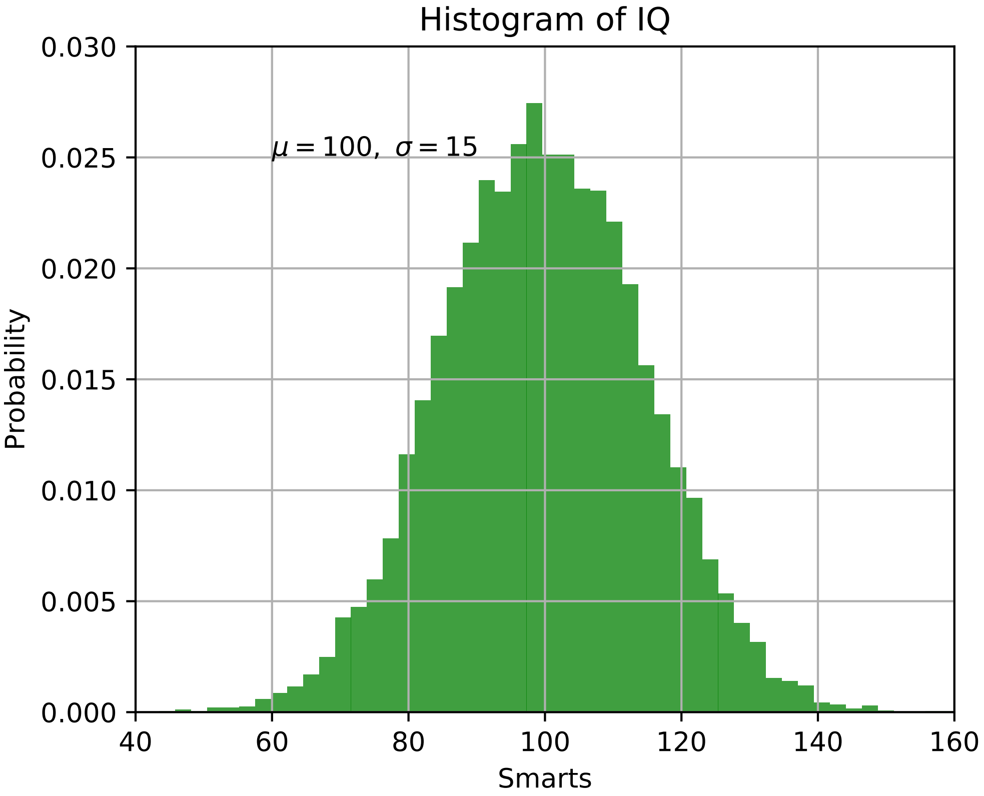
```
import numpy as np
import matplotlib.pyplot as plt

# Fixing random state for reproducibility
np.random.seed(19680801)

mu, sigma = 100, 15
x = mu + sigma * np.random.randn(10000)

# the histogram of the data
n, bins, patches = plt.hist(x, 50, normed=1, facecolor='g', alpha=0.75)

plt.xlabel('Smarts')
plt.ylabel('Probability')
plt.title('Histogram of IQ')
plt.text(60, .025, r'$\mu=100,\ \sigma=15$')
plt.axis([40, 160, 0, 0.03])
plt.grid(True)
plt.show()
```



All of the *`text()`* commands return an *`matplotlib.text.Text`* instance. Just as with with lines above, you can customize the properties by passing keyword arguments into the text functions or using *`setp()`*:

```
t = plt.xlabel('my data', fontsize=14, color='red')
```

These properties are covered in more detail in *Text properties and layout*.

Using mathematical expressions in text

matplotlib accepts TeX equation expressions in any text expression. For example to write the expression $\sigma_i = 15$ in the title, you can write a TeX expression surrounded by dollar signs:

```
plt.title(r'$\sigma_i=15$')
```

The `r` preceding the title string is important – it signifies that the string is a *raw* string and not to treat backslashes as python escapes. matplotlib has a built-in TeX expression parser and layout engine, and ships its own math fonts – for details see *Writing mathematical expressions*. Thus you can use mathematical text across platforms without requiring a TeX installation. For those who have LaTeX and dvipng installed, you can also use LaTeX to format your text and incorporate the output directly into your display figures or saved postscript – see *Text rendering With LaTeX*.

Annotating text

The uses of the basic *text()* command above place text at an arbitrary position on the Axes. A common use for text is to annotate some feature of the plot, and the *annotate()* method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are `(x,y)` tuples.

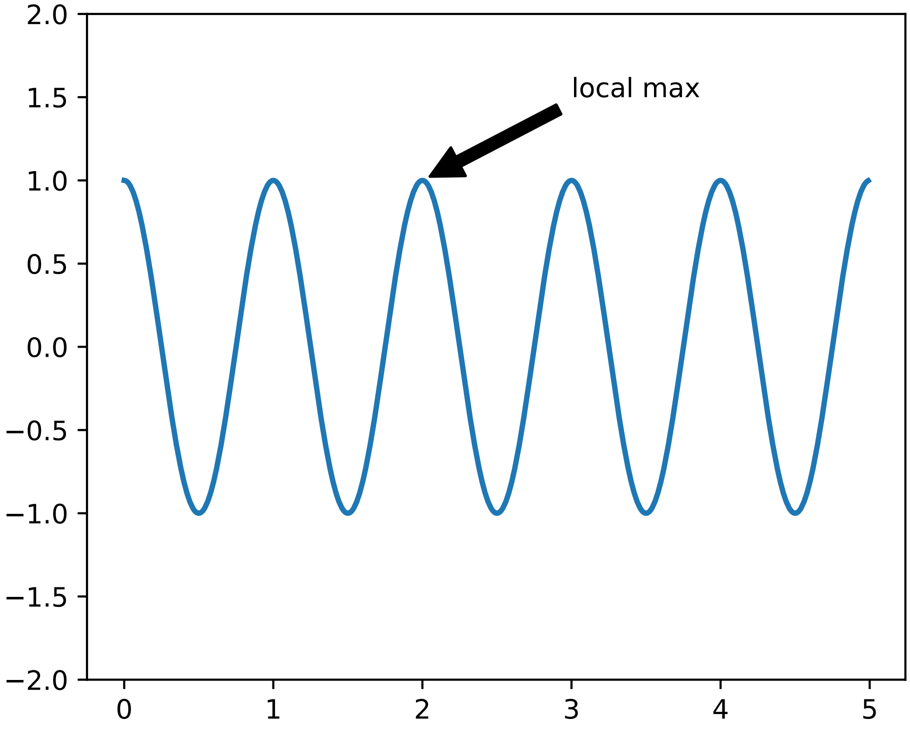
```
import numpy as np
import matplotlib.pyplot as plt

ax = plt.subplot(111)

t = np.arange(0.0, 5.0, 0.01)
s = np.cos(2*np.pi*t)
line, = plt.plot(t, s, lw=2)

plt.annotate('local max', xy=(2, 1), xytext=(3, 1.5),
            arrowprops=dict(facecolor='black', shrink=0.05),
            )

plt.ylim(-2,2)
plt.show()
```



In this basic example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates.

There are a variety of other coordinate systems one can choose – see *Basic annotation* and *Advanced Annotation* for details. More examples can be found in *pylab_examples example code: annotation_demo.py*.

Logarithmic and other nonlinear axes

matplotlib.pyplot supports not only linear axis scales, but also logarithmic and logit scales. This is commonly used if data spans many orders of magnitude. Changing the scale of an axis is easy:

> plt.xscale('log')

An example of four plots with the same data and different scales for the y axis is shown below.

```
import numpy as np
import matplotlib.pyplot as plt

from matplotlib.ticker import NullFormatter  # useful for `logit` scale

# Fixing random state for reproducibility
np.random.seed(19680801)

# make up some data in the interval ]0, 1[
y = np.random.normal(loc=0.5, scale=0.4, size=1000)
y = y[(y > 0) & (y < 1)]
y.sort()
x = np.arange(len(y))

# plot with various axes scales
plt.figure(1)

# linear
plt.subplot(221)
plt.plot(x, y)
plt.yscale('linear')
plt.title('linear')
plt.grid(True)

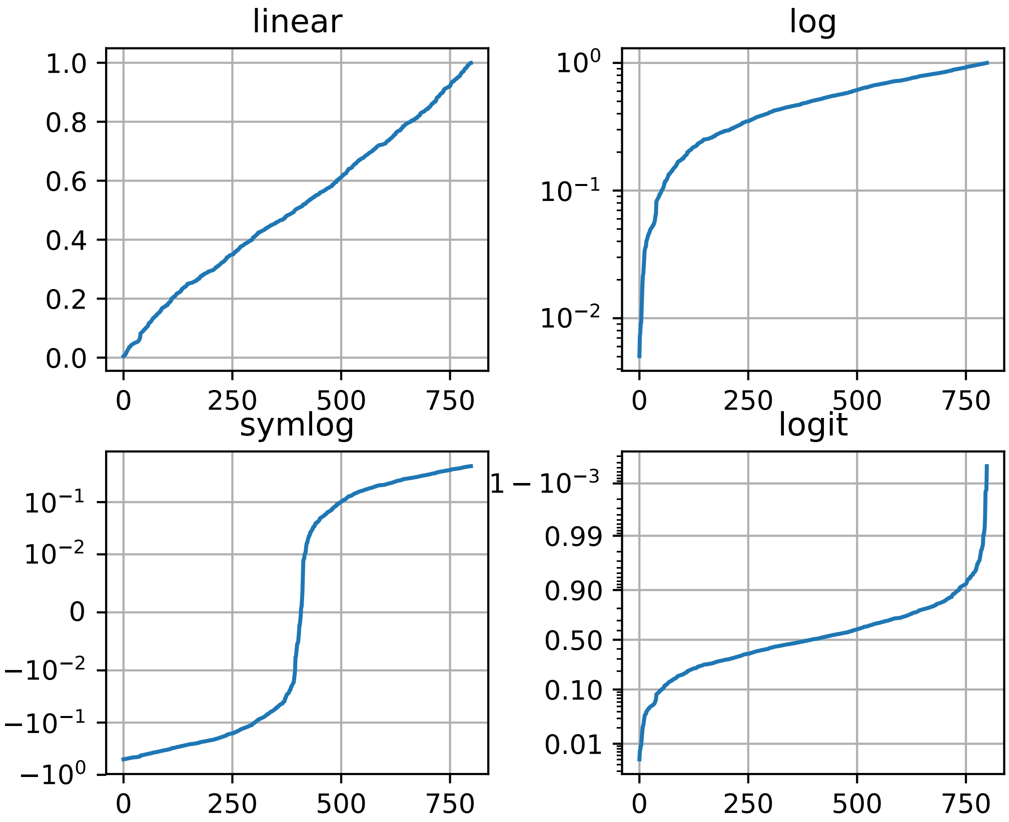
# log
plt.subplot(222)
plt.plot(x, y)
plt.yscale('log')
plt.title('log')
plt.grid(True)

# symmetric log
plt.subplot(223)
plt.plot(x, y - y.mean())
plt.yscale('symlog', linthreshy=0.01)
plt.title('symlog')
plt.grid(True)

# logit
```

```
plt.subplot(224)
plt.plot(x, y)
plt.yscale('logit')
plt.title('logit')
plt.grid(True)
# Format the minor tick labels of the y-axis into empty strings with
# `NullFormatter`, to avoid cumbering the axis with too many labels.
plt.gca().yaxis.set_minor_formatter(NullFormatter())
# Adjust the subplot layout, because the logit one may take more space
# than usual, due to y-tick labels like "1 - 10^{-3}"
plt.subplots_adjust(top=0.92, bottom=0.08, left=0.10, right=0.95, hspace=0.25,
                    wspace=0.35)

plt.show()
```



It is also possible to add your own scale, see *Developer's guide for creating scales and transformations* for details.

3.1.2 Image tutorial

Startup commands

First, let's start IPython. It is a most excellent enhancement to the standard Python prompt, and it ties in especially well with Matplotlib. Start IPython either at a shell, or the IPython Notebook now.

With IPython started, we now need to connect to a GUI event loop. This tells IPython where (and how) to display plots. To connect to a GUI loop, execute the **%matplotlib** magic at your IPython prompt. There's more detail on exactly what this does at IPython's documentation on GUI event loops.

If you're using IPython Notebook, the same commands are available, but people commonly use a specific argument to the %matplotlib magic:

```
In [1]: %matplotlib inline
```

This turns on inline plotting, where plot graphics will appear in your notebook. This has important implications for interactivity. For inline plotting, commands in cells below the cell that outputs a plot will not affect the plot. For example, changing the color map is not possible from cells below the cell that creates a plot. However, for other backends, such as qt4, that open a separate window, cells below those that create the plot will change the plot - it is a live object in memory.

This tutorial will use matplotlib's imperative-style plotting interface, pyplot. This interface maintains global state, and is very useful for quickly and easily experimenting with various plot settings. The alternative is the object-oriented interface, which is also very powerful, and generally more suitable for large application development. If you'd like to learn about the object-oriented interface, a great place to start is our FAQ on usage. For now, let's get on with the imperative-style approach:

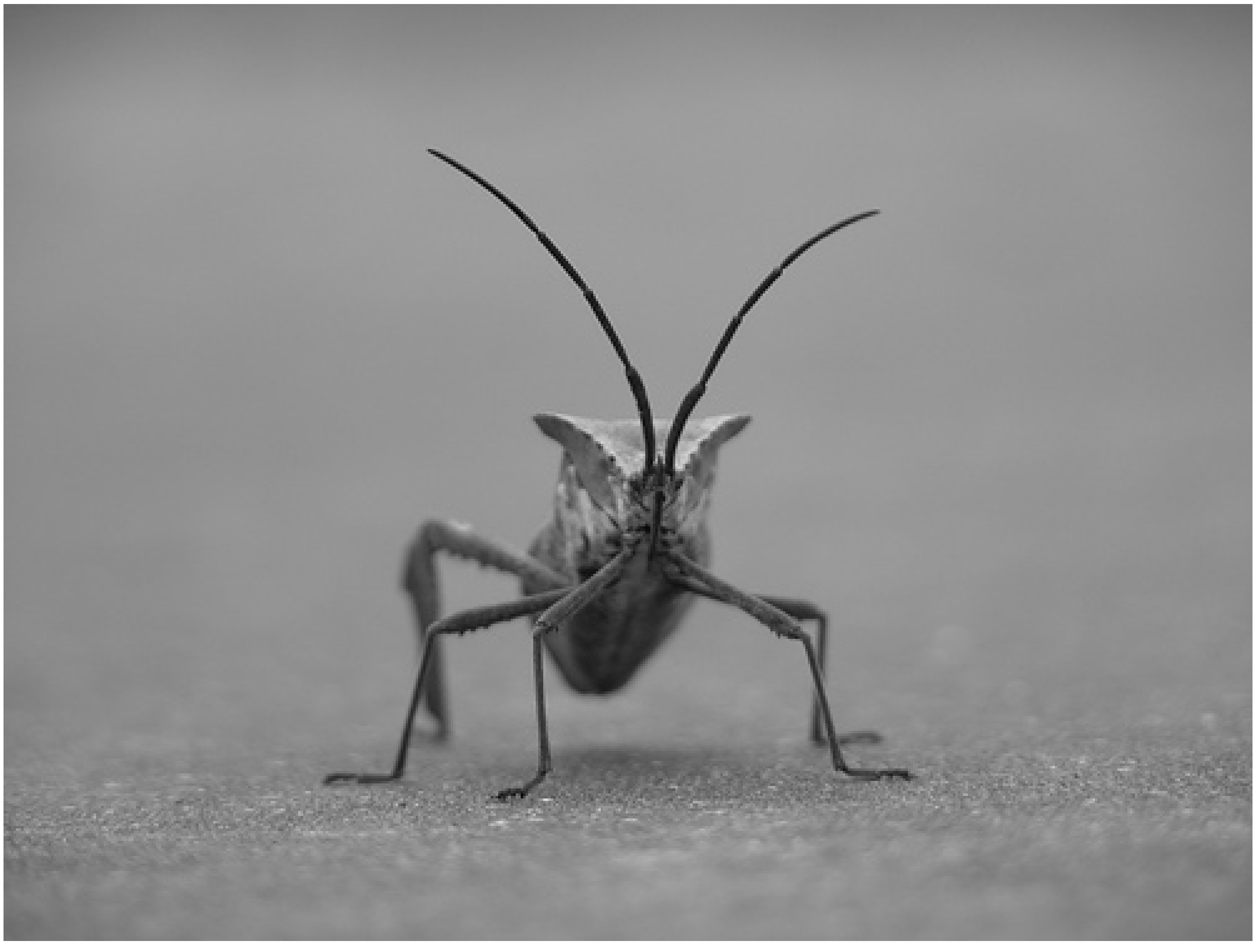
```
In [2]: import matplotlib.pyplot as plt
In [3]: import matplotlib.image as mpimg
In [4]: import numpy as np
```

Importing image data into Numpy arrays

Loading image data is supported by the Pillow library. Natively, matplotlib only supports PNG images. The commands shown below fall back on Pillow if the native read fails.

The image used in this example is a PNG file, but keep that Pillow requirement in mind for your own data.

Here's the image we're going to play with:



It's a 24-bit RGB PNG image (8 bits for each of R, G, B). Depending on where you get your data, the other kinds of image that you'll most likely encounter are RGBA images, which allow for transparency, or single-channel grayscale (luminosity) images. You can right click on it and choose "Save image as" to download it to your computer for the rest of this tutorial.

And here we go...

```
In [5]: img=mpimg.imread('stinkbug.png')
Out[5]:
array([[[ 0.40784314,  0.40784314,  0.40784314],
        [ 0.40784314,  0.40784314,  0.40784314],
        [ 0.40784314,  0.40784314,  0.40784314],
        ...,
        [ 0.42745098,  0.42745098,  0.42745098],
        [ 0.42745098,  0.42745098,  0.42745098],
        [ 0.42745098,  0.42745098,  0.42745098]],

       ...,
       [[ 0.44313726,  0.44313726,  0.44313726],
        [ 0.4509804 ,  0.4509804 ,  0.4509804 ],
        [ 0.4509804 ,  0.4509804 ,  0.4509804 ],
        ...,
        [ 0.44705883,  0.44705883,  0.44705883],
        [ 0.44705883,  0.44705883,  0.44705883],
        [ 0.44313726,  0.44313726,  0.44313726]]], dtype=float32)
```

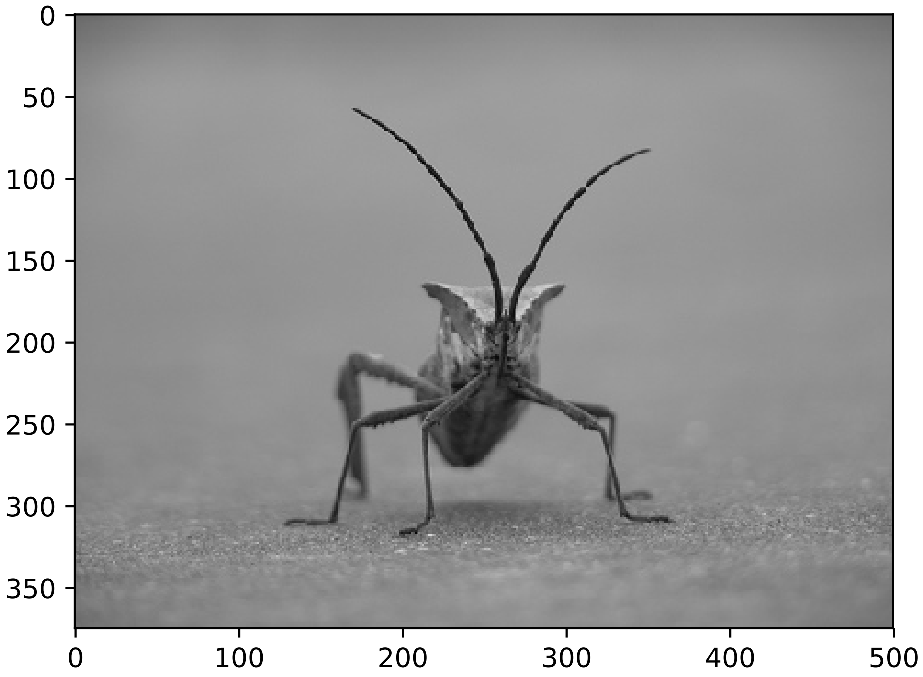
Note the dtype there - float32. Matplotlib has rescaled the 8 bit data from each channel to floating point data between 0.0 and 1.0. As a side note, the only datatype that Pillow can work with is uint8. Matplotlib plotting can handle float32 and uint8, but image reading/writing for any format other than PNG is limited to uint8 data. Why 8 bits? Most displays can only render 8 bits per channel worth of color gradation. Why can they only render 8 bits/channel? Because that's about all the human eye can see. More here (from a photography standpoint): Luminous Landscape bit depth tutorial.

Each inner list represents a pixel. Here, with an RGB image, there are 3 values. Since it's a black and white image, R, G, and B are all similar. An RGBA (where A is alpha, or transparency), has 4 values per inner list, and a simple luminance image just has one value (and is thus only a 2-D array, not a 3-D array). For RGB and RGBA images, matplotlib supports float32 and uint8 data types. For grayscale, matplotlib supports only float32. If your array data does not meet one of these descriptions, you need to rescale it.

Plotting numpy arrays as images

So, you have your data in a numpy array (either by importing it, or by generating it). Let's render it. In Matplotlib, this is performed using the *`imshow()`* function. Here we'll grab the plot object. This object gives you an easy way to manipulate the plot from the prompt.

```
In [6]: imgplot = plt.imshow(img)
```



You can also plot any numpy array.

Applying pseudocolor schemes to image plots

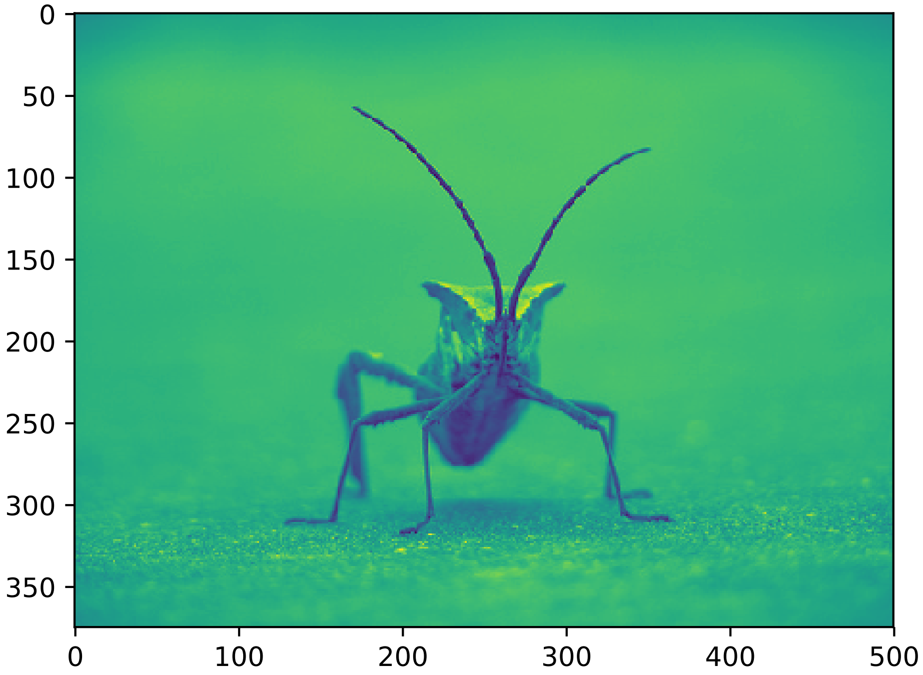
Pseudocolor can be a useful tool for enhancing contrast and visualizing your data more easily. This is especially useful when making presentations of your data using projectors - their contrast is typically quite poor.

Pseudocolor is only relevant to single-channel, grayscale, luminosity images. We currently have an RGB image. Since R, G, and B are all similar (see for yourself above or in your data), we can just pick one channel of our data:

```
In [7]: lum_img = img[:,:,0]
```

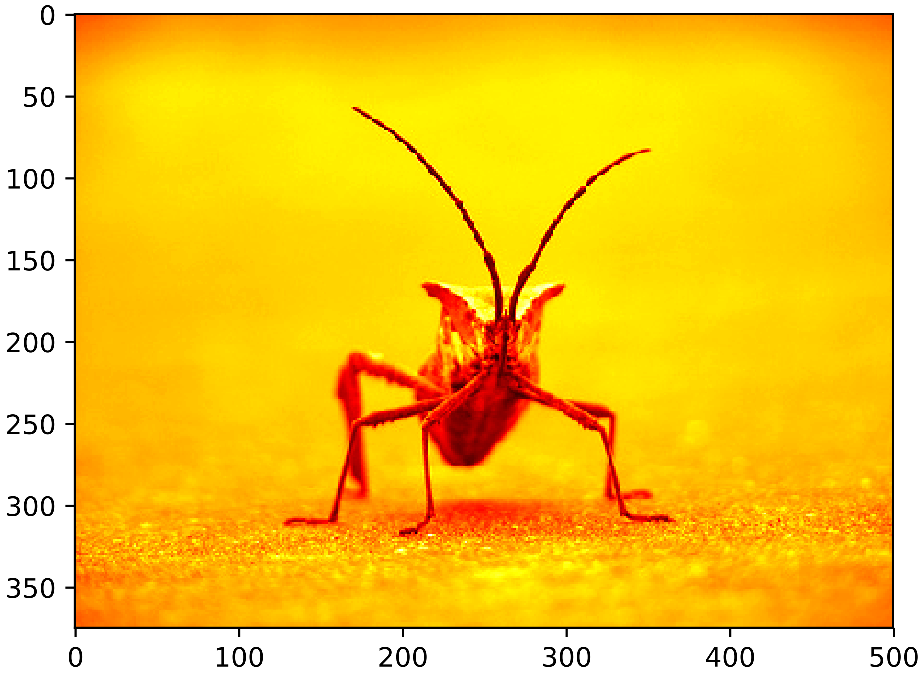
This is array slicing. You can read more in the Numpy tutorial.

```
In [8]: plt.imshow(lum_img)
```



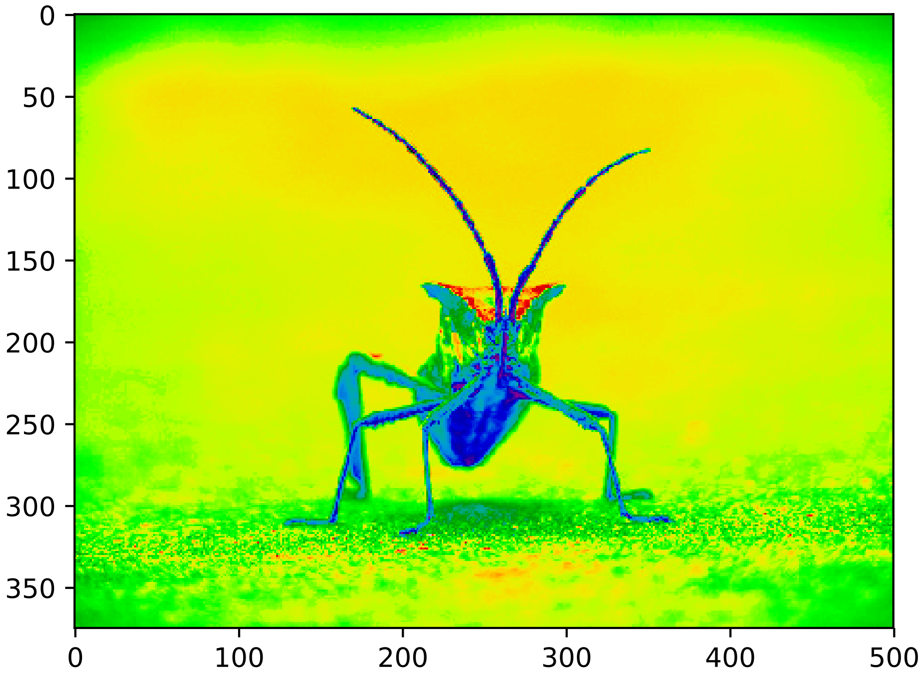
Now, with a luminosity (2D, no color) image, the default colormap (aka lookup table, LUT), is applied. The default is called viridis. There are plenty of others to choose from.

```
In [9]: plt.imshow(lum_img, cmap="hot")
```



Note that you can also change colormaps on existing plot objects using the `set_cmap()` method:

```
In [10]: imgplot = plt.imshow(lum_img)
In [11]: imgplot.set_cmap('nipy_spectral')
```



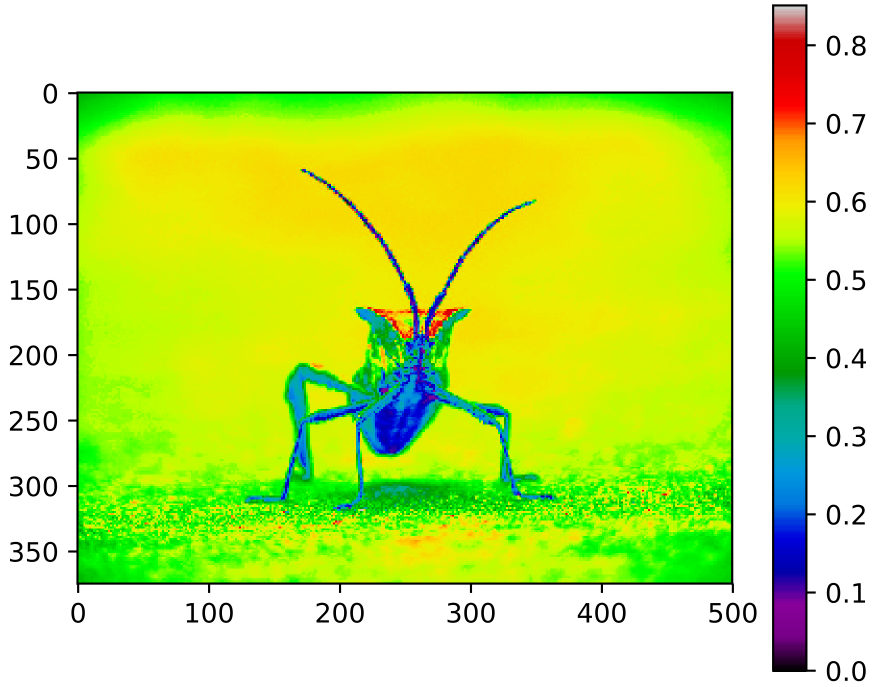
Note: However, remember that in the IPython notebook with the inline backend, you can't make changes to plots that have already been rendered. If you create imgplot here in one cell, you cannot call set_cmap() on it in a later cell and expect the earlier plot to change. Make sure that you enter these commands together in one cell. plt commands will not change plots from earlier cells.

There are many other colormap schemes available. See the list and images of the colormaps.

Color scale reference

It's helpful to have an idea of what value a color represents. We can do that by adding color bars.

```
In [12]: imgplot = plt.imshow(lum_img)
In [13]: plt.colorbar()
```

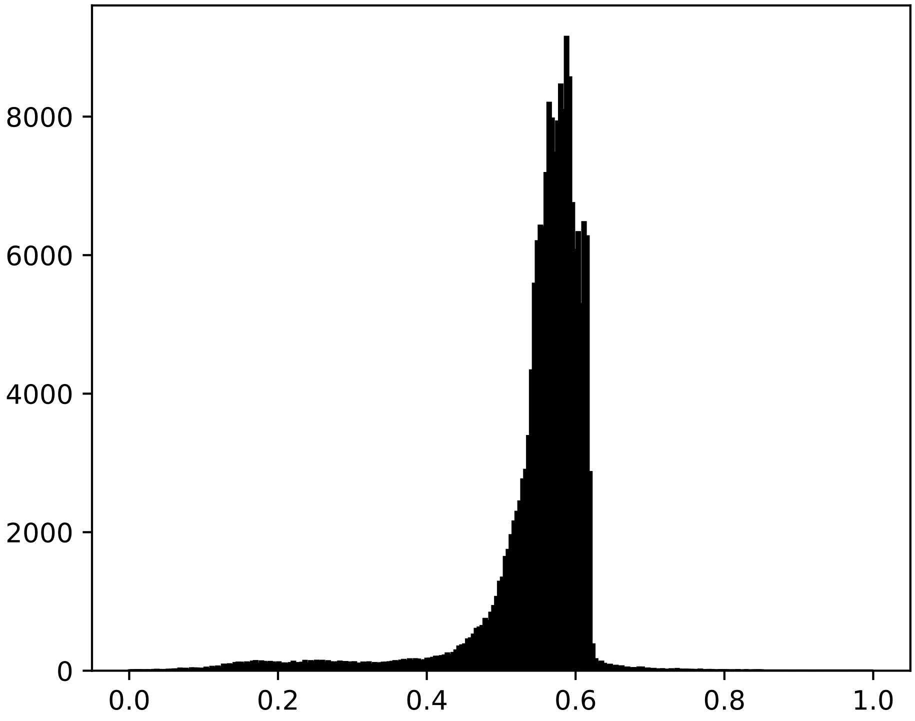


This adds a colorbar to your existing figure. This won't automatically change if you change you switch to a different colormap - you have to re-create your plot, and add in the colorbar again.

Examining a specific data range

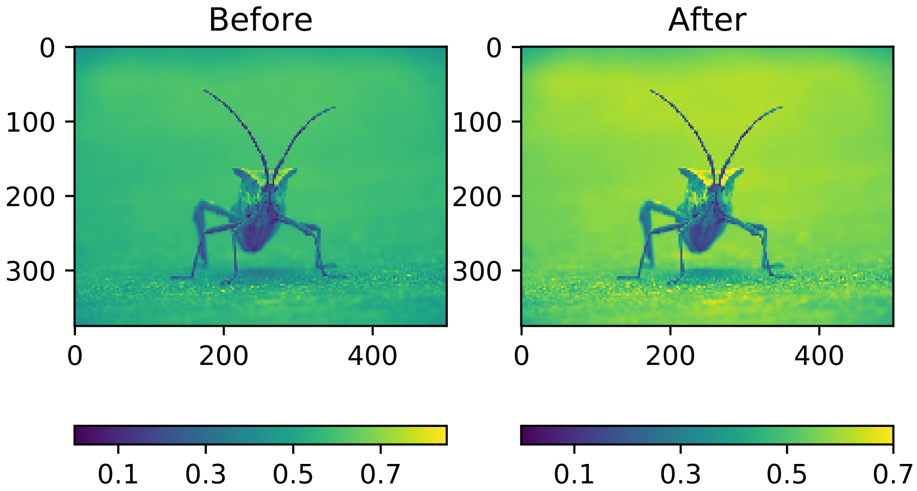
Sometimes you want to enhance the contrast in your image, or expand the contrast in a particular region while sacrificing the detail in colors that don't vary much, or don't matter. A good tool to find interesting regions is the histogram. To create a histogram of our image data, we use the `hist()` function.

```
In [14]: plt.hist(lum_img.ravel(), bins=256, range=(0.0, 1.0), fc='k', ec='k')
```



Most often, the "interesting" part of the image is around the peak, and you can get extra contrast by clipping the regions above and/or below the peak. In our histogram, it looks like there's not much useful information in the high end (not many white things in the image). Let's adjust the upper limit, so that we effectively "zoom in on" part of the histogram. We do this by passing the clim argument to imshow. You could also do this by calling the `set_clim()` method of the image plot object, but make sure that you do so in the same cell as your plot command when working with the IPython Notebook - it will not change plots from earlier cells.

```
In [15]: imgplot = plt.imshow(lum_img, clim=(0.0, 0.7))
```

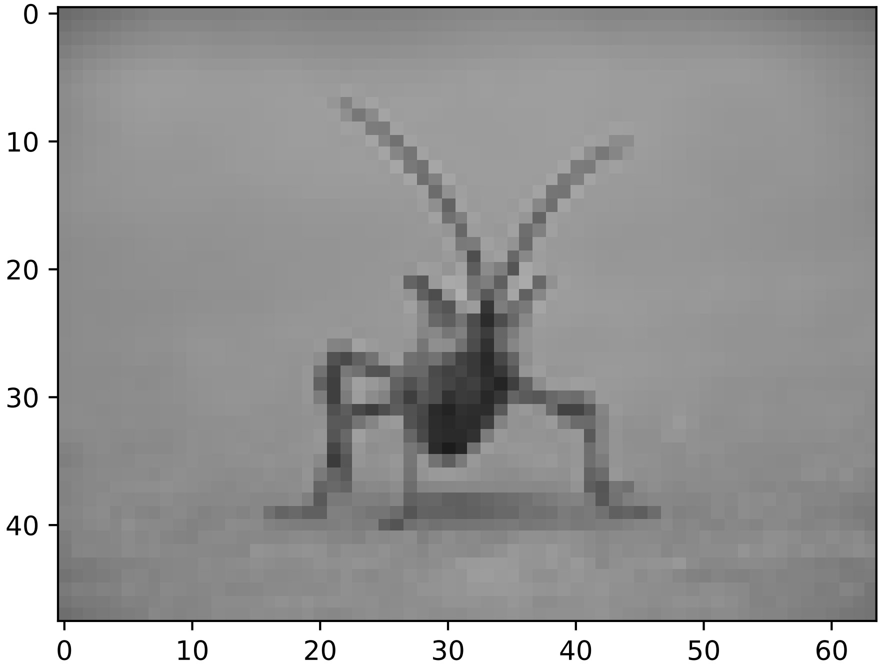


Array Interpolation schemes

Interpolation calculates what the color or value of a pixel "should" be, according to different mathematical schemes. One common place that this happens is when you resize an image. The number of pixels change, but you want the same information. Since pixels are discrete, there's missing space. Interpolation is how you fill that space. This is why your images sometimes come out looking pixelated when you blow them up. The effect is more pronounced when the difference between the original image and the expanded image is greater. Let's take our image and shrink it. We're effectively discarding pixels, only keeping a select few. Now when we plot it, that data gets blown up to the size on your screen. The old pixels aren't there anymore, and the computer has to draw in pixels to fill that space.

We'll use the Pillow library that we used to load the image also to resize the image.

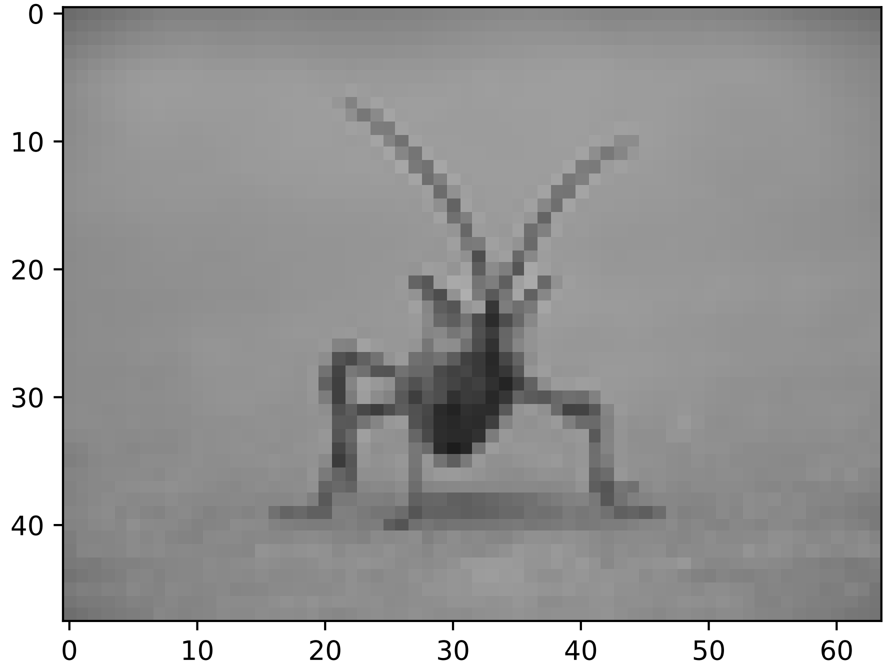
```
In [16]: from PIL import Image
In [17]: img = Image.open('../_static/stinkbug.png')
In [18]: img.thumbnail((64, 64), Image.ANTIALIAS) # resizes image in-place
In [19]: imgplot = plt.imshow(img)
```



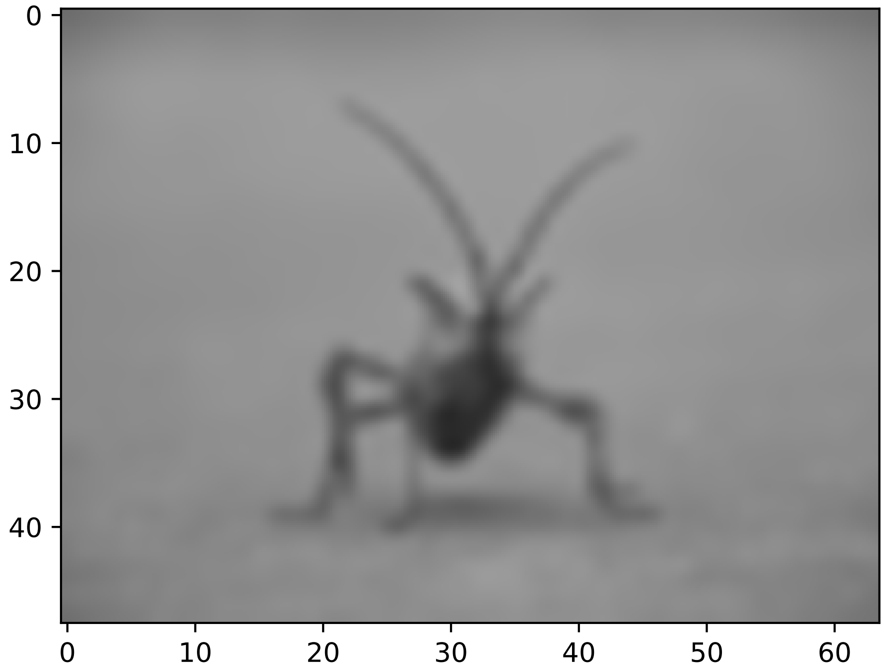
Here we have the default interpolation, bilinear, since we did not give *`imshow()`* any interpolation argument.

Let's try some others:

```
In [20]: imgplot = plt.imshow(img, interpolation="nearest")
```



```
In [21]: imgplot = plt.imshow(img, interpolation="bicubic")
```



Bicubic interpolation is often used when blowing up photos - people tend to prefer blurry over pixelated.

3.1.3 Customizing Location of Subplot Using GridSpec

`GridSpec` specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

`SubplotSpec` specifies the location of the subplot in the given *GridSpec*.

`subplot2grid()` a helper function that is similar to *`subplot()`* but uses 0-based indexing and let subplot to occupy multiple cells.

Basic Example of using subplot2grid

To use *`subplot2grid()`*, you provide geometry of the grid and the location of the subplot in the grid. For a simple single-cell subplot:

```
ax = plt.subplot2grid((2, 2), (0, 0))
```

is identical to

```
ax = plt.subplot(2, 2, 1)
```

Note that, unlike Matplotlib's subplot, the index starts from 0 in GridSpec.

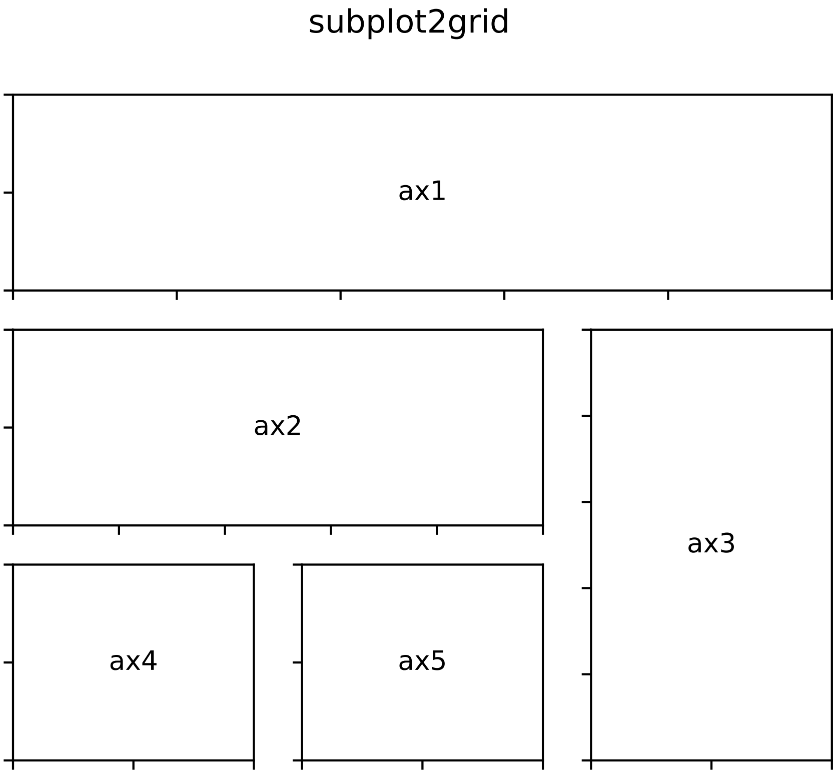
To create a subplot that spans multiple cells,

```
ax2 = plt.subplot2grid((3, 3), (1, 0), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)
```

For example, the following commands

```
ax1 = plt.subplot2grid((3, 3), (0, 0), colspan=3)
ax2 = plt.subplot2grid((3, 3), (1, 0), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)
ax4 = plt.subplot2grid((3, 3), (2, 0))
ax5 = plt.subplot2grid((3, 3), (2, 1))
```

creates



GridSpec and SubplotSpec

You can create *`GridSpec`* explicitly and use them to create a subplot.

For example,

```
ax = plt.subplot2grid((2, 2), (0, 0))
```

is equal to

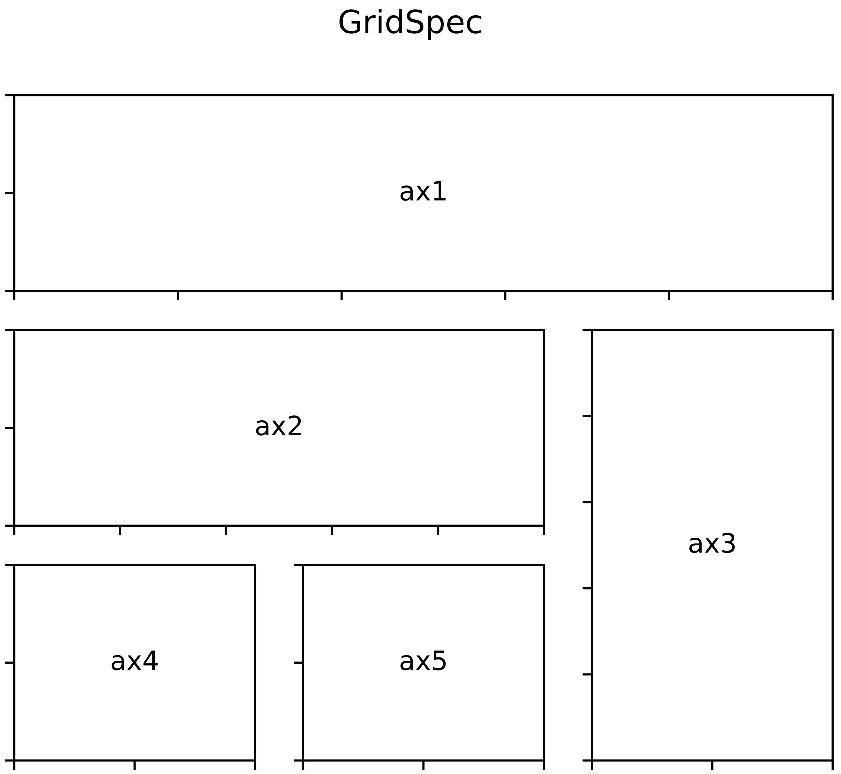
```
import matplotlib.gridspec as gridspec
gs = gridspec.GridSpec(2, 2)
ax = plt.subplot(gs[0, 0])
```

A GridSpec instance provides array-like (2d or 1d) indexing that returns the SubplotSpec instance. For a SubplotSpec that spans multiple cells, use slice.

```
ax2 = plt.subplot(gs[1, :-1])
ax3 = plt.subplot(gs[1:, -1])
```

The above example becomes

```
gs = gridspec.GridSpec(3, 3)
ax1 = plt.subplot(gs[0, :])
ax2 = plt.subplot(gs[1, :-1])
ax3 = plt.subplot(gs[1:, -1])
ax4 = plt.subplot(gs[-1, 0])
ax5 = plt.subplot(gs[-1, -2])
```



Adjust GridSpec layout

When a GridSpec is explicitly used, you can adjust the layout parameters of subplots that are created from the GridSpec.

```
gs1 = gridspec.GridSpec(3, 3)
gs1.update(left=0.05, right=0.48, wspace=0.05)
```

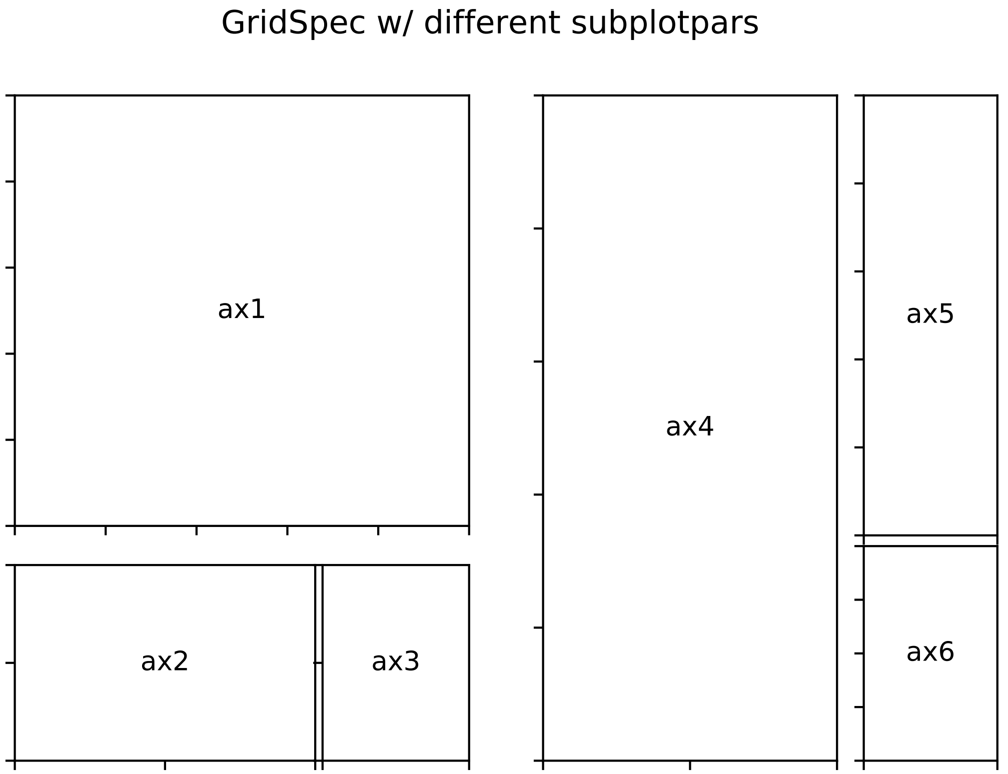
This is similar to *`subplots_adjust()`*, but it only affects the subplots that are created from the given GridSpec.

The code below

```
gs1 = gridspec.GridSpec(3, 3)
gs1.update(left=0.05, right=0.48, wspace=0.05)
ax1 = plt.subplot(gs1[:-1, :])
ax2 = plt.subplot(gs1[-1, :-1])
ax3 = plt.subplot(gs1[-1, -1])

gs2 = gridspec.GridSpec(3, 3)
gs2.update(left=0.55, right=0.98, hspace=0.05)
ax4 = plt.subplot(gs2[:, :-1])
ax5 = plt.subplot(gs2[:-1, -1])
ax6 = plt.subplot(gs2[-1, -1])
```

creates

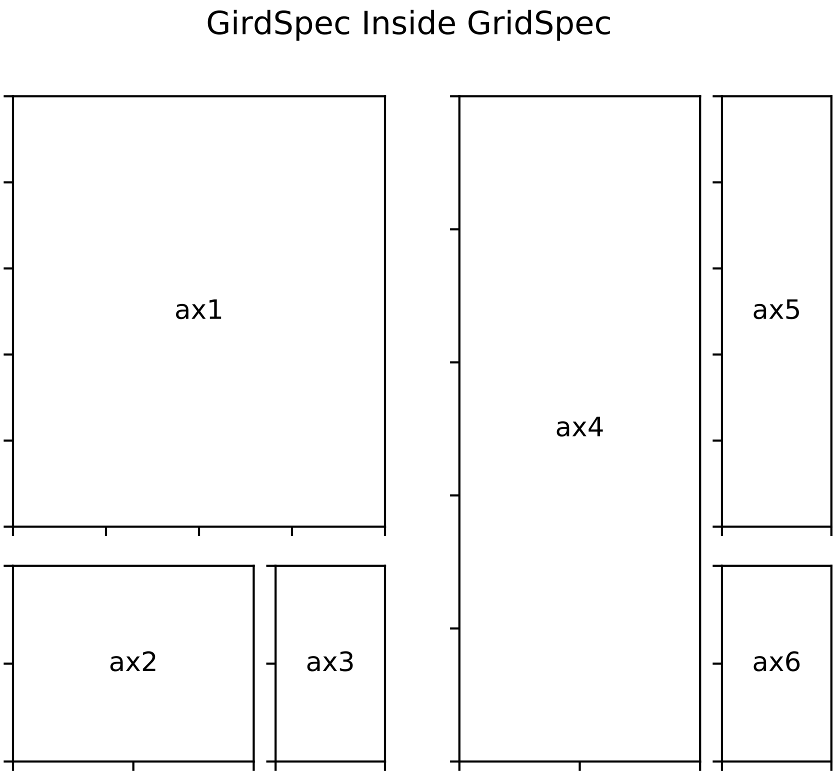


GridSpec using SubplotSpec

You can create GridSpec from the `SubplotSpec`, in which case its layout parameters are set to that of the location of the given SubplotSpec.

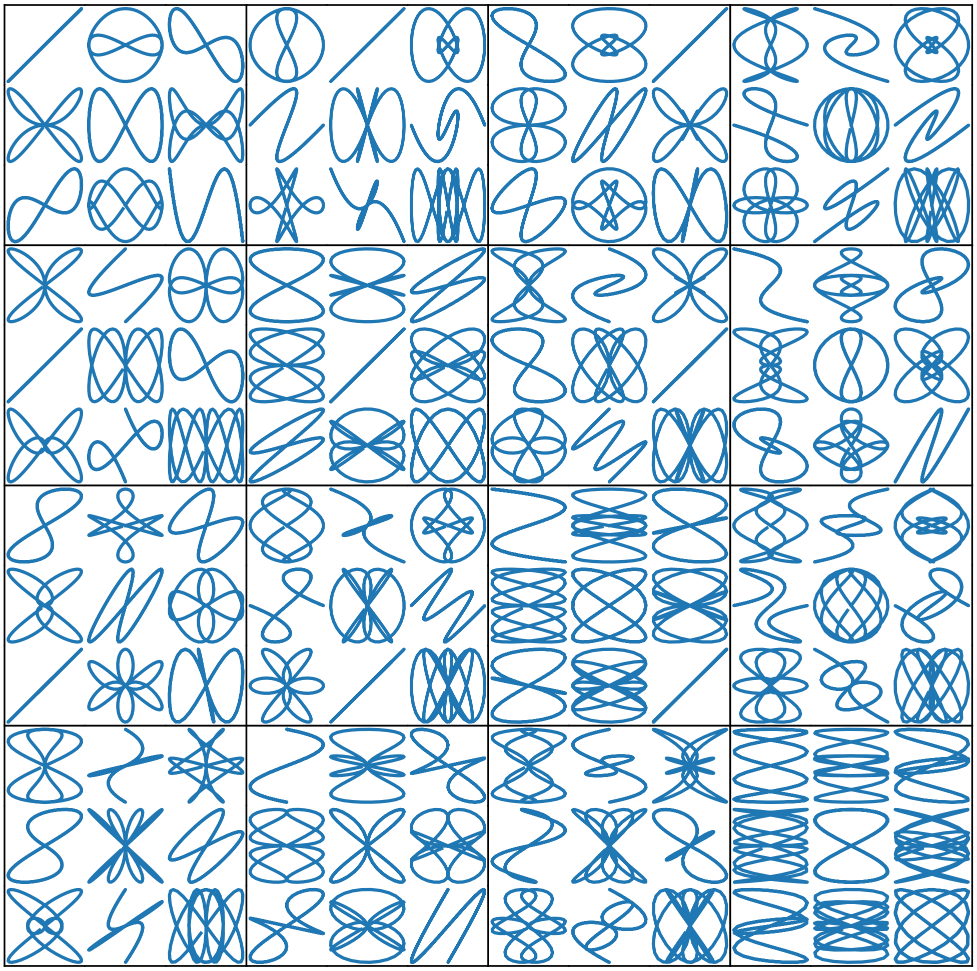
```
gs0 = gridspec.GridSpec(1, 2)

gs00 = gridspec.GridSpecFromSubplotSpec(3, 3, subplot_spec=gs0[0])
gs01 = gridspec.GridSpecFromSubplotSpec(3, 3, subplot_spec=gs0[1])
```



A Complex Nested GridSpec using SubplotSpec

Here's a more sophisticated example of nested GridSpec where we put a box around each cell of the outer 4x4 grid, by hiding appropriate spines in each of the inner 3x3 grids.



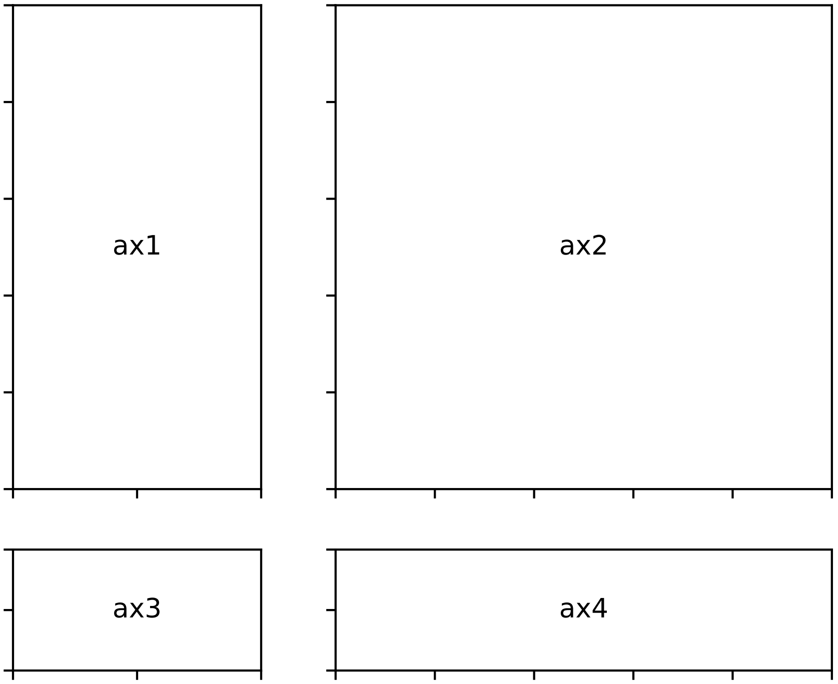
GridSpec with Varying Cell Sizes

By default, GridSpec creates cells of equal sizes. You can adjust relative heights and widths of rows and columns. Note that absolute values are meaningless, only their relative ratios matter.

```
gs = gridspec.GridSpec(2, 2,
                       width_ratios=[1, 2],
                       height_ratios=[4, 1]
                       )

ax1 = plt.subplot(gs[0])
ax2 = plt.subplot(gs[1])
```

```
ax3 = plt.subplot(gs[2])
ax4 = plt.subplot(gs[3])
```



3.1.4 Tight Layout guide

tight_layout automatically adjusts subplot params so that the subplot(s) fits in to the figure area. This is an experimental feature and may not work for some cases. It only checks the extents of ticklabels, axis labels, and titles.

Simple Example

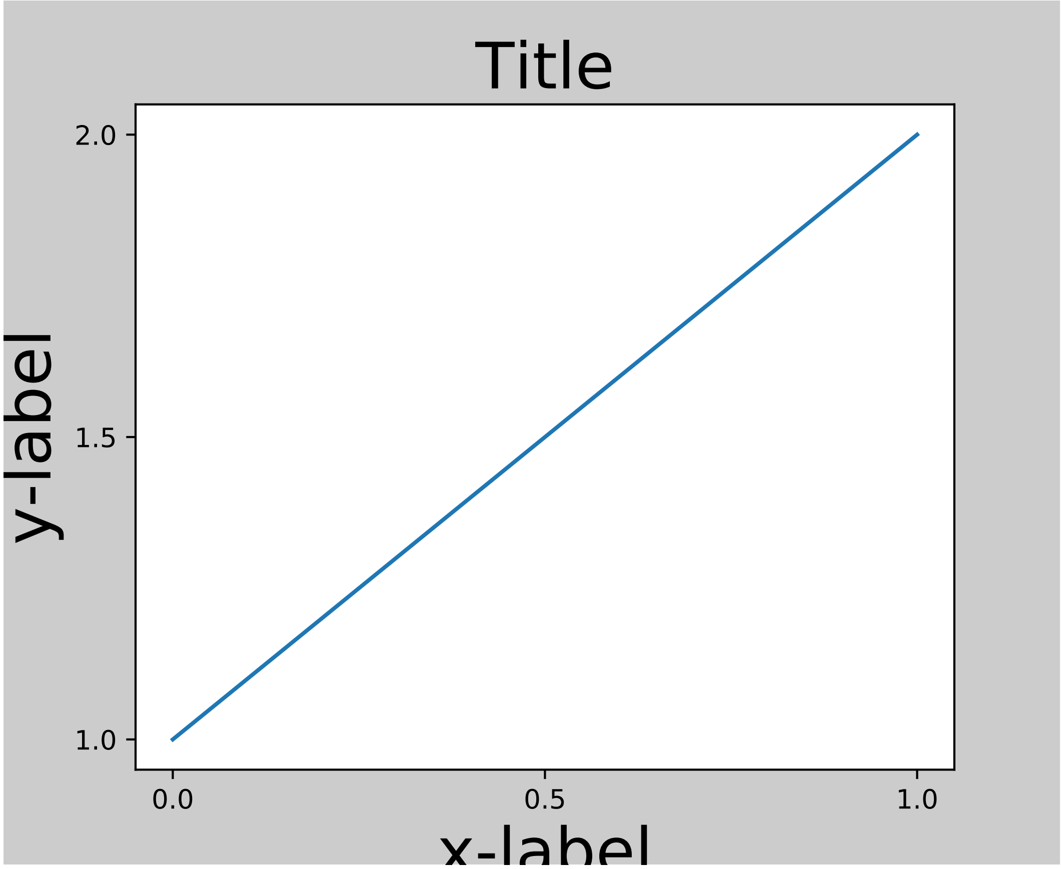
In matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.

```
plt.rcParams['savefig.facecolor'] = "0.8"

def example_plot(ax, fontsize=12):
     ax.plot([1, 2])
     ax.locator_params(nbins=3)
     ax.set_xlabel('x-label', fontsize=fontsize)
     ax.set_ylabel('y-label', fontsize=fontsize)
```

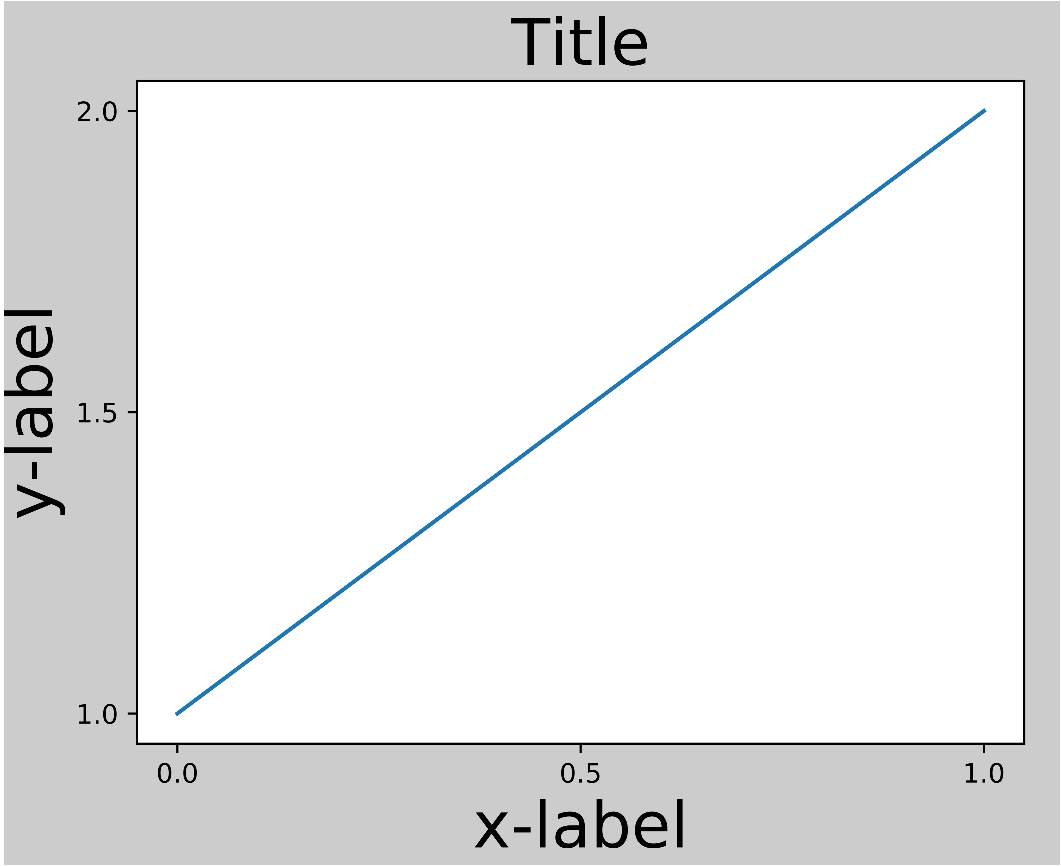
```
    ax.set_title('Title', fontsize=fontsize)

plt.close('all')
fig, ax = plt.subplots()
example_plot(ax, fontsize=24)
```



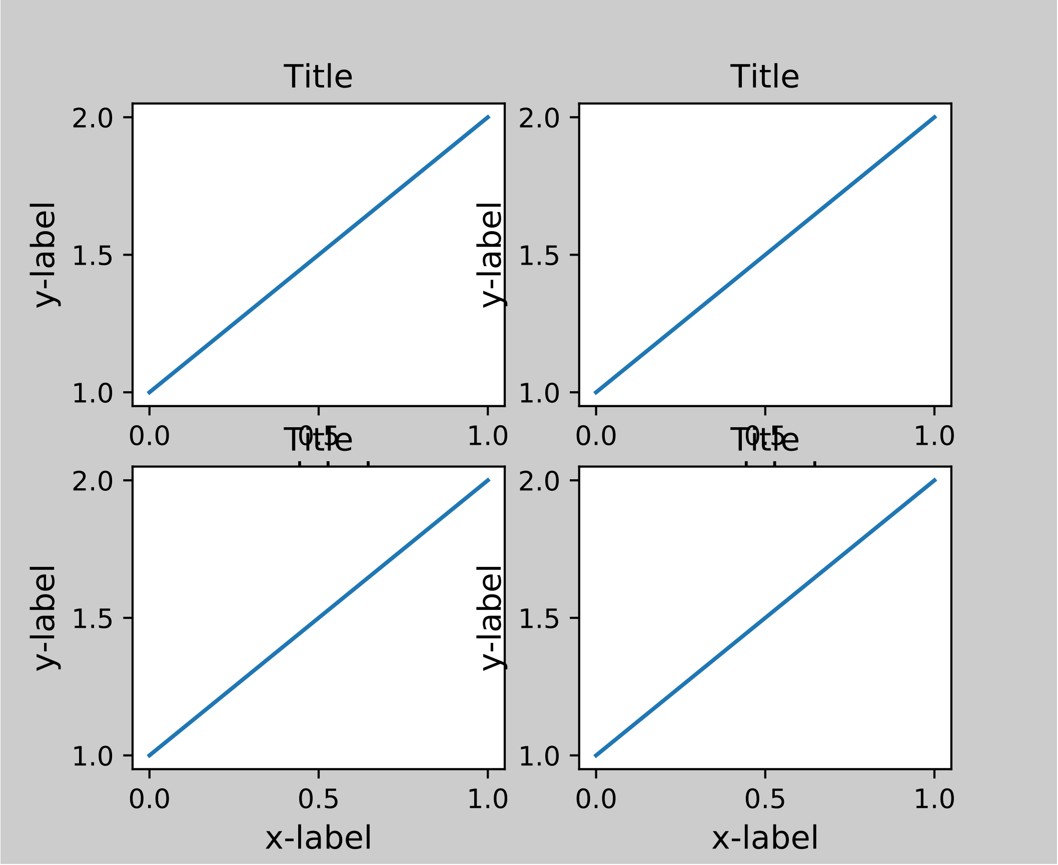
To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (*Move the edge of an axes to make room for tick labels*). Matplotlib v1.1 introduces a new command *`tight_layout()`* that does this automatically for you.

```
plt.tight_layout()
```



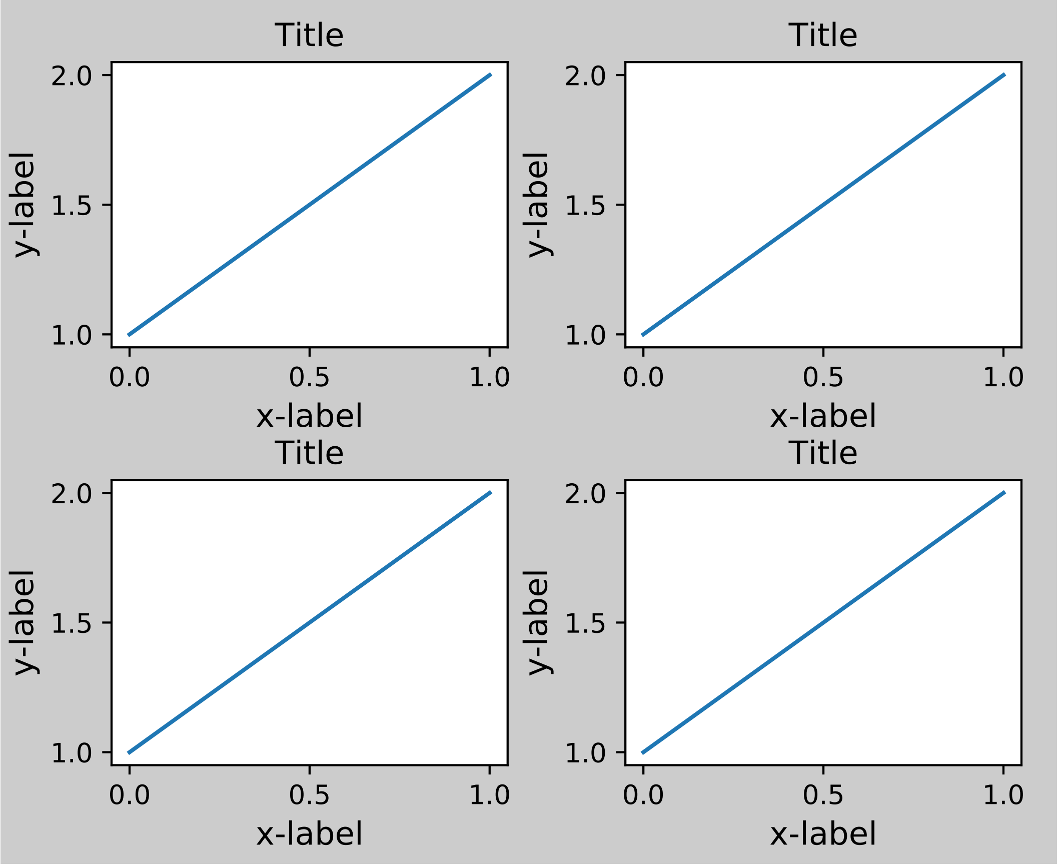
When you have multiple subplots, often you see labels of different axes overlapping each other.

```
plt.close('all')
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```



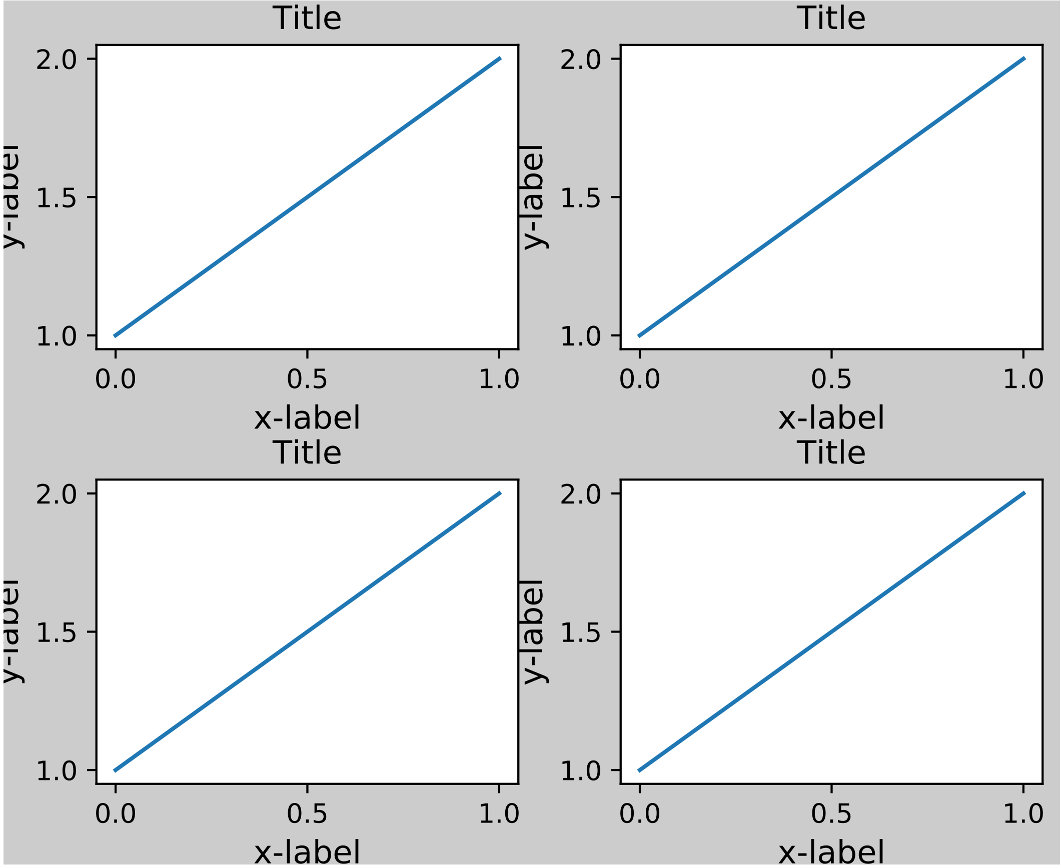
`tight_layout()` will also adjust spacing between subplots to minimize the overlaps.

```
plt.tight_layout()
```



`tight_layout()` can take keyword arguments of *pad*, *w_pad* and *h_pad*. These control the extra padding around the figure border and between subplots. The pads are specified in fraction of fontsize.

```
plt.tight_layout(pad=0.4, w_pad=0.5, h_pad=1.0)
```



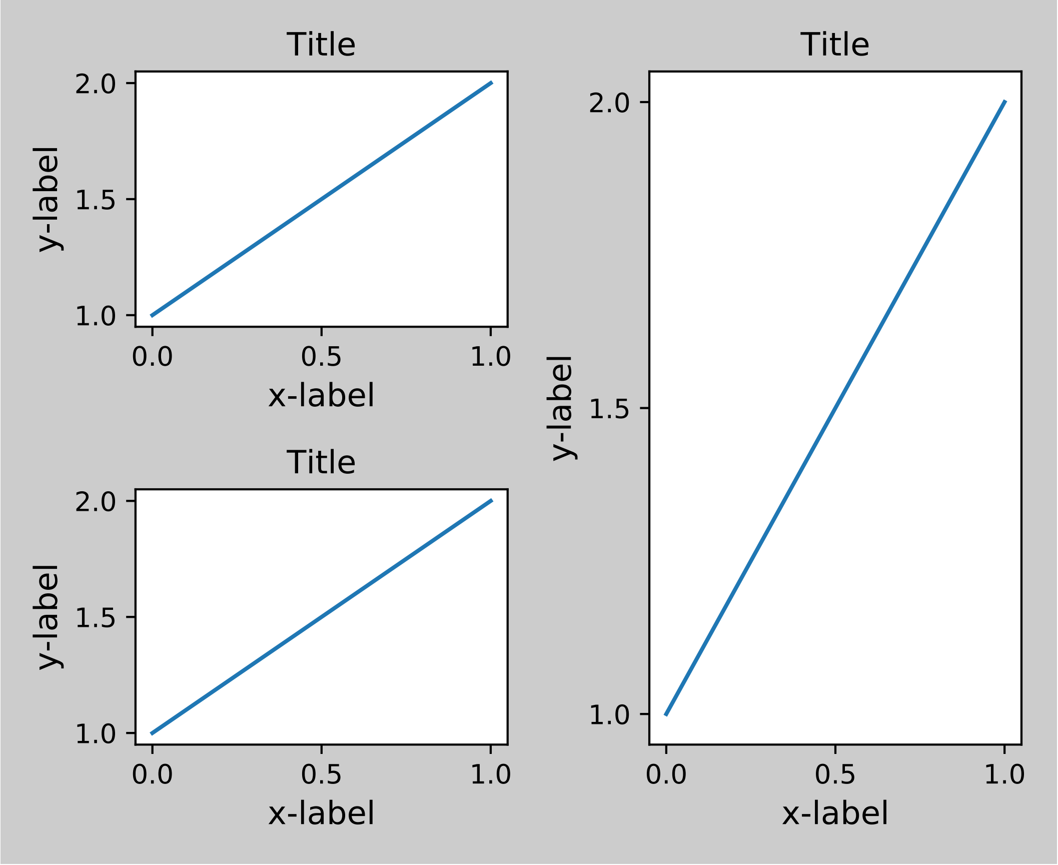
`tight_layout()` will work even if the sizes of subplots are different as far as their grid specification is compatible. In the example below, *ax1* and *ax2* are subplots of a 2x2 grid, while *ax3* is of a 1x2 grid.

```
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)

plt.tight_layout()
```



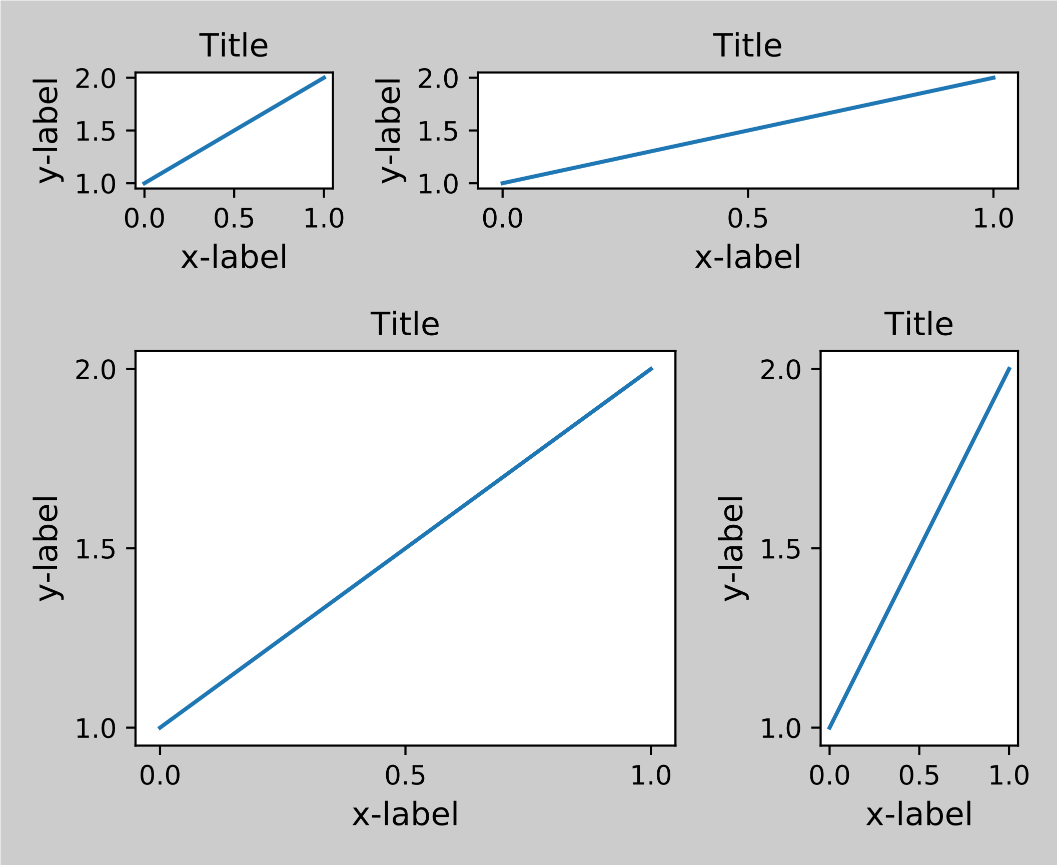
It works with subplots created with `subplot2grid()`. In general, subplots created from the gridspec (*Customizing Location of Subplot Using GridSpec*) will work.

```
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)

plt.tight_layout()
```



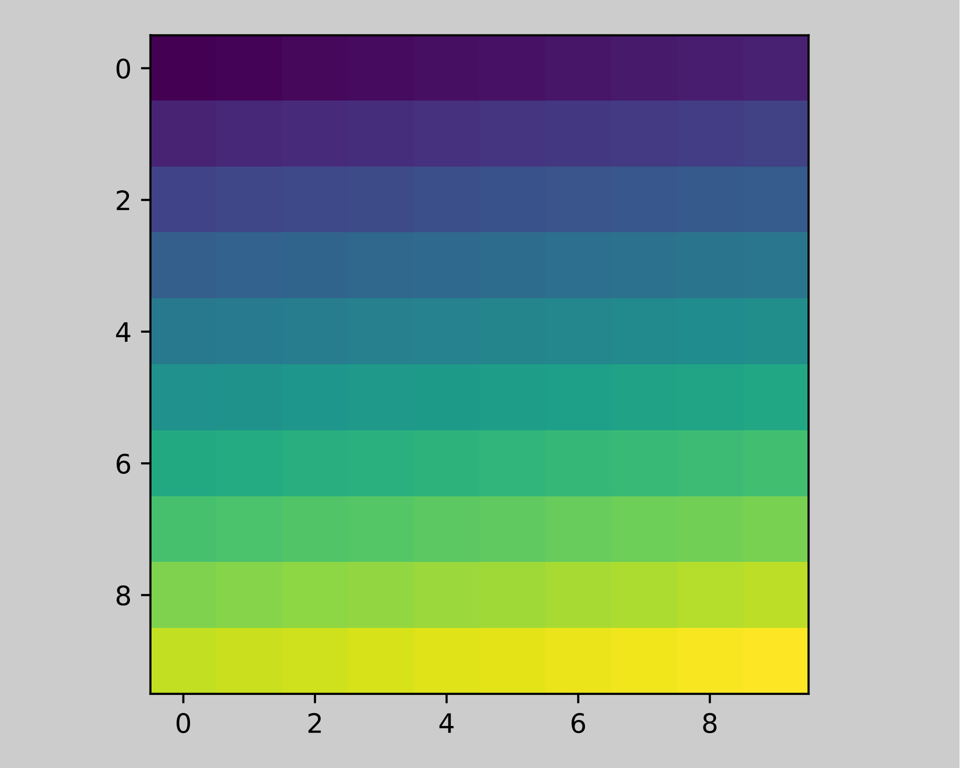
Although not thoroughly tested, it seems to work for subplots with aspect != "auto" (e.g., axes with images).

```
arr = np.arange(100).reshape((10,10))

plt.close('all')
fig = plt.figure(figsize=(5,4))

ax = plt.subplot(111)
im = ax.imshow(arr, interpolation="none")

plt.tight_layout()
```



Caveats

- *tight_layout()* only considers ticklabels, axis labels, and titles. Thus, other artists may be clipped and also may overlap.
- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.
- pad=0 clips some of the texts by a few pixels. This may be a bug or a limitation of the current algorithm and it is not clear why it happens. Meanwhile, use of pad at least larger than 0.3 is recommended.

Use with GridSpec

GridSpec has its own *tight_layout()* method (the pyplot api *tight_layout()* also works).

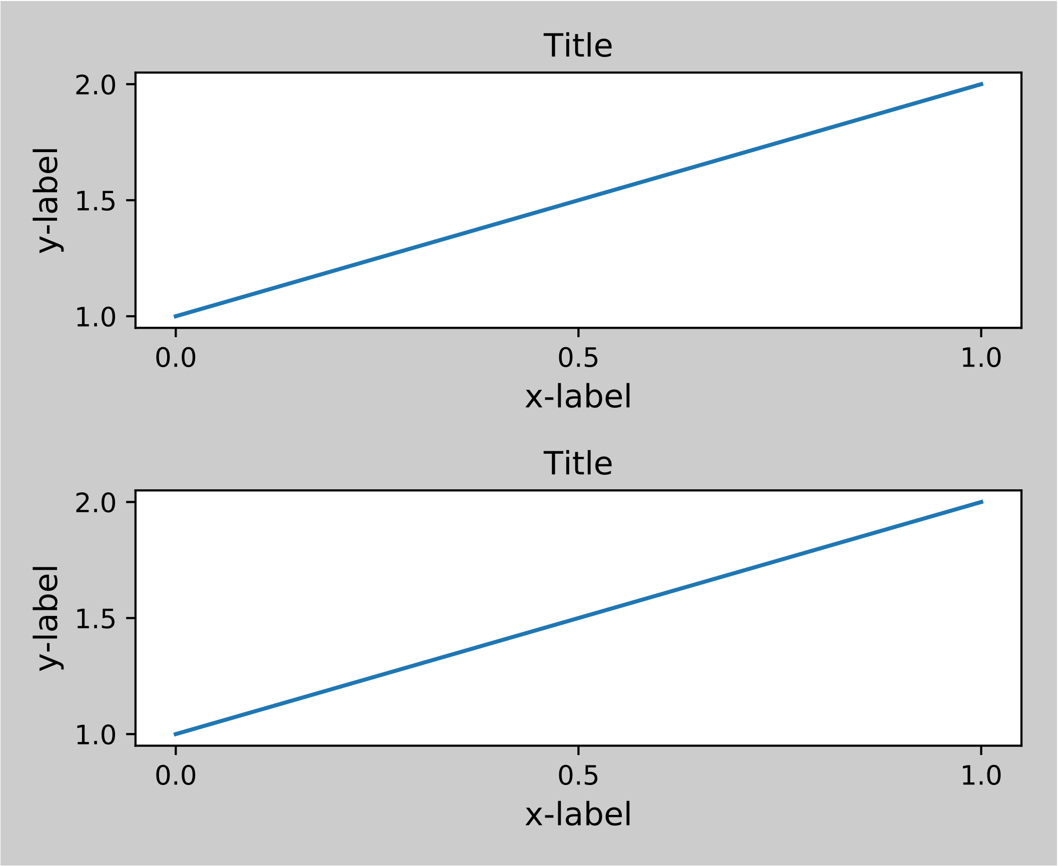
```
plt.close('all')
fig = plt.figure()

import matplotlib.gridspec as gridspec

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])
```

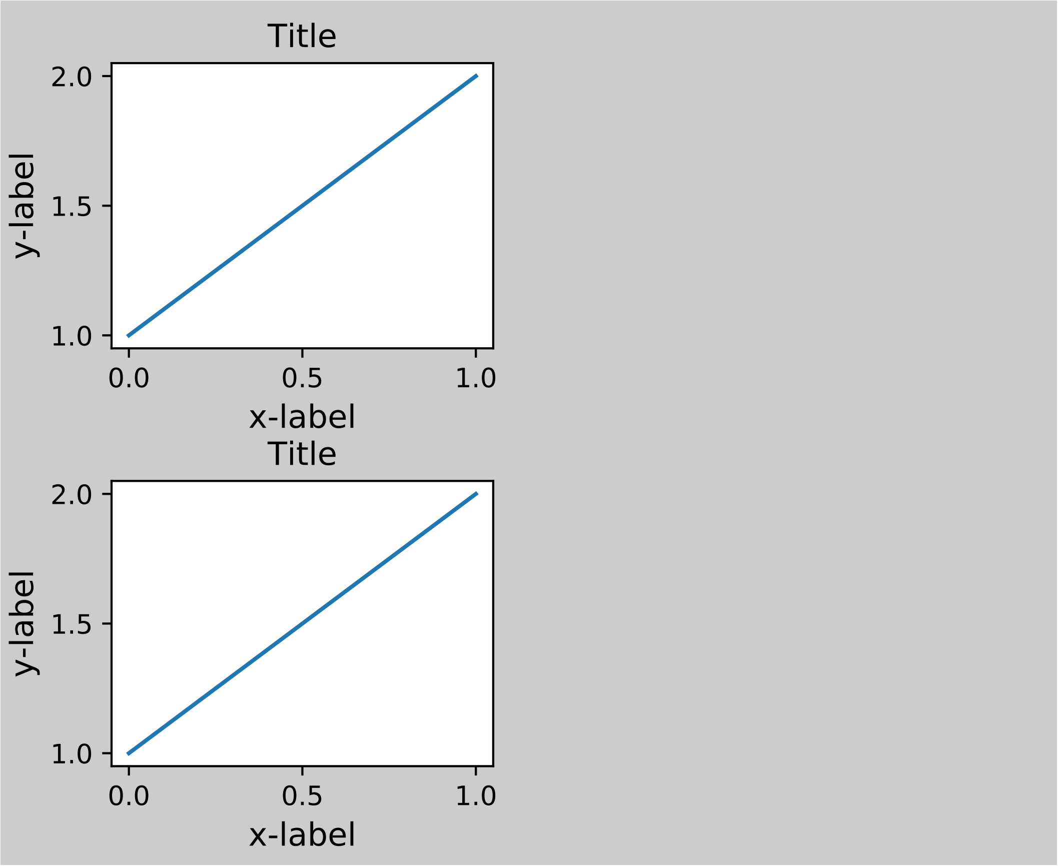
```
example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig)
```



You may provide an optional *rect* parameter, which specifies the bounding box that the subplots will be fit inside. The coordinates must be in normalized figure coordinates and the default is (0, 0, 1, 1).

```
gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])
```



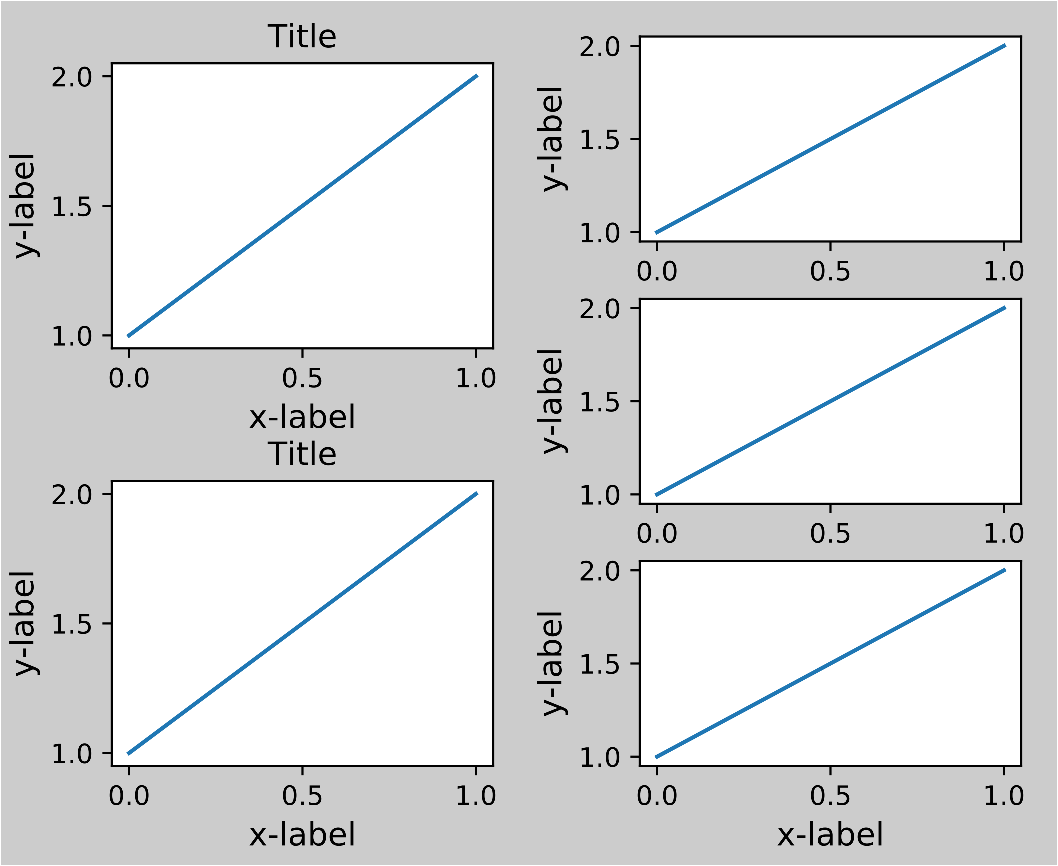
For example, this can be used for a figure with multiple gridspecs.

```
gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title("")
    ax.set_xlabel("")

ax.set_xlabel("x-label", fontsize=12)

gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)
```



We may try to match the top and bottom of two grids

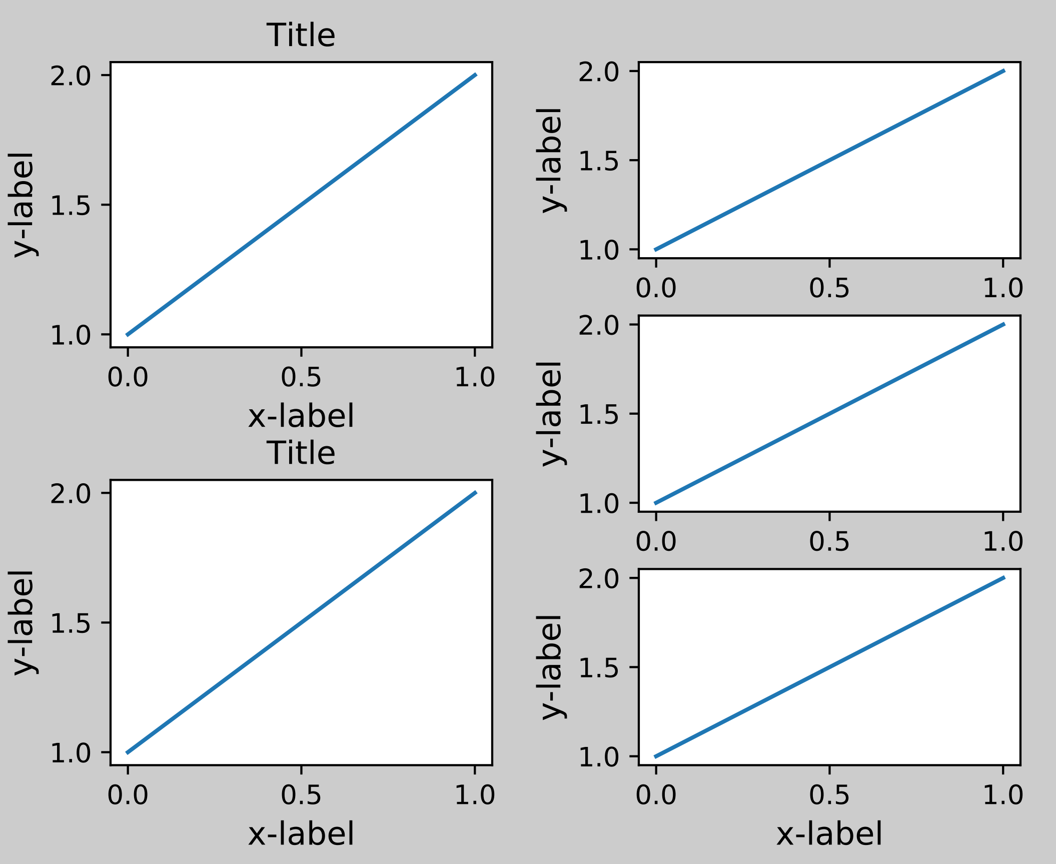
```
top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)
```

While this should be mostly good enough, adjusting top and bottom may require adjustment of hspace also. To update hspace & vspace, we call `tight_layout()` again with updated rect argument. Note that the rect argument specifies the area including the ticklabels, etc. Thus, we will increase the bottom (which is 0 for the normal case) by the difference between the *bottom* from above and the bottom of each gridspec. Same thing for the top.

```
top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.tight_layout(fig, rect=[None, 0 + (bottom-gs1.bottom),
                            0.5, 1 - (gs1.top-top)])
gs2.tight_layout(fig, rect=[0.5, 0 + (bottom-gs2.bottom),
                            None, 1 - (gs2.top-top)],
                 h_pad=0.5)
```



Use with AxesGrid1

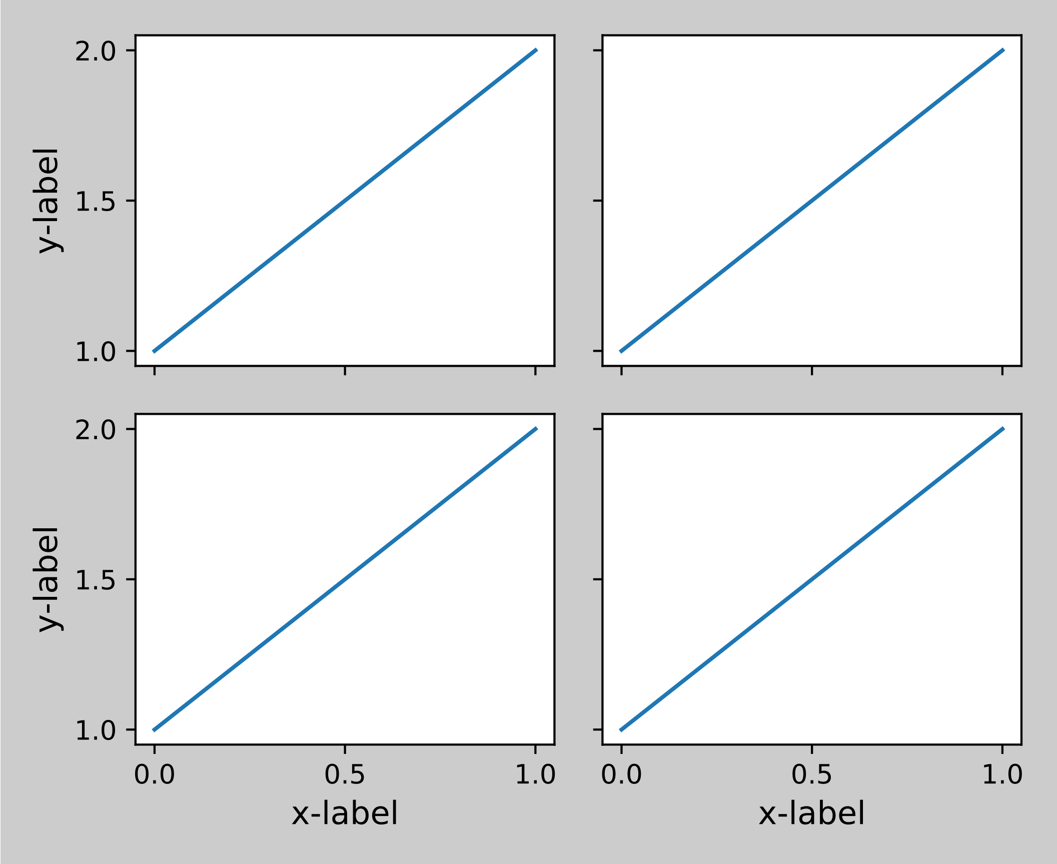
While limited, the axes_grid1 toolkit is also supported.

```
plt.close('all')
fig = plt.figure()

from mpl_toolkits.axes_grid1 import Grid
grid = Grid(fig, rect=111, nrows_ncols=(2,2),
            axes_pad=0.25, label_mode='L',
            )

for ax in grid:
    example_plot(ax)
    ax.title.set_visible(False)

plt.tight_layout()
```



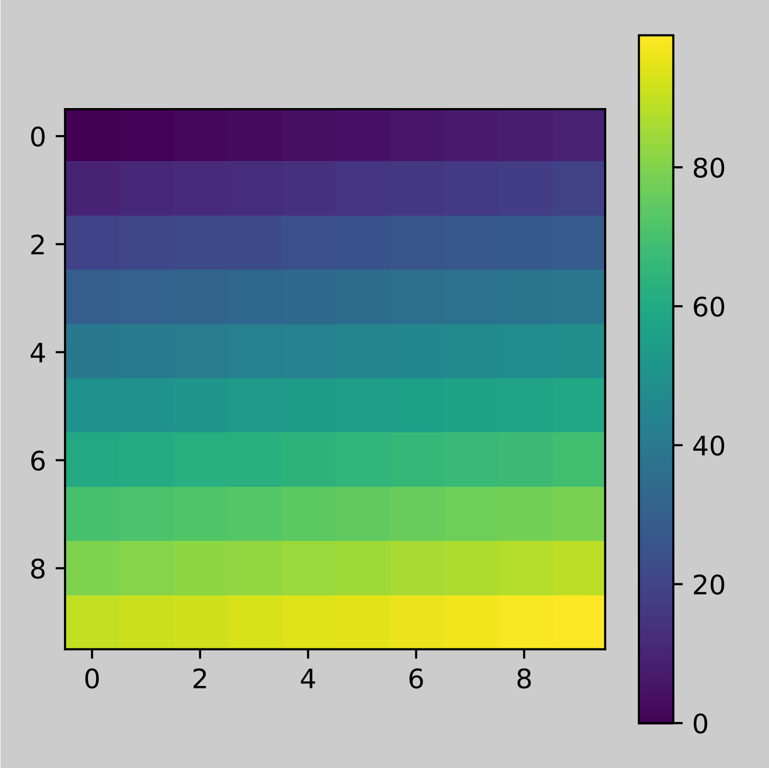
Colorbar

If you create a colorbar with the `colorbar()` command, the created colorbar is an instance of Axes, *not* Subplot, so tight_layout does not work. With Matplotlib v1.1, you may create a colorbar as a subplot using the gridspec.

```
plt.close('all')
arr = np.arange(100).reshape((10,10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

plt.colorbar(im, use_gridspec=True)

plt.tight_layout()
```

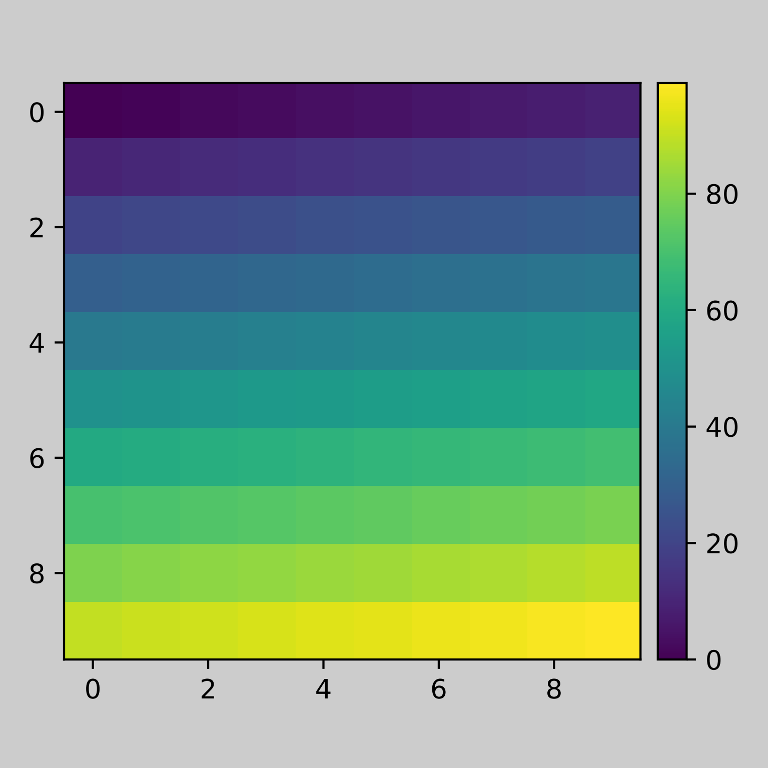


Another option is to use AxesGrid1 toolkit to explicitly create an axes for colorbar.

```
plt.close('all')
arr = np.arange(100).reshape((10,10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

from mpl_toolkits.axes_grid1 import make_axes_locatable
divider = make_axes_locatable(plt.gca())
cax = divider.append_axes("right", "5%", pad="3%")
plt.colorbar(im, cax=cax)

plt.tight_layout()
```



3.2 Intermediate

3.2.1 Artist tutorial

There are three layers to the matplotlib API. The `matplotlib.backend_bases.FigureCanvas` is the area onto which the figure is drawn, the `matplotlib.backend_bases.Renderer` is the object which knows how to draw on the `FigureCanvas`, and the *`matplotlib.artist.Artist`* is the object that knows how to use a renderer to paint onto the canvas. The `FigureCanvas` and `Renderer` handle all the details of talking to user interface toolkits like wxPython or drawing languages like PostScript®, and the `Artist` handles all the high level constructs like representing and laying out the figure, text, and lines. The typical user will spend 95% of their time working with the `Artists`.

There are two types of `Artists`: primitives and containers. The primitives represent the standard graphical objects we want to paint onto our canvas: *`Line2D`*, *`Rectangle`*, *`Text`*, *`AxesImage`*, etc., and the containers are places to put them (*`Axis`*, *`Axes`* and *`Figure`*). The standard use is to create a *`Figure`* instance, use the `Figure` to create one or more *`Axes`* or `Subplot` instances, and use the `Axes` instance helper methods to create the primitives. In the example below, we create a `Figure` instance using *`matplotlib.pyplot.figure()`*, which is a convenience method for instantiating `Figure` instances and connecting them with your user interface or drawing toolkit `FigureCanvas`. As we will discuss below, this is not necessary – you can work directly with PostScript, PDF Gtk+, or wxPython `FigureCanvas` instances, instantiate your `Figures` directly and connect them yourselves – but since we are focusing here on the `Artist` API we'll let *`pyplot`* handle some of those details for us:

```
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(2,1,1) # two rows, one column, first plot
```

The *Axes* is probably the most important class in the matplotlib API, and the one you will be working with most of the time. This is because the `Axes` is the plotting area into which most of the objects go, and the `Axes` has many special helper methods (*plot()*, *text()*, *hist()*, *imshow()*) to create the most common graphics primitives (*Line2D*, *Text*, *Rectangle*, `Image`, respectively). These helper methods will take your data (e.g., `numpy` arrays and strings) and create primitive `Artist` instances as needed (e.g., `Line2D`), add them to the relevant containers, and draw them when requested. Most of you are probably familiar with the `Subplot`, which is just a special case of an `Axes` that lives on a regular rows by columns grid of `Subplot` instances. If you want to create an `Axes` at an arbitrary location, simply use the *add_axes()* method which takes a list of `[left, bottom, width, height]` values in 0-1 relative figure coordinates:

```
fig2 = plt.figure()
ax2 = fig2.add_axes([0.15, 0.1, 0.7, 0.3])
```

Continuing with our example:

```
import numpy as np
t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax.plot(t, s, color='blue', lw=2)
```

In this example, `ax` is the `Axes` instance created by the `fig.add_subplot` call above (remember `Subplot` is just a subclass of `Axes`) and when you call `ax.plot`, it creates a `Line2D` instance and adds it to the `Axes.lines` list. In the interactive ipython session below, you can see that the `Axes.lines` list is length one and contains the same line that was returned by the `line, = ax.plot...` call:

```
In [101]: ax.lines[0]
Out[101]: <matplotlib.lines.Line2D instance at 0x19a95710>

In [102]: line
Out[102]: <matplotlib.lines.Line2D instance at 0x19a95710>
```

If you make subsequent calls to `ax.plot` (and the hold state is "on" which is the default) then additional lines will be added to the list. You can remove lines later simply by calling the list methods; either of these will work:

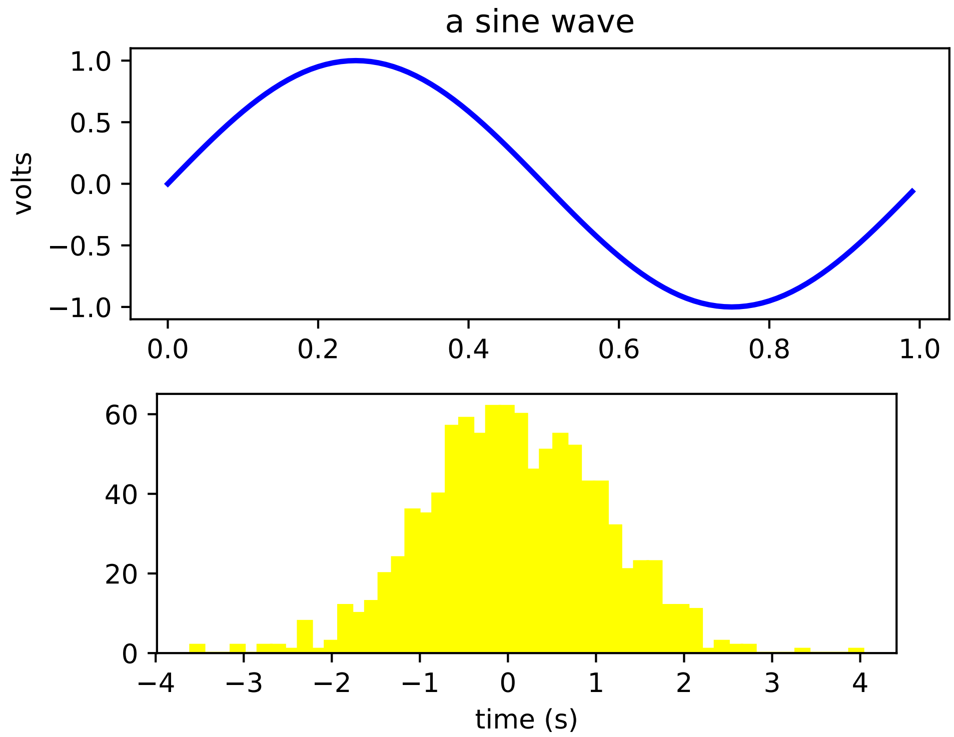
```
del ax.lines[0]
ax.lines.remove(line)  # one or the other, not both!
```

The Axes also has helper methods to configure and decorate the x-axis and y-axis tick, tick labels and axis labels:

```
xtext = ax.set_xlabel('my xdata') # returns a Text instance
ytext = ax.set_ylabel('my ydata')
```

When you call *ax.set_xlabel*, it passes the information on the *Text* instance of the *XAxis*. Each `Axes` instance contains an *XAxis* and a *YAxis* instance, which handle the layout and drawing of the ticks, tick labels and axis labels.

Try creating the figure below.



Customizing your objects

Every element in the figure is represented by a matplotlib *`Artist`*, and each has an extensive list of properties to configure its appearance. The figure itself contains a *`Rectangle`* exactly the size of the figure, which you can use to set the background color and transparency of the figures. Likewise, each *`Axes`* bounding box (the standard white box with black edges in the typical matplotlib plot, has a `Rectangle` instance that determines the color, transparency, and other properties of the Axes. These instances are stored as member variables `Figure.patch` and `Axes.patch` ("Patch" is a name inherited from MATLAB, and is a 2D "patch" of color on the figure, e.g., rectangles, circles and polygons). Every matplotlib `Artist` has the following properties

Property	Description
alpha	The transparency - a scalar from 0-1
animated	A boolean that is used to facilitate animated drawing
axes	The axes that the Artist lives in, possibly None
clip_box	The bounding box that clips the Artist
clip_on	Whether clipping is enabled
clip_path	The path the artist is clipped to
contains	A picking function to test whether the artist contains the pick point
figure	The figure instance the artist lives in, possibly None
label	A text label (e.g., for auto-labeling)
picker	A python object that controls object picking
transform	The transformation
visible	A boolean whether the artist should be drawn
zorder	A number which determines the drawing order
rasterized	Boolean; Turns vectors into rastergraphics: (for compression & eps transparency)

Each of the properties is accessed with an old-fashioned setter or getter (yes we know this irritates Pythonistas and we plan to support direct access via properties or traits but it hasn't been done yet). For example, to multiply the current alpha by a half:

```
a = o.get_alpha()
o.set_alpha(0.5*a)
```

If you want to set a number of properties at once, you can also use the `set` method with keyword arguments. For example:

```
o.set(alpha=0.5, zorder=2)
```

If you are working interactively at the python shell, a handy way to inspect the `Artist` properties is to use the *`matplotlib.artist.getp()`* function (simply `getp()` in pylab), which lists the properties and their values. This works for classes derived from `Artist` as well, e.g., `Figure` and `Rectangle`. Here are the `Figure` rectangle properties mentioned above:

```
In [149]: matplotlib.artist.getp(fig.patch)
    alpha = 1.0
    animated = False
    antialiased or aa = True
    axes = None
    clip_box = None
    clip_on = False
    clip_path = None
    contains = None
    edgecolor or ec = w
    facecolor or fc = 0.75
    figure = Figure(8.125x6.125)
    fill = 1
    hatch = None
    height = 1
    label =
    linewidth or lw = 1.0
    picker = None
    transform = <Affine object at 0x134cca84>
    verts = ((0, 0), (0, 1), (1, 1), (1, 0))
    visible = True
    width = 1
    window_extent = <Bbox object at 0x134acbcc>
    x = 0
    y = 0
    zorder = 1
```

The docstrings for all of the classes also contain the `Artist` properties, so you can consult the interactive "help" or the *artist Module* for a listing of properties for a given object.

Object containers

Now that we know how to inspect and set the properties of a given object we want to configure, we need to know how to get at that object. As mentioned in the introduction, there are two kinds of objects: primitives and containers. The primitives are usually the things you want to configure (the font of a *`Text`* instance, the width of a *`Line2D`*) although the containers also have some properties as well – for example the *`Axes Artist`* is a container that contains many of the primitives in your plot, but it also has properties like the `xscale` to control whether the xaxis is 'linear' or 'log'. In this section we'll review where the various container objects store the `Artists` that you want to get at.

Figure container

The top level container `Artist` is the *`matplotlib.figure.Figure`*, and it contains everything in the figure. The background of the figure is a *`Rectangle`* which is stored in `Figure.patch`. As you add subplots (*`add_subplot()`*) and axes (*`add_axes()`*) to the figure these will be appended to the *`Figure.axes`*. These are also returned by the methods that create them:

```
In [156]: fig = plt.figure()

In [157]: ax1 = fig.add_subplot(211)

In [158]: ax2 = fig.add_axes([0.1, 0.1, 0.7, 0.3])

In [159]: ax1
Out[159]: <matplotlib.axes.Subplot instance at 0xd54b26c>

In [160]: print fig.axes
[<matplotlib.axes.Subplot instance at 0xd54b26c>, <matplotlib.axes.Axes instance at␣
↪0xd3f0b2c>]
```

Because the figure maintains the concept of the "current axes" (see *`Figure.gca`* and *`Figure.sca`*) to support the pylab/pyplot state machine, you should not insert or remove axes directly from the axes list, but rather use the *`add_subplot()`* and *`add_axes()`* methods to insert, and the *`delaxes()`* method to delete. You are free however, to iterate over the list of axes or index into it to get access to `Axes` instances you want to customize. Here is an example which turns all the axes grids on:

```
for ax in fig.axes:
    ax.grid(True)
```

The figure also has its own text, lines, patches and images, which you can use to add primitives directly. The default coordinate system for the `Figure` will simply be in pixels (which is not usually what you want) but you can control this by setting the transform property of the `Artist` you are adding to the figure.

More useful is "figure coordinates" where (0, 0) is the bottom-left of the figure and (1, 1) is the top-right of the figure which you can obtain by setting the `Artist` transform to `fig.transFigure`:

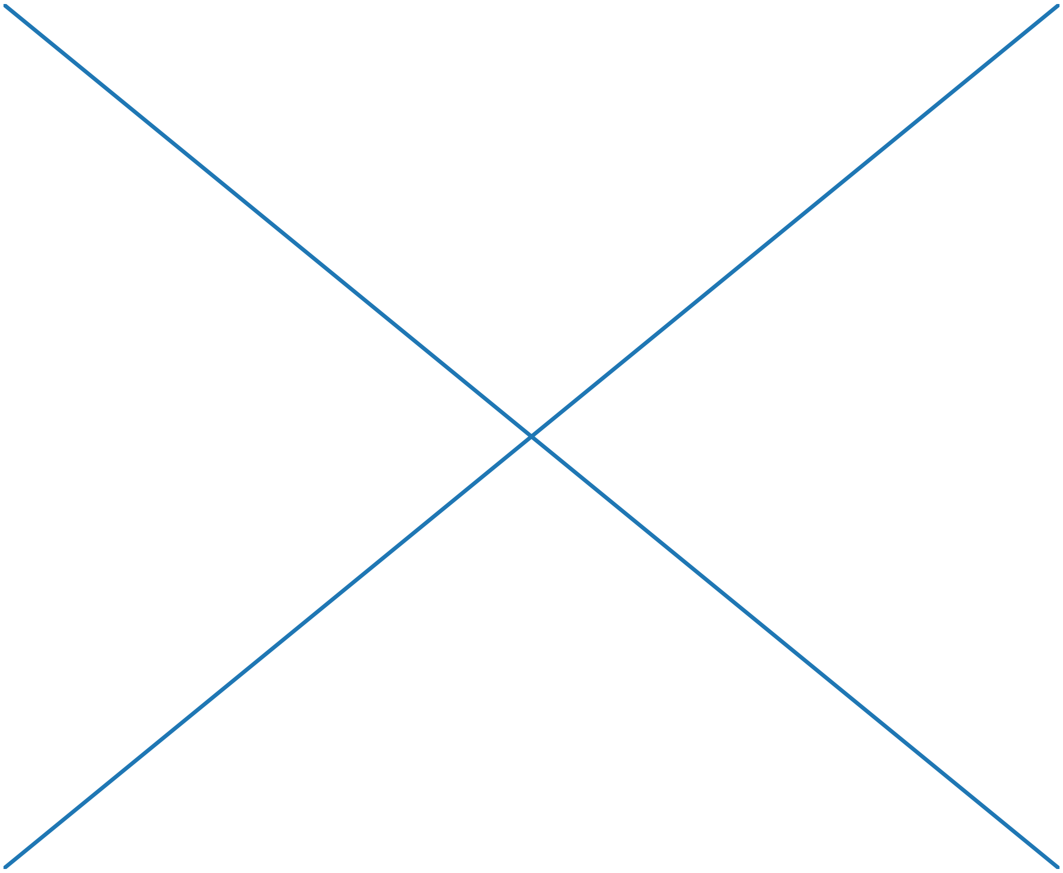
```
In [191]: fig = plt.figure()

In [192]: l1 = matplotlib.lines.Line2D([0, 1], [0, 1],
           transform=fig.transFigure, figure=fig)

In [193]: l2 = matplotlib.lines.Line2D([0, 1], [1, 0],
           transform=fig.transFigure, figure=fig)

In [194]: fig.lines.extend([l1, l2])

In [195]: fig.canvas.draw()
```



Here is a summary of the Artists the figure contains

Figure attribute	Description
axes	A list of Axes instances (includes Subplot)
patch	The Rectangle background
images	A list of FigureImages patches - useful for raw pixel display
legends	A list of Figure Legend instances (different from Axes.legends)
lines	A list of Figure Line2D instances (rarely used, see Axes.lines)
patches	A list of Figure patches (rarely used, see Axes.patches)
texts	A list Figure Text instances

Axes container

The *`matplotlib.axes.Axes`* is the center of the matplotlib universe – it contains the vast majority of all the `Artists` used in a figure with many helper methods to create and add these `Artists` to itself, as well as helper methods to access and customize the `Artists` it contains. Like the *`Figure`*, it contains a *`Patch`* `patch` which is a *`Rectangle`* for Cartesian coordinates and a *`Circle`* for polar coordinates; this patch determines the shape, background and border of the plotting region:

```
ax = fig.add_subplot(111)
rect = ax.patch  # a Rectangle instance
rect.set_facecolor('green')
```

When you call a plotting method, e.g., the canonical *`plot()`* and pass in arrays or lists of values, the method will create a *`matplotlib.lines.Line2D()`* instance, update the line with all the `Line2D` properties passed as keyword arguments, add the line to the `Axes.lines` container, and returns it to you:

```
In [213]: x, y = np.random.rand(2, 100)

In [214]: line, = ax.plot(x, y, '-', color='blue', linewidth=2)
```

`plot` returns a list of lines because you can pass in multiple x, y pairs to plot, and we are unpacking the first element of the length one list into the line variable. The line has been added to the `Axes.lines` list:

```
In [229]: print ax.lines
[<matplotlib.lines.Line2D instance at 0xd378b0c>]
```

Similarly, methods that create patches, like *`bar()`* creates a list of rectangles, will add the patches to the `Axes.patches` list:

```
In [233]: n, bins, rectangles = ax.hist(np.random.randn(1000), 50, facecolor='yellow')

In [234]: rectangles
Out[234]: <a list of 50 Patch objects>

In [235]: print len(ax.patches)
```

You should not add objects directly to the `Axes.lines` or `Axes.patches` lists unless you know exactly what you are doing, because the `Axes` needs to do a few things when it creates and adds an object. It sets the figure and axes property of the `Artist`, as well as the default `Axes` transformation (unless a transformation is set). It also inspects the data contained in the `Artist` to update the data structures controlling auto-scaling, so that the view limits can be adjusted to contain the plotted data. You can, nonetheless, create objects yourself and add them directly to the `Axes` using helper methods like *add_line()* and *add_patch()*. Here is an annotated interactive session illustrating what is going on:

```
In [261]: fig = plt.figure()

In [262]: ax = fig.add_subplot(111)

# create a rectangle instance
In [263]: rect = matplotlib.patches.Rectangle( (1,1), width=5, height=12)

# by default the axes instance is None
In [264]: print rect.get_axes()
None

# and the transformation instance is set to the "identity transform"
In [265]: print rect.get_transform()
<Affine object at 0x13695544>

# now we add the Rectangle to the Axes
In [266]: ax.add_patch(rect)

# and notice that the ax.add_patch method has set the axes
# instance
In [267]: print rect.get_axes()
Axes(0.125,0.1;0.775x0.8)

# and the transformation has been set too
In [268]: print rect.get_transform()
<Affine object at 0x15009ca4>

# the default axes transformation is ax.transData
In [269]: print ax.transData
<Affine object at 0x15009ca4>

# notice that the xlimits of the Axes have not been changed
In [270]: print ax.get_xlim()
(0.0, 1.0)

# but the data limits have been updated to encompass the rectangle
In [271]: print ax.dataLim.bounds
(1.0, 1.0, 5.0, 12.0)

# we can manually invoke the auto-scaling machinery
In [272]: ax.autoscale_view()

# and now the xlim are updated to encompass the rectangle
In [273]: print ax.get_xlim()
(1.0, 6.0)

# we have to manually force a figure draw
In [274]: ax.figure.canvas.draw()
```

There are many, many `Axes` helper methods for creating primitive `Artists` and adding them to their respective containers. The table below summarizes a small sampling of them, the kinds of `Artist` they create, and where they store them

Helper method	Artist	Container
ax.annotate - text annotations	Annotate	ax.texts
ax.bar - bar charts	Rectangle	ax.patches
ax.errorbar - error bar plots	Line2D and Rectangle	ax.lines and ax.patches
ax.fill - shared area	Polygon	ax.patches
ax.hist - histograms	Rectangle	ax.patches
ax.imshow - image data	AxesImage	ax.images
ax.legend - axes legends	Legend	ax.legends
ax.plot - xy plots	Line2D	ax.lines
ax.scatter - scatter charts	PolygonCollection	ax.collections
ax.text - text	Text	ax.texts

In addition to all of these `Artists`, the `Axes` contains two important `Artist` containers: the *`XAxis`* and *`YAxis`*, which handle the drawing of the ticks and labels. These are stored as instance variables `xaxis` and `yaxis`. The `XAxis` and `YAxis` containers will be detailed below, but note that the `Axes` contains many helper methods which forward calls on to the *`Axis`* instances so you often do not need to work with them directly unless you want to. For example, you can set the font color of the `XAxis` ticklabels using the `Axes` helper method:

```
for label in ax.get_xticklabels():
    label.set_color('orange')
```

Below is a summary of the Artists that the Axes contains

Axes attribute	Description
artists	A list of Artist instances
patch	Rectangle instance for Axes background
collections	A list of Collection instances
images	A list of AxesImage
legends	A list of Legend instances
lines	A list of Line2D instances
patches	A list of Patch instances
texts	A list of Text instances
xaxis	matplotlib.axis.XAxis instance
yaxis	matplotlib.axis.YAxis instance

Axis containers

The *`matplotlib.axis.Axis`* instances handle the drawing of the tick lines, the grid lines, the tick labels and the axis label. You can configure the left and right ticks separately for the y-axis, and the upper and lower ticks separately for the x-axis. The `Axis` also stores the data and view intervals used in auto-scaling, panning and zooming, as well as the *`Locator`* and *`Formatter`* instances which control where the ticks are placed and how they are represented as strings.

Each `Axis` object contains a `label` attribute (this is what `pylab` modifies in calls to `xlabel()` and `ylabel()`) as well as a list of major and minor ticks. The ticks are *`XTick`* and *`YTick`* instances, which contain the actual line and text primitives that render the ticks and ticklabels. Because the ticks are dynamically created as needed (e.g., when panning and zooming), you should access the lists of major and minor ticks through their accessor methods *`get_major_ticks()`* and *`get_minor_ticks()`*. Although the ticks contain all the primitives and will be covered below, `Axis` instances have accessor methods that return the tick lines, tick labels, tick locations etc.:

```
In [285]: axis = ax.xaxis

In [286]: axis.get_ticklocs()
Out[286]: array([ 0.,  1.,  2.,  3.,  4.,  5.,  6.,  7.,  8.,  9.])

In [287]: axis.get_ticklabels()
Out[287]: <a list of 10 Text major ticklabel objects>

# note there are twice as many ticklines as labels because by
#  default there are tick lines at the top and bottom but only tick
#  labels below the xaxis; this can be customized
In [288]: axis.get_ticklines()
Out[288]: <a list of 20 Line2D ticklines objects>

# by default you get the major ticks back
In [291]: axis.get_ticklines()
Out[291]: <a list of 20 Line2D ticklines objects>

# but you can also ask for the minor ticks
In [292]: axis.get_ticklines(minor=True)
Out[292]: <a list of 0 Line2D ticklines objects>
```

Here is a summary of some of the useful accessor methods of the `Axis` (these have corresponding setters where useful, such as set_major_formatter)

Accessor method	Description
get_scale	The scale of the axis, e.g., ‘log’ or ‘linear’
get_view_interval	The interval instance of the axis view limits
get_data_interval	The interval instance of the axis data limits
get_gridlines	A list of grid lines for the Axis
get_label	The axis label - a Text instance
get_ticklabels	A list of Text instances - keyword minor=True|False
get_ticklines	A list of Line2D instances - keyword minor=True|False
get_ticklocs	A list of Tick locations - keyword minor=True|False
get_major_locator	The matplotlib.ticker.Locator instance for major ticks
get_major_formatter	The matplotlib.ticker.Formatter instance for major ticks
get_minor_locator	The matplotlib.ticker.Locator instance for minor ticks
get_minor_formatter	The matplotlib.ticker.Formatter instance for minor ticks
get_major_ticks	A list of Tick instances for major ticks
get_minor_ticks	A list of Tick instances for minor ticks
grid	Turn the grid on or off for the major or minor ticks

Here is an example, not recommended for its beauty, which customizes the axes and tick properties

```
import numpy as np
import matplotlib.pyplot as plt

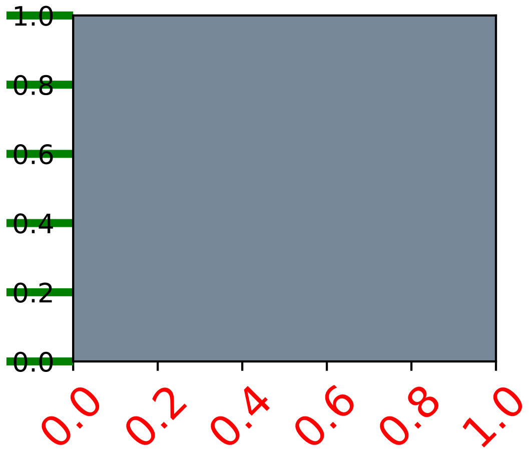
# plt.figure creates a matplotlib.figure.Figure instance
fig = plt.figure()
rect = fig.patch # a rectangle instance
rect.set_facecolor('lightgoldenrodyellow')

ax1 = fig.add_axes([0.1, 0.3, 0.4, 0.4])
rect = ax1.patch
rect.set_facecolor('lightslategray')

for label in ax1.xaxis.get_ticklabels():
    # label is a Text instance
    label.set_color('red')
    label.set_rotation(45)
    label.set_fontsize(16)

for line in ax1.yaxis.get_ticklines():
    # line is a Line2D instance
    line.set_color('green')
    line.set_markersize(25)
    line.set_markeredgewidth(3)

plt.show()
```



Tick containers

The *matplotlib.axis.Tick* is the final container object in our descent from the *Figure* to the *Axes* to the *Axis* to the *Tick*. The `Tick` contains the tick and grid line instances, as well as the label instances for the upper and lower ticks. Each of these is accessible directly as an attribute of the `Tick`. In addition, there are boolean variables that determine whether the upper labels and ticks are on for the x-axis and whether the right labels and ticks are on for the y-axis.

Tick attribute	Description
tick1line	Line2D instance
tick2line	Line2D instance
gridline	Line2D instance
label1	Text instance
label2	Text instance
gridOn	boolean which determines whether to draw the gridline
tick1On	boolean which determines whether to draw the 1st tickline
tick2On	boolean which determines whether to draw the 2nd tickline
label1On	boolean which determines whether to draw the 1st tick label
label2On	boolean which determines whether to draw the 2nd tick label

Here is an example which sets the formatter for the right side ticks with dollar signs and colors them green on the right side of the yaxis

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.ticker as ticker

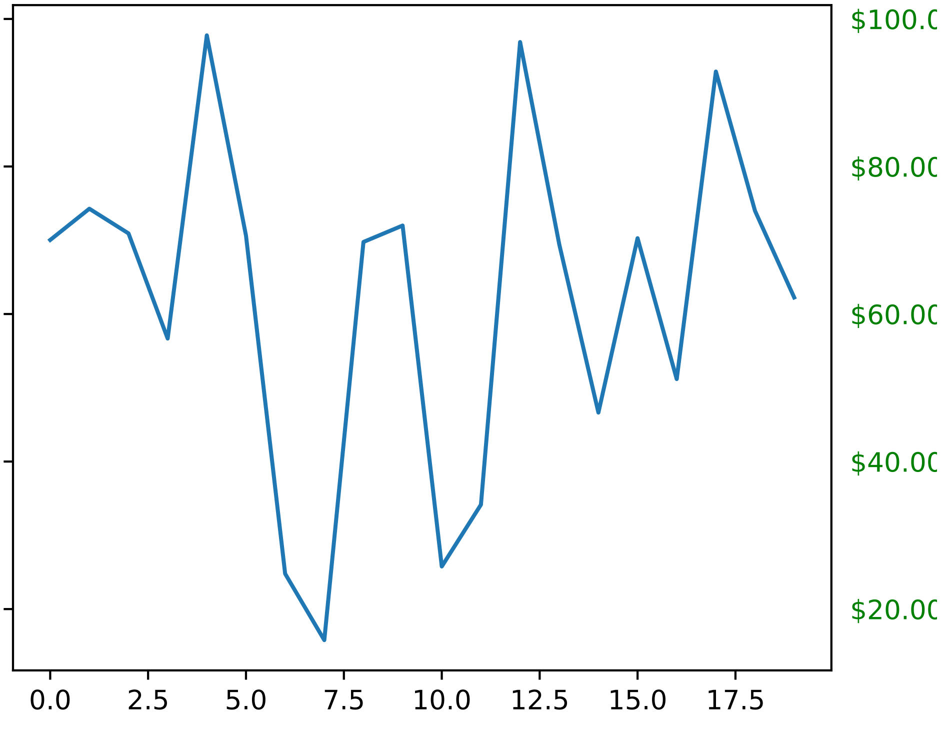
# Fixing random state for reproducibility
np.random.seed(19680801)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(100*np.random.rand(20))

formatter = ticker.FormatStrFormatter('$%1.2f')
ax.yaxis.set_major_formatter(formatter)

for tick in ax.yaxis.get_major_ticks():
    tick.label1On = False
    tick.label2On = True
    tick.label2.set_color('green')

plt.show()
```



3.2.2 Legend guide

This legend guide is an extension of the documentation available at `legend()` - please ensure you are familiar with contents of that documentation before proceeding with this guide.

This guide makes use of some common terms, which are documented here for clarity:

legend entry A legend is made up of one or more legend entries. An entry is made up of exactly one key and one label.

legend key The colored/patterned marker to the left of each legend label.

legend label The text which describes the handle represented by the key.

legend handle The original object which is used to generate an appropriate entry in the legend.

Controlling the legend entries

Calling `legend()` with no arguments automatically fetches the legend handles and their associated labels. This functionality is equivalent to:

```
handles, labels = ax.get_legend_handles_labels()
ax.legend(handles, labels)
```

The `get_legend_handles_labels()` function returns a list of handles/artists which exist on the Axes which can be used to generate entries for the resulting legend - it is worth noting however that not all artists can be added to a legend, at which point a "proxy" will have to be created (see *Creating artists specifically for adding to the legend (aka. Proxy artists)* for further details).

For full control of what is being added to the legend, it is common to pass the appropriate handles directly to `legend()`:

```
line_up, = plt.plot([1,2,3], label='Line 2')
line_down, = plt.plot([3,2,1], label='Line 1')
plt.legend(handles=[line_up, line_down])
```

In some cases, it is not possible to set the label of the handle, so it is possible to pass through the list of labels to `legend()`:

```
line_up, = plt.plot([1,2,3], label='Line 2')
line_down, = plt.plot([3,2,1], label='Line 1')
plt.legend([line_up, line_down], ['Line Up', 'Line Down'])
```

Creating artists specifically for adding to the legend (aka. Proxy artists)

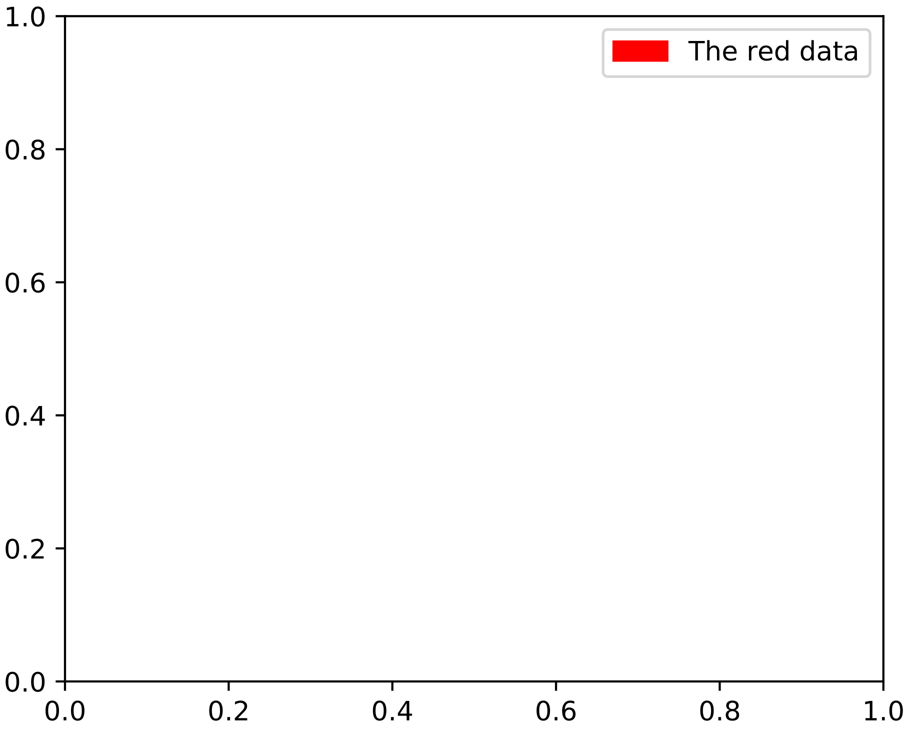
Not all handles can be turned into legend entries automatically, so it is often necessary to create an artist which *can*. Legend handles don't have to exists on the Figure or Axes in order to be used.

Suppose we wanted to create a legend which has an entry for some data which is represented by a red color:

```
import matplotlib.patches as mpatches
import matplotlib.pyplot as plt

red_patch = mpatches.Patch(color='red', label='The red data')
plt.legend(handles=[red_patch])

plt.show()
```

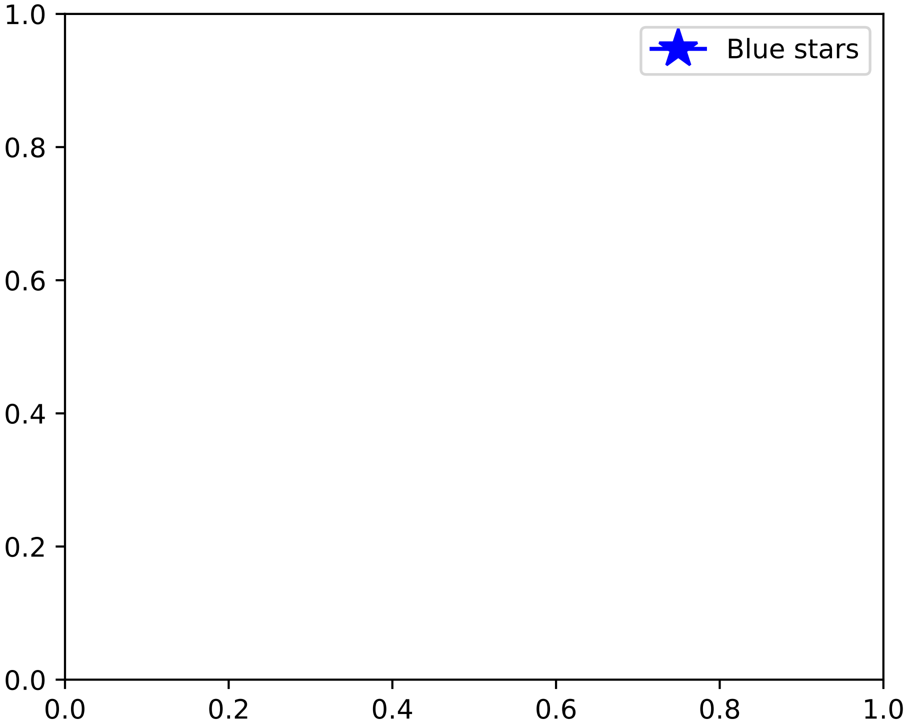


There are many supported legend handles, instead of creating a patch of color we could have created a line with a marker:

```
import matplotlib.lines as mlines
import matplotlib.pyplot as plt

blue_line = mlines.Line2D([], [], color='blue', marker='*',
                          markersize=15, label='Blue stars')
plt.legend(handles=[blue_line])

plt.show()
```



Legend location

The location of the legend can be specified by the keyword argument *loc*. Please see the documentation at `legend()` for more details.

The `bbox_to_anchor` keyword gives a great degree of control for manual legend placement. For example, if you want your axes legend located at the figure's top right-hand corner instead of the axes' corner, simply specify the corner's location, and the coordinate system of that location:

```
plt.legend(bbox_to_anchor=(1, 1),
           bbox_transform=plt.gcf().transFigure)
```

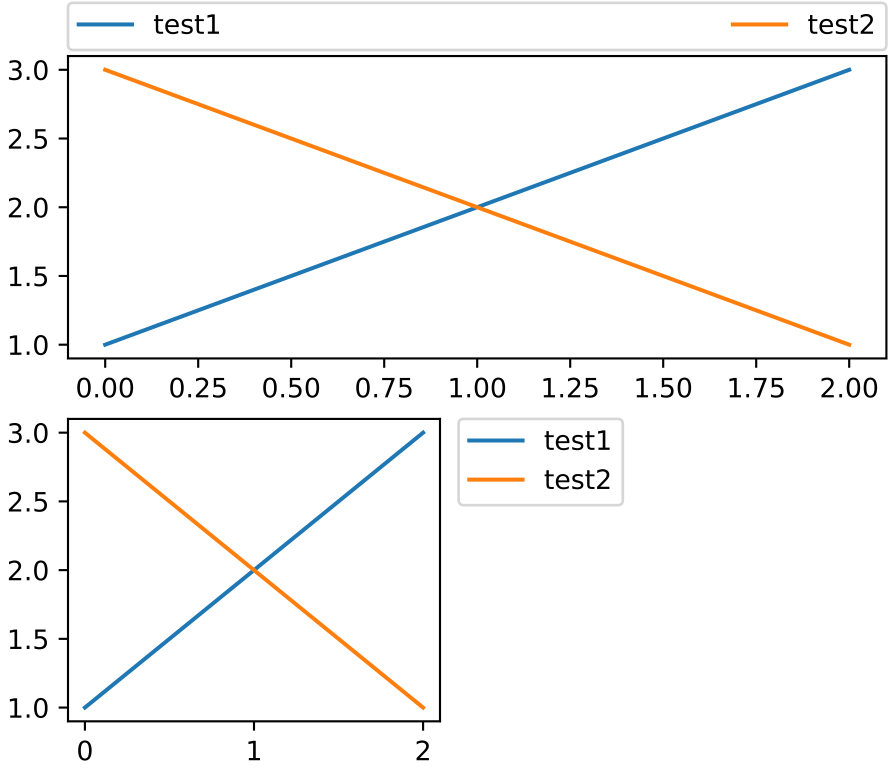
More examples of custom legend placement:

```
import matplotlib.pyplot as plt

plt.subplot(211)
plt.plot([1,2,3], label="test1")
plt.plot([3,2,1], label="test2")
# Place a legend above this subplot, expanding itself to
# fully use the given bounding box.
plt.legend(bbox_to_anchor=(0., 1.02, 1., .102), loc=3,
           ncol=2, mode="expand", borderaxespad=0.)
```

```
plt.subplot(223)
plt.plot([1,2,3], label="test1")
plt.plot([3,2,1], label="test2")
# Place a legend to the right of this smaller subplot.
plt.legend(bbox_to_anchor=(1.05, 1), loc=2, borderaxespad=0.)

plt.show()
```



Multiple legends on the same Axes

Sometimes it is more clear to split legend entries across multiple legends. Whilst the instinctive approach to doing this might be to call the `legend()` function multiple times, you will find that only one legend ever exists on the Axes. This has been done so that it is possible to call `legend()` repeatedly to update the legend to the latest handles on the Axes, so to persist old legend instances, we must add them manually to the Axes:

```
import matplotlib.pyplot as plt

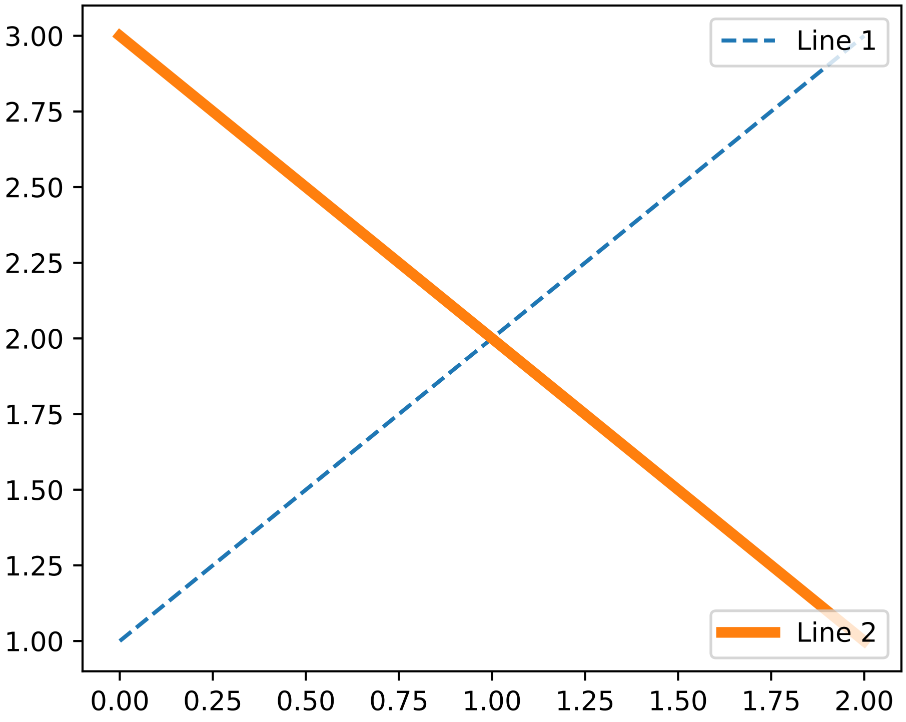
line1, = plt.plot([1,2,3], label="Line 1", linestyle='--')
line2, = plt.plot([3,2,1], label="Line 2", linewidth=4)

# Create a legend for the first line.
first_legend = plt.legend(handles=[line1], loc=1)
```

```
# Add the legend manually to the current Axes.
ax = plt.gca().add_artist(first_legend)

# Create another legend for the second line.
plt.legend(handles=[line2], loc=4)

plt.show()
```



Legend Handlers

In order to create legend entries, handles are given as an argument to an appropriate *HandlerBase* subclass. The choice of handler subclass is determined by the following rules:

1. Update *get_legend_handler_map()* with the value in the `handler_map` keyword.
2. Check if the `handle` is in the newly created `handler_map`.
3. Check if the type of `handle` is in the newly created `handler_map`.
4. Check if any of the types in the `handle`'s mro is in the newly created `handler_map`.

For completeness, this logic is mostly implemented in *get_legend_handler()*.

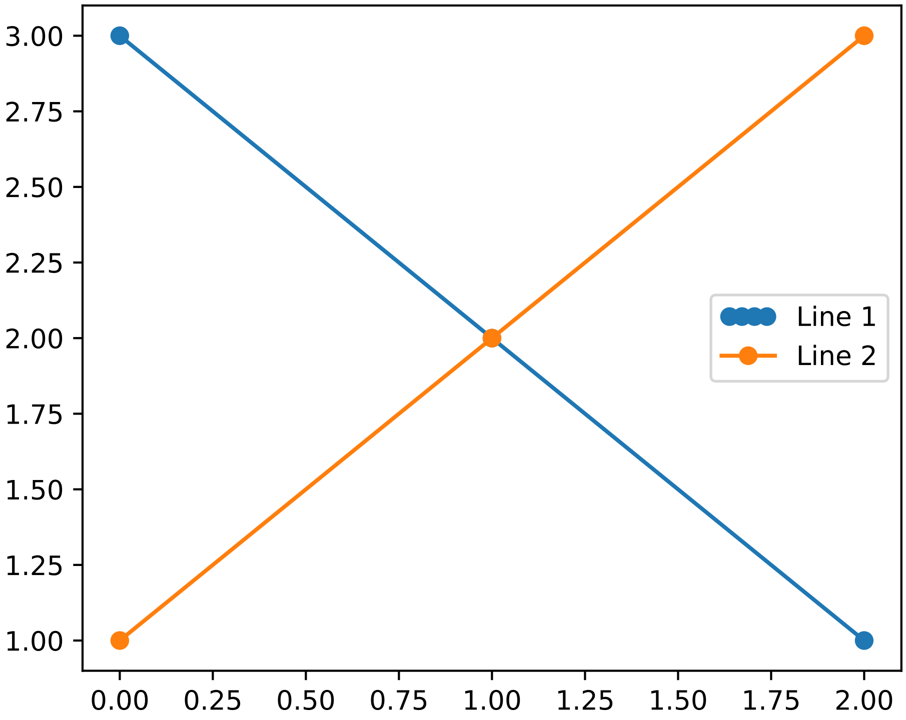
All of this flexibility means that we have the necessary hooks to implement custom handlers for our own type of legend key.

The simplest example of using custom handlers is to instantiate one of the existing *`HandlerBase`* subclasses. For the sake of simplicity, let's choose *`matplotlib.legend_handler.HandlerLine2D`* which accepts a `numpoints` argument (note numpoints is a keyword on the *`legend()`* function for convenience). We can then pass the mapping of instance to Handler as a keyword to legend.

```
import matplotlib.pyplot as plt
from matplotlib.legend_handler import HandlerLine2D

line1, = plt.plot([3,2,1], marker='o', label='Line 1')
line2, = plt.plot([1,2,3], marker='o', label='Line 2')

plt.legend(handler_map={line1: HandlerLine2D(numpoints=4)})
```



As you can see, "Line 1" now has 4 marker points, where "Line 2" has 2 (the default). Try the above code, only change the map's key from `line1` to `type(line1)`. Notice how now both *`Line2D`* instances get 4 markers.

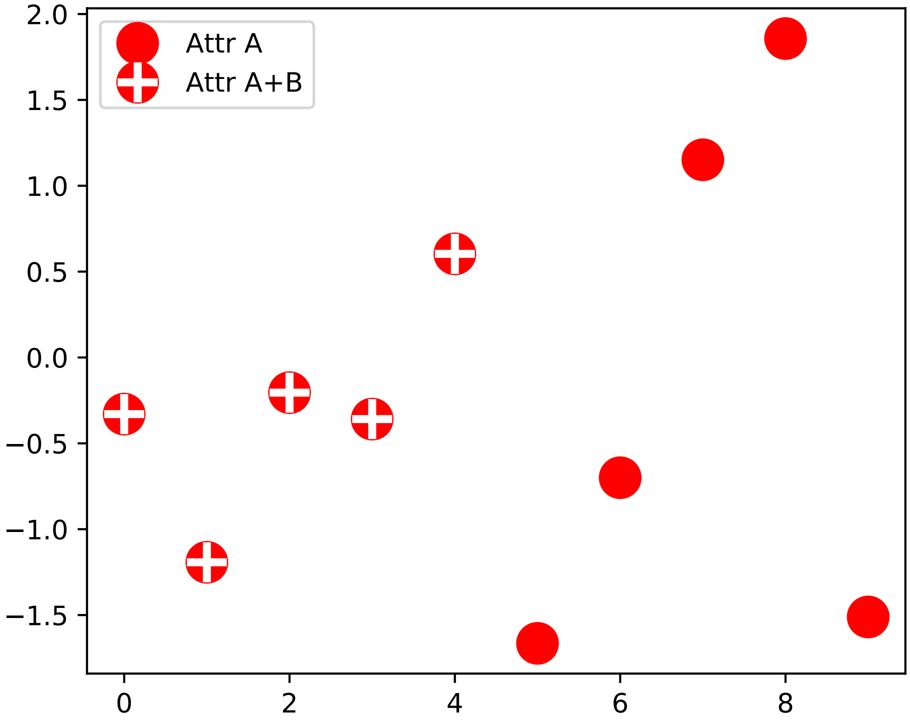
Along with handlers for complex plot types such as errorbars, stem plots and histograms, the default `handler_map` has a special `tuple` handler (*`HandlerTuple`*) which simply plots the handles on top of one another for each item in the given tuple. The following example demonstrates combining two legend keys on top of one another:

```
import matplotlib.pyplot as plt
from numpy.random import randn

z = randn(10)

red_dot, = plt.plot(z, "ro", markersize=15)
# Put a white cross over some of the data.
white_cross, = plt.plot(z[:5], "w+", markeredgewidth=3, markersize=15)

plt.legend([red_dot, (red_dot, white_cross)], ["Attr A", "Attr A+B"])
```



Implementing a custom legend handler

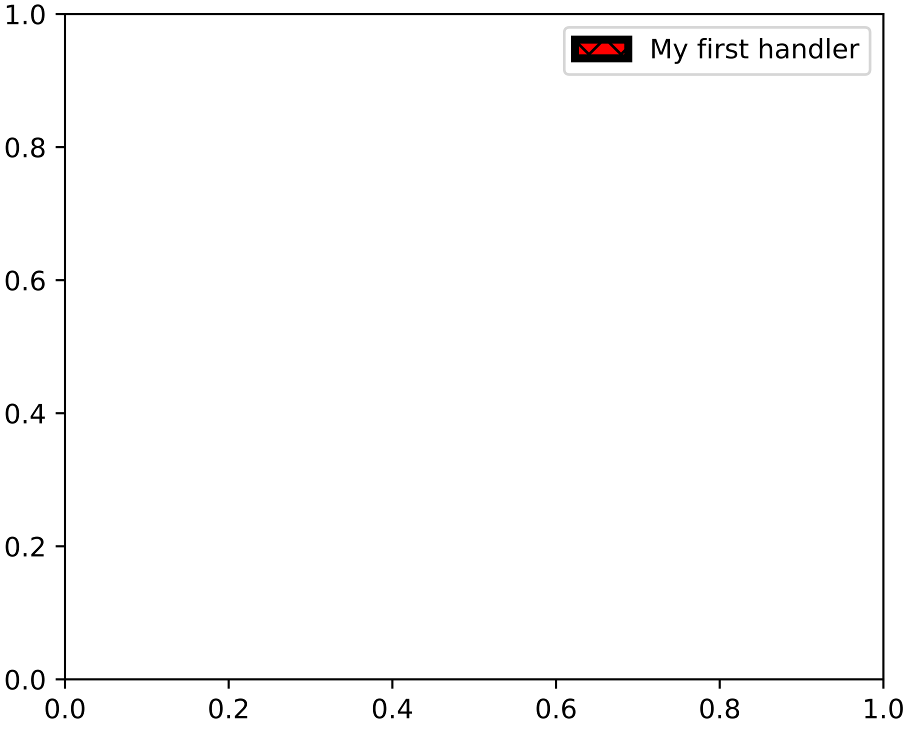
A custom handler can be implemented to turn any handle into a legend key (handles don't necessarily need to be matplotlib artists). The handler must implement a "legend_artist" method which returns a single artist for the legend to use. Signature details about the "legend_artist" are documented at *`legend_artist()`*.

```
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches

class AnyObject(object):
    pass
```

```
class AnyObjectHandler(object):
    def legend_artist(self, legend, orig_handle, fontsize, handlebox):
        x0, y0 = handlebox.xdescent, handlebox.ydescent
        width, height = handlebox.width, handlebox.height
        patch = mpatches.Rectangle([x0, y0], width, height, facecolor='red',
                                   edgecolor='black', hatch='xx', lw=3,
                                   transform=handlebox.get_transform())
        handlebox.add_artist(patch)
        return patch

plt.legend([AnyObject()], ['My first handler'],
           handler_map={AnyObject: AnyObjectHandler()})
```



Alternatively, had we wanted to globally accept `AnyObject` instances without needing to manually set the `handler_map` keyword all the time, we could have registered the new handler with:

```
from matplotlib.legend import Legend
Legend.update_default_handler_map({AnyObject: AnyObjectHandler()})
```

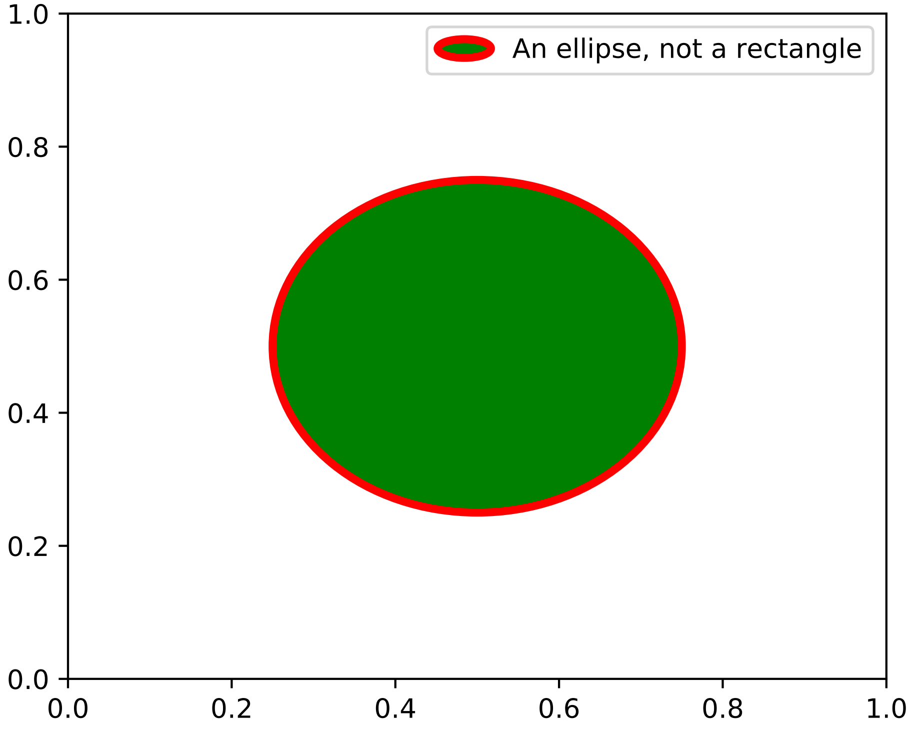
Whilst the power here is clear, remember that there are already many handlers implemented and what you want to achieve may already be easily possible with existing classes. For example, to produce elliptical legend keys, rather than rectangular ones:

```
from matplotlib.legend_handler import HandlerPatch
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches

class HandlerEllipse(HandlerPatch):
    def create_artists(self, legend, orig_handle,
                       xdescent, ydescent, width, height, fontsize, trans):
        center = 0.5 * width - 0.5 * xdescent, 0.5 * height - 0.5 * ydescent
        p = mpatches.Ellipse(xy=center, width=width + xdescent,
                             height=height + ydescent)
        self.update_prop(p, orig_handle, legend)
        p.set_transform(trans)
        return [p]

c = mpatches.Circle((0.5, 0.5), 0.25, facecolor="green",
                    edgecolor="red", linewidth=3)
plt.gca().add_patch(c)

plt.legend([c], ["An ellipse, not a rectangle"],
           handler_map={mpatches.Circle: HandlerEllipse()})
```



Known examples of using legend

Here is a non-exhaustive list of the examples available involving legend being used in various ways:

- *lines_bars_and_markers example code: scatter_with_legend.py*
- *api example code: legend_demo.py*
- *pylab_examples example code: contourf_hatching.py*
- *pylab_examples example code: figlegend_demo.py*
- *pylab_examples example code: scatter_symbol.py*

3.3 Advanced

3.3.1 Transformations Tutorial

Like any graphics packages, matplotlib is built on top of a transformation framework to easily move between coordinate systems, the userland `data` coordinate system, the `axes` coordinate system, the `figure` coordinate system, and the `display` coordinate system. In 95% of your plotting, you won't need to think about this, as it happens under the hood, but as you push the limits of custom figure generation, it helps to have an understanding of these objects so you can reuse the existing transformations matplotlib makes available to you, or create your own (see `matplotlib.transforms`). The table below summarizes the existing coordinate systems, the transformation object you should use to work in that coordinate system, and the description of that system. In the `Transformation Object` column, `ax` is a `Axes` instance, and `fig` is a `Figure` instance.

Coordinate	Transformation Object	Description
`data`	`ax.transData`	The userland data coordinate system, controlled by the xlim and ylim
`axes`	`ax.transAxes`	The coordinate system of the `Axes`; (0,0) is bottom left of the axes, and (1,1) is top right of the axes.
`figure`	`fig.transFigure`	The coordinate system of the `Figure`; (0,0) is bottom left of the figure, and (1,1) is top right of the figure.
`display`	`None`	This is the pixel coordinate system of the display; (0,0) is the bottom left of the display, and (width, height) is the top right of the display in pixels. Alternatively, the identity transform (`matplotlib.transforms.IdentityTransform()`) may be used instead of None.

All of the transformation objects in the table above take inputs in their coordinate system, and transform the input to the `display` coordinate system. That is why the `display` coordinate system has `None` for the `Transformation Object` column – it already is in display coordinates. The transformations also know how to invert themselves, to go from `display` back to the native coordinate system. This is particularly useful when processing events from the user interface, which typically occur in display space, and you want to know where the mouse click or key-press occurred in your data coordinate system.

Data coordinates

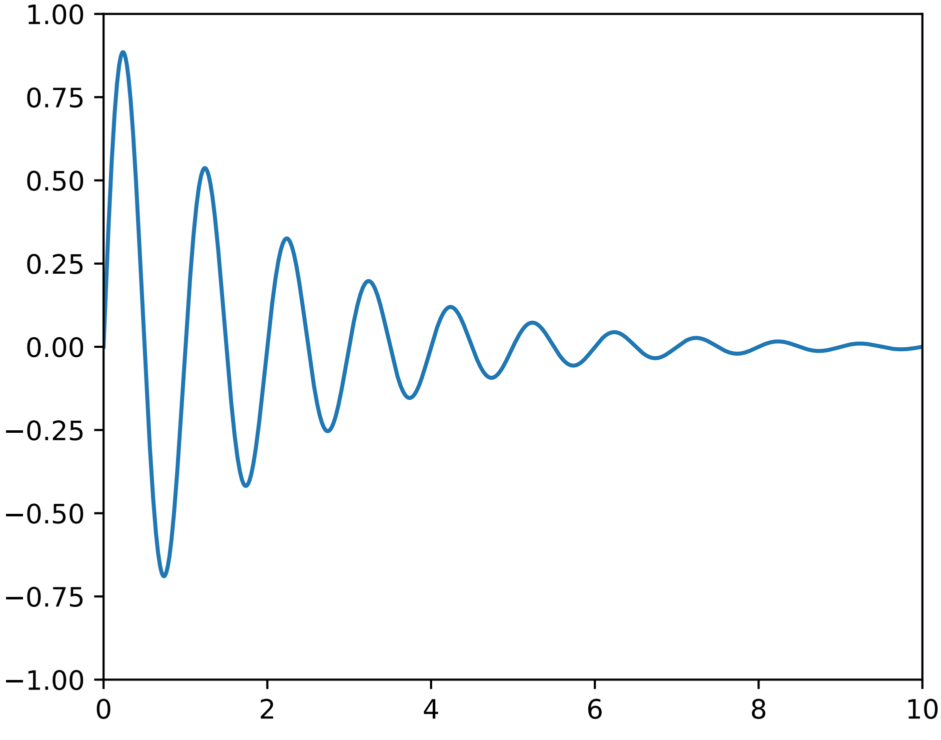
Let's start with the most commonly used coordinate, the `data` coordinate system. Whenever you add data to the axes, matplotlib updates the datalimits, most commonly updated with the *set_xlim()* and *set_ylim()* methods. For example, in the figure below, the data limits stretch from 0 to 10 on the x-axis, and -1 to 1 on the y-axis.

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)

plt.show()
```



You can use the `ax.transData` instance to transform from your `data` to your `display` coordinate system, either a single point or a sequence of points as shown below:

```
In [14]: type(ax.transData)
Out[14]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [15]: ax.transData.transform((5, 0))
Out[15]: array([ 335.175,  247.   ])

In [16]: ax.transData.transform([(5, 0), (1,2)])
Out[16]:
array([[ 335.175,  247.   ],
       [ 132.435,  642.2  ]])
```

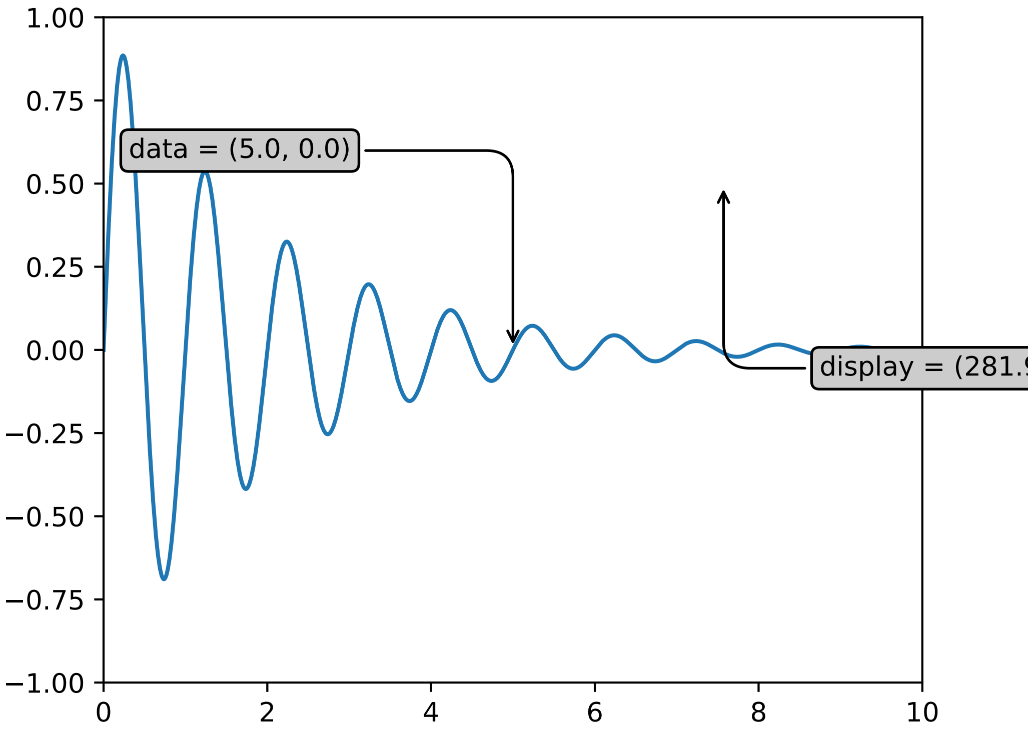
You can use the *`inverted()`* method to create a transform which will take you from display to data coordinates:

```
In [41]: inv = ax.transData.inverted()

In [42]: type(inv)
Out[42]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [43]: inv.transform((335.175,  247.))
Out[43]: array([ 5.,  0.])
```

If your are typing along with this tutorial, the exact values of the display coordinates may differ if you have a different window size or dpi setting. Likewise, in the figure below, the display labeled points are probably not the same as in the ipython session because the documentation figure size defaults are different.



Note: If you run the source code in the example above in a GUI backend, you may also find that the two arrows for the `data` and `display` annotations do not point to exactly the same point. This is because the display point was computed before the figure was displayed, and the GUI backend may slightly resize the figure when it is created. The effect is more pronounced if you resize the figure yourself. This is one good reason why you rarely want to work in display space, but you can connect to the `'on_draw'` *`Event`* to update figure coordinates on figure draws; see *Event handling and picking*.

When you change the x or y limits of your axes, the data limits are updated so the transformation yields a new display point. Note that when we just change the ylim, only the y-display coordinate is altered, and when we change the xlim too, both are altered. More on this later when we talk about the *`Bbox`*.

```
In [54]: ax.transData.transform((5, 0))
Out[54]: array([ 335.175,  247.   ])

In [55]: ax.set_ylim(-1,2)
Out[55]: (-1, 2)

In [56]: ax.transData.transform((5, 0))
Out[56]: array([ 335.175     ,  181.13333333])

In [57]: ax.set_xlim(10,20)
Out[57]: (10, 20)

In [58]: ax.transData.transform((5, 0))
Out[58]: array([-171.675     ,  181.13333333])
```

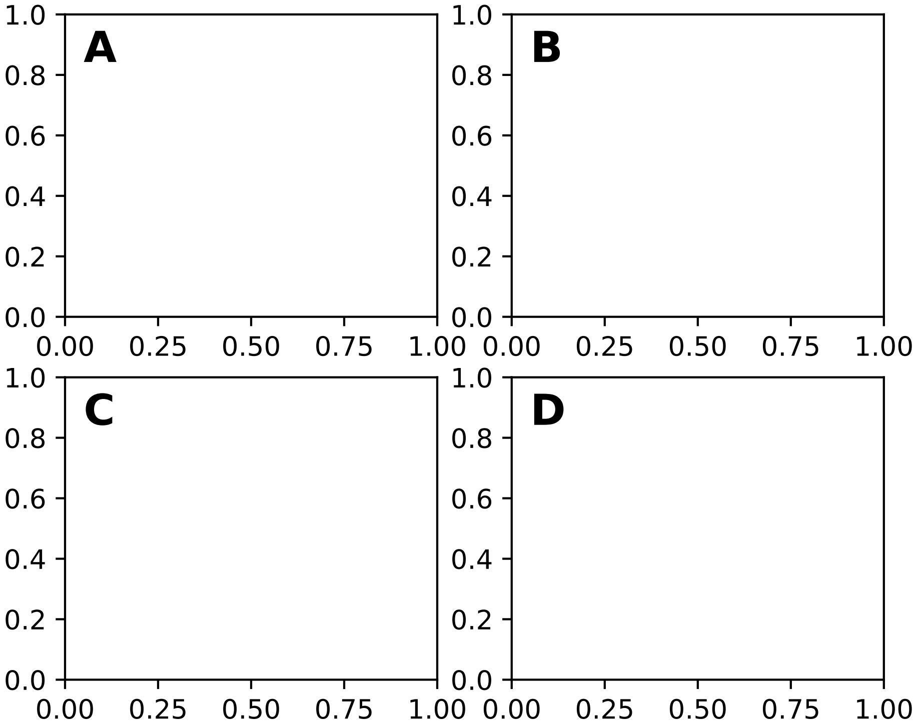
Axes coordinates

After the `data` coordinate system, `axes` is probably the second most useful coordinate system. Here the point (0,0) is the bottom left of your axes or subplot, (0.5, 0.5) is the center, and (1.0, 1.0) is the top right. You can also refer to points outside the range, so (-0.1, 1.1) is to the left and above your axes. This coordinate system is extremely useful when placing text in your axes, because you often want a text bubble in a fixed, location, e.g., the upper left of the axes pane, and have that location remain fixed when you pan or zoom. Here is a simple example that creates four panels and labels them ‘A’, ‘B’, ‘C’, ‘D’ as you often see in journals.

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
for i, label in enumerate(('A', 'B', 'C', 'D')):
    ax = fig.add_subplot(2,2,i+1)
    ax.text(0.05, 0.95, label, transform=ax.transAxes,
      fontsize=16, fontweight='bold', va='top')

plt.show()
```

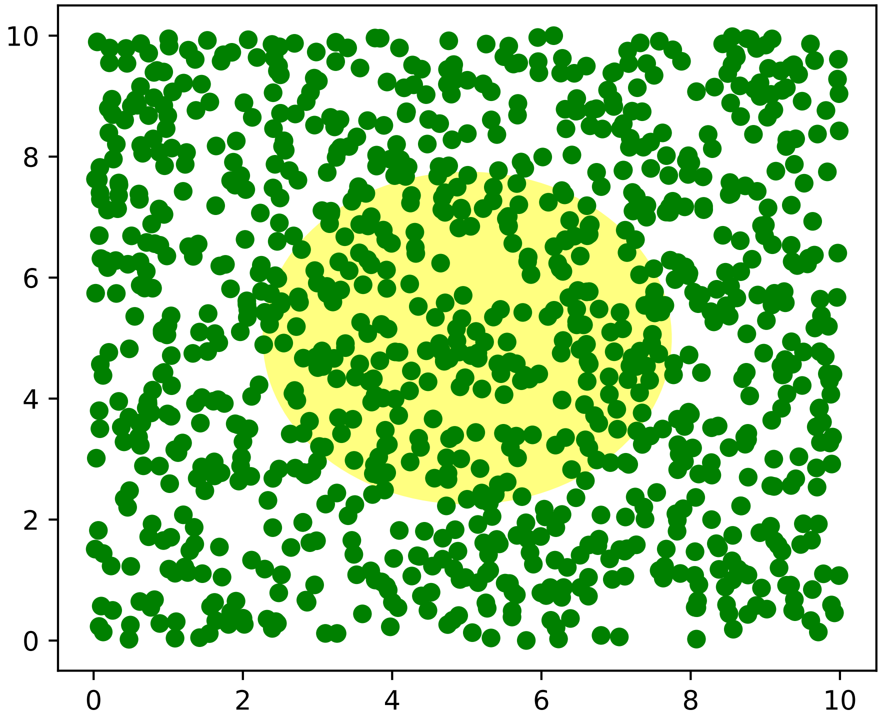


You can also make lines or patches in the axes coordinate system, but this is less useful in my experience than using `ax.transAxes` for placing text. Nonetheless, here is a silly example which plots some random dots in `data` space, and overlays a semi-transparent *`Circle`* centered in the middle of the axes with a radius one quarter of the axes – if your axes does not preserve aspect ratio (see *`set_aspect()`*), this will look like an ellipse. Use the pan/zoom tool to move around, or manually change the data xlim and ylim, and you will see the data move, but the circle will remain fixed because it is not in `data` coordinates and will always remain at the center of the axes.

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as patches
fig = plt.figure()
ax = fig.add_subplot(111)
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y, 'go')  # plot some data in data coordinates

circ = patches.Circle((0.5, 0.5), 0.25, transform=ax.transAxes,
                      facecolor='yellow', alpha=0.5)
ax.add_patch(circ)

plt.show()
```



Blended transformations

Drawing in `blended` coordinate spaces which mix `axes` with `data` coordinates is extremely useful, for example to create a horizontal span which highlights some region of the y-data but spans across the x-axis regardless of the data limits, pan or zoom level, etc. In fact these blended lines and spans are so useful, we have built in functions to make them easy to plot (see `axhline()`, `axvline()`, `axhspan()`, `axvspan()`) but for didactic purposes we will implement the horizontal span here using a blended transformation. This trick only works for separable transformations, like you see in normal Cartesian coordinate systems, but not on inseparable transformations like the `PolarTransform`.

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as patches
import matplotlib.transforms as transforms

fig = plt.figure()
ax = fig.add_subplot(111)

x = np.random.randn(1000)

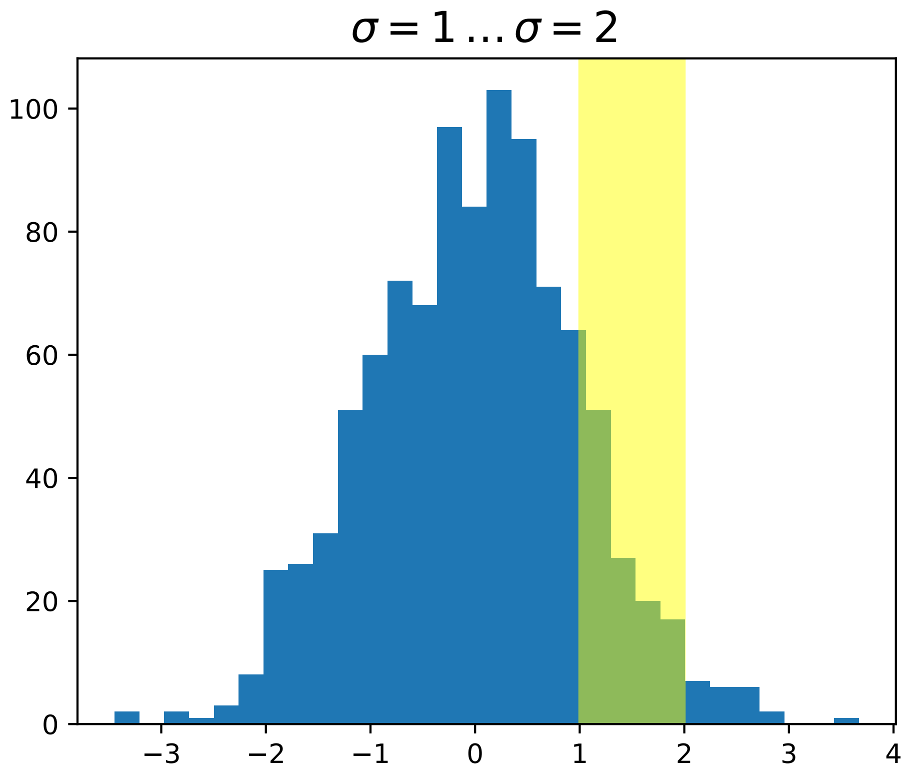
ax.hist(x, 30)
ax.set_title(r'$\sigma=1 \/ \dots \/ \sigma=2$', fontsize=16)

# the x coords of this transformation are data, and the
# y coord are axes
trans = transforms.blended_transform_factory(
    ax.transData, ax.transAxes)

# highlight the 1..2 stddev region with a span.
# We want x to be in data coordinates and y to
# span from 0..1 in axes coords
rect = patches.Rectangle((1,0), width=1, height=1,
                         transform=trans, color='yellow',
                         alpha=0.5)

ax.add_patch(rect)

plt.show()
```



Note: The blended transformations where x is in data coords and y in axes coordinates is so useful that we have helper methods to return the versions mpl uses internally for drawing ticks, ticklabels, etc. The methods are *matplotlib.axes.Axes.get_xaxis_transform()* and *matplotlib.axes.Axes.get_yaxis_transform()*. So in the example above, the call to *blended_transform_factory()* can be replaced by `get_xaxis_transform`:

```
trans = ax.get_xaxis_transform()
```

Using offset transforms to create a shadow effect

One use of transformations is to create a new transformation that is offset from another transformation, e.g., to place one object shifted a bit relative to another object. Typically you want the shift to be in some physical dimension, like points or inches rather than in data coordinates, so that the shift effect is constant at different zoom levels and dpi settings.

One use for an offset is to create a shadow effect, where you draw one object identical to the first just to the right of it, and just below it, adjusting the zorder to make sure the shadow is drawn first and then the object it is shadowing above it. The transforms module has a helper transformation *ScaledTranslation*. It is instantiated with:

```
trans = ScaledTranslation(xt, yt, scale_trans)
```

where `xt` and `yt` are the translation offsets, and `scale_trans` is a transformation which scales `xt` and `yt` at transformation time before applying the offsets. A typical use case is to use the figure `fig.dpi_scale_trans` transformation for the `scale_trans` argument, to first scale `xt` and `yt` specified in points to `display` space before doing the final offset. The dpi and inches offset is a common-enough use case that we have a special helper function to create it in `matplotlib.transforms.offset_copy()`, which returns a new transform with an added offset. But in the example below, we'll create the offset transform ourselves. Note the use of the plus operator in:

```
offset = transforms.ScaledTranslation(dx, dy,
  fig.dpi_scale_trans)
shadow_transform = ax.transData + offset
```

showing that can chain transformations using the addition operator. This code says: first apply the data transformation `ax.transData` and then translate the data by `dx` and `dy` points. In typography, a'point <https://en.wikipedia.org/wiki/Point_%28typography%29>'_ is 1/72 inches, and by specifying your offsets in points, your figure will look the same regardless of the dpi resolution it is saved in.

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as patches
import matplotlib.transforms as transforms

fig = plt.figure()
ax = fig.add_subplot(111)

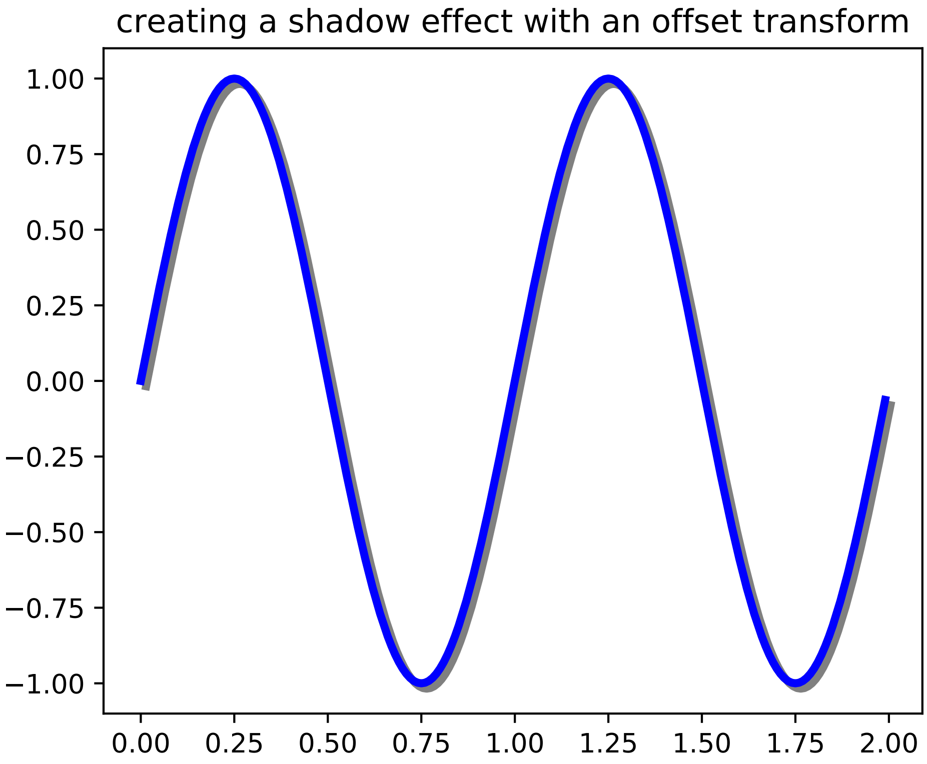
# make a simple sine wave
x = np.arange(0., 2., 0.01)
y = np.sin(2*np.pi*x)
line, = ax.plot(x, y, lw=3, color='blue')

# shift the object over 2 points, and down 2 points
dx, dy = 2/72., -2/72.
offset = transforms.ScaledTranslation(dx, dy,
  fig.dpi_scale_trans)
shadow_transform = ax.transData + offset

# now plot the same data with our offset transform;
# use the zorder to make sure we are below the line
```

```
ax.plot(x, y, lw=3, color='gray',
  transform=shadow_transform,
  zorder=0.5*line.get_zorder())

ax.set_title('creating a shadow effect with an offset transform')
plt.show()
```



The transformation pipeline

The `ax.transData` transform we have been working with in this tutorial is a composite of three different transformations that comprise the transformation pipeline from `data` -> `display` coordinates. Michael Droettboom implemented the transformations framework, taking care to provide a clean API that segregated the nonlinear projections and scales that happen in polar and logarithmic plots, from the linear affine transformations that happen when you pan and zoom. There is an efficiency here, because you can pan and zoom in your axes which affects the affine transformation, but you may not need to compute the potentially expensive nonlinear scales or projections on simple navigation events. It is also possible to multiply affine transformation matrices together, and then apply them to coordinates in one step. This is not true of all possible transformations.

Here is how the `ax.transData` instance is defined in the basic separable axis *`Axes`* class:

```
self.transData = self.transScale + (self.transLimits + self.transAxes)
```

We've been introduced to the `transAxes` instance above in *Axes coordinates*, which maps the (0,0), (1,1) corners of the axes or subplot bounding box to `display` space, so let's look at these other two pieces.

`self.transLimits` is the transformation that takes you from `data` to `axes` coordinates; i.e., it maps your view xlim and ylim to the unit space of the axes (and `transAxes` then takes that unit space to display space). We can see this in action here

```
In [80]: ax = subplot(111)

In [81]: ax.set_xlim(0, 10)
Out[81]: (0, 10)

In [82]: ax.set_ylim(-1,1)
Out[82]: (-1, 1)

In [84]: ax.transLimits.transform((0,-1))
Out[84]: array([ 0.,  0.])

In [85]: ax.transLimits.transform((10,-1))
Out[85]: array([ 1.,  0.])

In [86]: ax.transLimits.transform((10,1))
Out[86]: array([ 1.,  1.])

In [87]: ax.transLimits.transform((5,0))
Out[87]: array([ 0.5,  0.5])
```

and we can use this same inverted transformation to go from the unit `axes` coordinates back to `data` coordinates.

```
In [90]: inv.transform((0.25, 0.25))
Out[90]: array([ 2.5, -0.5])
```

The final piece is the `self.transScale` attribute, which is responsible for the optional non-linear scaling of the data, e.g., for logarithmic axes. When an Axes is initially setup, this is just set to the identity transform, since the basic matplotlib axes has linear scale, but when you call a logarithmic scaling function like *`semilogx()`* or explicitly set the scale to logarithmic with *`set_xscale()`*, then the `ax.transScale` attribute is set to handle the nonlinear projection. The scales transforms are properties of the respective `xaxis` and `yaxis` *`Axis`* instances. For example, when you call `ax.set_xscale('log')`, the xaxis updates its scale to a *`matplotlib.scale.LogScale`* instance.

For non-separable axes the PolarAxes, there is one more piece to consider, the projection transformation. The `transData` *`matplotlib.projections.polar.PolarAxes`* is similar to that for the typical separable matplotlib Axes, with one additional piece `transProjection`:

```
self.transData = self.transScale + self.transProjection + \
    (self.transProjectionAffine + self.transAxes)
```

`transProjection` handles the projection from the space, e.g., latitude and longitude for map data, or radius and theta for polar data, to a separable Cartesian coordinate system. There are several projection examples in the `matplotlib.projections` package, and the best way to learn more is to open the source for those packages and see how to make your own, since matplotlib supports extensible axes and projections. Michael

Droettboom has provided a nice tutorial example of creating a hammer projection axes; see *api example code: custom_projection_example.py*.

3.3.2 Path Tutorial

The object underlying all of the `matplotlib.patch` objects is the *`Path`*, which supports the standard set of moveto, lineto, curveto commands to draw simple and compound outlines consisting of line segments and splines. The `Path` is instantiated with a (N,2) array of (x,y) vertices, and a N-length array of path codes. For example to draw the unit rectangle from (0,0) to (1,1), we could use this code

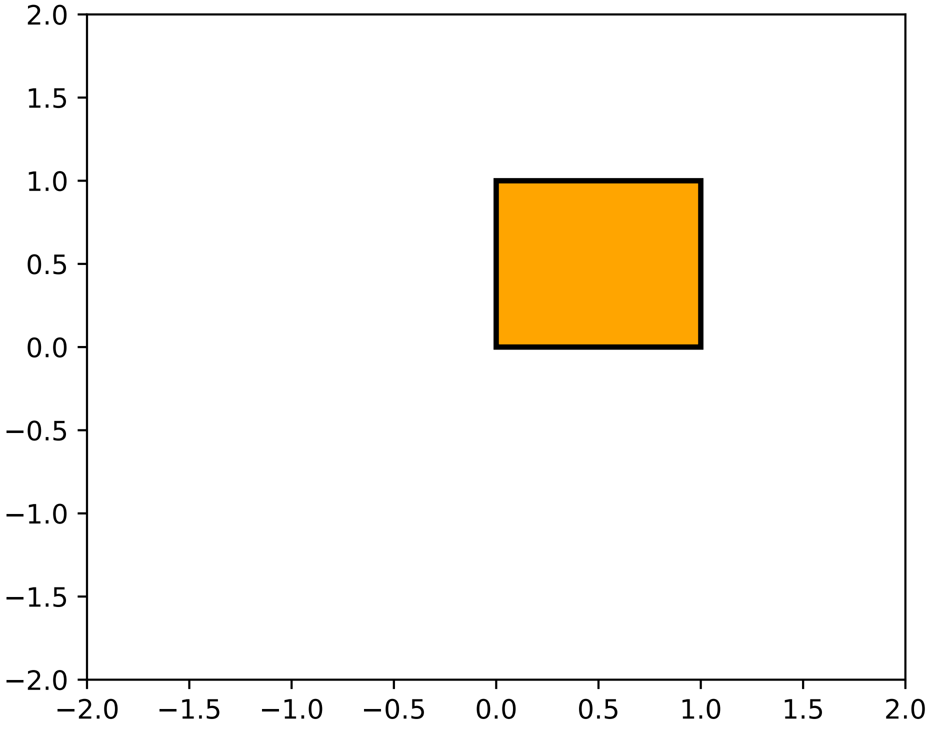
```
import matplotlib.pyplot as plt
from matplotlib.path import Path
import matplotlib.patches as patches

verts = [
    (0., 0.), # left, bottom
    (0., 1.), # left, top
    (1., 1.), # right, top
    (1., 0.), # right, bottom
    (0., 0.), # ignored
    ]

codes = [Path.MOVETO,
         Path.LINETO,
         Path.LINETO,
         Path.LINETO,
         Path.CLOSEPOLY,
         ]

path = Path(verts, codes)

fig = plt.figure()
ax = fig.add_subplot(111)
patch = patches.PathPatch(path, facecolor='orange', lw=2)
ax.add_patch(patch)
ax.set_xlim(-2,2)
ax.set_ylim(-2,2)
plt.show()
```



The following path codes are recognized

Code	Vertices	Description
`STOP`	1 (ignored)	A marker for the end of the entire path (currently not required and ignored)
`MOVETO`	1	Pick up the pen and move to the given vertex.
`LINETO`	1	Draw a line from the current position to the given vertex.
`CURVE3`	2 (1 control point, 1 endpoint)	Draw a quadratic Bézier curve from the current position, with the given control point, to the given end point.
`CURVE4`	3 (2 control points, 1 endpoint)	Draw a cubic Bézier curve from the current position, with the given control points, to the given end point.
`CLOSEPOLY`	1 (point itself is ignored)	Draw a line segment to the start point of the current polyline.

Bézier example

Some of the path components require multiple vertices to specify them: for example CURVE 3 is a bézier curve with one control point and one end point, and CURVE4 has three vertices for the two control points and the end point. The example below shows a CURVE4 Bézier spline – the bézier curve will be contained in the convex hull of the start point, the two control points, and the end point

```
import matplotlib.pyplot as plt
from matplotlib.path import Path
```

```
import matplotlib.patches as patches

verts = [
    (0., 0.),  # P0
    (0.2, 1.), # P1
    (1., 0.8), # P2
    (0.8, 0.), # P3
    ]

codes = [Path.MOVETO,
         Path.CURVE4,
         Path.CURVE4,
         Path.CURVE4,
         ]

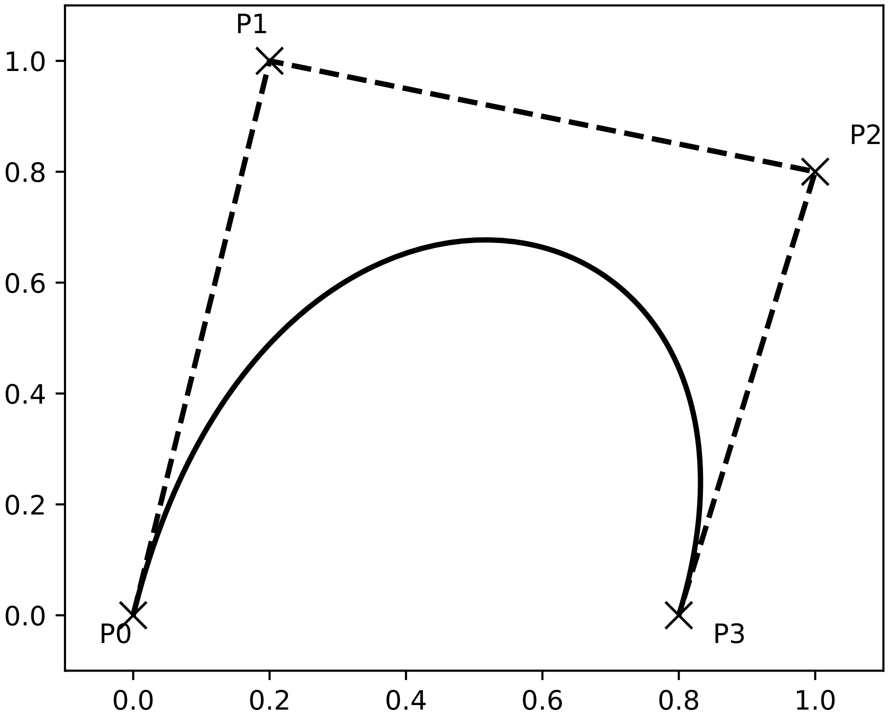
path = Path(verts, codes)

fig = plt.figure()
ax = fig.add_subplot(111)
patch = patches.PathPatch(path, facecolor='none', lw=2)
ax.add_patch(patch)

xs, ys = zip(*verts)
ax.plot(xs, ys, 'x--', lw=2, color='black', ms=10)

ax.text(-0.05, -0.05, 'P0')
ax.text(0.15, 1.05, 'P1')
ax.text(1.05, 0.85, 'P2')
ax.text(0.85, -0.05, 'P3')

ax.set_xlim(-0.1, 1.1)
ax.set_ylim(-0.1, 1.1)
plt.show()
```



Compound paths

All of the simple patch primitives in matplotlib, Rectangle, Circle, Polygon, etc, are implemented with simple path. Plotting functions like *hist()* and *bar()*, which create a number of primitives, e.g., a bunch of Rectangles, can usually be implemented more efficiently using a compound path. The reason `bar` creates a list of rectangles and not a compound path is largely historical: the *Path* code is comparatively new and `bar` predates it. While we could change it now, it would break old code, so here we will cover how to create compound paths, replacing the functionality in bar, in case you need to do so in your own code for efficiency reasons, e.g., you are creating an animated bar plot.

We will make the histogram chart by creating a series of rectangles for each histogram bar: the rectangle width is the bin width and the rectangle height is the number of datapoints in that bin. First we'll create some random normally distributed data and compute the histogram. Because numpy returns the bin edges and not centers, the length of `bins` is 1 greater than the length of `n` in the example below:

```
# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)
```

We'll now extract the corners of the rectangles. Each of the `left`, `bottom`, etc, arrays below is `len(n)`, where `n` is the array of counts for each histogram bar:

```
# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:])
bottom = np.zeros(len(left))
top = bottom + n
```

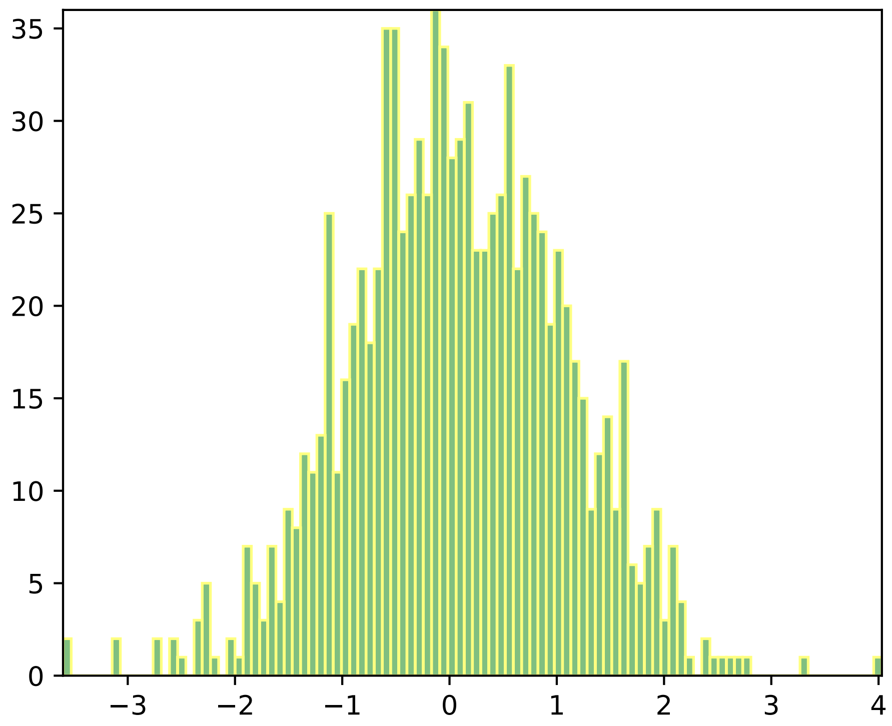
Now we have to construct our compound path, which will consist of a series of `MOVETO`, `LINETO` and `CLOSEPOLY` for each rectangle. For each rectangle, we need 5 vertices: 1 for the `MOVETO`, 3 for the `LINETO`, and 1 for the `CLOSEPOLY`. As indicated in the table above, the vertex for the closepoly is ignored but we still need it to keep the codes aligned with the vertices:

```
nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5,0] = left
verts[0::5,1] = bottom
verts[1::5,0] = left
verts[1::5,1] = top
verts[2::5,0] = right
verts[2::5,1] = top
verts[3::5,0] = right
verts[3::5,1] = bottom
```

All that remains is to create the path, attach it to a `PathPatch`, and add it to our axes:

```
barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
  edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)
```

Here is the result



3.3.3 Path effects guide

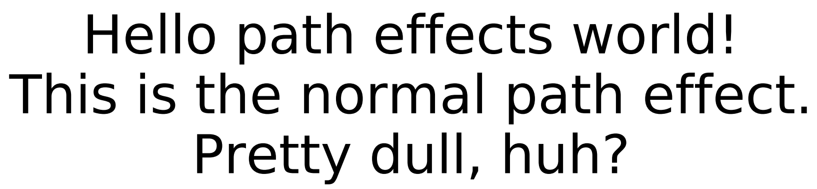
Matplotlib's *patheffects* module provides functionality to apply a multiple draw stage to any Artist which can be rendered via a *Path*.

Artists which can have a path effect applied to them include *Patch*, *Line2D*, *Collection* and even *Text*. Each artist's path effects can be controlled via the `set_path_effects` method (*set_path_effects*), which takes an iterable of *AbstractPathEffect* instances.

The simplest path effect is the *Normal* effect, which simply draws the artist without any effect:

```python
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(5, 1.5))
text = fig.text(0.5, 0.5, 'Hello path effects world!\nThis is the normal '
                          'path effect.\nPretty dull, huh?',
                ha='center', va='center', size=20)
text.set_path_effects([path_effects.Normal()])
plt.show()
```



Hello path effects world!
This is the normal path effect.
Pretty dull, huh?

Whilst the plot doesn't look any different to what you would expect without any path effects, the drawing of the text now been changed to use the path effects framework, opening up the possibilities for more interesting examples.

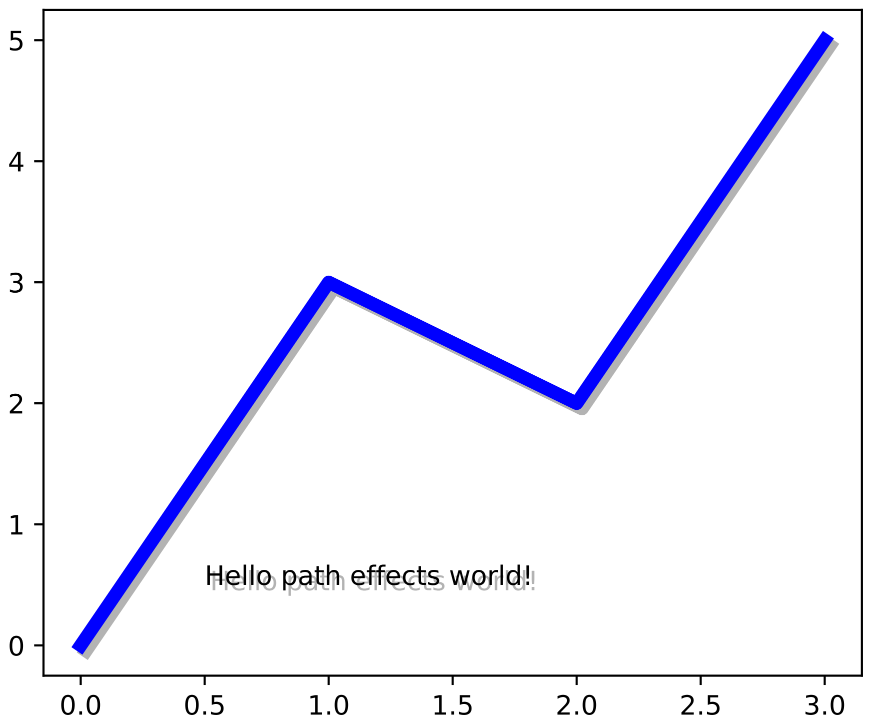
Adding a shadow

A far more interesting path effect than *Normal* is the drop-shadow, which we can apply to any of our path based artists. The classes *SimplePatchShadow* and *SimpleLineShadow* do precisely this by drawing either a filled patch or a line patch below the original artist:

```
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

text = plt.text(0.5, 0.5, 'Hello path effects world!',
                path_effects=[path_effects.withSimplePatchShadow()])

plt.plot([0, 3, 2, 5], linewidth=5, color='blue',
         path_effects=[path_effects.SimpleLineShadow(),
                       path_effects.Normal()])
plt.show()
```



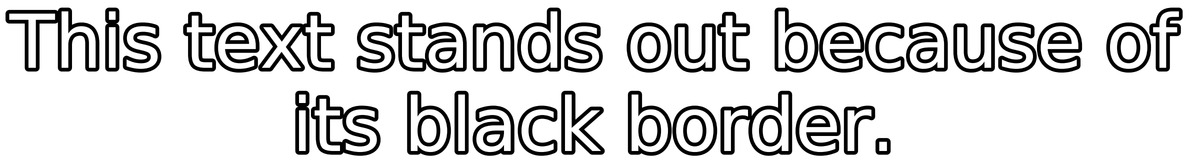
Notice the two approaches to setting the path effects in this example. The first uses the `with*` classes to include the desired functionality automatically followed with the "normal" effect, whereas the latter explicitly defines the two path effects to draw.

Making an artist stand out

One nice way of making artists visually stand out is to draw an outline in a bold color below the actual artist. The *`Stroke`* path effect makes this a relatively simple task:

```
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(7, 1))
text = fig.text(0.5, 0.5, 'This text stands out because of\n'
                          'its black border.', color='white',
                          ha='center', va='center', size=30)
text.set_path_effects([path_effects.Stroke(linewidth=3, foreground='black'),
                       path_effects.Normal()])
plt.show()
```



This text stands out because of its black border.

It is important to note that this effect only works because we have drawn the text path twice; once with a thick black line, and then once with the original text path on top.

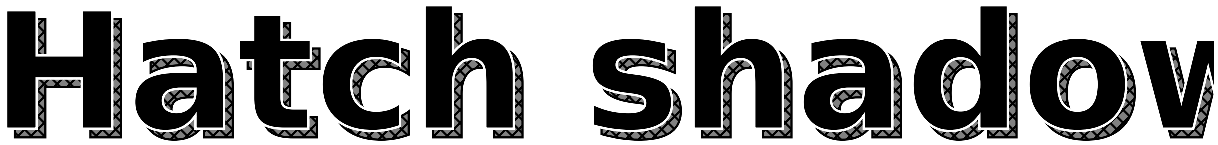
You may have noticed that the keywords to *`Stroke`* and *`SimplePatchShadow`* and *`SimpleLineShadow`* are not the usual Artist keywords (such as `facecolor` and `edgecolor` etc.). This is because with these path effects we are operating at lower level of matplotlib. In fact, the keywords which are accepted are those for a *`matplotlib.backend_bases.GraphicsContextBase`* instance, which have been designed for making it easy to create new backends - and not for its user interface.

Greater control of the path effect artist

As already mentioned, some of the path effects operate at a lower level than most users will be used to, meaning that setting keywords such as `facecolor` and `edgecolor` raise an AttributeError. Luckily there is a generic *`PathPatchEffect`* path effect which creates a *`PathPatch`* class with the original path. The keywords to this effect are identical to those of *`PathPatch`*:

```
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(8, 1))
t = fig.text(0.02, 0.5, 'Hatch shadow', fontsize=75, weight=1000, va='center')
t.set_path_effects([path_effects.PathPatchEffect(offset=(4, -4), hatch='xxxx',
                                                  facecolor='gray'),
                    path_effects.PathPatchEffect(edgecolor='white', linewidth=1.1,
                                                 facecolor='black')])
plt.show()
```



CHAPTER

FOUR

WORKING WITH TEXT

4.1 Text introduction

matplotlib has extensive text support, including support for mathematical expressions, truetype support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support. Because it embeds fonts directly in output documents, e.g., for postscript or PDF, what you see on the screen is what you get in the hardcopy. FreeType support produces very nice, antialiased fonts, that look good even at small raster sizes. matplotlib includes its own *`matplotlib.font_manager`* (thanks to Paul Barrett), which implements a cross platform, `W3C` compliant font finding algorithm.

The user has a great deal of control over text properties (font size, font weight, text location and color, etc.) with sensible defaults set in the `rc file`. And significantly, for those interested in mathematical or scientific figures, matplotlib implements a large number of TeX math symbols and commands, supporting *mathematical expressions* anywhere in your figure.

4.2 Basic text commands

The following commands are used to create text in the pyplot interface

- *`text()`* - add text at an arbitrary location to the `Axes`; *`matplotlib.axes.Axes.text()`* in the API.
- *`xlabel()`* - add a label to the x-axis; *`matplotlib.axes.Axes.set_xlabel()`* in the API.
- *`ylabel()`* - add a label to the y-axis; *`matplotlib.axes.Axes.set_ylabel()`* in the API.
- *`title()`* - add a title to the `Axes`; *`matplotlib.axes.Axes.set_title()`* in the API.
- *`figtext()`* - add text at an arbitrary location to the `Figure`; *`matplotlib.figure.Figure.text()`* in the API.
- *`suptitle()`* - add a title to the `Figure`; *`matplotlib.figure.Figure.suptitle()`* in the API.
- **`annotate()` - add an annotation, with** optional arrow, to the `Axes` ; *`matplotlib.axes.Axes.annotate()`* in the API.

All of these functions create and return a *`matplotlib.text.Text()`* instance, which can be configured with a variety of font and other properties. The example below shows all of these commands in action.

```
# -*- coding: utf-8 -*-
import matplotlib.pyplot as plt

fig = plt.figure()
fig.suptitle('bold figure suptitle', fontsize=14, fontweight='bold')

ax = fig.add_subplot(111)
fig.subplots_adjust(top=0.85)
ax.set_title('axes title')

ax.set_xlabel('xlabel')
ax.set_ylabel('ylabel')

ax.text(3, 8, 'boxed italics text in data coords', style='italic',
        bbox={'facecolor':'red', 'alpha':0.5, 'pad':10})

ax.text(2, 6, r'an equation: $E=mc^2$', fontsize=15)

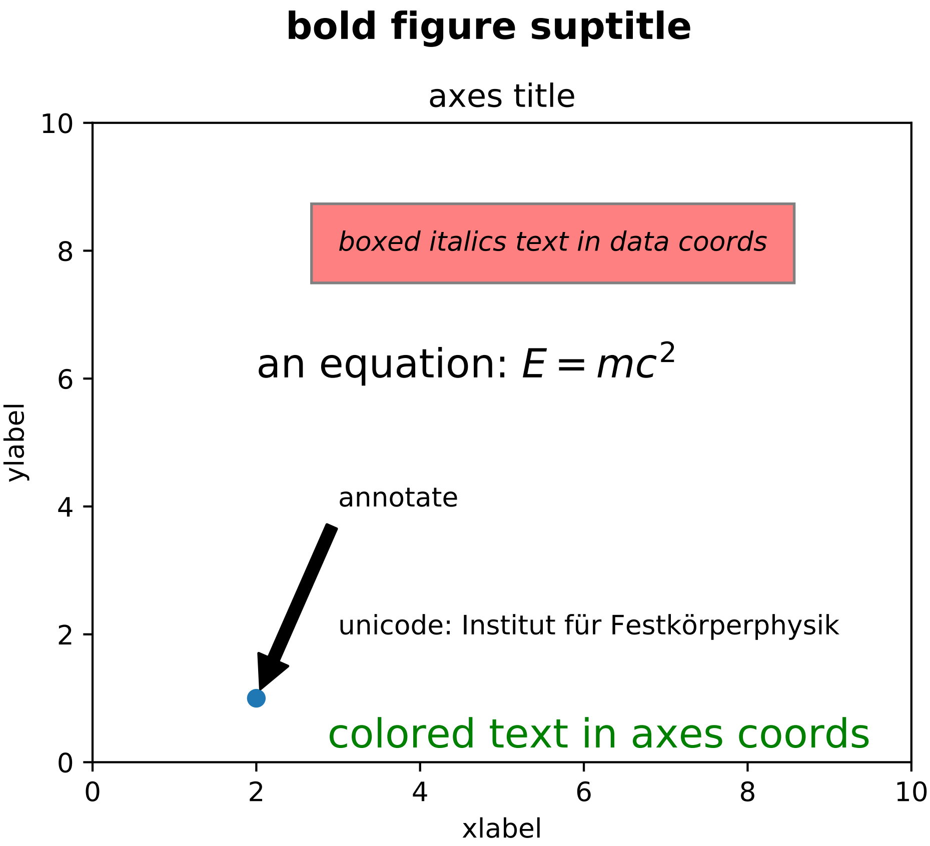
ax.text(3, 2, u'unicode: Institut f\374r Festk\366rperphysik')

ax.text(0.95, 0.01, 'colored text in axes coords',
        verticalalignment='bottom', horizontalalignment='right',
        transform=ax.transAxes,
        color='green', fontsize=15)

ax.plot([2], [1], 'o')
ax.annotate('annotate', xy=(2, 1), xytext=(3, 4),
            arrowprops=dict(facecolor='black', shrink=0.05))

ax.axis([0, 10, 0, 10])

plt.show()
```



4.3 Text properties and layout

The *`matplotlib.text.Text`* instances have a variety of properties which can be configured via keyword arguments to the text commands (e.g., *`title()`*, *`xlabel()`* and *`text()`*).

Property	Value Type
alpha	`float`
backgroundcolor	any matplotlib *color*
bbox	*`Rectangle`* prop dict plus key `'pad'` which is a pad in points
clip_box	a matplotlib.transform.Bbox instance
clip_on	[True | False]
clip_path	a *`Path`* instance and a *`Transform`* instance, a *`Patch`*
color	any matplotlib *color*
family	[`'serif'` | `'sans-serif'` | `'cursive'` | `'fantasy'` | `'monospace'`]
fontproperties	a *`FontProperties`* instance
horizontalalignment or ha	[`'center'` | `'right'` | `'left'`]
label	any string
linespacing	`float`
multialignment	[`'left'` | `'right'` | `'center'`]
name or fontname	string e.g., [`'Sans'` | `'Courier'` | `'Helvetica'` ...]
picker	[None|float|boolean|callable]
position	(x, y)
rotation	[angle in degrees | `'vertical'` | `'horizontal'`]
size or fontsize	[size in points | relative size, e.g., `'smaller'`, `'x-large'`]
style or fontstyle	[`'normal'` | `'italic'` | `'oblique'`]
text	string or anything printable with ‘%s’ conversion
transform	a *`Transform`* instance
variant	[`'normal'` | `'small-caps'`]
verticalalignment or va	[`'center'` | `'top'` | `'bottom'` | `'baseline'`]
visible	[True | False]
weight or fontweight	[`'normal'` | `'bold'` | `'heavy'` | `'light'` | `'ultrabold'` | `'ultralight'`]
x	`float`
y	`float`
zorder	any number

You can lay out text with the alignment arguments `horizontalalignment`, `verticalalignment`, and `multialignment`. `horizontalalignment` controls whether the x positional argument for the text indicates the left, center or right side of the text bounding box. `verticalalignment` controls whether the y positional argument for the text indicates the bottom, center or top side of the text bounding box. `multialignment`, for newline separated strings only, controls whether the different lines are left, center or right justified. Here is an example which uses the *`text()`* command to show the various alignment possibilities. The use of `transform=ax.transAxes` throughout the code indicates that the coordinates are given relative to the axes bounding box, with 0,0 being the lower left of the axes and 1,1 the upper right.

```
import matplotlib.pyplot as plt
import matplotlib.patches as patches

# build a rectangle in axes coords
left, width = .25, .5
bottom, height = .25, .5
right = left + width
```

```
top = bottom + height

fig = plt.figure()
ax = fig.add_axes([0,0,1,1])

# axes coordinates are 0,0 is bottom left and 1,1 is upper right
p = patches.Rectangle(
    (left, bottom), width, height,
    fill=False, transform=ax.transAxes, clip_on=False
    )

ax.add_patch(p)

ax.text(left, bottom, 'left top',
        horizontalalignment='left',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, bottom, 'left bottom',
        horizontalalignment='left',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right bottom',
        horizontalalignment='right',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right top',
        horizontalalignment='right',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(right, bottom, 'center top',
        horizontalalignment='center',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'right center',
        horizontalalignment='right',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

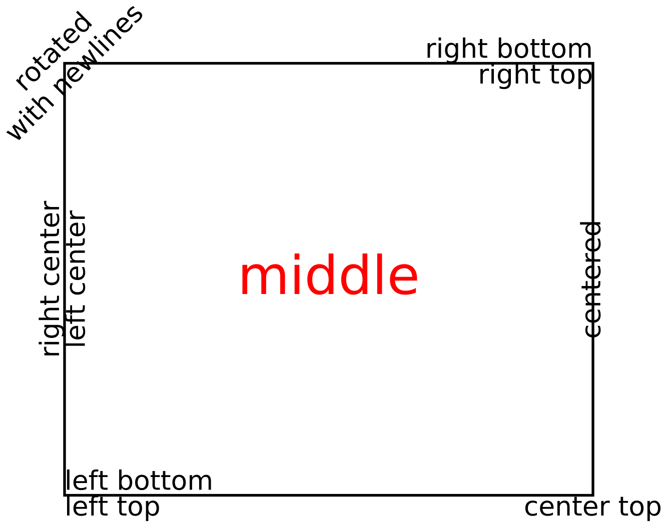
ax.text(left, 0.5*(bottom+top), 'left center',
        horizontalalignment='left',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(0.5*(left+right), 0.5*(bottom+top), 'middle',
        horizontalalignment='center',
        verticalalignment='center',
        fontsize=20, color='red',
        transform=ax.transAxes)

ax.text(right, 0.5*(bottom+top), 'centered',
        horizontalalignment='center',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(left, top, 'rotated\nwith newlines',
        horizontalalignment='center',
        verticalalignment='center',
        rotation=45,
        transform=ax.transAxes)

ax.set_axis_off()
plt.show()
```



rotated
with newlines
right bottom
right top
right center
left center
middle
centered
left bottom
left top
center top

4.4 Default Font

The base default font is controlled by a set of rcParams:

rcParam	usage
`'font.family'`	List of either names of font or `{'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}`.
`'font.style'`	The default style, ex `'normal'`, `'italic'`.
`'font.variant'`	Default variant, ex `'normal'`, `'small-caps'` (untested)
`'font.stretch'`	Default stretch, ex `'normal'`, `'condensed'` (incomplete)
`'font.weight'`	Default weight. Either string or integer
`'font.size'`	Default font size in points. Relative font sizes (`'large'`, `'x-small'`) are computed against this size.

The mapping between the family aliases (`{'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}`) and actual font names is controlled by the following rcParams:

family alias	rcParam with mappings
`'serif'`	`'font.serif'`
`'monospace'`	`'font.monospace'`
`'fantasy'`	`'font.fantasy'`
`'cursive'`	`'font.cursive'`
`{'sans', 'sans serif', 'sans-serif'}`	`'font.sans-serif'`

which are lists of font names.

4.4.1 Text with non-latin glyphs

As of v2.0 the *default font* contains glyphs for many western alphabets, but still does not cover all of the glyphs that may be required by mpl users. For example, DejaVu has no coverage of Chinese, Korean, or Japanese.

To set the default font to be one that supports the code points you need, prepend the font name to `'font.family'` or the desired alias lists

```
matplotlib.rcParams['font.sans-serif'] = ['Source Han Sans TW', 'sans-serif']
```

or set it in your `.matplotlibrc` file:

```
font.sans-serif: Source Han Sans TW, Ariel, sans-serif
```

To control the font used on per-artist basis use the `'name'`, `'fontname'` or `'fontproperties'` kwargs documented *above*.

On linux, fc-list can be a useful tool to discover the font name; for example

```
$ fc-list :lang=zh family
Noto to Sans Mono CJK TC,Noto Sans Mono CJK TC Bold
Noto Sans CJK TC,Noto Sans CJK TC Medium
Noto Sans CJK TC,Noto Sans CJK TC DemiLight
Noto Sans CJK KR,Noto Sans CJK KR Black
Noto Sans CJK TC,Noto Sans CJK TC Black
Noto Sans Mono CJK TC,Noto Sans Mono CJK TC Regular
Noto Sans CJK SC,Noto Sans CJK SC Light
```

lists all of the fonts that support Chinese.

4.5 Annotation

4.5.1 Basic annotation

The uses of the basic `text()` will place text at an arbitrary position on the Axes. A common use case of text is to annotate some feature of the plot, and the `annotate()` method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are `(x,y)` tuples.

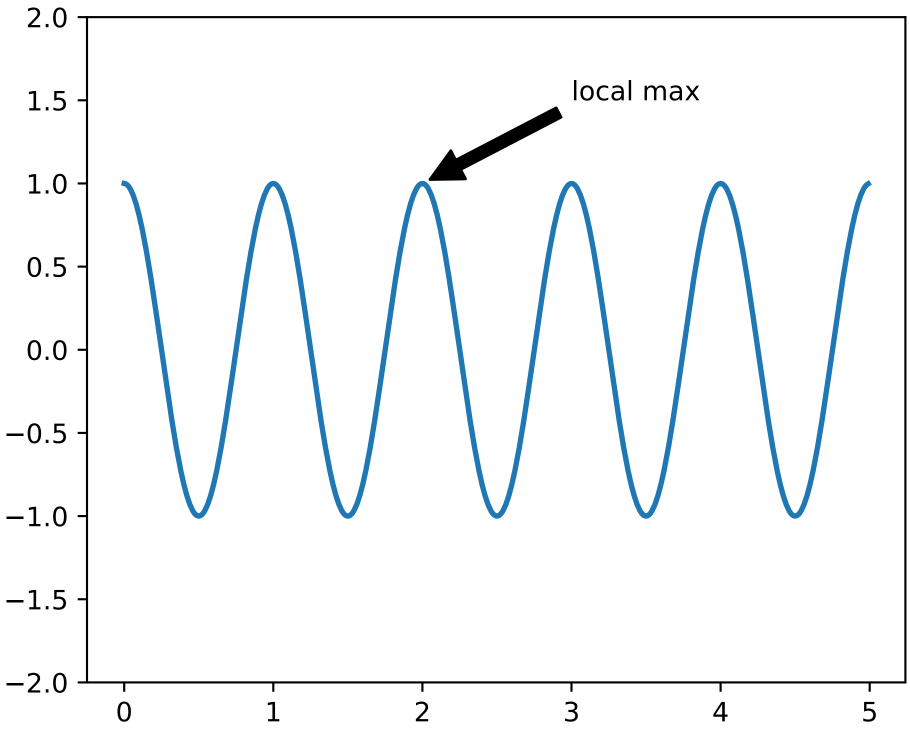
```python
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)

t = np.arange(0.0, 5.0, 0.01)
s = np.cos(2*np.pi*t)
line, = ax.plot(t, s, lw=2)

ax.annotate('local max', xy=(2, 1), xytext=(3, 1.5),
            arrowprops=dict(facecolor='black', shrink=0.05),
            )
```

```
ax.set_ylim(-2,2)
plt.show()
```



In this example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose – you can specify the coordinate system of `xy` and `xytext` with one of the following strings for `xycoords` and `textcoords` (default is 'data')

argument	coordinate system
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0,0 is lower left of figure and 1,1 is upper right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0,0 is lower left of axes and 1,1 is upper right
'data'	use the axes data coordinate system

For example to place the text coordinates in fractional axes coordinates, one could do:

```
ax.annotate('local max', xy=(3, 1),  xycoords='data',
            xytext=(0.8, 0.95), textcoords='axes fraction',
            arrowprops=dict(facecolor='black', shrink=0.05),
            horizontalalignment='right', verticalalignment='top',
            )
```

For physical coordinate systems (points or pixels) the origin is the bottom-left of the figure or axes.

Optionally, you can enable drawing of an arrow from the text to the annotated point by giving a dictionary of arrow properties in the optional keyword argument `arrowprops`.

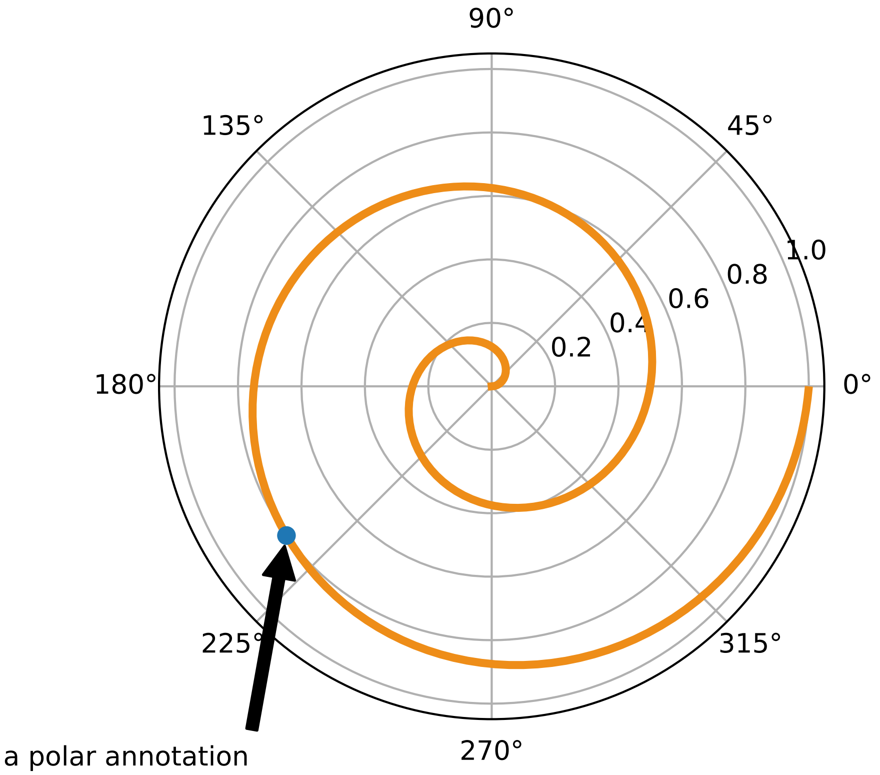
`arrowprops` key	description
width	the width of the arrow in points
frac	the fraction of the arrow length occupied by the head
headwidth	the width of the base of the arrow head in points
shrink	move the tip and base some percent away from the annotated point and text
**kwargs	any key for *`matplotlib.patches.Polygon`*, e.g., `facecolor`

In the example below, the `xy` point is in native coordinates (`xycoords` defaults to 'data'). For a polar axes, this is in (theta, radius) space. The text in this example is placed in the fractional figure coordinate system. *`matplotlib.text.Text`* keyword args like `horizontalalignment`, `verticalalignment` and `fontsize` are passed from `annotate` to the `Text` instance.

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111, polar=True)
r = np.arange(0,1,0.001)
theta = 2*2*np.pi*r
line, = ax.plot(theta, r, color='#ee8d18', lw=3)

ind = 800
thisr, thistheta = r[ind], theta[ind]
ax.plot([thistheta], [thisr], 'o')
ax.annotate('a polar annotation',
            xy=(thistheta, thisr),  # theta, radius
            xytext=(0.05, 0.05),    # fraction, fraction
            textcoords='figure fraction',
            arrowprops=dict(facecolor='black', shrink=0.05),
            horizontalalignment='left',
            verticalalignment='bottom',
            )
plt.show()
```



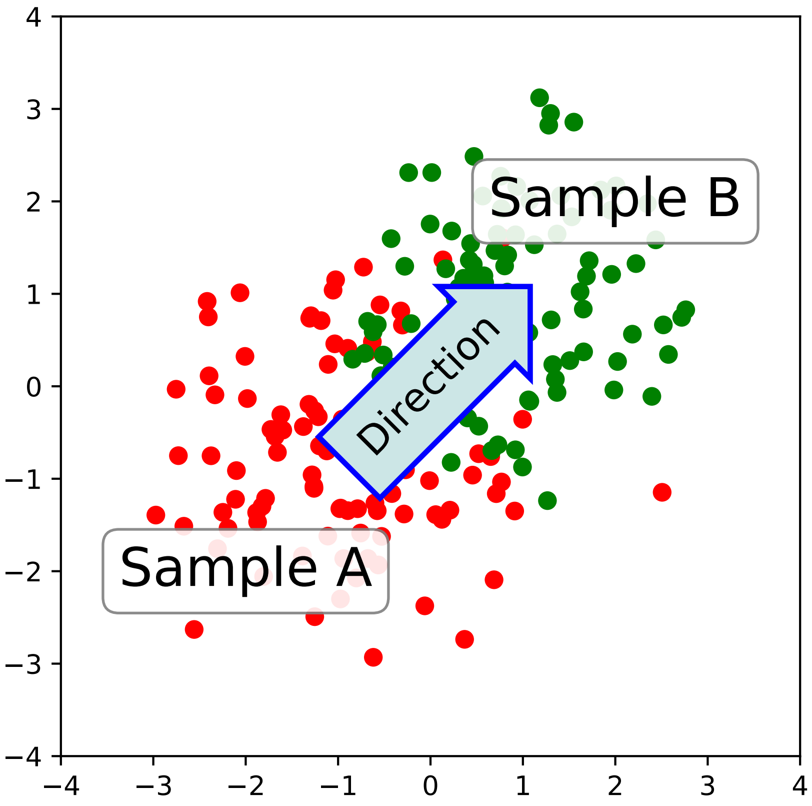
For more on all the wild and wonderful things you can do with annotations, including fancy arrows, see *Advanced Annotation* and *pylab_examples example code: annotation_demo.py*.

Do not proceed unless you have already read *Basic annotation*, `text()` and `annotate()`!

4.5.2 Advanced Annotation

Annotating with Text with Box

Let's start with a simple example.



The *text()* function in the pyplot module (or text method of the Axes class) takes bbox keyword argument, and when given, a box around the text is drawn.

```
bbox_props = dict(boxstyle="rarrow,pad=0.3", fc="cyan", ec="b", lw=2)
t = ax.text(0, 0, "Direction", ha="center", va="center", rotation=45,
            size=15,
            bbox=bbox_props)
```

The patch object associated with the text can be accessed by:

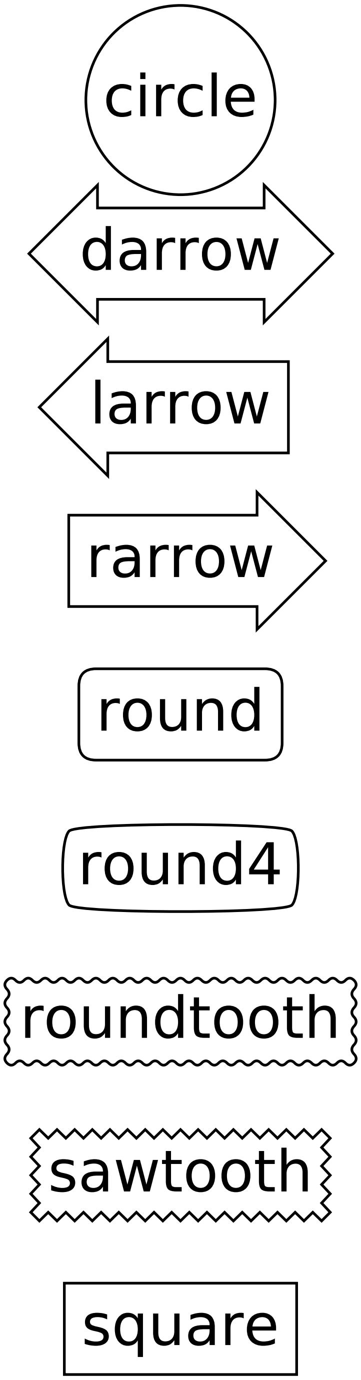
```
bb = t.get_bbox_patch()
```

The return value is an instance of FancyBboxPatch and the patch properties like facecolor, edgewidth, etc. can be accessed and modified as usual. To change the shape of the box, use the *set_boxstyle* method.

```
bb.set_boxstyle("rarrow", pad=0.6)
```

The arguments are the name of the box style with its attributes as keyword arguments. Currently, following box styles are implemented.

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3,rounding_size=None
Round4	`round4`	pad=0.3,rounding_size=None
Roundtooth	`roundtooth`	pad=0.3,tooth_size=None
Sawtooth	`sawtooth`	pad=0.3,tooth_size=None
Square	`square`	pad=0.3



circle
darrow
larrow
rarrow
round
round4
roundtooth
sawtooth
square

Note that the attribute arguments can be specified within the style name with separating comma (this form can be used as "boxstyle" value of bbox argument when initializing the text instance)

```
bb.set_boxstyle("rarrow,pad=0.6")
```

Annotating with Arrow

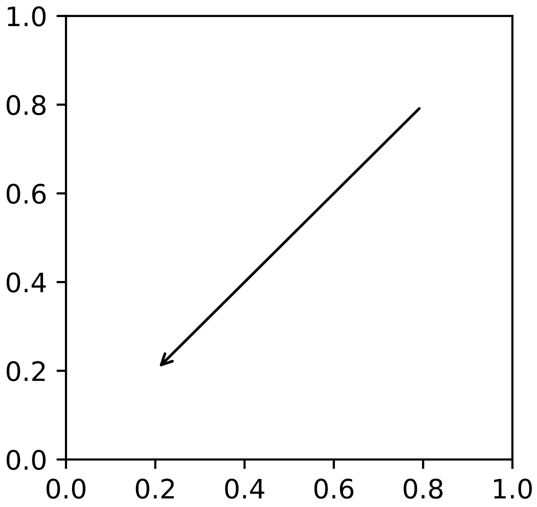
The `annotate()` function in the pyplot module (or annotate method of the Axes class) is used to draw an arrow connecting two points on the plot.

```
ax.annotate("Annotation",
            xy=(x1, y1), xycoords='data',
            xytext=(x2, y2), textcoords='offset points',
            )
```

This annotates a point at `xy` in the given coordinate (`xycoords`) with the text at `xytext` given in `textcoords`. Often, the annotated point is specified in the *data* coordinate and the annotating text in *offset points*. See `annotate()` for available coordinate systems.

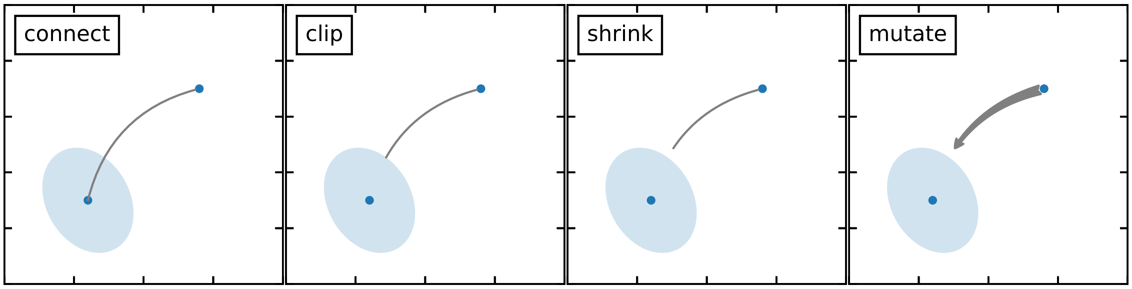
An arrow connecting two points (xy & xytext) can be optionally drawn by specifying the `arrowprops` argument. To draw only an arrow, use empty string as the first argument.

```
ax.annotate("",
            xy=(0.2, 0.2), xycoords='data',
            xytext=(0.8, 0.8), textcoords='data',
            arrowprops=dict(arrowstyle="->",
                            connectionstyle="arc3"),
            )
```



The arrow drawing takes a few steps.

1. a connecting path between two points are created. This is controlled by `connectionstyle` key value.
2. If patch object is given (*patchA* & *patchB*), the path is clipped to avoid the patch.
3. The path is further shrunk by given amount of pixels (*shrinkA* & *shrinkB*)
4. The path is transmuted to arrow patch, which is controlled by the `arrowstyle` key value.

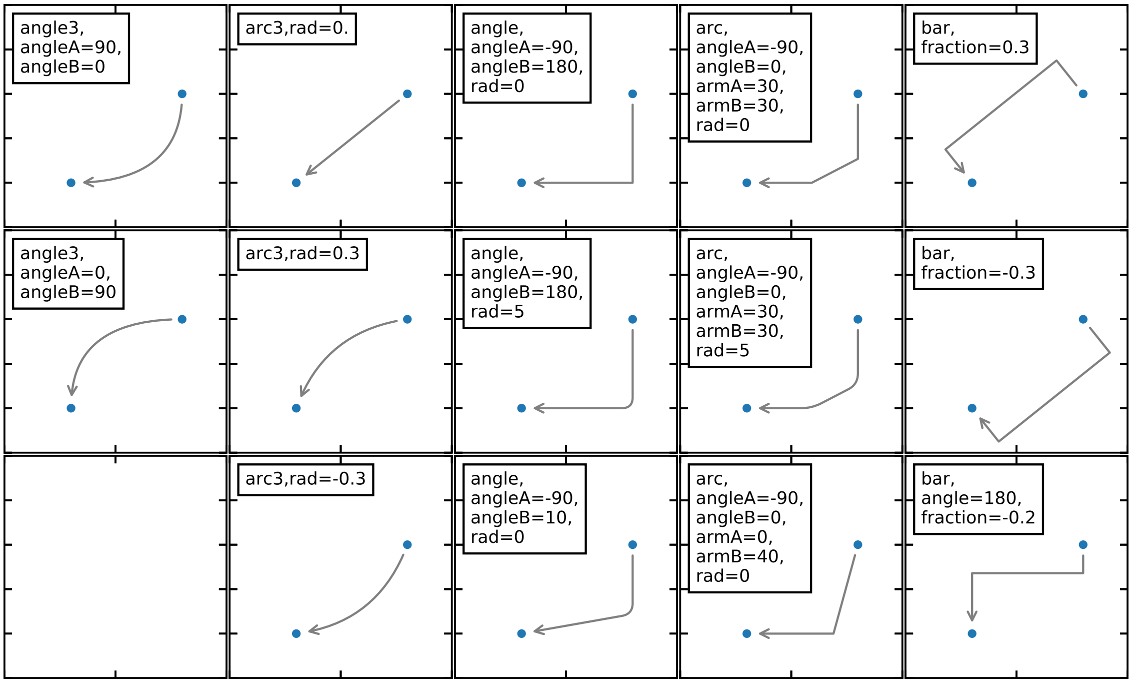


The creation of the connecting path between two points is controlled by `connectionstyle` key and the following styles are available.

Name	Attrs
`angle`	angleA=90,angleB=0,rad=0.0
`angle3`	angleA=90,angleB=0
`arc`	angleA=0,angleB=0,armA=None,armB=None,rad=0.0
`arc3`	rad=0.0
`bar`	armA=0.0,armB=0.0,fraction=0.3,angle=None

Note that "3" in `angle3` and `arc3` is meant to indicate that the resulting path is a quadratic spline segment (three control points). As will be discussed below, some arrow style options can only be used when the connecting path is a quadratic spline.

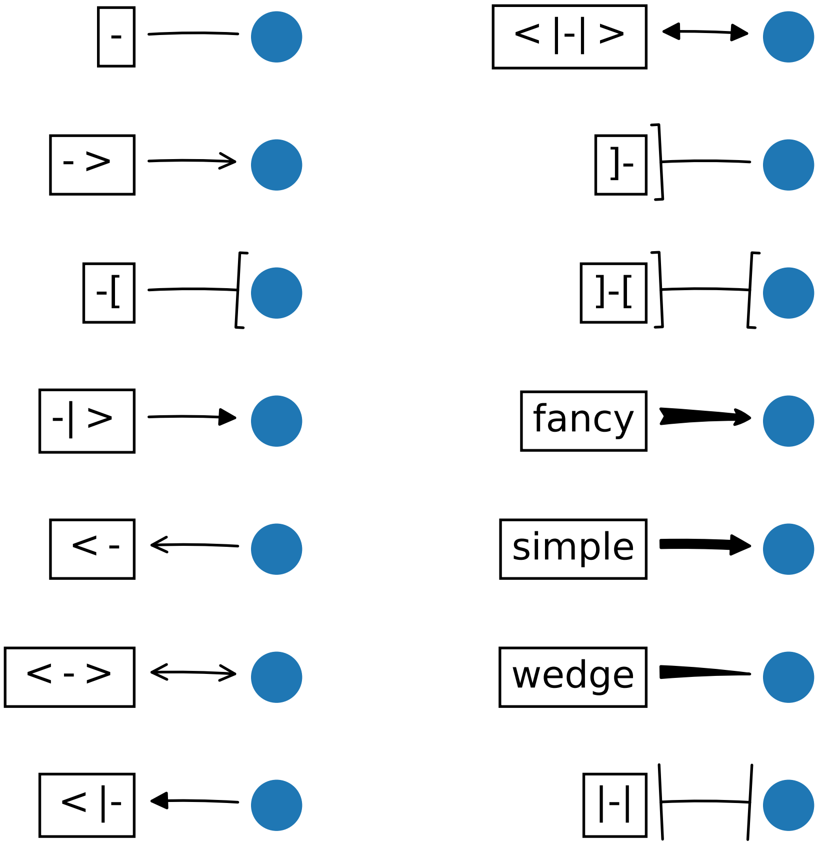
The behavior of each connection style is (limitedly) demonstrated in the example below. (Warning : The behavior of the `bar` style is currently not well defined, it may be changed in the future).



angle3,
angleA=90,
angleB=0
arc3,rad=0.
angle,
angleA=-90,
angleB=180,
rad=0
arc,
angleA=-90,
angleB=0,
armA=30,
armB=30,
rad=0
bar,
fraction=0.3
angle3,
angleA=0,
angleB=90
arc3,rad=0.3
angle,
angleA=-90,
angleB=180,
rad=5
arc,
angleA=-90,
angleB=0,
armA=30,
armB=30,
rad=5
bar,
fraction=-0.3
arc3,rad=-0.3
angle,
angleA=-90,
angleB=10,
rad=0
arc,
angleA=-90,
angleB=0,
armA=0,
armB=40,
rad=0
bar,
angle=180,
fraction=-0.2

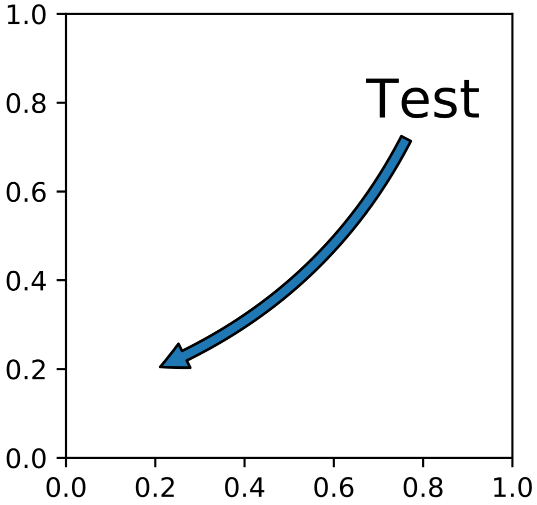
The connecting path (after clipping and shrinking) is then mutated to an arrow patch, according to the given `arrowstyle`.

Name	Attrs
`-`	None
`->`	head_length=0.4,head_width=0.2
`-[`	widthB=1.0,lengthB=0.2,angleB=None
`|-|`	widthA=1.0,widthB=1.0
`-|>`	head_length=0.4,head_width=0.2
`<-`	head_length=0.4,head_width=0.2
`<->`	head_length=0.4,head_width=0.2
`<|-`	head_length=0.4,head_width=0.2
`<|-|>`	head_length=0.4,head_width=0.2
`fancy`	head_length=0.4,head_width=0.4,tail_width=0.4
`simple`	head_length=0.5,head_width=0.5,tail_width=0.2
`wedge`	tail_width=0.3,shrink_factor=0.5

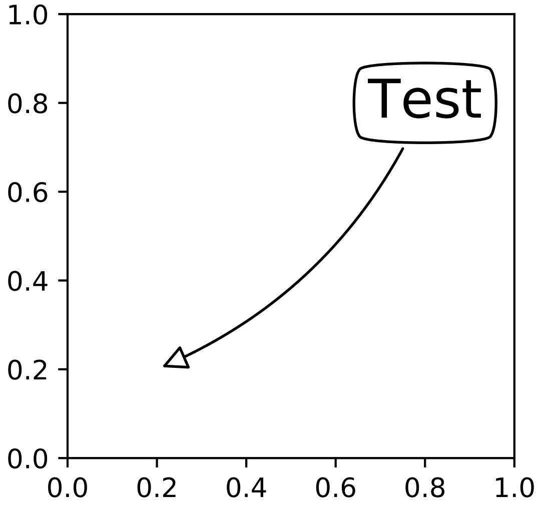


Some arrowstyles only work with connection styles that generate a quadratic-spline segment. They are `fancy`, `simple`, and `wedge`. For these arrow styles, you must use the “angle3” or “arc3” connection style.

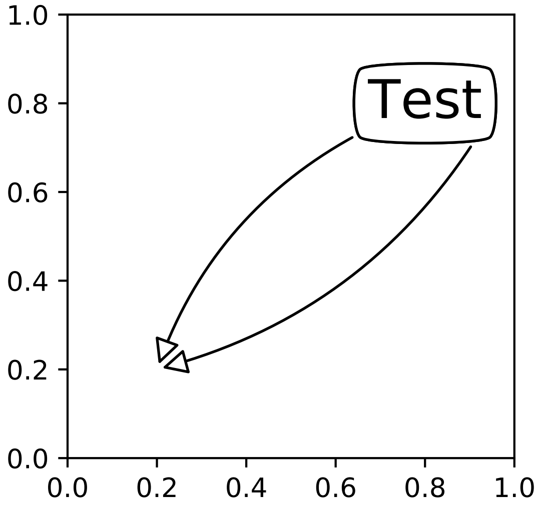
If the annotation string is given, the patchA is set to the bbox patch of the text by default.



As in the text command, a box around the text can be drawn using the `bbox` argument.



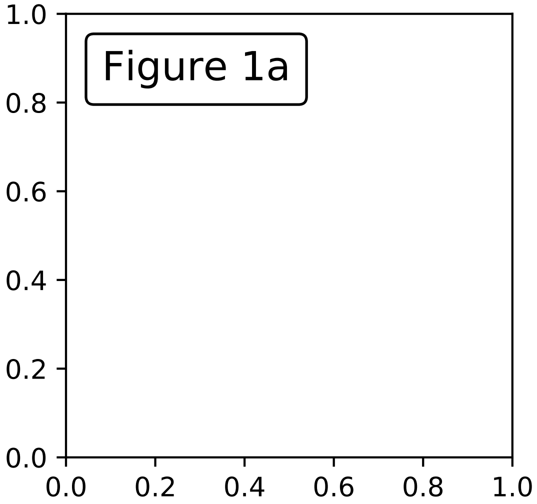
By default, the starting point is set to the center of the text extent. This can be adjusted with `relpos` key value. The values are normalized to the extent of the text. For example, (0,0) means lower-left corner and (1,1) means top-right.



Placing Artist at the anchored location of the Axes

There are classes of artists that can be placed at an anchored location in the Axes. A common example is the legend. This type of artist can be created by using the OffsetBox class. A few predefined classes are available in `mpl_toolkits.axes_grid.anchored_artists`.

```
from mpl_toolkits.axes_grid.anchored_artists import AnchoredText
at = AnchoredText("Figure 1a",
                  prop=dict(size=8), frameon=True,
                  loc=2,
                  )
at.patch.set_boxstyle("round,pad=0.,rounding_size=0.2")
ax.add_artist(at)
```



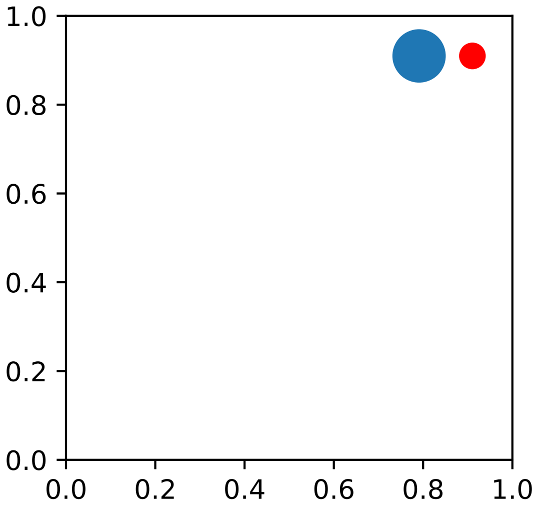
The *loc* keyword has same meaning as in the legend command.

A simple application is when the size of the artist (or collection of artists) is known in pixel size during the time of creation. For example, If you want to draw a circle with fixed size of 20 pixel x 20 pixel (radius = 10 pixel), you can utilize `AnchoredDrawingArea`. The instance is created with a size of the drawing area (in pixels), and arbitrary artists can added to the drawing area. Note that the extents of the artists that are added to the drawing area are not related to the placement of the drawing area itself. Only the initial size matters.

```
from mpl_toolkits.axes_grid.anchored_artists import AnchoredDrawingArea

ada = AnchoredDrawingArea(20, 20, 0, 0,
                          loc=1, pad=0., frameon=False)
p1 = Circle((10, 10), 10)
ada.drawing_area.add_artist(p1)
p2 = Circle((30, 10), 5, fc="r")
ada.drawing_area.add_artist(p2)
```

The artists that are added to the drawing area should not have a transform set (it will be overridden) and the dimensions of those artists are interpreted as a pixel coordinate, i.e., the radius of the circles in above example are 10 pixels and 5 pixels, respectively.

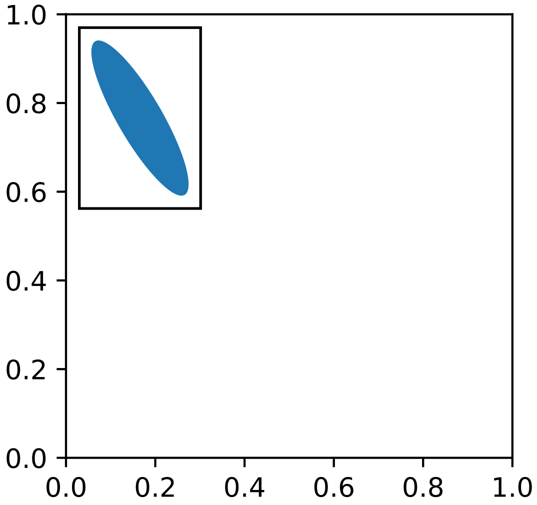


Sometimes, you want your artists to scale with the data coordinate (or coordinates other than canvas pixels). You can use `AnchoredAuxTransformBox` class. This is similar to `AnchoredDrawingArea` except that the extent of the artist is determined during the drawing time respecting the specified transform.

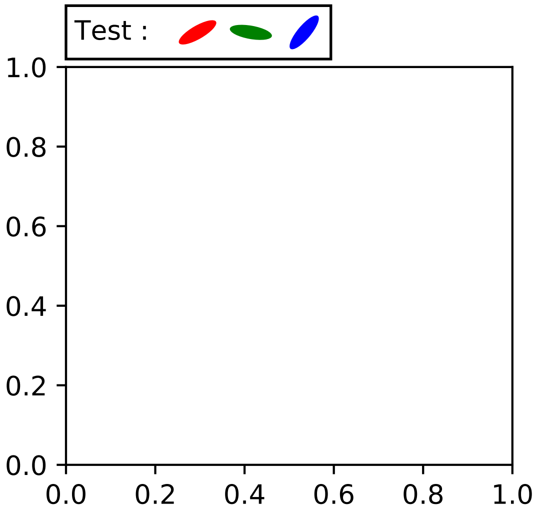
```
from mpl_toolkits.axes_grid.anchored_artists import AnchoredAuxTransformBox

box = AnchoredAuxTransformBox(ax.transData, loc=2)
el = Ellipse((0,0), width=0.1, height=0.4, angle=30)  # in data coordinates!
box.drawing_area.add_artist(el)
```

The ellipse in the above example will have width and height corresponding to 0.1 and 0.4 in data coordinateing and will be automatically scaled when the view limits of the axes change.



As in the legend, the bbox_to_anchor argument can be set. Using the HPacker and VPacker, you can have an arrangement(?) of artist as in the legend (as a matter of fact, this is how the legend is created).



Note that unlike the legend, the `bbox_transform` is set to IdentityTransform by default.

Using Complex Coordinates with Annotations

The Annotation in matplotlib supports several types of coordinates as described in *Basic annotation*. For an advanced user who wants more control, it supports a few other options.

1. `Transform` instance. For example,

```
ax.annotate("Test", xy=(0.5, 0.5), xycoords=ax.transAxes)
```

   is identical to

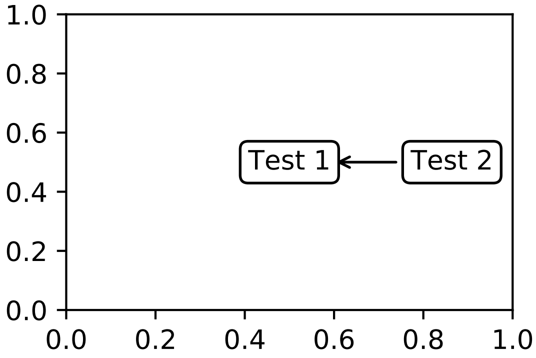
```
ax.annotate("Test", xy=(0.5, 0.5), xycoords="axes fraction")
```

   With this, you can annotate a point in other axes.

```
ax1, ax2 = subplot(121), subplot(122)
ax2.annotate("Test", xy=(0.5, 0.5), xycoords=ax1.transData,
             xytext=(0.5, 0.5), textcoords=ax2.transData,
             arrowprops=dict(arrowstyle="->"))
```

2. `Artist` instance. The xy value (or xytext) is interpreted as a fractional coordinate of the bbox (return value of *get_window_extent*) of the artist.

```
an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                  va="center", ha="center",
                  bbox=dict(boxstyle="round", fc="w"))
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1, # (1,0.5) of the an1's bbox
                  xytext=(30,0), textcoords="offset points",
                  va="center", ha="left",
                  bbox=dict(boxstyle="round", fc="w"),
                  arrowprops=dict(arrowstyle="->"))
```



Note that it is your responsibility that the extent of the coordinate artist (*an1* in above example) is determined before *an2* gets drawn. In most cases, it means that *an2* needs to be drawn later than *an1*.

3. A callable object that returns an instance of either `BboxBase` or `Transform`. If a transform is returned, it is the same as 1 and if a bbox is returned, it is the same as 2. The callable object should take a single argument of the renderer instance. For example, the following two commands give identical results

```
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
                  xytext=(30,0), textcoords="offset points")
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1.get_window_extent,
                  xytext=(30,0), textcoords="offset points")
```

4. A tuple of two coordinate specifications. The first item is for the x-coordinate and the second is for the y-coordinate. For example,

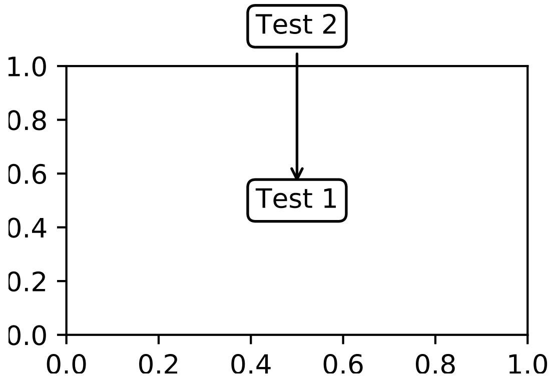
```
annotate("Test", xy=(0.5, 1), xycoords=("data", "axes fraction"))
```

0.5 is in data coordinates, and 1 is in normalized axes coordinates. You may use an artist or transform as with a tuple. For example,

```
import matplotlib.pyplot as plt

plt.figure(figsize=(3,2))
ax=plt.axes([0.1, 0.1, 0.8, 0.7])
an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                  va="center", ha="center",
                  bbox=dict(boxstyle="round", fc="w"))

an2 = ax.annotate("Test 2", xy=(0.5, 1.), xycoords=an1,
                  xytext=(0.5,1.1), textcoords=(an1, "axes fraction"),
                  va="bottom", ha="center",
                  bbox=dict(boxstyle="round", fc="w"),
                  arrowprops=dict(arrowstyle="->"))
plt.show()
```

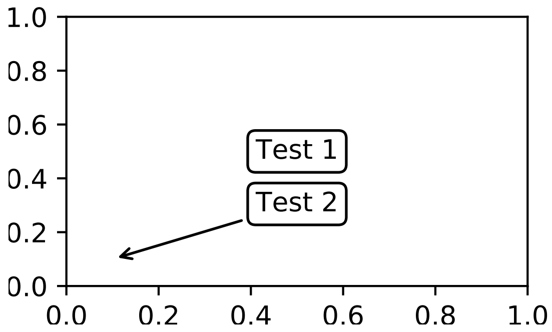


5. Sometimes, you want your annotation with some "offset points", not from the annotated point but from some other point. `OffsetFrom` is a helper class for such cases.

```
import matplotlib.pyplot as plt

plt.figure(figsize=(3,2))
ax=plt.axes([0.1, 0.1, 0.8, 0.7])
an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                  va="center", ha="center",
                  bbox=dict(boxstyle="round", fc="w"))

from matplotlib.text import OffsetFrom
offset_from = OffsetFrom(an1, (0.5, 0))
an2 = ax.annotate("Test 2", xy=(0.1, 0.1), xycoords="data",
                  xytext=(0, -10), textcoords=offset_from,
                  # xytext is offset points from "xy=(0.5, 0), xycoords=an1"
                  va="top", ha="center",
                  bbox=dict(boxstyle="round", fc="w"),
                  arrowprops=dict(arrowstyle="->"))
plt.show()
```



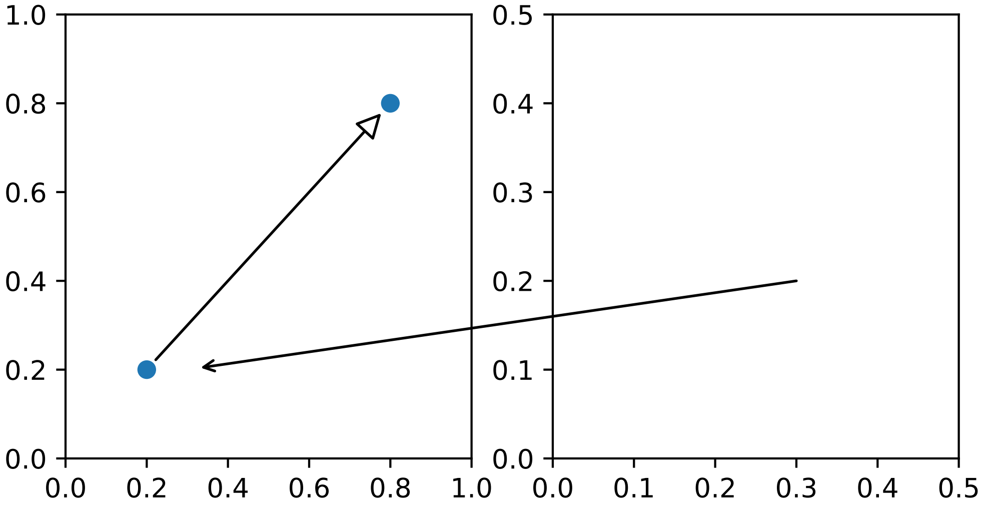
You may take a look at this example *pylab_examples example code: annotation_demo3.py*.

Using ConnectorPatch

The ConnectorPatch is like an annotation without text. While the annotate function is recommended in most situations, the ConnectorPatch is useful when you want to connect points in different axes.

```
from matplotlib.patches import ConnectionPatch
xy = (0.2, 0.2)
con = ConnectionPatch(xyA=xy, xyB=xy, coordsA="data", coordsB="data",
                      axesA=ax1, axesB=ax2)
ax2.add_artist(con)
```

The above code connects point xy in the data coordinates of `ax1` to point xy in the data coordinates of `ax2`. Here is a simple example.

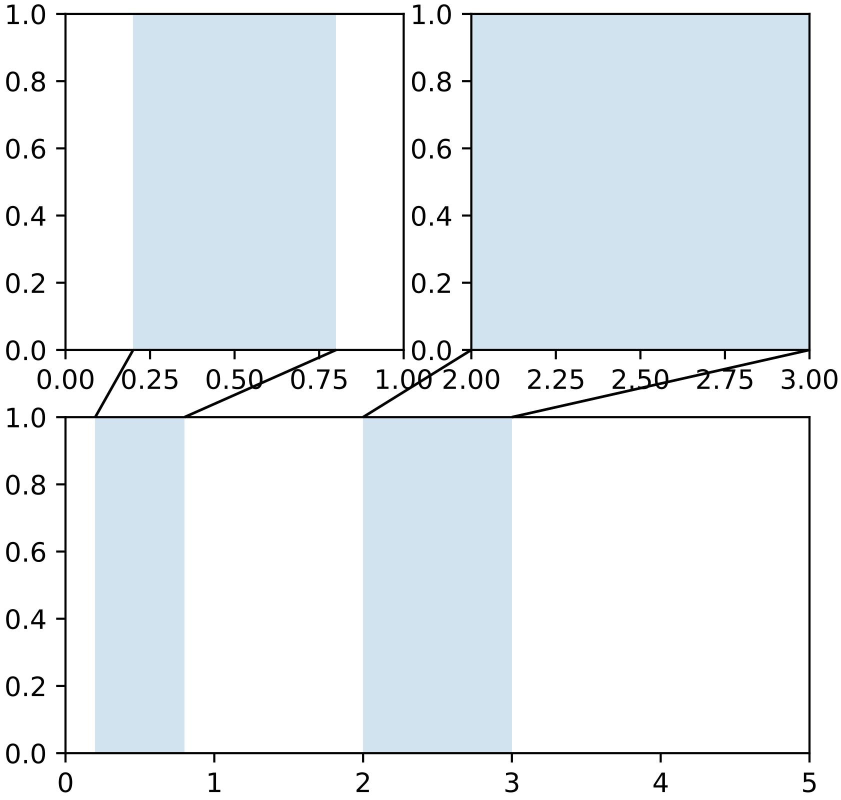


While the ConnectorPatch instance can be added to any axes, you may want to add it to the axes that is latest in drawing order to prevent overlap by other axes.

Advanced Topics

Zoom effect between Axes

mpl_toolkits.axes_grid.inset_locator defines some patch classes useful for interconnecting two axes. Understanding the code requires some knowledge of how mpl's transform works. But, utilizing it will be straight forward.



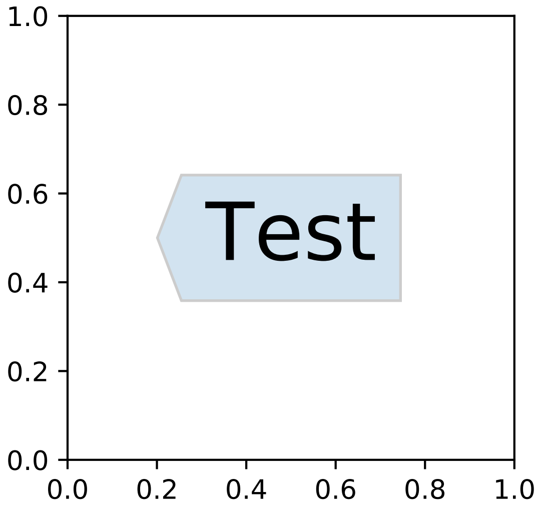
Define Custom BoxStyle

You can use a custom box style. The value for the `boxstyle` can be a callable object in the following forms.:

```
def __call__(self, x0, y0, width, height, mutation_size,
             aspect_ratio=1.):
    """
    Given the location and size of the box, return the path of
    the box around it.

      - *x0*, *y0*, *width*, *height* : location and size of the box
      - *mutation_size* : a reference scale for the mutation.
      - *aspect_ratio* : aspect-ratio for the mutation.
    """
    path = ...
    return path
```

Here is a complete example.



However, it is recommended that you derive from the matplotlib.patches.BoxStyle._Base as demonstrated below.

```
from matplotlib.path import Path
from matplotlib.patches import BoxStyle
import matplotlib.pyplot as plt

# we may derive from matplotlib.patches.BoxStyle._Base class.
# You need to override transmute method in this case.

class MyStyle(BoxStyle._Base):
    """
    A simple box.
    """

    def __init__(self, pad=0.3):
        """
        The arguments need to be floating numbers and need to have
        default values.

         *pad*
            amount of padding
        """

        self.pad = pad
        super(MyStyle, self).__init__()

    def transmute(self, x0, y0, width, height, mutation_size):
        """
        Given the location and size of the box, return the path of
        the box around it.

         - *x0*, *y0*, *width*, *height* : location and size of the box
         - *mutation_size* : a reference scale for the mutation.
        Often, the *mutation_size* is the font size of the text.
        You don't need to worry about the rotation as it is
        automatically taken care of.
        """

        # padding
        pad = mutation_size * self.pad

        # width and height with padding added.
        width, height = width + 2.*pad, \
                        height + 2.*pad,

        # boundary of the padded box
        x0, y0 = x0-pad, y0-pad,
        x1, y1 = x0+width, y0 + height

        cp = [(x0, y0),
              (x1, y0), (x1, y1), (x0, y1),
              (x0-pad, (y0+y1)/2.), (x0, y0),
              (x0, y0)]

        com = [Path.MOVETO,
               Path.LINETO, Path.LINETO, Path.LINETO,
               Path.LINETO, Path.LINETO,
               Path.CLOSEPOLY]

        path = Path(cp, com)

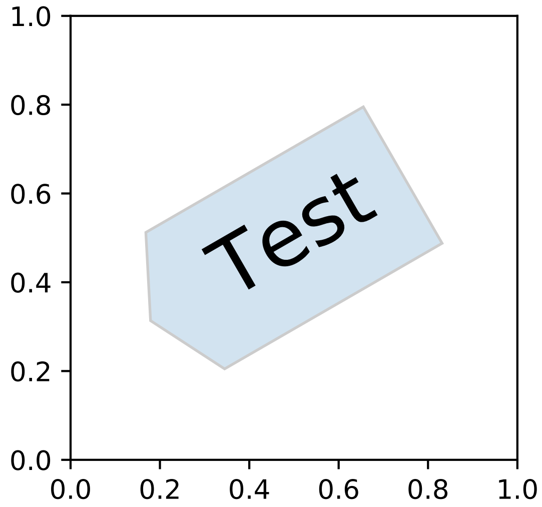
        return path

# register the custom style
BoxStyle._style_list["angled"] = MyStyle

plt.figure(1, figsize=(3,3))
ax = plt.subplot(111)
ax.text(0.5, 0.5, "Test", size=30, va="center", ha="center", rotation=30,
        bbox=dict(boxstyle="angled,pad=0.5", alpha=0.2))

del BoxStyle._style_list["angled"]

plt.show()
```



Similarly, you can define a custom ConnectionStyle and a custom ArrowStyle. See the source code of `lib/matplotlib/patches.py` and check how each style class is defined.

4.6 Writing mathematical expressions

You can use a subset TeX markup in any matplotlib text string by placing it inside a pair of dollar signs ($).

Note that you do not need to have TeX installed, since matplotlib ships its own TeX expression parser, layout engine and fonts. The layout engine is a fairly direct adaptation of the layout algorithms in Donald Knuth's TeX, so the quality is quite good (matplotlib also provides a `usetex` option for those who do want to call out to TeX to generate their text (see *Text rendering With LaTeX*).

Any text element can use math text. You should use raw strings (precede the quotes with an `'r'`), and surround the math text with dollar signs ($), as in TeX. Regular text and mathtext can be interleaved within the same string. Mathtext can use DejaVu Sans (default), DejaVu Serif, the Computer Modern fonts (from (La)TeX), STIX fonts (with are designed to blend well with Times), or a Unicode font that you provide. The mathtext font can be selected with the customization variable `mathtext.fontset` (see *Customizing matplotlib*)

Note: On "narrow" builds of Python, if you use the STIX fonts you should also set `ps.fonttype` and `pdf.fonttype` to 3 (the default), not 42. Otherwise some characters will not be visible.

Here is a simple example:

```
# plain text
plt.title('alpha > beta')
```

produces "alpha > beta".

Whereas this:

```
# math text
plt.title(r'$\alpha > \beta$')
```

produces “$\alpha > \beta$”.

Note: Mathtext should be placed between a pair of dollar signs ($). To make it easy to display monetary values, e.g., “$100.00”, if a single dollar sign is present in the entire string, it will be displayed verbatim as a dollar sign. This is a small change from regular TeX, where the dollar sign in non-math text would have to be escaped (‘\$’).

Note: While the syntax inside the pair of dollar signs ($) aims to be TeX-like, the text outside does not. In particular, characters such as:

```
# $ % & ~ _ ^ \ { } \( \) \[ \]
```

have special meaning outside of math mode in TeX. Therefore, these characters will behave differently depending on the rcParam `text.usetex` flag. See the *usetex tutorial* for more information.

4.6.1 Subscripts and superscripts

To make subscripts and superscripts, use the `'_'` and `'^'` symbols:

```
r'$\alpha_i > \beta_i$'
```

$$\alpha_i > \beta_i \tag{4.1}$$

Some symbols automatically put their sub/superscripts under and over the operator. For example, to write the sum of x_i from 0 to ∞, you could do:

```
r'$\sum_{i=0}^\infty x_i$'
```

$$\sum_{i=0}^\infty x_i \tag{4.2}$$

4.6.2 Fractions, binomials and stacked numbers

Fractions, binomials and stacked numbers can be created with the `\frac{}{}`, `\binom{}{}` and `\stackrel{}{}` commands, respectively:

```
r'$\frac{3}{4} \binom{3}{4} \stackrel{3}{4}$'
```

produces

$$\frac{3}{4} \binom{3}{4} \stackrel{3}{4} \tag{4.3}$$

Fractions can be arbitrarily nested:

```
r'$\frac{5 - \frac{1}{x}}{4}$'
```

produces

$$\frac{5 - \frac{1}{x}}{4} \tag{4.4}$$

Note that special care needs to be taken to place parentheses and brackets around fractions. Doing things the obvious way produces brackets that are too small:

```
r'$(\frac{5 - \frac{1}{x}}{4})$'
```

$$(\frac{5 - \frac{1}{x}}{4}) \tag{4.5}$$

The solution is to precede the bracket with `\left` and `\right` to inform the parser that those brackets encompass the entire object:

```
r'$\left(\frac{5 - \frac{1}{x}}{4}\right)$'
```

$$\left(\frac{5 - \frac{1}{x}}{4}\right) \tag{4.6}$$

4.6.3 Radicals

Radicals can be produced with the `\sqrt[]{}` command. For example:

```
r'$\sqrt{2}$'
```

$$\sqrt{2} \tag{4.7}$$

Any base can (optionally) be provided inside square brackets. Note that the base must be a simple expression, and can not contain layout commands such as fractions or sub/superscripts:

```
r'$\sqrt[3]{x}$'
```

$$\sqrt[3]{x} \tag{4.8}$$

4.6.4 Fonts

The default font is *italics* for mathematical symbols.

Note: This default can be changed using the `mathtext.default` rcParam. This is useful, for example, to use the same font as regular non-math text for math text, by setting it to `regular`.

To change fonts, e.g., to write “sin” in a Roman font, enclose the text in a font command:

```
r'$s(t) = \mathcal{A}\mathrm{sin}(2 \omega t)$'
```

$$s(t) = \mathcal{A}\mathrm{sin}(2 \omega t) \tag{4.9}$$

More conveniently, many commonly used function names that are typeset in a Roman font have shortcuts. So the expression above could be written as follows:

```
r'$s(t) = \mathcal{A}\sin(2 \omega t)$'
```

$$s(t) = \mathcal{A}\sin(2 \omega t) \tag{4.10}$$

Here "s" and "t" are variable in italics font (default), "sin" is in Roman font, and the amplitude "A" is in calligraphy font. Note in the example above the caligraphy `A` is squished into the `sin`. You can use a spacing command to add a little whitespace between them:

```
s(t) = \mathcal{A}\/\sin(2 \omega t)
```

$$s(t) = \mathcal{A}\/\sin(2 \omega t) \tag{4.11}$$

The choices available with all fonts are:

Command	Result
`\mathrm{Roman}`	Roman
`\mathit{Italic}`	Italic
`\mathtt{Typewriter}`	$\mathtt{Typewriter}$
`\mathcal{CALLIGRAPHY}`	$\mathcal{CALLIGRAPHY}$

When using the STIX fonts, you also have the choice of:

Command	Result
`\mathbb{blackboard}`	⋖ᗜ˥⋊ᗜ⟍
`\mathrm{\mathbb{blackboard}}`	⋖ᗜ˥⋊ᗜ⟍
`\mathfrak{Fraktur}`	$\mathfrak{Fraktur}$
`\mathsf{sansserif}`	$\mathsf{sansserif}$
`\mathrm{\mathsf{sansserif}}`	$\mathsf{sansserif}$

There are also three global "font sets" to choose from, which are selected using the `mathtext.fontset` parameter in *matplotlibrc*.

`cm`: **Computer Modern (TeX)**

$$\mathcal{R}\prod_{i=\alpha_{i+1}}^\infty a_i\sin(2\pi f x_i)$$

`stix`: **STIX** (designed to blend well with Times)

$$\mathcal{R}\prod_{i=\alpha_{i+1}}^\infty a_i\sin(2\pi f x_i)$$

`stixsans`: **STIX sans-serif**

$$\mathcal{R}\prod_{i=\alpha_{i+1}}^{\infty} a_i \sin(2\pi f x_i)$$

Additionally, you can use `\mathdefault{...}` or its alias `\mathregular{...}` to use the font used for regular text outside of mathtext. There are a number of limitations to this approach, most notably that far fewer symbols will be available, but it can be useful to make math expressions blend well with other text in the plot.

Custom fonts

mathtext also provides a way to use custom fonts for math. This method is fairly tricky to use, and should be considered an experimental feature for patient users only. By setting the rcParam `mathtext.fontset` to `custom`, you can then set the following parameters, which control which font file to use for a particular set of math characters.

Parameter	Corresponds to
`mathtext.it`	`\mathit{}` or default italic
`mathtext.rm`	`\mathrm{}` Roman (upright)
`mathtext.tt`	`\mathtt{}` Typewriter (monospace)
`mathtext.bf`	`\mathbf{}` bold italic
`mathtext.cal`	`\mathcal{}` calligraphic
`mathtext.sf`	`\mathsf{}` sans-serif

Each parameter should be set to a fontconfig font descriptor (as defined in the yet-to-be-written font chapter).

The fonts used should have a Unicode mapping in order to find any non-Latin characters, such as Greek. If you want to use a math symbol that is not contained in your custom fonts, you can set the rcParam `mathtext.fallback_to_cm` to `True` which will cause the mathtext system to use characters from the default Computer Modern fonts whenever a particular character can not be found in the custom font.

Note that the math glyphs specified in Unicode have evolved over time, and many fonts may not have glyphs in the correct place for mathtext.

4.6.5 Accents

An accent command may precede any symbol to add an accent above it. There are long and short forms for some of them.

Command	Result
`\acute a` or `\'a`	$\acute{a}$
`\bar a`	$\bar{a}$
`\breve a`	$\breve{a}$
`\ddot a` or `\"a`	$\ddot{a}$
`\dot a` or `\.a`	$\dot{a}$
`\grave a` or ``\`a``	$\grave{a}$
`\hat a` or `\^a`	$\hat{a}$
`\tilde a` or `\~a`	$\tilde{a}$
`\vec a`	$\vec{a}$
`\overline{abc}`	$\overline{abc}$

In addition, there are two special accents that automatically adjust to the width of the symbols below:

Command	Result
`\widehat{xyz}`	$\widehat{xyz}$
`\widetilde{xyz}`	$\widetilde{xyz}$

Care should be taken when putting accents on lower-case i's and j's. Note that in the following `\imath` is used to avoid the extra dot over the i:

```
r"$\hat i\ \ \hat \imath$"
```

$$\hat i\ \ \hat \imath \tag{4.12}$$

4.6.6 Symbols

You can also use a large number of the TeX symbols, as in `\infty`, `\leftarrow`, `\sum`, `\int`.

Lower-case Greek

α `\alpha`	β `\beta`	χ `\chi`	δ `\delta`	$\digamma$ `\digamma`
ϵ `\epsilon`	η `\eta`	γ `\gamma`	ι `\iota`	κ `\kappa`
λ `\lambda`	μ `\mu`	ν `\nu`	ω `\omega`	ϕ `\phi`
π `\pi`	ψ `\psi`	ρ `\rho`	σ `\sigma`	τ `\tau`
θ `\theta`	υ `\upsilon`	ε `\varepsilon`	$\varkappa$ `\varkappa`	φ `\varphi`
ϖ `\varpi`	ϱ `\varrho`	ς `\varsigma`	ϑ `\vartheta`	ξ `\xi`
ζ `\zeta`				

Upper-case Greek

Δ `\Delta`	Γ `\Gamma`	Λ `\Lambda`	Ω `\Omega`	Φ `\Phi`	Π `\Pi`
Ψ `\Psi`	Σ `\Sigma`	Θ `\Theta`	Υ `\Upsilon`	Ξ `\Xi`	$\mho$ `\mho`
∇ `\nabla`					

Hebrew

$\aleph$ `\aleph`	$\beth$ `\beth`	$\daleth$ `\daleth`	$\gimel$ `\gimel`

Delimiters

/ `/`	[`[`	⇓ `\Downarrow`	⇑ `\Uparrow`	‖ `\Vert`	\ `\backslash`
↓ `\downarrow`	⟨ `\langle`	⌈ `\lceil`	⌊ `\lfloor`	⌞ `\llcorner`	⌟ `\lrcorner`
⟩ `\rangle`	⌉ `\rceil`	⌋ `\rfloor`	⌜ `\ulcorner`	↑ `\uparrow`	⌝ `\urcorner`
| `\vert`	{ `\{`	‖ `\\|`	} `\}`	] `]`	| `|`

Big symbols

⋂ `\bigcap`	⋃ `\bigcup`	⨀ `\bigodot`	⨁ `\bigoplus`	⨂ `\bigotimes`
⨄ `\biguplus`	⋁ `\bigvee`	⋀ `\bigwedge`	∐ `\coprod`	∫ `\int`
∮ `\oint`	∏ `\prod`	∑ `\sum`		

Standard function names

Pr `\Pr`	arccos `\arccos`	arcsin `\arcsin`	arctan `\arctan`
arg `\arg`	cos `\cos`	cosh `\cosh`	cot `\cot`
coth `\coth`	csc `\csc`	deg `\deg`	det `\det`
dim `\dim`	exp `\exp`	gcd `\gcd`	hom `\hom`
inf `\inf`	ker `\ker`	lg `\lg`	lim `\lim`
lim inf `\liminf`	lim sup `\limsup`	ln `\ln`	log `\log`
max `\max`	min `\min`	sec `\sec`	sin `\sin`
sinh `\sinh`	sup `\sup`	tan `\tan`	tanh `\tanh`

Binary operation and relation symbols

≎ `\Bumpeq`	⋒ `\Cap`	⋓ `\Cup`
≑ `\Doteq`	⋈ `\Join`	⋐ `\Subset`
⋑ `\Supset`	⊩ `\Vdash`	⊪ `\Vvdash`
≈ `\approx`	≊ `\approxeq`	∗ `\ast`
≍ `\asymp`	϶ `\backepsilon`	∽ `\backsim`
⋍ `\backsimeq`	⊼ `\barwedge`	∵ `\because`
≬ `\between`	◯ `\bigcirc`	▽ `\bigtriangledown`
△ `\bigtriangleup`	◀ `\blacktriangleleft`	▶ `\blacktriangleright`
⊥ `\bot`	⋈ `\bowtie`	⊡ `\boxdot`
⊟ `\boxminus`	⊞ `\boxplus`	⊠ `\boxtimes`
∙ `\bullet`	≏ `\bumpeq`	∩ `\cap`
· `\cdot`	∘ `\circ`	≗ `\circeq`
:− `\coloneq`	≅ `\cong`	∪ `\cup`
⋞ `\curlyeqprec`	⋟ `\curlyeqsucc`	⋎ `\curlyvee`
⋏ `\curlywedge`	† `\dag`	⊣ `\dashv`
‡ `\ddag`	⋄ `\diamond`	÷ `\div`
⋇ `\divideontimes`	≐ `\doteq`	≑ `\doteqdot`
∔ `\dotplus`	⩞ `\doublebarwedge`	≖ `\eqcirc`
−: `\eqcolon`	≂ `\eqsim`	⪖ `\eqslantgtr`
⪕ `\eqslantless`	≡ `\equiv`	≒ `\fallingdotseq`

⌢ `\frown`	≥ `\geq`	≧ `\geqq`
⩾ `\geqslant`	≫ `\gg`	⋙ `\ggg`
⪊ `\gnapprox`	≩ `\gneqq`	⋧ `\gnsim`
⪆ `\gtrapprox`	⋗ `\gtrdot`	⋛ `\gtreqless`
⪌ `\gtreqqless`	≷ `\gtrless`	≳ `\gtrsim`
∈ `\in`	⊺ `\intercal`	⋋ `\leftthreetimes`
≤ `\leq`	≦ `\leqq`	⩽ `\leqslant`

∅ \varnothing	▵ \vartriangle	⋮ \vdots
℘ \wp	¥ \yen	

If a particular symbol does not have a name (as is true of many of the more obscure symbols in the STIX fonts), Unicode characters can also be used:

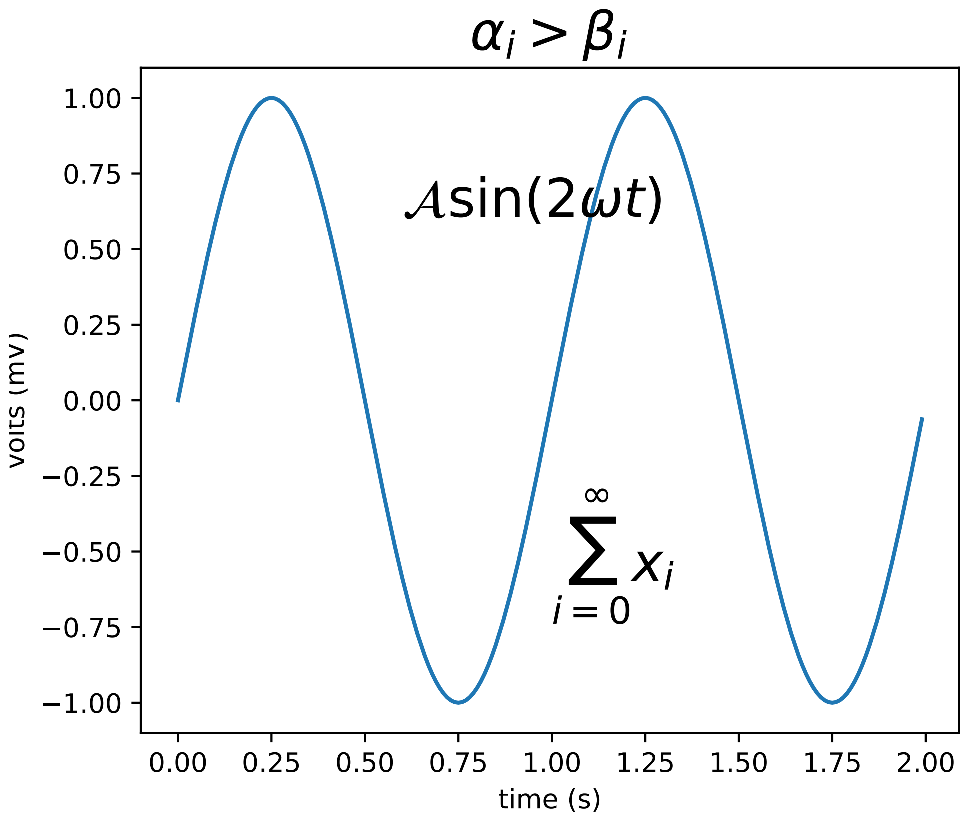
```
ur'$\u23ce$'
```

4.6.7 Example

Here is an example illustrating many of these features in context.

```
import numpy as np
import matplotlib.pyplot as plt
t = np.arange(0.0, 2.0, 0.01)
s = np.sin(2*np.pi*t)

plt.plot(t,s)
plt.title(r'$\alpha_i > \beta_i$', fontsize=20)
plt.text(1, -0.6, r'$\sum_{i=0}^\infty x_i$', fontsize=20)
plt.text(0.6, 0.6, r'$\mathcal{A}\mathrm{sin}(2 \omega t)$',
         fontsize=20)
plt.xlabel('time (s)')
plt.ylabel('volts (mV)')
plt.show()
```



4.7 Text rendering With LaTeX

Matplotlib has the option to use LaTeX to manage all text layout. This option is available with the following backends:

- Agg
- PS
- PDF

The LaTeX option is activated by setting `text.usetex : True` in your rc settings. Text handling with matplotlib's LaTeX support is slower than matplotlib's very capable *mathtext*, but is more flexible, since different LaTeX packages (font packages, math packages, etc.) can be used. The results can be striking, especially when you take care to use the same fonts in your figures as in the main document.

Matplotlib's LaTeX support requires a working LaTeX installation, dvipng (which may be included with your LaTeX installation), and Ghostscript (GPL Ghostscript 8.60 or later is recommended). The executables for these external dependencies must all be located on your *PATH*.

There are a couple of options to mention, which can be changed using *rc settings*. Here is an example matplotlibrc file:

```
font.family        : serif
font.serif         : Times, Palatino, New Century Schoolbook, Bookman, Computer Modern␣
↪Roman
font.sans-serif    : Helvetica, Avant Garde, Computer Modern Sans serif
font.cursive       : Zapf Chancery
font.monospace     : Courier, Computer Modern Typewriter

text.usetex        : true
```

The first valid font in each family is the one that will be loaded. If the fonts are not specified, the Computer Modern fonts are used by default. All of the other fonts are Adobe fonts. Times and Palatino each have their own accompanying math fonts, while the other Adobe serif fonts make use of the Computer Modern math fonts. See the PSNFSS documentation for more details.

To use LaTeX and select Helvetica as the default font, without editing matplotlibrc use:

```python
from matplotlib import rc
rc('font',**{'family':'sans-serif','sans-serif':['Helvetica']})
## for Palatino and other serif fonts use:
#rc('font',**{'family':'serif','serif':['Palatino']})
rc('text', usetex=True)
```

Here is the standard example, `tex_demo.py`:

```python
"""
Demo of TeX rendering.

You can use TeX to render all of your matplotlib text if the rc
parameter text.usetex is set.  This works currently on the agg and ps
backends, and requires that you have tex and the other dependencies
described at http://matplotlib.org/users/usetex.html
properly installed on your system.  The first time you run a script
you will see a lot of output from tex and associated tools.  The next
time, the run may be silent, as a lot of the information is cached in
~/.tex.cache

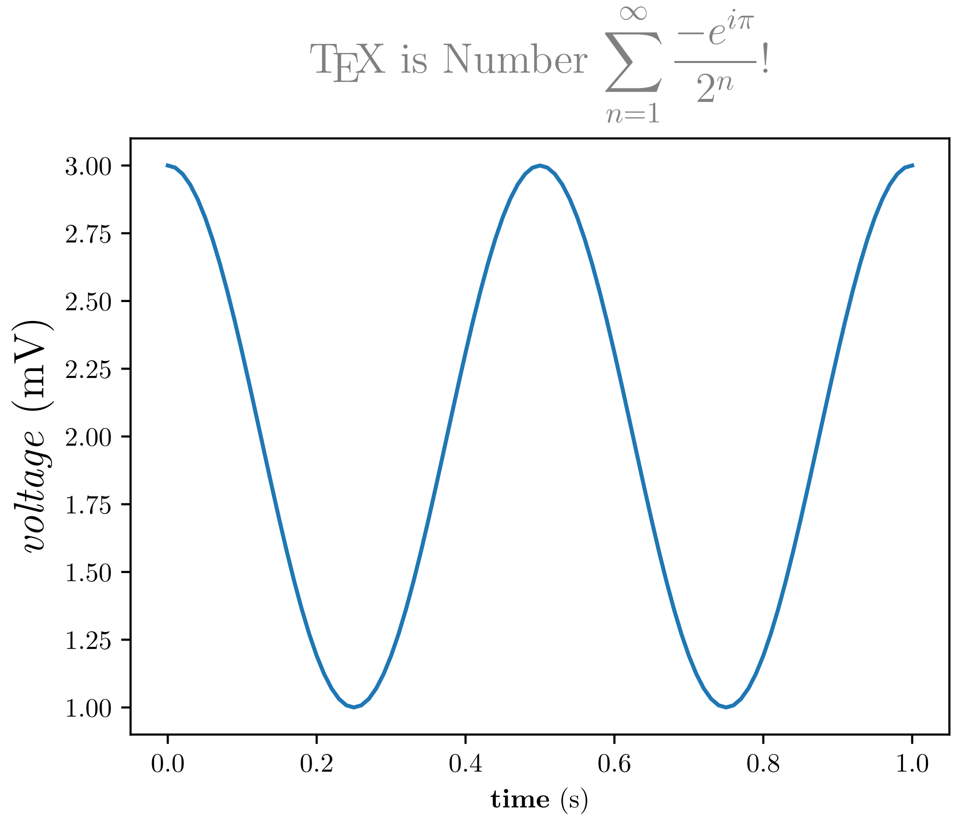
"""
import numpy as np
import matplotlib.pyplot as plt

# Example data
t = np.arange(0.0, 1.0 + 0.01, 0.01)
s = np.cos(4 * np.pi * t) + 2

plt.rc('text', usetex=True)
plt.rc('font', family='serif')
plt.plot(t, s)

plt.xlabel(r'\textbf{time} (s)')
plt.ylabel(r'\textit{voltage} (mV)',fontsize=16)
plt.title(r"\TeX\ is Number "
          r"$\displaystyle\sum_{n=1}^\infty\frac{-e^{i\pi}}{2^n}$!",
          fontsize=16, color='gray')
# Make room for the ridiculously large title.
plt.subplots_adjust(top=0.8)

plt.savefig('tex_demo')
plt.show()
```



Note that display math mode (`$$ e=mc^2 $$`) is not supported, but adding the command `\displaystyle`, as in `tex_demo.py`, will produce the same results.

Note: Certain characters require special escaping in TeX, such as:

```
# $ % & ~ _ ^ \ { } \( \) \[ \]
```

Therefore, these characters will behave differently depending on the rcParam `text.usetex` flag.

4.7.1 usetex with unicode

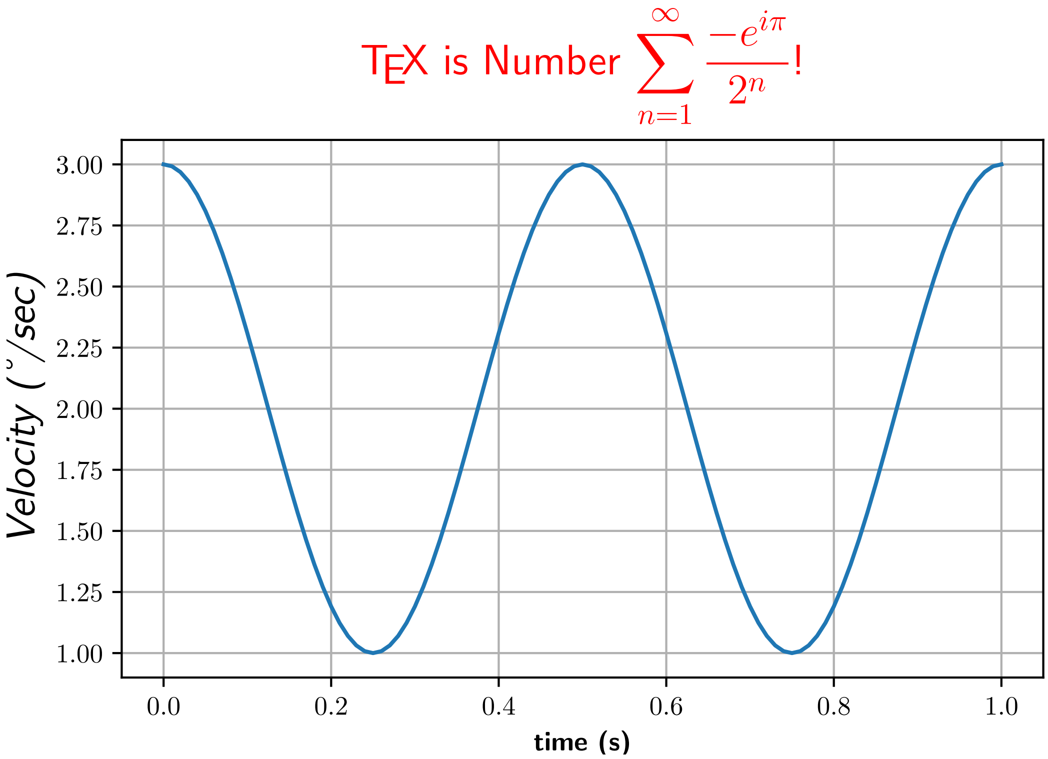
It is also possible to use unicode strings with the LaTeX text manager, here is an example taken from `tex_unicode_demo.py`:

```
# -*- coding: utf-8 -*-
"""
This demo is tex_demo.py modified to have unicode. See that file for
more information.
"""

from __future__ import unicode_literals
import numpy as np
import matplotlib
matplotlib.rcParams['text.usetex'] = True
matplotlib.rcParams['text.latex.unicode'] = True
import matplotlib.pyplot as plt

plt.figure(1, figsize=(6, 4))
ax = plt.axes([0.1, 0.1, 0.8, 0.7])
t = np.arange(0.0, 1.0 + 0.01, 0.01)
s = np.cos(2*2*np.pi*t) + 2
plt.plot(t, s)

plt.xlabel(r'\textbf{time (s)}')
plt.ylabel('\\textit{Velocity (\u00B0/sec)}', fontsize=16)
plt.title(r'\TeX\ is Number $\displaystyle\sum_{n=1}^\infty'
          r'\frac{-e^{i\pi}}{2^n}$!', fontsize=16, color='r')
plt.grid(True)
plt.show()
```



4.7.2 Postscript options

In order to produce encapsulated postscript files that can be embedded in a new LaTeX document, the default behavior of matplotlib is to distill the output, which removes some postscript operators used by LaTeX that are illegal in an eps file. This step produces results which may be unacceptable to some users, because the text is coarsely rasterized and converted to bitmaps, which are not scalable like standard postscript, and the text is not searchable. One workaround is to to set `ps.distiller.res` to a higher value (perhaps 6000) in your rc settings, which will produce larger files but may look better and scale reasonably. A better workaround, which requires Poppler or Xpdf, can be activated by changing the `ps.usedistiller` rc setting to `xpdf`. This alternative produces postscript without rasterizing text, so it scales properly, can be edited in Adobe Illustrator, and searched text in pdf documents.

4.7.3 Possible hangups

- On Windows, the *PATH* environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See *Environment Variables* and *Setting environment variables in windows* for details.
- Using MiKTeX with Computer Modern fonts, if you get odd *Agg and PNG results, go to MiKTeX/Options and update your format files
- The fonts look terrible on screen. You are probably running Mac OS, and there is some funny business with older versions of dvipng on the mac. Set `text.dvipnghack : True` in your matplotlibrc file.
- On Ubuntu and Gentoo, the base texlive install does not ship with the type1cm package. You may need to install some of the extra packages to get all the goodies that come bundled with other latex distributions.
- Some progress has been made so matplotlib uses the dvi files directly for text layout. This allows latex to be used for text layout with the pdf and svg backends, as well as the *Agg and PS backends. In the future, a latex installation may be the only external dependency.

4.7.4 Troubleshooting

- Try deleting your `.matplotlib/tex.cache` directory. If you don't know where to find `.matplotlib`, see *matplotlib configuration and cache directory locations*.
- Make sure LaTeX, dvipng and ghostscript are each working and on your *PATH*.
- Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
- Most problems reported on the mailing list have been cleared up by upgrading Ghostscript. If possible, please try upgrading to the latest release before reporting problems to the list.
- The `text.latex.preamble` rc setting is not officially supported. This option provides lots of flexibility, and lots of ways to cause problems. Please disable this option before reporting problems to the mailing list.
- If you still need help, please see *Getting help*

4.8 Typesetting With XeLaTeX/LuaLaTeX

Using the `pgf` backend, matplotlib can export figures as pgf drawing commands that can be processed with pdflatex, xelatex or lualatex. XeLaTeX and LuaLaTeX have full unicode support and can use any font that is installed in the operating system, making use of advanced typographic features of OpenType, AAT and Graphite. Pgf pictures created by `plt.savefig('figure.pgf')` can be embedded as raw commands in LaTeX documents. Figures can also be directly compiled and saved to PDF with `plt.savefig('figure.pdf')` by either switching to the backend

```
matplotlib.use('pgf')
```

or registering it for handling pdf output

```
from matplotlib.backends.backend_pgf import FigureCanvasPgf
matplotlib.backend_bases.register_backend('pdf', FigureCanvasPgf)
```

The second method allows you to keep using regular interactive backends and to save xelatex, lualatex or pdflatex compiled PDF files from the graphical user interface.

Matplotlib's pgf support requires a recent LaTeX installation that includes the TikZ/PGF packages (such as TeXLive), preferably with XeLaTeX or LuaLaTeX installed. If either pdftocairo or ghostscript is present on your system, figures can optionally be saved to PNG images as well. The executables for all applications must be located on your *PATH*.

Rc parameters that control the behavior of the pgf backend:

Parameter	Documentation
pgf.preamble	Lines to be included in the LaTeX preamble
pgf.rcfonts	Setup fonts from rc params using the fontspec package
pgf.texsystem	Either "xelatex" (default), "lualatex" or "pdflatex"

Note: TeX defines a set of special characters, such as:

```
# $ % & ~ _ ^ \ { }
```

Generally, these characters must be escaped correctly. For convenience, some characters (_,^,%) are automatically escaped outside of math environments.

4.8.1 Font specification

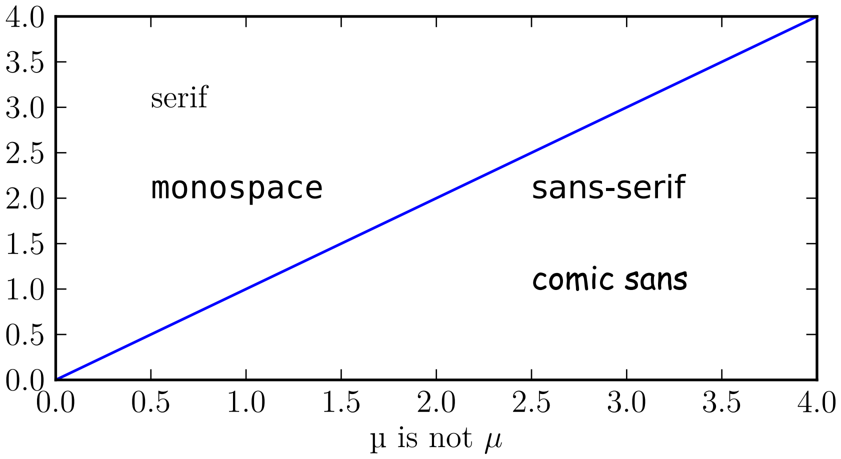
The fonts used for obtaining the size of text elements or when compiling figures to PDF are usually defined in the matplotlib rc parameters. You can also use the LaTeX default Computer Modern fonts by clearing the lists for `font.serif`, `font.sans-serif` or `font.monospace`. Please note that the glyph coverage of these fonts is very limited. If you want to keep the Computer Modern font face but require extended unicode support, consider installing the Computer Modern Unicode fonts *CMU Serif*, *CMU Sans Serif*, etc.

When saving to `.pgf`, the font configuration matplotlib used for the layout of the figure is included in the header of the text file.

```
# -*- coding: utf-8 -*-

import matplotlib as mpl
mpl.use("pgf")
pgf_with_rc_fonts = {
    "font.family": "serif",
    "font.serif": [],                   # use latex default serif font
    "font.sans-serif": ["DejaVu Sans"], # use a specific sans-serif font
}
mpl.rcParams.update(pgf_with_rc_fonts)

import matplotlib.pyplot as plt
plt.figure(figsize=(4.5,2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.text(2.5, 1., "comic sans", family="Comic Sans MS")
plt.xlabel(u"µ is not $\\mu$")
plt.tight_layout(.5)
```

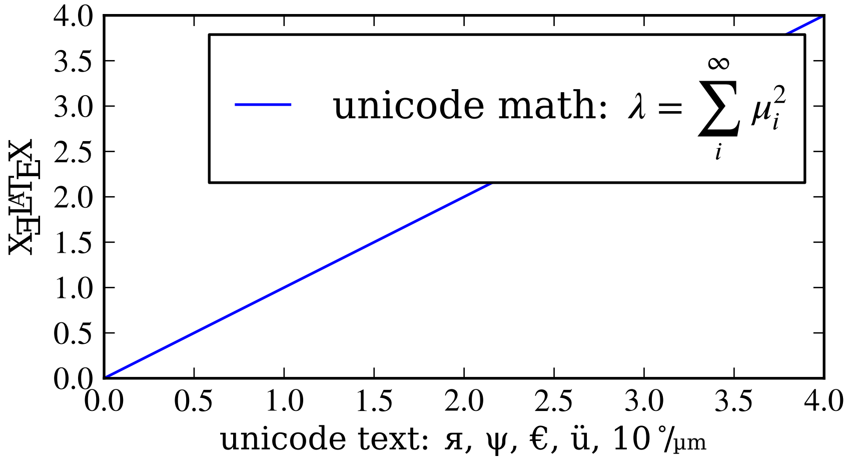


4.8.2 Custom preamble

Full customization is possible by adding your own commands to the preamble. Use the `pgf.preamble` parameter if you want to configure the math fonts, using `unicode-math` for example, or for loading additional packages. Also, if you want to do the font configuration yourself instead of using the fonts specified in the rc parameters, make sure to disable `pgf.rcfonts`.

```
# -*- coding: utf-8 -*-
from __future__ import (absolute_import, division, print_function,
                        unicode_literals)

import six
import matplotlib as mpl
mpl.use("pgf")
pgf_with_custom_preamble = {
    "font.family": "serif", # use serif/main font for text elements
    "text.usetex": True,    # use inline math for ticks
    "pgf.rcfonts": False,   # don't setup fonts from rc parameters
    "pgf.preamble": [
         "\\usepackage{units}",         # load additional packages
         "\\usepackage{metalogo}",
         "\\usepackage{unicode-math}",  # unicode math setup
         r"\setmathfont{xits-math.otf}",
         r"\setmainfont{DejaVu Serif}", # serif font via preamble
         ]
}
mpl.rcParams.update(pgf_with_custom_preamble)
```



4.8.3 Choosing the TeX system

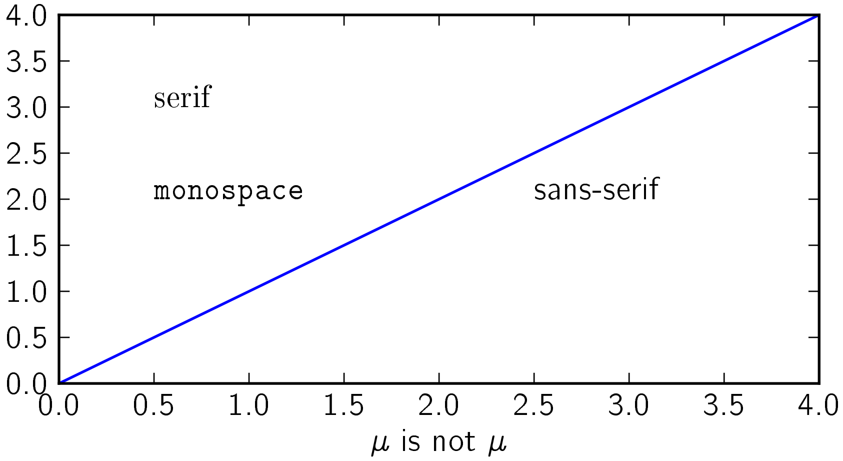
The TeX system to be used by matplotlib is chosen by the `pgf.texsystem` parameter. Possible values are `'xelatex'` (default), `'lualatex'` and `'pdflatex'`. Please note that when selecting pdflatex the fonts and unicode handling must be configured in the preamble.

```
# -*- coding: utf-8 -*-

import matplotlib as mpl
mpl.use("pgf")
pgf_with_pdflatex = {
    "pgf.texsystem": "pdflatex",
    "pgf.preamble": [
         r"\usepackage[utf8x]{inputenc}",
         r"\usepackage[T1]{fontenc}",
         r"\usepackage{cmbright}",
         ]
}
```

```
mpl.rcParams.update(pgf_with_pdflatex)

import matplotlib.pyplot as plt
plt.figure(figsize=(4.5,2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif", family="serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.xlabel(u"µ is not $\\mu$")
plt.tight_layout(.5)
```



4.8.4 Troubleshooting

- Please note that the TeX packages found in some Linux distributions and MiKTeX installations are dramatically outdated. Make sure to update your package catalog and upgrade or install a recent TeX distribution.
- On Windows, the *PATH* environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See *Environment Variables* and *Setting environment variables in windows* for details.
- A limitation on Windows causes the backend to keep file handles that have been opened by your application open. As a result, it may not be possible to delete the corresponding files until the application closes (see #1324).
- Sometimes the font rendering in figures that are saved to png images is very bad. This happens when the pdftocairo tool is not available and ghostscript is used for the pdf to png conversion.
- Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
- The `pgf.preamble` rc setting provides lots of flexibility, and lots of ways to cause problems. When experiencing problems, try to minimalize or disable the custom preamble.

- Configuring an `unicode-math` environment can be a bit tricky. The TeXLive distribution for example provides a set of math fonts which are usually not installed system-wide. XeTeX, unlike LuaLatex, cannot find these fonts by their name, which is why you might have to specify `\setmathfont{xits-math.otf}` instead of `\setmathfont{XITS Math}` or alternatively make the fonts available to your OS. See this tex.stackexchange.com question for more details.
- If the font configuration used by matplotlib differs from the font setting in yout LaTeX document, the alignment of text elements in imported figures may be off. Check the header of your `.pgf` file if you are unsure about the fonts matplotlib used for the layout.
- Vector images and hence `.pgf` files can become bloated if there are a lot of objects in the graph. This can be the case for image processing or very big scatter graphs. In an extreme case this can cause TeX to run out of memory: "TeX capacity exceeded, sorry" You can configure latex to increase the amount of memory available to generate the `.pdf` image as discussed on tex.stackexchange.com. Another way would be to "rasterize" parts of the graph causing problems using either the `rasterized=True` keyword, or `.set_rasterized(True)` as per this example.
- If you still need help, please see *Getting help*

CHAPTER

FIVE

COLORS

5.1 Specifying Colors

In almost all places in matplotlib where a color can be specified by the user it can be provided as:

- an RGB or RGBA tuple of float values in `[0, 1]` (e.g., `(0.1, 0.2, 0.5)` or `(0.1, 0.2, 0.5, 0.3)`)
- a hex RGB or RGBA string (e.g., `'#0F0F0F'` or `'#0F0F0F0F'`)
- a string representation of a float value in `[0, 1]` inclusive for gray level (e.g., `'0.5'`)
- one of `{'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}`
- a X11/CSS4 color name
- a name from the xkcd color survey prefixed with `'xkcd:'` (e.g., `'xkcd:sky blue'`)
- one of `{'C0', 'C1', 'C2', 'C3', 'C4', 'C5', 'C6', 'C7', 'C8', 'C9'}`
- one of `{'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'}` which are the Tableau Colors from the 'T10' categorical palette (which is the default color cycle).

All string specifications of color are case-insensitive.

5.1.1 `'CN'` color selection

Color can be specified by a string matching the regex `C[0-9]`. This can be passed any place that a color is currently accepted and can be used as a 'single character color' in format-string to `matplotlib.Axes.plot`.

The single digit is the index into the default property cycle (`matplotlib.rcParams['axes.prop_cycle']`). If the property cycle does not include `'color'` then black is returned. The color is evaluated when the artist is created. For example,

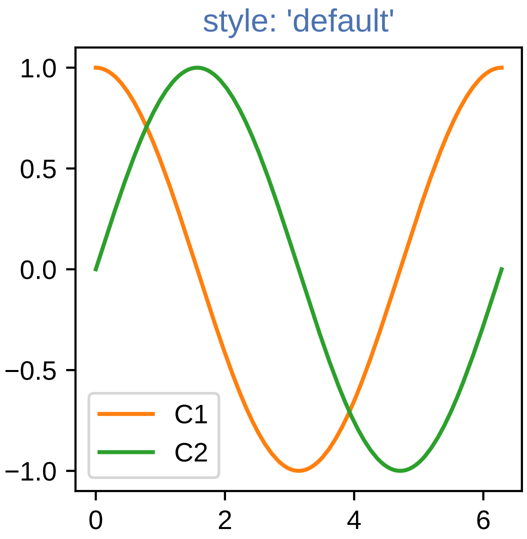
```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
th = np.linspace(0, 2*np.pi, 128)
```

```
def demo(sty):
    mpl.style.use(sty)
    fig, ax = plt.subplots(figsize=(3, 3))

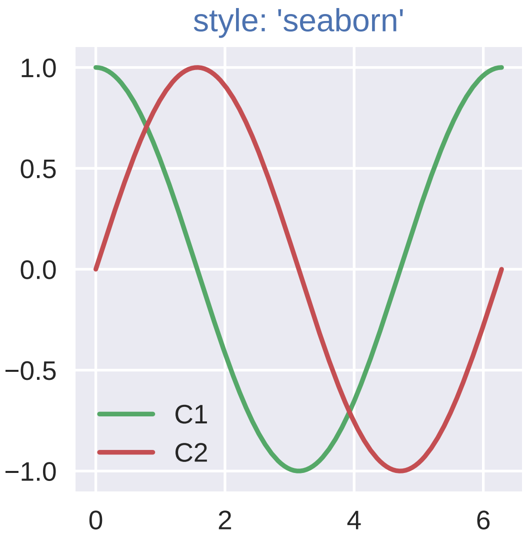
    ax.set_title('style: {!r}'.format(sty), color='C0')

    ax.plot(th, np.cos(th), 'C1', label='C1')
    ax.plot(th, np.sin(th), 'C2', label='C2')
    ax.legend()

demo('default')
demo('seaborn')
```



style: 'default'



style: 'seaborn'

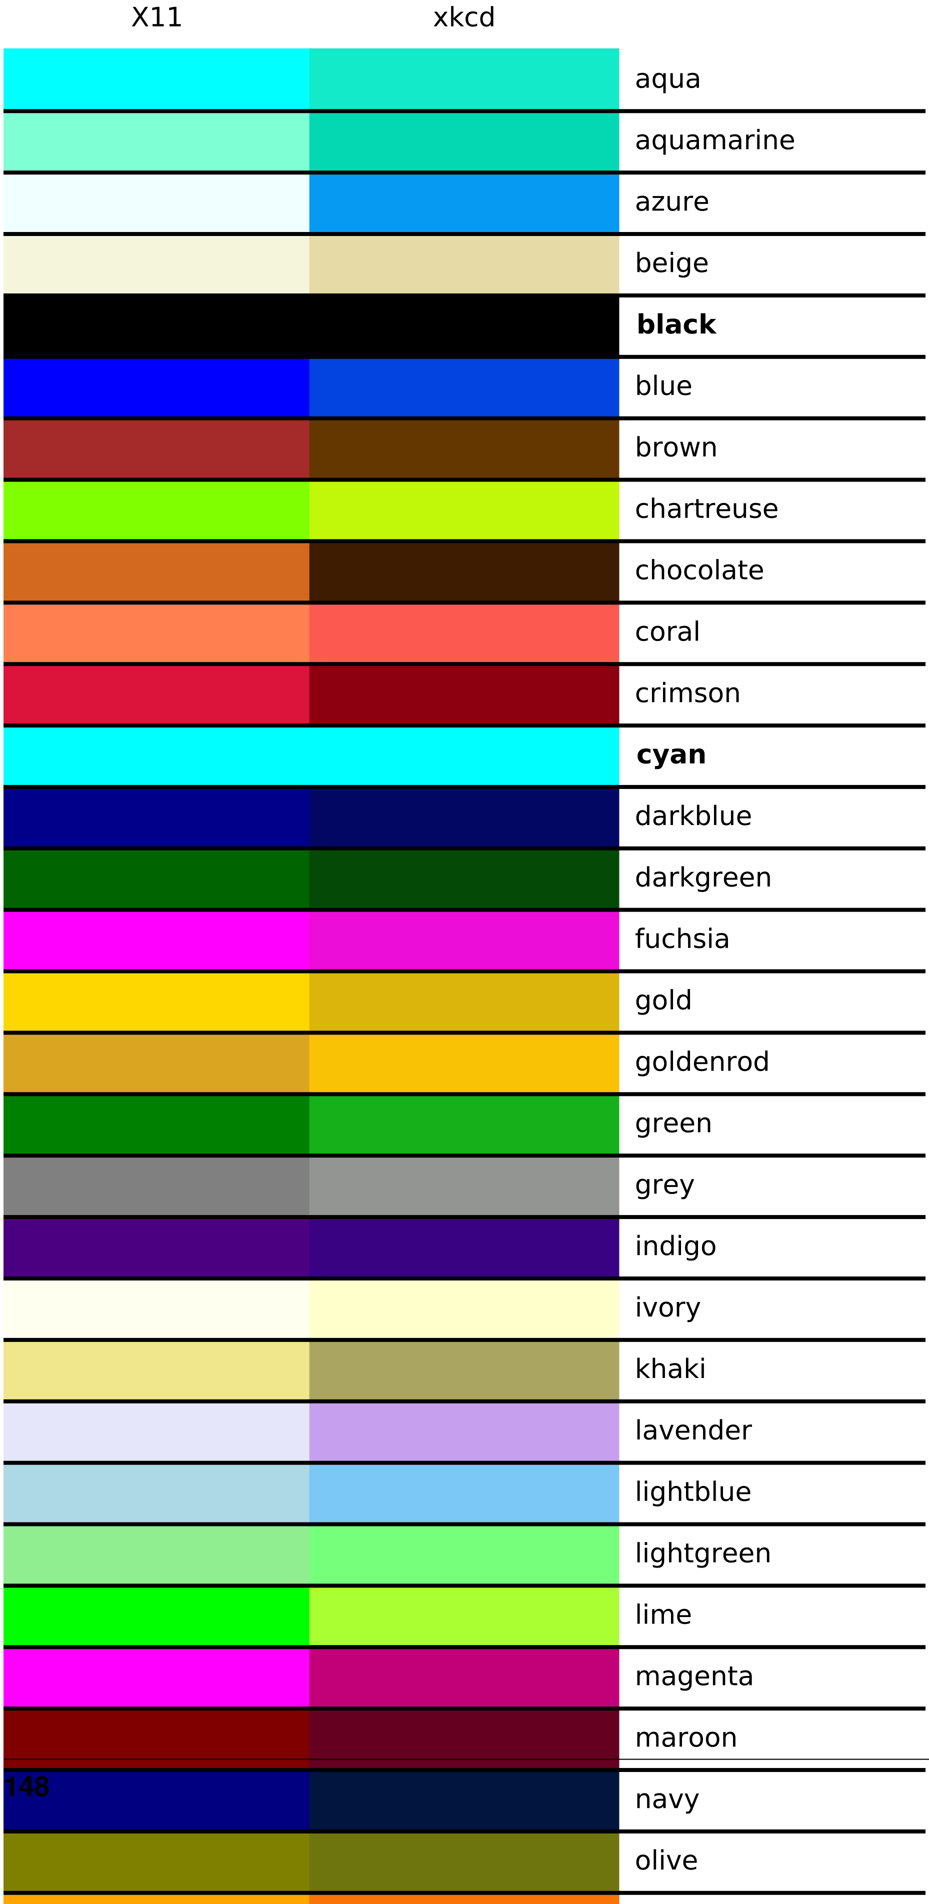
will use the first color for the title and then plot using the second and third colors of each style's `mpl.rcParams['axes.prop_cycle']`.

5.1.2 xkcd v X11/CSS4

The xkcd colors are derived from a user survey conducted by the webcomic xkcd. Details of the survey are available on the xkcd blog.

Out of 148 colors in the CSS color list, there are 95 name collisions between the X11/CSS4 names and the xkcd names, all but 3 of which have different hex values. For example `'blue'` maps to `'#0000FF'` where as `'xkcd:blue'` maps to `'#0343DF'`. Due to these name collisions all of the xkcd colors have `'xkcd:'` prefixed. As noted in the blog post, while it might be interesting to re-define the X11/CSS4 names based on such a survey, we do not do so unilaterally.

The name collisions are shown in the table below; the color names where the hex values agree are shown in bold.



X11
xkcd
aqua
aquamarine
azure
beige
black
blue
brown
chartreuse
chocolate
coral
crimson
cyan
darkblue
darkgreen
fuchsia
gold
goldenrod
green
grey
indigo
ivory
khaki
lavender
lightblue
lightgreen
lime
magenta
maroon
navy
olive

5.2 Choosing Colormaps

5.2.1 Overview

The idea behind choosing a good colormap is to find a good representation in 3D colorspace for your data set. The best colormap for any given data set depends on many things including:

- Whether representing form or metric data (*[Ware]*)
- Your knowledge of the data set (*e.g.*, is there a critical value from which the other values deviate?)
- If there is an intuitive color scheme for the parameter you are plotting
- If there is a standard in the field the audience may be expecting

For many applications, a perceptually uniform colormap is the best choice — one in which equal steps in data are perceived as equal steps in the color space. Researchers have found that the human brain perceives changes in the lightness parameter as changes in the data much better than, for example, changes in hue. Therefore, colormaps which have monotonically increasing lightness through the colormap will be better interpreted by the viewer. A wonderful example of perceptually uniform colormaps is *[colorcet]*.

Color can be represented in 3D space in various ways. One way to represent color is using CIELAB. In CIELAB, color space is represented by lightness, L^*; red-green, a^*; and yellow-blue, b^*. The lightness parameter L^* can then be used to learn more about how the matplotlib colormaps will be perceived by viewers.

An excellent starting resource for learning about human perception of colormaps is from *[IBM]*.

5.2.2 Classes of colormaps

Colormaps are often split into several categories based on their function (see, *e.g.*, *[Moreland]*):

1. Sequential: change in lightness and often saturation of color incrementally, often using a single hue; should be used for representing information that has ordering.
2. Diverging: change in lightness and possibly saturation of two different colors that meet in the middle at an unsaturated color; should be used when the information being plotted has a critical middle value, such as topography or when the data deviates around zero.
3. Qualitative: often are miscellaneous colors; should be used to represent information which does not have ordering or relationships.

5.2.3 Lightness of matplotlib colormaps

Here we examine the lightness values of the matplotlib colormaps. Note that some documentation on the colormaps is available (*[list-colormaps]*).

Sequential

For the Sequential plots, the lightness value increases monotonically through the colormaps. This is good. Some of the L^* values in the colormaps span from 0 to 100 (binary and the other grayscale), and others start around $L^* = 20$. Those that have a smaller range of L^* will accordingly have a smaller perceptual range. Note also that the L^* function varies amongst the colormaps: some are approximately linear in L^* and others are more curved.

Sequential2

Many of the L^* values from the Sequential2 plots are monotonically increasing, but some (autumn, cool, spring, and winter) plateau or even go both up and down in L^* space. Others (afmhot, copper, gist_heat, and hot) have kinks in the L^* functions. Data that is being represented in a region of the colormap that is at a plateau or kink will lead to a perception of banding of the data in those values in the colormap (see *[mycarta-banding]* for an excellent example of this).

Diverging

For the Diverging maps, we want to have monotonically increasing L^* values up to a maximum, which should be close to $L^* = 100$, followed by monotonically decreasing L^* values. We are looking for approximately equal minimum L^* values at opposite ends of the colormap. By these measures, BrBG and RdBu are good options. coolwarm is a good option, but it doesn't span a wide range of L^* values (see grayscale section below).

Qualitative

Qualitative colormaps are not aimed at being perceptual maps, but looking at the lightness parameter can verify that for us. The L^* values move all over the place throughout the colormap, and are clearly not monotonically increasing. These would not be good options for use as perceptual colormaps.

Miscellaneous

Some of the miscellaneous colormaps have particular uses for which they have been created. For example, gist_earth, ocean, and terrain all seem to be created for plotting topography (green/brown) and water depths (blue) together. We would expect to see a divergence in these colormaps, then, but multiple kinks may not be ideal, such as in gist_earth and terrain. CMRmap was created to convert well to grayscale, though it does appear to have some small kinks in L^*. cubehelix was created to vary smoothly in both lightness and hue, but appears to have a small hump in the green hue area.

The often-used jet colormap is included in this set of colormaps. We can see that the L^* values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at *[mycarta-jet]*.

5.2.4 Grayscale conversion

It is important to pay attention to conversion to grayscale for color plots, since they may be printed on black and white printers. If not carefully considered, your readers may end up with indecipherable plots because the grayscale changes unpredictably through the colormap.

Conversion to grayscale is done in many different ways *[bw]*. Some of the better ones use a linear combination of the rgb values of a pixel, but weighted according to how we perceive color intensity. A nonlinear method of conversion to grayscale is to use the L^* values of the pixels. In general, similar principles apply for this question as they do for presenting one's information perceptually; that is, if a colormap is chosen that is monotonically increasing in L^* values, it will print in a reasonable manner to grayscale.

With this in mind, we see that the Sequential colormaps have reasonable representations in grayscale. Some of the Sequential2 colormaps have decent enough grayscale representations, though some (autumn, spring, summer, winter) have very little grayscale change. If a colormap like this was used in a plot and then the plot was printed to grayscale, a lot of the information may map to the same gray values. The Diverging colormaps mostly vary from darker gray on the outer edges to white in the middle. Some (PuOr and seismic) have noticably darker gray on one side than the other and therefore are not very symmetric. coolwarm has little range of gray scale and would print to a more uniform plot, losing a lot of detail. Note that overlaid, labeled contours could help differentiate between one side of the colormap vs. the other since color cannot be used once a plot is printed to grayscale. Many of the Qualitative and Miscellaneous colormaps, such as Accent, hsv, and jet, change from darker to lighter and back to darker gray throughout the colormap. This would make it impossible for a viewer to interpret the information in a plot once it is printed in grayscale.

5.2.5 Color vision deficiencies

There is a lot of information available about color blindness (*e.g.*, *[colorblindness]*). Additionally, there are tools available to convert images to how they look for different types of color vision deficiencies (*e.g.*, *[vischeck]*).

The most common form of color vision deficiency involves differentiating between red and green. Thus, avoiding colormaps with both red and green will avoid many problems in general.

5.2.6 References

5.3 Colormap Normalization

Objects that use colormaps by default linearly map the colors in the colormap from data values *vmin* to *vmax*. For example:

```
pcm = ax.pcolormesh(x, y, Z, vmin=-1., vmax=1., cmap='RdBu_r')
```

will map the data in *Z* linearly from -1 to +1, so *Z=0* will give a color at the center of the colormap *RdBu_r* (white in this case).

Matplotlib does this mapping in two steps, with a normalization from [0,1] occurring first, and then mapping onto the indices in the colormap. Normalizations are classes defined in the *`matplotlib.colors()`* module. The default, linear normalization is *`matplotlib.colors.Normalize()`*.

Artists that map data to color pass the arguments *vmin* and *vmax* to construct a *`matplotlib.colors.Normalize()`* instance, then call it:

```
In [1]: import matplotlib as mpl

In [2]: norm = mpl.colors.Normalize(vmin=-1.,vmax=1.)

In [3]: norm(0.)
Out[3]: 0.5
```

However, there are sometimes cases where it is useful to map data to colormaps in a non-linear fashion.

5.3.1 Logarithmic

One of the most common transformations is to plot data by taking its logarithm (to the base-10). This transformation is useful to display changes across disparate scales. Using `colors.LogNorm()` normalizes the data via log_{10}. In the example below, there are two bumps, one much smaller than the other. Using `colors.LogNorm()`, the shape and location of each bump can clearly be seen:

```
"""
Demonstration of using norm to map colormaps onto data in non-linear ways.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
from matplotlib.mlab import bivariate_normal

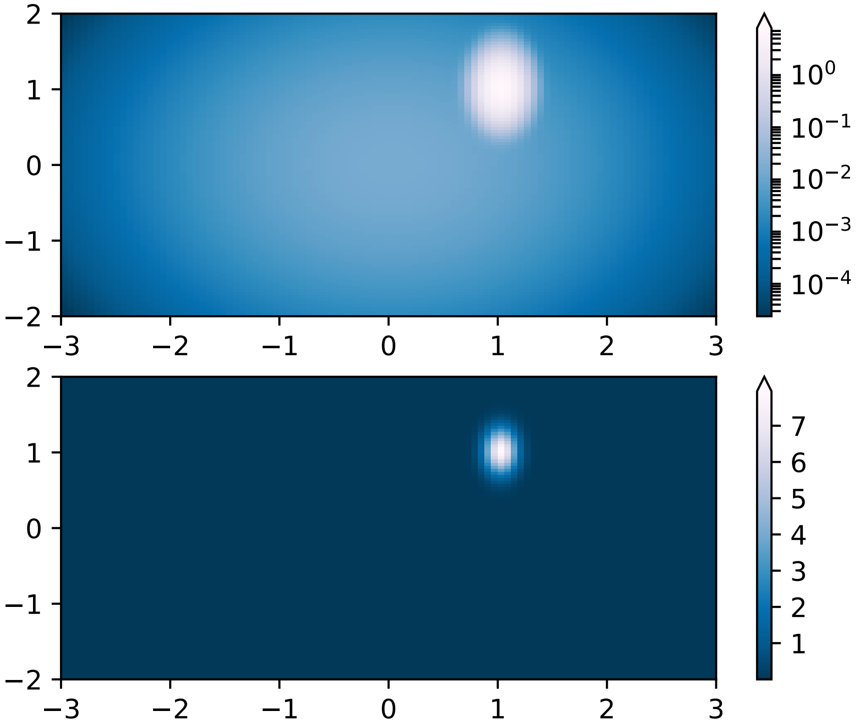
'''
Lognorm: Instead of pcolor log10(Z1) you can have colorbars that have
the exponential labels using a norm.
'''
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]

# A low hump with a spike coming out of the top right.  Needs to have
# z/colour axis on a log scale so we see both hump and spike.  linear
# scale only shows the spike.
Z1 = bivariate_normal(X, Y, 0.1, 0.2, 1.0, 1.0) +  \
    0.1 * bivariate_normal(X, Y, 1.0, 1.0, 0.0, 0.0)

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolor(X, Y, Z1,
                   norm=colors.LogNorm(vmin=Z1.min(), vmax=Z1.max()),
                   cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[0], extend='max')
```

```
pcm = ax[1].pcolor(X, Y, Z1, cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[1], extend='max')
fig.show()
```



5.3.2 Symmetric logarithmic

Similarly, it sometimes happens that there is data that is positive and negative, but we would still like a logarithmic scaling applied to both. In this case, the negative numbers are also scaled logarithmically, and mapped to smaller numbers; e.g., if `vmin=-vmax`, then they the negative numbers are mapped from 0 to 0.5 and the positive from 0.5 to 1.

Since the logarithm of values close to zero tends toward infinity, a small range around zero needs to be mapped linearly. The parameter *linthresh* allows the user to specify the size of this range (-*linthresh*, *linthresh*). The size of this range in the colormap is set by *linscale*. When *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

```
"""
Demonstration of using norm to map colormaps onto data in non-linear ways.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
from matplotlib.mlab import bivariate_normal

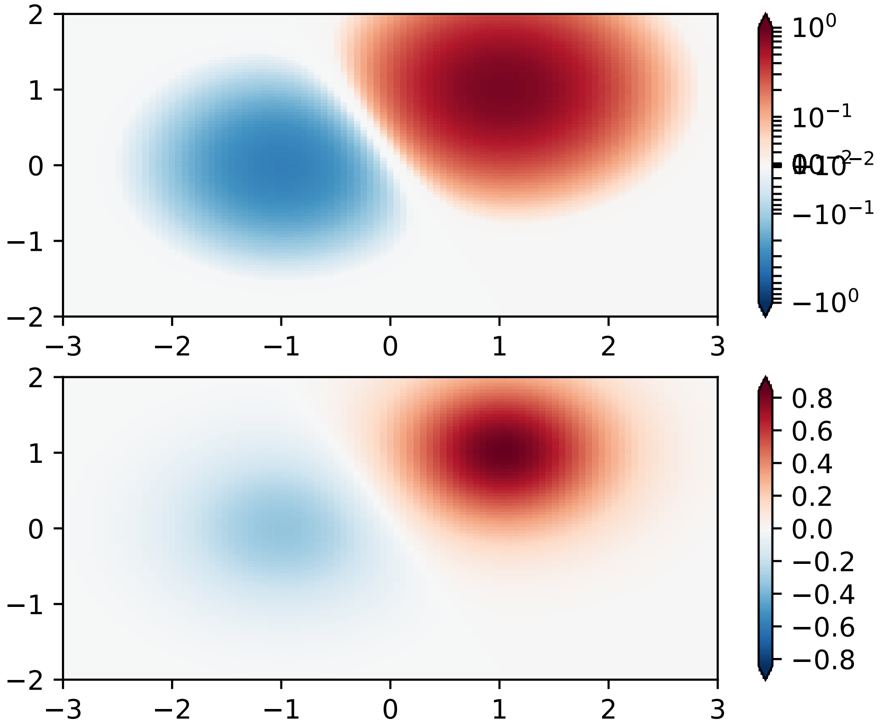
"""
SymLogNorm: two humps, one negative and one positive, The positive
with 5-times the amplitude. Linearly, you cannot see detail in the
negative hump.  Here we logarithmically scale the positive and
negative data separately.

Note that colorbar labels do not come out looking very good.
"""
N=100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = (bivariate_normal(X, Y, 1., 1., 1.0, 1.0))**2  \
    - 0.4 * (bivariate_normal(X, Y, 1.0, 1.0, -1.0, 0.0))**2
Z1 = Z1/0.03

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z1,
                       norm=colors.SymLogNorm(linthresh=0.03, linscale=0.03,
                                              vmin=-1.0, vmax=1.0),
                       cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], extend='both')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='RdBu_r', vmin=-np.max(Z1))
fig.colorbar(pcm, ax=ax[1], extend='both')
fig.show()
```



5.3.3 Power-law

Sometimes it is useful to remap the colors onto a power-law relationship (i.e. $y = x^\gamma$, where γ is the power). For this we use the `colors.PowerNorm()`. It takes as an argument *gamma* (*gamma* == 1.0 will just yield the default linear normalization):

Note: There should probably be a good reason for plotting the data using this type of transformation. Technical viewers are used to linear and logarithmic axes and data transformations. Power laws are less common, and viewers should explicitly be made aware that they have been used.

```
"""
Demonstration of using norm to map colormaps onto data in non-linear ways.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
from matplotlib.mlab import bivariate_normal

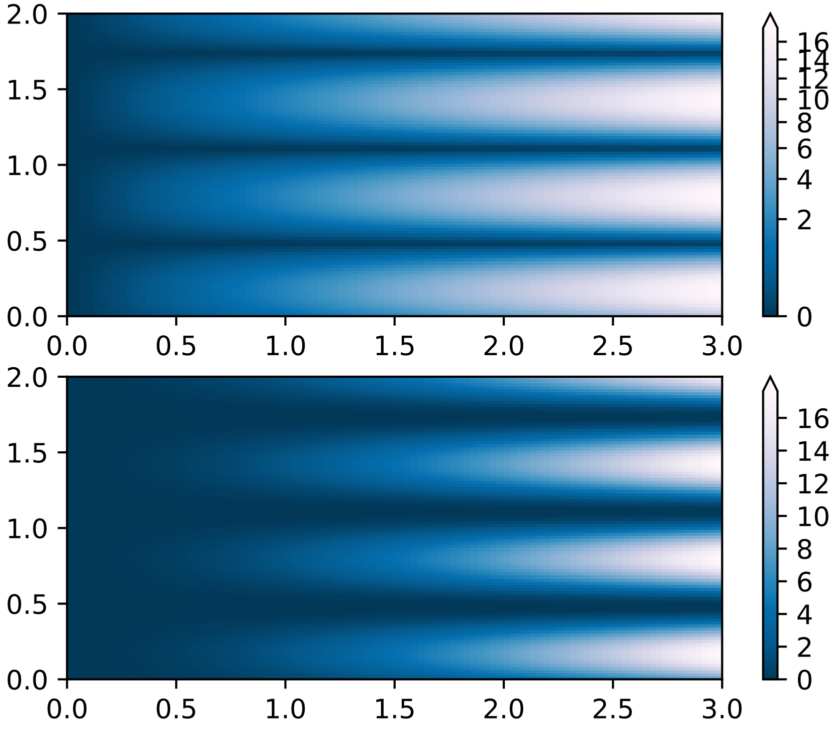
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
```

```
'''
PowerNorm: Here a power-law trend in X partially obscures a rectified
sine wave in Y. We can remove the power law using a PowerNorm.
'''
X, Y = np.mgrid[0:3:complex(0, N), 0:2:complex(0, N)]
Z1 = (1 + np.sin(Y * 10.)) * X**(2.)

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z1, norm=colors.PowerNorm(gamma=1./2.),
                       cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[1], extend='max')
fig.show()
```



5.3.4 Discrete bounds

Another normaization that comes with matplolib is `colors.BoundaryNorm()`. In addition to *vmin* and *vmax*, this takes as arguments boundaries between which data is to be mapped. The colors are then linearly distributed between these "bounds". For instance:

```
In [4]: import matplotlib.colors as colors

In [5]: bounds = np.array([-0.25, -0.125, 0, 0.5, 1])

In [6]: norm = colors.BoundaryNorm(boundaries=bounds, ncolors=4)

In [7]: print(norm([-0.2,-0.15,-0.02, 0.3, 0.8, 0.99]))
[0 0 1 2 3 3]
```

Note unlike the other norms, this norm returns values from 0 to *ncolors*-1.

```
"""
Demonstration of using norm to map colormaps onto data in non-linear ways.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
from matplotlib.mlab import bivariate_normal

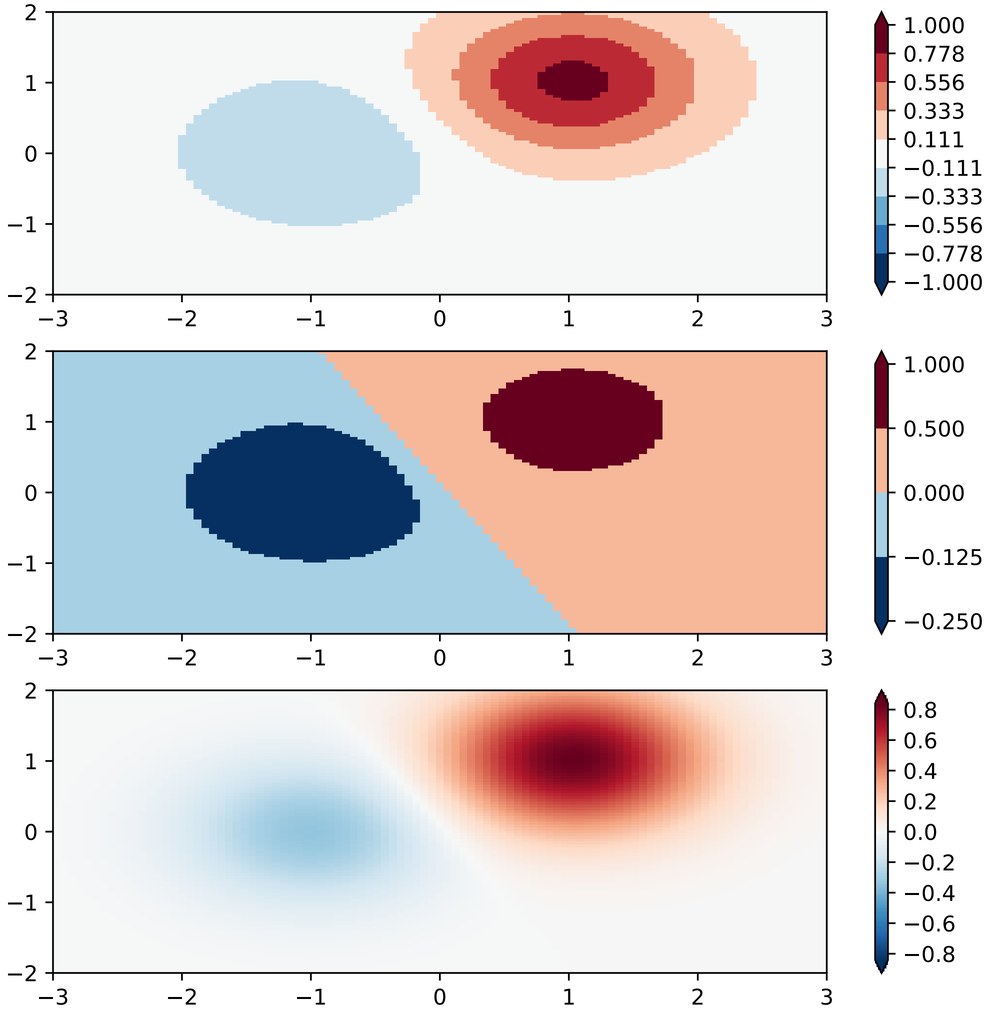
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = (bivariate_normal(X, Y, 1., 1., 1.0, 1.0))**2  \
    - 0.4 * (bivariate_normal(X, Y, 1.0, 1.0, -1.0, 0.0))**2
Z1 = Z1/0.03

'''
BoundaryNorm: For this one you provide the boundaries for your colors,
and the Norm puts the first color in between the first pair, the
second color between the second pair, etc.
'''

fig, ax = plt.subplots(3, 1, figsize=(8, 8))
ax = ax.flatten()
# even bounds gives a contour-like effect
bounds = np.linspace(-1, 1, 10)
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[0].pcolormesh(X, Y, Z1,
                       norm=norm,
                       cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], extend='both', orientation='vertical')

# uneven bounds changes the colormapping:
bounds = np.array([-0.25, -0.125, 0, 0.5, 1])
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[1].pcolormesh(X, Y, Z1, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[1], extend='both', orientation='vertical')

pcm = ax[2].pcolormesh(X, Y, Z1, cmap='RdBu_r', vmin=-np.max(Z1))
fig.colorbar(pcm, ax=ax[2], extend='both', orientation='vertical')
fig.show()
```



5.3.5 Custom normalization: Two linear ranges

It is possible to define your own normalization. In the following example, we modify `colors:SymLogNorm()` to use different linear maps for the negative data values and the positive. (Note that this example is simple, and does not validate inputs or account for complex cases such as masked data)

Note: This may appear soon as `colors.OffsetNorm()`.

As above, non-symmetric mapping of data to color is non-standard practice for quantitative data, and should only be used advisedly. A practical example is having an ocean/land colormap where the land and ocean data span different ranges.

```
"""
Demonstration of using norm to map colormaps onto data in non-linear ways.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
from matplotlib.mlab import bivariate_normal

N = 100
'''
Custom Norm: An example with a customized normalization.  This one
uses the example above, and normalizes the negative data differently
from the positive.
'''
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = (bivariate_normal(X, Y, 1., 1., 1.0, 1.0))**2  \
    - 0.4 * (bivariate_normal(X, Y, 1.0, 1.0, -1.0, 0.0))**2
Z1 = Z1/0.03

# Example of making your own norm.  Also see matplotlib.colors.
# From Joe Kington: This one gives two different linear ramps:

class MidpointNormalize(colors.Normalize):
    def __init__(self, vmin=None, vmax=None, midpoint=None, clip=False):
        self.midpoint = midpoint
        colors.Normalize.__init__(self, vmin, vmax, clip)

    def __call__(self, value, clip=None):
        # I'm ignoring masked values and all kinds of edge cases to make a
        # simple example...
        x, y = [self.vmin, self.midpoint, self.vmax], [0, 0.5, 1]
        return np.ma.masked_array(np.interp(value, x, y))
#####
fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z1,
                       norm=MidpointNormalize(midpoint=0.),
                       cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], extend='both')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='RdBu_r', vmin=-np.max(Z1))
fig.colorbar(pcm, ax=ax[1], extend='both')
fig.show()
```

CHAPTER

SIX

CUSTOMIZING MATPLOTLIB

6.1 Using style sheets

The `style` package adds support for easy-to-switch plotting "styles" with the same parameters as a matplotlibrc file (which is read at startup to configure matplotlib).

There are a number of pre-defined styles provided by matplotlib. For example, there's a pre-defined style called "ggplot", which emulates the aesthetics of ggplot (a popular plotting package for R). To use this style, just add:

```
>>> import matplotlib.pyplot as plt
>>> plt.style.use('ggplot')
```

To list all available styles, use:

```
>>> print(plt.style.available)
```

6.1.1 Defining your own style

You can create custom styles and use them by calling `style.use` with the path or URL to the style sheet. Additionally, if you add your `<style-name>.mplstyle` file to `mpl_configdir/stylelib`, you can reuse your custom style sheet with a call to `style.use(<style-name>)`. By default `mpl_configdir` should be `~/.config/matplotlib`, but you can check where yours is with `matplotlib.get_configdir()`; you may need to create this directory. You also can change the directory where matplotlib looks for the stylelib/ folder by setting the MPLCONFIGDIR environment variable, see *matplotlib configuration and cache directory locations*.

Note that a custom style sheet in `mpl_configdir/stylelib` will override a style sheet defined by matplotlib if the styles have the same name.

For example, you might want to create `mpl_configdir/stylelib/presentation.mplstyle` with the following:

```
axes.titlesize : 24
axes.labelsize : 20
lines.linewidth : 3
lines.markersize : 10
```

```
xtick.labelsize : 16
ytick.labelsize : 16
```

Then, when you want to adapt a plot designed for a paper to one that looks good in a presentation, you can just add:

```
>>> import matplotlib.pyplot as plt
>>> plt.style.use('presentation')
```

6.1.2 Composing styles

Style sheets are designed to be composed together. So you can have a style sheet that customizes colors and a separate style sheet that alters element sizes for presentations. These styles can easily be combined by passing a list of styles:

```
>>> import matplotlib.pyplot as plt
>>> plt.style.use(['dark_background', 'presentation'])
```

Note that styles further to the right will overwrite values that are already defined by styles on the left.

6.1.3 Temporary styling

If you only want to use a style for a specific block of code but don't want to change the global styling, the style package provides a context manager for limiting your changes to a specific scope. To isolate your styling changes, you can write something like the following:

```
>>> import numpy as np
>>> import matplotlib.pyplot as plt
>>>
>>> with plt.style.context(('dark_background')):
>>>     plt.plot(np.sin(np.linspace(0, 2 * np.pi)), 'r-o')
>>>
>>> # Some plotting code with the default style
>>>
>>> plt.show()
```

6.2 matplotlib rcParams

6.2.1 Dynamic rc settings

You can also dynamically change the default rc settings in a python script or interactively from the python shell. All of the rc settings are stored in a dictionary-like variable called `matplotlib.rcParams`, which is global to the matplotlib package. rcParams can be modified directly, for example:

```
import matplotlib as mpl
mpl.rcParams['lines.linewidth'] = 2
mpl.rcParams['lines.color'] = 'r'
```

Matplotlib also provides a couple of convenience functions for modifying rc settings. The *`matplotlib.rc()`* command can be used to modify multiple settings in a single group at once, using keyword arguments:

```
import matplotlib as mpl
mpl.rc('lines', linewidth=2, color='r')
```

The `matplotlib.rcdefaults()` command will restore the standard matplotlib default settings.

There is some degree of validation when setting the values of rcParams, see *`matplotlib.rcsetup`* for details.

6.2.2 The `matplotlibrc` file

matplotlib uses `matplotlibrc` configuration files to customize all kinds of properties, which we call `rc settings` or `rc parameters`. You can control the defaults of almost every property in matplotlib: figure size and dpi, line width, color and style, axes, axis and grid properties, text and font properties and so on. matplotlib looks for `matplotlibrc` in four locations, in the following order:

1. `matplotlibrc` in the current working directory, usually used for specific customizations that you do not want to apply elsewhere.
2. `$MATPLOTLIBRC/matplotlibrc`.
3. It next looks in a user-specific place, depending on your platform:
    - On Linux and FreeBSD, it looks in `.config/matplotlib/matplotlibrc` (or `$XDG_CONFIG_HOME/matplotlib/matplotlibrc`) if you've customized your environment.
    - On other platforms, it looks in `.matplotlib/matplotlibrc`.

    See *matplotlib configuration and cache directory locations*.
4. *`INSTALL`*`/matplotlib/mpl-data/matplotlibrc`, where *`INSTALL`* is something like `/usr/lib/python3.5/site-packages` on Linux, and maybe `C:\Python35\Lib\site-packages` on Windows. Every time you install matplotlib, this file will be overwritten, so if you want your customizations to be saved, please move this file to your user-specific matplotlib directory.

To display where the currently active `matplotlibrc` file was loaded from, one can do the following:

```
>>> import matplotlib
>>> matplotlib.matplotlib_fname()
'/home/foo/.config/matplotlib/matplotlibrc'
```

See below for a sample *matplotlibrc file*.

A sample matplotlibrc file

```
### MATPLOTLIBRC FORMAT

# This is a sample matplotlib configuration file - you can find a copy
# of it on your system in
# site-packages/matplotlib/mpl-data/matplotlibrc.  If you edit it
# there, please note that it will be overwritten in your next install.
# If you want to keep a permanent local copy that will not be
# overwritten, place it in the following location:
# unix/linux:
#     $HOME/.config/matplotlib/matplotlibrc or
#     $XDG_CONFIG_HOME/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is set)
# other platforms:
#     $HOME/.matplotlib/matplotlibrc
#
# See http://matplotlib.org/users/customizing.html#the-matplotlibrc-file for
# more details on the paths which are checked for the configuration file.
#
# This file is best viewed in a editor which supports python mode
# syntax highlighting. Blank lines, or lines starting with a comment
# symbol, are ignored, as are trailing comments.  Other lines must
# have the format
#    key : val # optional comment
#
# Colors: for the color values below, you can either use - a
# matplotlib color string, such as r, k, or b - an rgb tuple, such as
# (1.0, 0.5, 0.0) - a hex string, such as ff00ff - a scalar
# grayscale intensity such as 0.75 - a legal html color name, e.g., red,
# blue, darkslategray

```

```
#boxplot.meanprops.linewidth       : 1.0

### FONT
#
# font properties used by text.Text.  See
# http://matplotlib.org/api/font_manager_api.html for more
# information on font properties.  The 6 font properties used for font
# matching are given below with their default values.
#
# The font.family property has five values: 'serif' (e.g., Times),
# 'sans-serif' (e.g., Helvetica), 'cursive' (e.g., Zapf-Chancery),
# 'fantasy' (e.g., Western), and 'monospace' (e.g., Courier).  Each of
# these font families has a default list of font names in decreasing
# order of priority associated with them.  When text.usetex is False,
# font.family may also be one or more concrete font names.
#
# The font.style property has three values: normal (or roman), italic
# or oblique.  The oblique style will be used for italic, if it is not
# present.
#
# The font.variant property has two values: normal or small-caps.  For
# TrueType fonts, which are scalable fonts, small-caps is equivalent
# to using a font size of 'smaller', or about 83%% of the current font
# size.
#
# The font.weight property has effectively 13 values: normal, bold,
# bolder, lighter, 100, 200, 300, ..., 900.  Normal is the same as
# 400, and bold is 700.  bolder and lighter are relative values with
# respect to the current weight.
#
# The font.stretch property has 11 values: ultra-condensed,
# extra-condensed, condensed, semi-condensed, normal, semi-expanded,
# expanded, extra-expanded, ultra-expanded, wider, and narrower.  This
# property is not currently implemented.
#
# The font.size property is the default font size for text, given in pts.
# 10 pt is the standard value.
#
#font.family         : sans-serif
#font.style          : normal
#font.variant        : normal
#font.weight         : medium
#font.stretch        : normal
# note that font.size controls default text sizes.  To configure
# special text sizes tick labels, axes, labels, title, etc, see the rc
# settings for axes and ticks. Special text sizes can be defined
# relative to font.size, using the following values: xx-small, x-small,
# small, medium, large, x-large, xx-large, larger, or smaller
#font.size           : 10.0
#font.serif          : DejaVu Serif, Bitstream Vera Serif, New Century Schoolbook,␣
↪Century Schoolbook L, Utopia, ITC Bookman, Bookman, Nimbus Roman No9 L, Times New␣
↪Roman, Times, Palatino, Charter, serif
#font.sans-serif     : DejaVu Sans, Bitstream Vera Sans, Lucida Grande, Verdana, Geneva,␣
↪Lucid, Arial, Helvetica, Avant Garde, sans-serif
```

```
#font.cursive        : Apple Chancery, Textile, Zapf Chancery, Sand, Script MT, Felipa,␣
↪cursive
#font.fantasy        : Comic Sans MS, Chicago, Charcoal, Impact, Western, Humor Sans,␣
↪xkcd, fantasy
#font.monospace      : DejaVu Sans Mono, Bitstream Vera Sans Mono, Andale Mono, Nimbus␣
↪Mono L, Courier New, Courier, Fixed, Terminal, monospace

### TEXT
# text properties used by text.Text.  See
# http://matplotlib.org/api/artist_api.html#module-matplotlib.text for more
# information on text properties

#text.color          : black

### LaTeX customizations. See http://wiki.scipy.org/Cookbook/Matplotlib/UsingTex
#text.usetex         : False  # use latex for all text handling. The following fonts
                              # are supported through the usual rc parameter settings:
                              # new century schoolbook, bookman, times, palatino,
                              # zapf chancery, charter, serif, sans-serif, helvetica,
                              # avant garde, courier, monospace, computer modern roman,
                              # computer modern sans serif, computer modern typewriter
                              # If another font is desired which can loaded using the
                              # LaTeX \usepackage command, please inquire at the
                              # matplotlib mailing list
#text.latex.unicode : False # use "ucs" and "inputenc" LaTeX packages for handling
                            # unicode strings.
#text.latex.preamble :  # IMPROPER USE OF THIS FEATURE WILL LEAD TO LATEX FAILURES
                            # AND IS THEREFORE UNSUPPORTED. PLEASE DO NOT ASK FOR HELP
                            # IF THIS FEATURE DOES NOT DO WHAT YOU EXPECT IT TO.
                            # preamble is a comma separated list of LaTeX statements
                            # that are included in the LaTeX document preamble.
                            # An example:
                            # text.latex.preamble : \usepackage{bm},\usepackage{euler}
                            # The following packages are always loaded with usetex, so
                            # beware of package collisions: color, geometry, graphicx,
                            # type1cm, textcomp. Adobe Postscript (PSSNFS) font packages
                            # may also be loaded, depending on your font settings

#text.dvipnghack : None      # some versions of dvipng don't handle alpha
                             # channel properly.  Use True to correct
                             # and flush ~/.matplotlib/tex.cache
                             # before testing and False to force
                             # correction off.  None will try and
                             # guess based on your dvipng version

#text.hinting : auto   # May be one of the following:
                       #   'none': Perform no hinting
                       #   'auto': Use FreeType's autohinter
                       #   'native': Use the hinting information in the
                       #             font file, if available, and if your
                       #             FreeType library supports it
                       #   'either': Use the native hinting information,
                       #             or the autohinter if none is available.
```

```
                        # For backward compatibility, this value may also be
                        # True === 'auto' or False === 'none'.
#text.hinting_factor : 8 # Specifies the amount of softness for hinting in the
                          # horizontal direction.  A value of 1 will hint to full
                          # pixels.  A value of 2 will hint to half pixels etc.

#text.antialiased : True # If True (default), the text will be antialiased.
                          # This only affects the Agg backend.

# The following settings allow you to select the fonts in math mode.
# They map from a TeX font name to a fontconfig font pattern.
# These settings are only used if mathtext.fontset is 'custom'.
# Note that this "custom" mode is unsupported and may go away in the
# future.
#mathtext.cal : cursive
#mathtext.rm  : serif
#mathtext.tt  : monospace
#mathtext.it  : serif:italic

                            # Use "round_number" move to the nearest "round" number
#axes.xmargin        : .05  # x margin.  See `axes.Axes.margins`
#axes.ymargin        : .05  # y margin See `axes.Axes.margins`

#polaraxes.grid      : True    # display grid on polar axes
#axes3d.grid         : True    # display grid on 3d axes

### DATES
# These control the default format strings used in AutoDateFormatter.
# Any valid format datetime format string can be used (see the python
# `datetime` for details).  For example using '%%x' will use the locale date representation
# '%%X' will use the locale time representation and '%%c' will use the full locale datetime
# representation.
# These values map to the scales:
#    {'year': 365, 'month': 30, 'day': 1, 'hour': 1/24, 'minute': 1 / (24 * 60)}

# date.autoformatter.year     : %Y
# date.autoformatter.month    : %Y-%m
# date.autoformatter.day      : %Y-%m-%d
# date.autoformatter.hour     : %m-%d %H
# date.autoformatter.minute   : %d %H:%M
# date.autoformatter.second   : %H:%M:%S
# date.autoformatter.microsecond   : %M:%S.%f

### TICKS
# see http://matplotlib.org/api/axis_api.html#matplotlib.axis.Tick
#xtick.top            : False   # draw ticks on the top side

#legend.loc           : best
#legend.frameon       : True     # if True, draw the legend on a background patch
```

```
#legend.framealpha    : 0.8      # legend patch transparency
#legend.facecolor     : inherit  # inherit from axes.facecolor; or color spec
#legend.edgecolor     : 0.8      # background patch boundary color
#legend.fancybox      : True     # if True, use a rounded box for the
                                 # legend background, else a rectangle
#legend.shadow        : False    # if True, give background a shadow effect
#legend.numpoints     : 1        # the number of marker points in the legend line
#legend.scatterpoints : 1        # number of scatter points
#legend.markerscale   : 1.0      # the relative size of legend markers vs. original
#legend.fontsize      : medium
# Dimensions as fraction of fontsize:
#legend.borderpad     : 0.4      # border whitespace
#legend.labelspacing  : 0.5      # the vertical space between the legend entries
#legend.handlelength  : 2.0      # the length of the legend lines
#legend.handleheight  : 0.7      # the height of the legend handle
#legend.handletextpad : 0.8      # the space between the legend line and legend text
#legend.borderaxespad : 0.5      # the border between the axes and legend edge
#legend.columnspacing : 2.0      # column separation

### FIGURE
# See http://matplotlib.org/api/figure_api.html#matplotlib.figure.Figure
#figure.titlesize : large      # size of the figure title (Figure.suptitle())
#figure.titleweight : normal   # weight of the figure title
#figure.figsize   : 6.4, 4.8   # figure size in inches
#figure.dpi       : 100      # figure dots per inch
#figure.facecolor : white   # figure facecolor; 0.75 is scalar gray
#figure.edgecolor : white   # figure edgecolor
#figure.autolayout : False  # When True, automatically adjust subplot
                            # parameters to make the plot fit the figure
#figure.max_open_warning : 20  # The maximum number of figures to open through
                               # the pyplot interface before emitting a warning.
                               # If less than one this feature is disabled.

# The figure subplot parameters.  All dimensions are a fraction of the
#figure.subplot.left    : 0.125  # the left side of the subplots of the figure
#figure.subplot.right   : 0.9    # the right side of the subplots of the figure
#figure.subplot.bottom  : 0.11    # the bottom of the subplots of the figure
#figure.subplot.top     : 0.88    # the top of the subplots of the figure
#figure.subplot.wspace  : 0.2    # the amount of width reserved for blank space between␣
↪subplots,
                                 # expressed as a fraction of the average axis width
#figure.subplot.hspace  : 0.2    # the amount of height reserved for white space between␣
↪subplots,
                                 # expressed as a fraction of the average axis height

### IMAGES
#image.aspect : equal             # equal | auto | a number
#image.interpolation  : nearest   # see help(imshow) for options
#image.cmap   : viridis           # A colormap name, gray etc...
#image.lut    : 256               # the size of the colormap lookup table
#image.origin : upper             # lower | upper
#image.resample  : True
```

```
#image.composite_image : True     # When True, all the images on a set of axes are
                                  # combined into a single composite image before
                                  # saving a figure as a vector graphics file,
                                  # such as a PDF.

### CONTOUR PLOTS
#contour.negative_linestyle : dashed # dashed | solid
#contour.corner_mask        : True   # True | False | legacy

### ERRORBAR PLOTS
#errorbar.capsize : 0             # length of end cap on error bars in pixels

### HISTOGRAM PLOTS
#hist.bins : 10                   # The default number of histogram bins.
                                  # If Numpy 1.11 or later is
                                  # installed, may also be `auto`

### SCATTER PLOTS
#scatter.marker : o               # The default marker type for scatter plots.

### Agg rendering
### Warning: experimental, 2008/10/10
#agg.path.chunksize : 0           # 0 to disable; values in the range
                                  # 10000 to 100000 can improve speed slightly
                                  # and prevent an Agg rendering failure
                                  # when plotting very large data sets,
                                  # especially if they are very gappy.
                                  # It may cause minor artifacts, though.
                                  # A value of 20000 is probably a good
                                  # starting point.
### SAVING FIGURES
#path.simplify : True   # When True, simplify paths by removing "invisible"
                        # points to reduce file size and increase rendering
                        # speed
#path.simplify_threshold : 0.1  # The threshold of similarity below which
                                # vertices will be removed in the simplification
                                # process
#path.snap : True # When True, rectilinear axis-aligned paths will be snapped to
                  # the nearest pixel when certain criteria are met.  When False,
                  # paths will never be snapped.
#path.sketch : None # May be none, or a 3-tuple of the form (scale, length,
                    # randomness).
                    # *scale* is the amplitude of the wiggle
                    # perpendicular to the line (in pixels).  *length*
                    # is the length of the wiggle along the line (in
                    # pixels).  *randomness* is the factor by which
                    # the length is randomly scaled.

# the default savefig params can be different from the display params
# e.g., you may want a higher resolution, or to make the figure
# background white
#savefig.dpi         : figure   # figure dots per inch or 'figure'
#savefig.facecolor   : white    # figure facecolor when saving
```

```
#savefig.edgecolor   : white    # figure edgecolor when saving
#savefig.format      : png      # png, ps, pdf, svg
#savefig.bbox        : standard # 'tight' or 'standard'.
                                # 'tight' is incompatible with pipe-based animation
                                # backends but will workd with temporary file based ones:
                                # e.g. setting animation.writer to ffmpeg will not work,
                                # use ffmpeg_file instead
#savefig.pad_inches  : 0.1      # Padding to be used when bbox is set to 'tight'
#savefig.jpeg_quality: 95       # when a jpeg is saved, the default quality parameter.
#savefig.directory   : ~        # default directory in savefig dialog box,
                                # leave empty to always use current working directory
#savefig.transparent : False    # setting that controls whether figures are saved with a
                                # transparent background by default

# tk backend params
#tk.window_focus   : False    # Maintain shell focus for TkAgg

# ps backend params
#ps.papersize      : letter   # auto, letter, legal, ledger, A0-A10, B0-B10
#ps.useafm         : False    # use of afm fonts, results in small files
#ps.usedistiller   : False    # can be: None, ghostscript or xpdf
                                          # Experimental: may produce smaller files.
                                          # xpdf intended for production of publication␣
↪quality files,
                                          # but requires ghostscript, xpdf and ps2eps
#ps.distiller.res  : 6000      # dpi
#ps.fonttype       : 3         # Output Type 3 (Type3) or Type 42 (TrueType)

# pdf backend params
#pdf.compression   : 6 # integer from 0 to 9
                       # 0 disables compression (good for debugging)
#pdf.fonttype       : 3         # Output Type 3 (Type3) or Type 42 (TrueType)

# svg backend params
#svg.image_inline : True       # write raster image data directly into the svg file
#svg.fonttype : 'path'        # How to handle SVG fonts:
#    'none': Assume fonts are installed on the machine where the SVG will be viewed.
#    'path': Embed characters as paths -- supported by most SVG renderers
#    'svgfont': Embed characters as SVG fonts -- supported only by Chrome,
#               Opera and Safari
#svg.hashsalt : None           # if not None, use this string as hash salt
                               # instead of uuid4

# docstring params
#docstring.hardcopy = False  # set this when you want to generate hardcopy docstring

# Set the verbose flags.  This controls how much information
# matplotlib gives you at runtime and where it goes.  The verbosity
# levels are: silent, helpful, debug, debug-annoying.  Any level is
# inclusive of all the levels below it.  If your setting is "debug",
# you'll get all the debug and helpful messages.  When submitting
# problems to the mailing-list, please set verbose to "helpful" or "debug"
# and paste the output into your report.
```

```
#
# The "fileo" gives the destination for any calls to verbose.report.
# These objects can a filename, or a filehandle like sys.stdout.
#
# You can override the rc default verbosity from the command line by
# giving the flags --verbose-LEVEL where LEVEL is one of the legal
# levels, e.g., --verbose-helpful.
#
# You can access the verbose instance in your code
#   from matplotlib import verbose.
#verbose.level  : silent      # one of silent, helpful, debug, debug-annoying
#verbose.fileo  : sys.stdout  # a log filename, sys.stdout or sys.stderr

# Event keys to interact with figures/plots via keyboard.
# Customize these settings according to your needs.

#examples.directory : "   # directory to look in for custom installation

###ANIMATION settings
#animation.html : 'none'           # How to display the animation as HTML in
                                   # the IPython notebook. 'html5' uses
                                   # HTML5 video tag.
#animation.writer : ffmpeg         # MovieWriter 'backend' to use
#animation.codec : h264            # Codec to use for writing movie
#animation.bitrate: -1             # Controls size/quality tradeoff for movie.
                                   # -1 implies let utility auto-determine
#animation.frame_format: 'png'     # Controls frame format used by temp files
#animation.ffmpeg_path: 'ffmpeg'   # Path to ffmpeg binary. Without full path
                                   # $PATH is searched
#animation.ffmpeg_args: "          # Additional arguments to pass to ffmpeg
#animation.avconv_path: 'avconv'   # Path to avconv binary. Without full path
                                   # $PATH is searched
#animation.avconv_args: "          # Additional arguments to pass to avconv
#animation.mencoder_path: 'mencoder'
                                   # Path to mencoder binary. Without full path
                                   # $PATH is searched
#animation.mencoder_args: "        # Additional arguments to pass to mencoder
#animation.convert_path: 'convert' # Path to ImageMagick's convert binary.
```

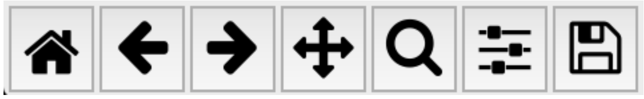
```
                                   # On Windows use the full path since convert
                                   # is also the name of a system tool.
```

CHAPTER

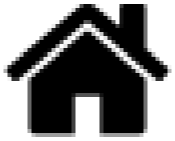
SEVEN

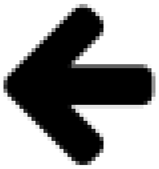
INTERACTIVE PLOTS

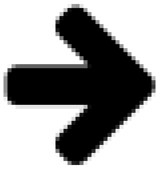
7.1 Interactive navigation



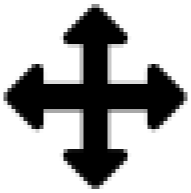
All figure windows come with a navigation toolbar, which can be used to navigate through the data set. Here is a description of each of the buttons at the bottom of the toolbar





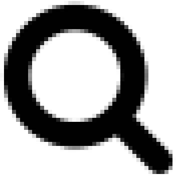


The `Home`, `Forward` and `Back` buttons These are akin to a web browser's home, forward and back controls. `Forward` and `Back` are used to navigate back and forth between previously defined views. They have no meaning unless you have already navigated somewhere else using the pan and zoom buttons. This is analogous to trying to click `Back` on your web browser before visiting a new page or `Forward` before you have gone back to a page – nothing happens. `Home` always takes you to the first, default view of your data. Again, all of these buttons should feel very familiar to any user of a web browser.

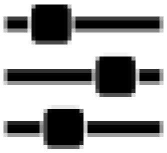


The `Pan/Zoom` button This button has two modes: pan and zoom. Click the toolbar button to activate panning and zooming, then put your mouse somewhere over an axes. Press the left mouse button and hold it to pan the figure, dragging it to a new position. When you release it, the data under the point where you pressed will be moved to the point where you released. If you press 'x' or 'y' while panning the motion will be constrained to the x or y axis, respectively. Press the right mouse button to zoom, dragging it to a new position. The x axis will be zoomed in proportionately to the rightward movement and zoomed out proportionately to the leftward movement. The same is true for the y axis and up/down motions. The point under your mouse when you begin the zoom remains stationary, allowing you to zoom in or out around that point as much as you wish. You can use the modifier keys 'x', 'y' or 'CONTROL' to constrain the zoom to the x axis, the y axis, or aspect ratio preserve, respectively.

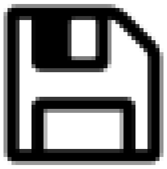
With polar plots, the pan and zoom functionality behaves differently. The radius axis labels can be dragged using the left mouse button. The radius scale can be zoomed in and out using the right mouse button.



The `Zoom-to-rectangle` button Click this toolbar button to activate this mode. Put your mouse somewhere over an axes and press the left mouse button. Drag the mouse while holding the button to a new location and release. The axes view limits will be zoomed to the rectangle you have defined. There is also an experimental 'zoom out to rectangle' in this mode with the right button, which will place your entire axes in the region defined by the zoom out rectangle.



The `Subplot-configuration` button Use this tool to configure the appearance of the subplot: you can stretch or compress the left, right, top, or bottom side of the subplot, or the space between the rows or space between the columns.



The Save button Click this button to launch a file save dialog. You can save files with the following extensions: `png`, `ps`, `eps`, `svg` and `pdf`.

7.1.1 Navigation Keyboard Shortcuts

The following table holds all the default keys, which can be overwritten by use of your matplotlibrc (#keymap.*).

Command	Keyboard Shortcut(s)
Home/Reset	**h** or **r** or **home**
Back	**c** or **left arrow** or **backspace**
Forward	**v** or **right arrow**
Pan/Zoom	**p**
Zoom-to-rect	**o**
Save	**ctrl** + **s**
Toggle fullscreen	**f** or **ctrl** + **f**
Close plot	**ctrl** + **w**
Constrain pan/zoom to x axis	hold **x** when panning/zooming with mouse
Constrain pan/zoom to y axis	hold **y** when panning/zooming with mouse
Preserve aspect ratio	hold **CONTROL** when panning/zooming with mouse
Toggle grid	**g** when mouse is over an axes
Toggle x axis scale (log/linear)	**L** or **k** when mouse is over an axes
Toggle y axis scale (log/linear)	**l** when mouse is over an axes

If you are using `matplotlib.pyplot` the toolbar will be created automatically for every figure. If you are writing your own user interface code, you can add the toolbar as a widget. The exact syntax depends on your UI, but we have examples for every supported UI in the `matplotlib/examples/user_interfaces` directory. Here is some example code for GTK:

```
import gtk

from matplotlib.figure import Figure
from matplotlib.backends.backend_gtkagg import FigureCanvasGTKAgg as FigureCanvas
from matplotlib.backends.backend_gtkagg import NavigationToolbar2GTKAgg as␣
↪NavigationToolbar

win = gtk.Window()
win.connect("destroy", lambda x: gtk.main_quit())
win.set_default_size(400,300)
win.set_title("Embedding in GTK")

vbox = gtk.VBox()
win.add(vbox)

fig = Figure(figsize=(5,4), dpi=100)
ax = fig.add_subplot(111)
ax.plot([1,2,3])

canvas = FigureCanvas(fig)  # a gtk.DrawingArea
vbox.pack_start(canvas)
```

```
toolbar = NavigationToolbar(canvas, win)
vbox.pack_start(toolbar, False, False)

win.show_all()
gtk.main()
```

7.2 Using matplotlib in a python shell

Warning: This page is significantly out of date

By default, matplotlib defers drawing until the end of the script because drawing can be an expensive operation, and you may not want to update the plot every time a single property is changed, only once after all the properties have changed.

But when working from the python shell, you usually do want to update the plot with every command, e.g., after changing the *`xlabel()`*, or the marker style of a line. While this is simple in concept, in practice it can be tricky, because matplotlib is a graphical user interface application under the hood, and there are some tricks to make the applications work right in a python shell.

7.2.1 IPython to the rescue

Note: The mode described here still exists for historical reasons, but it is highly advised not to use. It pollutes namespaces with functions that will shadow python built-in and can lead to hard to track bugs. To get IPython integration without imports the use of the `%matplotlib` magic is preferred. See ipython documentation .

Fortunately, ipython, an enhanced interactive python shell, has figured out all of these tricks, and is matplotlib aware, so when you start ipython in the *pylab* mode.

```
johnh@flag:~> ipython
Python 2.4.5 (#4, Apr 12 2008, 09:09:16)
IPython 0.9.0 -- An enhanced Interactive Python.

In [1]: %pylab

  Welcome to pylab, a matplotlib-based Python environment.
  For more information, type 'help(pylab)'.

In [2]: x = randn(10000)

In [3]: hist(x, 100)
```

it sets everything up for you so interactive plotting works as you would expect it to. Call *`figure()`* and a figure window pops up, call *`plot()`* and your data appears in the figure window.

Note in the example above that we did not import any matplotlib names because in pylab mode, ipython will import them automatically. ipython also turns on *interactive* mode for you, which causes every pyplot command to trigger a figure update, and also provides a matplotlib aware `run` command to run matplotlib scripts efficiently. ipython will turn off interactive mode during a `run` command, and then restore the interactive state at the end of the run so you can continue tweaking the figure manually.

There has been a lot of recent work to embed ipython, with pylab support, into various GUI applications, so check on the ipython mailing list for the latest status.

7.2.2 Other python interpreters

If you can't use ipython, and still want to use matplotlib/pylab from an interactive python shell, e.g., the plain-ole standard python interactive interpreter, you are going to need to understand what a matplotlib backend is *What is a backend?*.

With the TkAgg backend, which uses the Tkinter user interface toolkit, you can use matplotlib from an arbitrary non-gui python shell. Just set your `backend : TkAgg` and `interactive : True` in your `matplotlibrc` file (see *Customizing matplotlib*) and fire up python. Then:

```
>>> from pylab import *
>>> plot([1,2,3])
>>> xlabel('hi mom')
```

should work out of the box. This is also likely to work with recent versions of the qt4agg and gtkagg backends, and with the macosx backend on the Macintosh. Note, in batch mode, i.e. when making figures from scripts, interactive mode can be slow since it redraws the figure with each command. So you may want to think carefully before making this the default behavior via the `matplotlibrc` file instead of using the functions listed in the next section.

Gui shells are at best problematic, because they have to run a mainloop, but interactive plotting also involves a mainloop. Ipython has sorted all this out for the primary matplotlib backends. There may be other shells and IDEs that also work with matplotlib in interactive mode, but one obvious candidate does not: the python IDLE IDE is a Tkinter gui app that does not support pylab interactive mode, regardless of backend.

7.2.3 Controlling interactive updating

The *interactive* property of the pyplot interface controls whether a figure canvas is drawn on every pyplot command. If *interactive* is *False*, then the figure state is updated on every plot command, but will only be drawn on explicit calls to `draw()`. When *interactive* is *True*, then every pyplot command triggers a draw.

The pyplot interface provides 4 commands that are useful for interactive control.

`isinteractive()` returns the interactive setting *True|False*

`ion()` turns interactive mode on

`ioff()` turns interactive mode off

`draw()` forces a figure redraw

When working with a big figure in which drawing is expensive, you may want to turn matplotlib's interactive setting off temporarily to avoid the performance hit:

```
>>> #create big-expensive-figure
>>> ioff()      # turn updates off
>>> title('now how much would you pay?')
>>> xticklabels(fontsize=20, color='green')
>>> draw()      # force a draw
>>> savefig('alldone', dpi=300)
>>> close()
>>> ion()      # turn updating back on
>>> plot(rand(20), mfc='g', mec='r', ms=40, mew=4, ls='--', lw=3)
```

7.3 Event handling and picking

matplotlib works with a number of user interface toolkits (wxpython, tkinter, qt4, gtk, and macosx) and in order to support features like interactive panning and zooming of figures, it is helpful to the developers to have an API for interacting with the figure via key presses and mouse movements that is "GUI neutral" so we don't have to repeat a lot of code across the different user interfaces. Although the event handling API is GUI neutral, it is based on the GTK model, which was the first user interface matplotlib supported. The events that are triggered are also a bit richer vis-a-vis matplotlib than standard GUI events, including information like which *`matplotlib.axes.Axes`* the event occurred in. The events also understand the matplotlib coordinate system, and report event locations in both pixel and data coordinates.

7.3.1 Event connections

To receive events, you need to write a callback function and then connect your function to the event manager, which is part of the *`FigureCanvasBase`*. Here is a simple example that prints the location of the mouse click and which button was pressed:

```
fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(np.random.rand(10))

def onclick(event):
    print('button=%d, x=%d, y=%d, xdata=%f, ydata=%f' %
          (event.button, event.x, event.y, event.xdata, event.ydata))

cid = fig.canvas.mpl_connect('button_press_event', onclick)
```

The `FigureCanvas` method *`mpl_connect()`* returns a connection id which is simply an integer. When you want to disconnect the callback, just call:

```
fig.canvas.mpl_disconnect(cid)
```

Note: The canvas retains only weak references to the callbacks. Therefore if a callback is a method of a class instance, you need to retain a reference to that instance. Otherwise the instance will be garbage-collected and the callback will vanish.

Here are the events that you can connect to, the class instances that are sent back to you when the event occurs, and the event descriptions

Event name	Class and description
'button_press_event'	`MouseEvent` - mouse button is pressed
'button_release_event'	`MouseEvent` - mouse button is released
'draw_event'	`DrawEvent` - canvas draw
'key_press_event'	`KeyEvent` - key is pressed
'key_release_event'	`KeyEvent` - key is released
'motion_notify_event'	`MouseEvent` - mouse motion
'pick_event'	`PickEvent` - an object in the canvas is selected
'resize_event'	`ResizeEvent` - figure canvas is resized
'scroll_event'	`MouseEvent` - mouse scroll wheel is rolled
'figure_enter_event'	`LocationEvent` - mouse enters a new figure
'figure_leave_event'	`LocationEvent` - mouse leaves a figure
'axes_enter_event'	`LocationEvent` - mouse enters a new axes
'axes_leave_event'	`LocationEvent` - mouse leaves an axes

7.3.2 Event attributes

All matplotlib events inherit from the base class `matplotlib.backend_bases.Event`, which store the attributes:

`name` the event name

`canvas` the FigureCanvas instance generating the event

`guiEvent` the GUI event that triggered the matplotlib event

The most common events that are the bread and butter of event handling are key press/release events and mouse press/release and movement events. The `KeyEvent` and `MouseEvent` classes that handle these events are both derived from the LocationEvent, which has the following attributes

`x` x position - pixels from left of canvas

`y` y position - pixels from bottom of canvas

`inaxes` the `Axes` instance if mouse is over axes

`xdata` x coord of mouse in data coords

`ydata` y coord of mouse in data coords

Let's look a simple example of a canvas, where a simple line segment is created every time a mouse is pressed:

```python
from matplotlib import pyplot as plt

class LineBuilder:
    def __init__(self, line):
        self.line = line
        self.xs = list(line.get_xdata())
        self.ys = list(line.get_ydata())
        self.cid = line.figure.canvas.mpl_connect('button_press_event', self)

    def __call__(self, event):
        print('click', event)
        if event.inaxes!=self.line.axes: return
        self.xs.append(event.xdata)
        self.ys.append(event.ydata)
        self.line.set_data(self.xs, self.ys)
        self.line.figure.canvas.draw()

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click to build line segments')
line, = ax.plot([0], [0])  # empty line
linebuilder = LineBuilder(line)

plt.show()
```

The *`MouseEvent`* that we just used is a *`LocationEvent`*, so we have access to the data and pixel coordinates in event.x and event.xdata. In addition to the `LocationEvent` attributes, it has

`button` button pressed None, 1, 2, 3, 'up', 'down' (up and down are used for scroll events)

`key` the key pressed: None, any character, 'shift', 'win', or 'control'

Draggable rectangle exercise

Write draggable rectangle class that is initialized with a *`Rectangle`* instance but will move its x,y location when dragged. Hint: you will need to store the original `xy` location of the rectangle which is stored as rect.xy and connect to the press, motion and release mouse events. When the mouse is pressed, check to see if the click occurs over your rectangle (see `matplotlib.patches.Rectangle.contains()`) and if it does, store the rectangle xy and the location of the mouse click in data coords. In the motion event callback, compute the deltax and deltay of the mouse movement, and add those deltas to the origin of the rectangle you stored. The redraw the figure. On the button release event, just reset all the button press data you stored as None.

Here is the solution:

```
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    def __init__(self, rect):
        self.rect = rect
        self.press = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect(
            'button_press_event', self.on_press)
        self.cidrelease = self.rect.figure.canvas.mpl_connect(
            'button_release_event', self.on_release)
        self.cidmotion = self.rect.figure.canvas.mpl_connect(
            'motion_notify_event', self.on_motion)

    def on_press(self, event):
        'on button press we will see if the mouse is over us and store some data'
        if event.inaxes != self.rect.axes: return

        contains, attrd = self.rect.contains(event)
        if not contains: return
        print('event contains', self.rect.xy)
        x0, y0 = self.rect.xy
        self.press = x0, y0, event.xdata, event.ydata

    def on_motion(self, event):
        'on motion we will move the rect if the mouse is over us'
        if self.press is None: return
        if event.inaxes != self.rect.axes: return
        x0, y0, xpress, ypress = self.press
        dx = event.xdata - xpress
        dy = event.ydata - ypress
        #print('x0=%f, xpress=%f, event.xdata=%f, dx=%f, x0+dx=%f' %
        #      (x0, xpress, event.xdata, dx, x0+dx))
        self.rect.set_x(x0+dx)
        self.rect.set_y(y0+dy)

        self.rect.figure.canvas.draw()

    def on_release(self, event):
        'on release we reset the press data'
        self.press = None
        self.rect.figure.canvas.draw()

    def disconnect(self):
        'disconnect all the stored connection ids'
        self.rect.figure.canvas.mpl_disconnect(self.cidpress)
        self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
        self.rect.figure.canvas.mpl_disconnect(self.cidmotion)

fig = plt.figure()
ax = fig.add_subplot(111)
rects = ax.bar(range(10), 20*np.random.rand(10))
drs = []
for rect in rects:
    dr = DraggableRectangle(rect)
    dr.connect()
    drs.append(dr)

plt.show()
```

Extra credit: use the animation blit techniques discussed in the animations recipe to make the animated drawing faster and smoother.

Extra credit solution:

```
# draggable rectangle with the animation blit techniques; see
# http://www.scipy.org/Cookbook/Matplotlib/Animations
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    lock = None  # only one can be animated at a time
    def __init__(self, rect):
        self.rect = rect
        self.press = None
        self.background = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect(
            'button_press_event', self.on_press)
        self.cidrelease = self.rect.figure.canvas.mpl_connect(
            'button_release_event', self.on_release)
        self.cidmotion = self.rect.figure.canvas.mpl_connect(
            'motion_notify_event', self.on_motion)

    def on_press(self, event):
        'on button press we will see if the mouse is over us and store some data'
        if event.inaxes != self.rect.axes: return
        if DraggableRectangle.lock is not None: return
        contains, attrd = self.rect.contains(event)
        if not contains: return
        print('event contains', self.rect.xy)
        x0, y0 = self.rect.xy
        self.press = x0, y0, event.xdata, event.ydata
        DraggableRectangle.lock = self

        # draw everything but the selected rectangle and store the pixel buffer
        canvas = self.rect.figure.canvas
        axes = self.rect.axes
        self.rect.set_animated(True)
        canvas.draw()
        self.background = canvas.copy_from_bbox(self.rect.axes.bbox)

        # now redraw just the rectangle
        axes.draw_artist(self.rect)

        # and blit just the redrawn area
        canvas.blit(axes.bbox)

    def on_motion(self, event):
        'on motion we will move the rect if the mouse is over us'
        if DraggableRectangle.lock is not self:
            return
        if event.inaxes != self.rect.axes: return
        x0, y0, xpress, ypress = self.press
        dx = event.xdata - xpress
        dy = event.ydata - ypress
        self.rect.set_x(x0+dx)
        self.rect.set_y(y0+dy)

        canvas = self.rect.figure.canvas
        axes = self.rect.axes
        # restore the background region
        canvas.restore_region(self.background)

        # redraw just the current rectangle
        axes.draw_artist(self.rect)

        # blit just the redrawn area
        canvas.blit(axes.bbox)

    def on_release(self, event):
        'on release we reset the press data'
        if DraggableRectangle.lock is not self:
            return

        self.press = None
        DraggableRectangle.lock = None

        # turn off the rect animation property and reset the background
        self.rect.set_animated(False)
        self.background = None

        # redraw the full figure
        self.rect.figure.canvas.draw()

    def disconnect(self):
        'disconnect all the stored connection ids'
        self.rect.figure.canvas.mpl_disconnect(self.cidpress)
        self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
        self.rect.figure.canvas.mpl_disconnect(self.cidmotion)

fig = plt.figure()
ax = fig.add_subplot(111)
rects = ax.bar(range(10), 20*np.random.rand(10))
drs = []
for rect in rects:
    dr = DraggableRectangle(rect)
    dr.connect()
    drs.append(dr)

plt.show()
```

7.3.3 Mouse enter and leave

If you want to be notified when the mouse enters or leaves a figure or axes, you can connect to the figure/axes enter/leave events. Here is a simple example that changes the colors of the axes and figure background that the mouse is over:

```
"""
Illustrate the figure and axes enter and leave events by changing the
frame colors on enter and leave
"""
import matplotlib.pyplot as plt

def enter_axes(event):
    print('enter_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('yellow')
    event.canvas.draw()

def leave_axes(event):
    print('leave_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('white')
    event.canvas.draw()

def enter_figure(event):
    print('enter_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('red')
    event.canvas.draw()

def leave_figure(event):
    print('leave_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('grey')
    event.canvas.draw()

fig1 = plt.figure()
fig1.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig1.add_subplot(211)
ax2 = fig1.add_subplot(212)

fig1.canvas.mpl_connect('figure_enter_event', enter_figure)
fig1.canvas.mpl_connect('figure_leave_event', leave_figure)
fig1.canvas.mpl_connect('axes_enter_event', enter_axes)
fig1.canvas.mpl_connect('axes_leave_event', leave_axes)

fig2 = plt.figure()
fig2.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig2.add_subplot(211)
ax2 = fig2.add_subplot(212)

fig2.canvas.mpl_connect('figure_enter_event', enter_figure)
fig2.canvas.mpl_connect('figure_leave_event', leave_figure)
fig2.canvas.mpl_connect('axes_enter_event', enter_axes)
fig2.canvas.mpl_connect('axes_leave_event', leave_axes)

plt.show()
```

7.3.4 Object picking

You can enable picking by setting the `picker` property of an *`Artist`* (e.g., a matplotlib *`Line2D`*, *`Text`*, *`Patch`*, *`Polygon`*, `AxesImage`, etc...)

There are a variety of meanings of the `picker` property:

`None` picking is disabled for this artist (default)

`boolean` if True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist

`float` if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

`function` if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event. The signature is `hit, props = picker(artist, mouseevent)` to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the *`PickEvent`* attributes

After you have enabled an artist for picking by setting the `picker` property, you need to connect to the figure canvas pick_event to get pick callbacks on mouse press events. e.g.:

```
def pick_handler(event):
    mouseevent = event.mouseevent
    artist = event.artist
    # now do something with this...
```

The *`PickEvent`* which is passed to your callback is always fired with two attributes:

`mouseevent` the mouse event that generate the pick event. The mouse event in turn has attributes like `x` and `y` (the coords in display space, e.g., pixels from left, bottom) and xdata, ydata (the coords in data space). Additionally, you can get information about which buttons were pressed, which keys were pressed, which *`Axes`* the mouse is over, etc. See *`matplotlib.backend_bases.MouseEvent`* for details.

`artist` the *`Artist`* that generated the pick event.

Additionally, certain artists like *`Line2D`* and *`PatchCollection`* may attach additional meta data like the indices into the data that meet the picker criteria (e.g., all the points in the line that are within the specified epsilon tolerance)

Simple picking example

In the example below, we set the line picker property to a scalar, so it represents a tolerance in points (72 points per inch). The onpick callback function will be called when the pick event it within the tolerance distance from the line, and has the indices of the data vertices that are within the pick distance tolerance. Our onpick callback function simply prints the data that are under the pick location. Different matplotlib Artists can attach different data to the PickEvent. For example, `Line2D` attaches the ind property, which are the indices into the line data under the pick point. See `pick()` for details on the `PickEvent` properties of the line. Here is the code:

```
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on points')

line, = ax.plot(np.random.rand(100), 'o', picker=5)  # 5 points tolerance

def onpick(event):
    thisline = event.artist
    xdata = thisline.get_xdata()
    ydata = thisline.get_ydata()
    ind = event.ind
    points = tuple(zip(xdata[ind], ydata[ind]))
    print('onpick points:', points)

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
```

Picking exercise

Create a data set of 100 arrays of 1000 Gaussian random numbers and compute the sample mean and standard deviation of each of them (hint: numpy arrays have a mean and std method) and make a xy marker plot of the 100 means vs the 100 standard deviations. Connect the line created by the plot command to the pick event, and plot the original time series of the data that generated the clicked on points. If more than one point is within the tolerance of the clicked on point, you can use multiple subplots to plot the multiple time series.

Exercise solution:

```
"""
compute the mean and stddev of 100 data sets and plot mean vs stddev.
When you click on one of the mu, sigma points, plot the raw data from
the dataset that generated the mean and stddev
"""
import numpy as np
import matplotlib.pyplot as plt

X = np.random.rand(100, 1000)
xs = np.mean(X, axis=1)
ys = np.std(X, axis=1)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on point to plot time series')
line, = ax.plot(xs, ys, 'o', picker=5)  # 5 points tolerance
```

```
def onpick(event):

    if event.artist!=line: return True

    N = len(event.ind)
    if not N: return True

    figi = plt.figure()
    for subplotnum, dataind in enumerate(event.ind):
        ax = figi.add_subplot(N,1,subplotnum+1)
        ax.plot(X[dataind])
        ax.text(0.05, 0.9, 'mu=%1.3f\nsigma=%1.3f'%(xs[dataind], ys[dataind]),
                transform=ax.transAxes, va='top')
        ax.set_ylim(-0.5, 1.5)
    figi.show()
    return True

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
```

CHAPTER

EIGHT

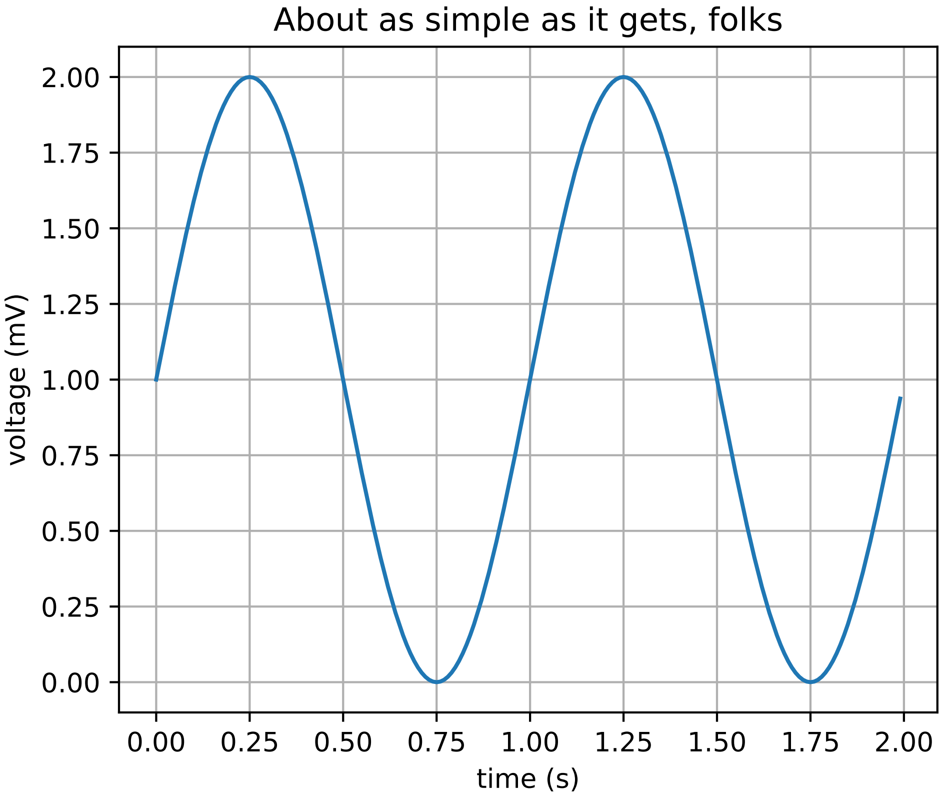
SELECTED EXAMPLES

8.1 Screenshots

Here you'll find a host of example plots with the code that generated them.

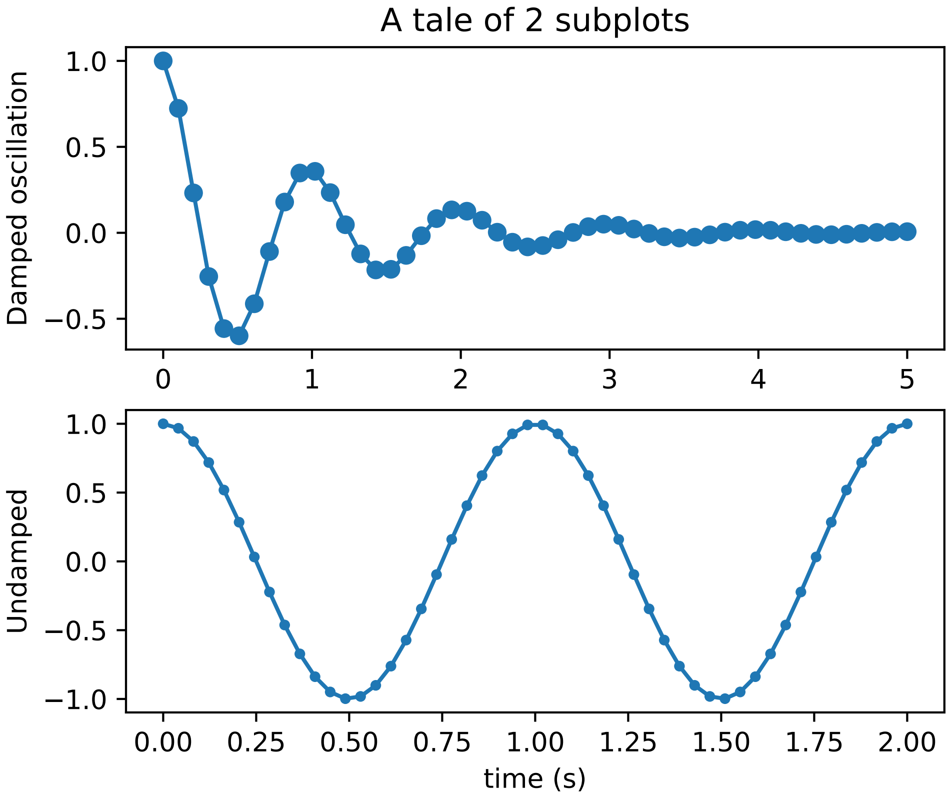
8.1.1 Simple Plot

Here's a very basic `plot()` with text labels:



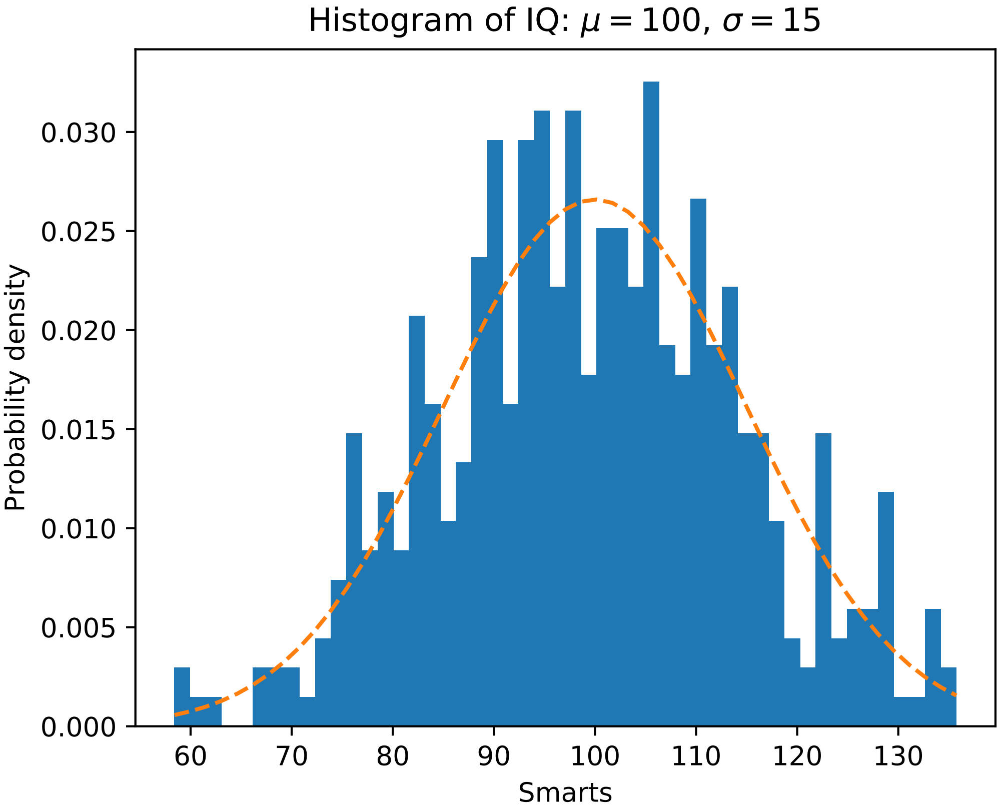
8.1.2 Subplot demo

Multiple axes (i.e. subplots) are created with the *subplot()* command:



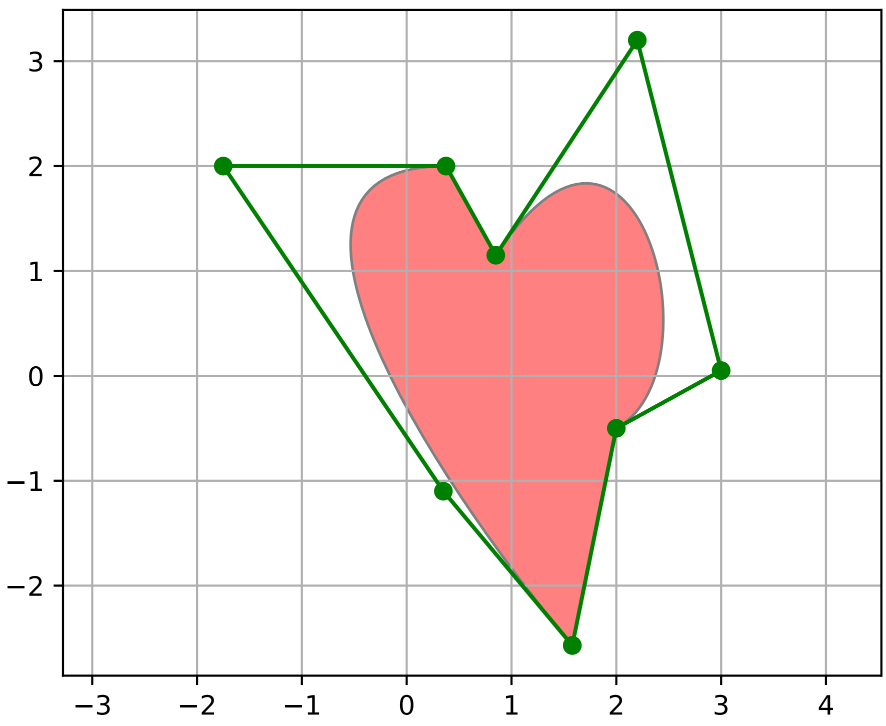
8.1.3 Histograms

The *hist()* command automatically generates histograms and returns the bin counts or probabilities:



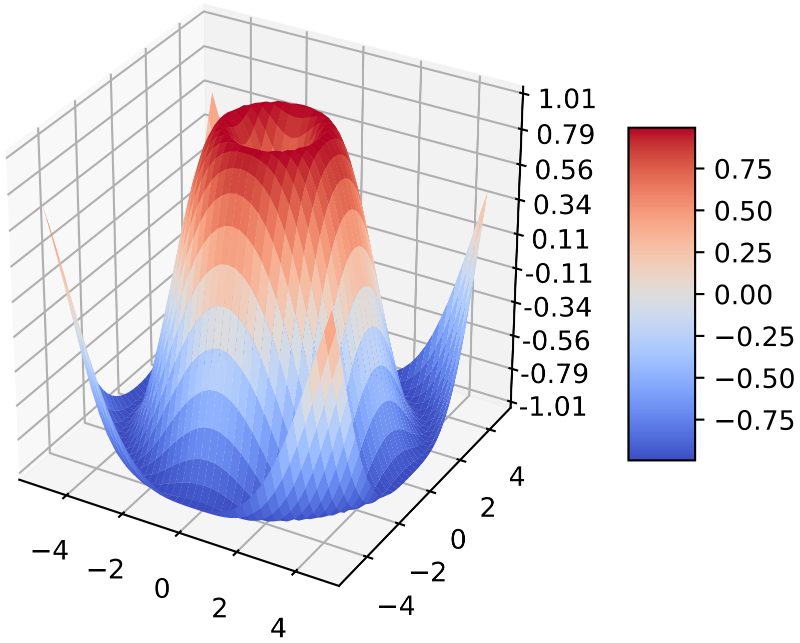
8.1.4 Path demo

You can add arbitrary paths in matplotlib using the `matplotlib.path` module:



8.1.5 mplot3d

The mplot3d toolkit (see *mplot3d tutorial* and *mplot3d Examples*) has support for simple 3d graphs including surface, wireframe, scatter, and bar charts.



Thanks to John Porter, Jonathon Taylor, Reinier Heeres, and Ben Root for the `mplot3d` toolkit. This toolkit is included with all standard matplotlib installs.

8.1.6 Streamplot

The *streamplot()* function plots the streamlines of a vector field. In addition to simply plotting the streamlines, it allows you to map the colors and/or line widths of streamlines to a separate parameter, such as the speed or local intensity of the vector field.

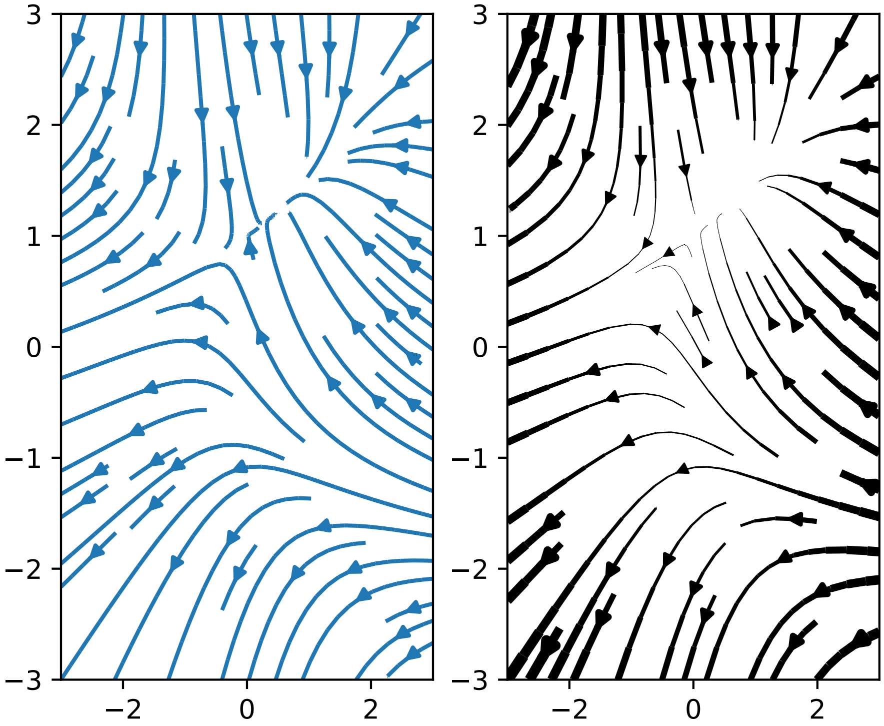
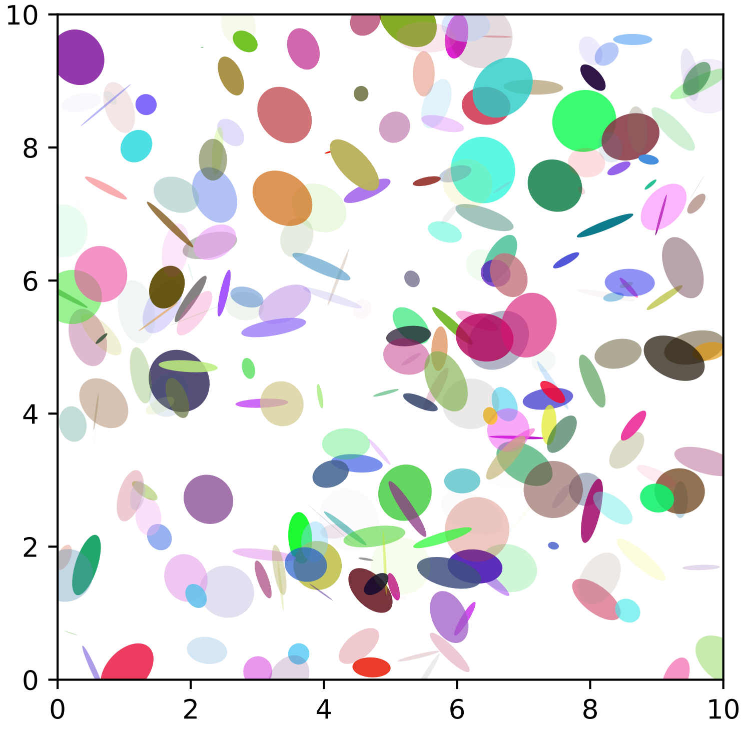
−12



This feature complements the `quiver()` function for plotting vector fields. Thanks to Tom Flannaghan and Tony Yu for adding the streamplot function.

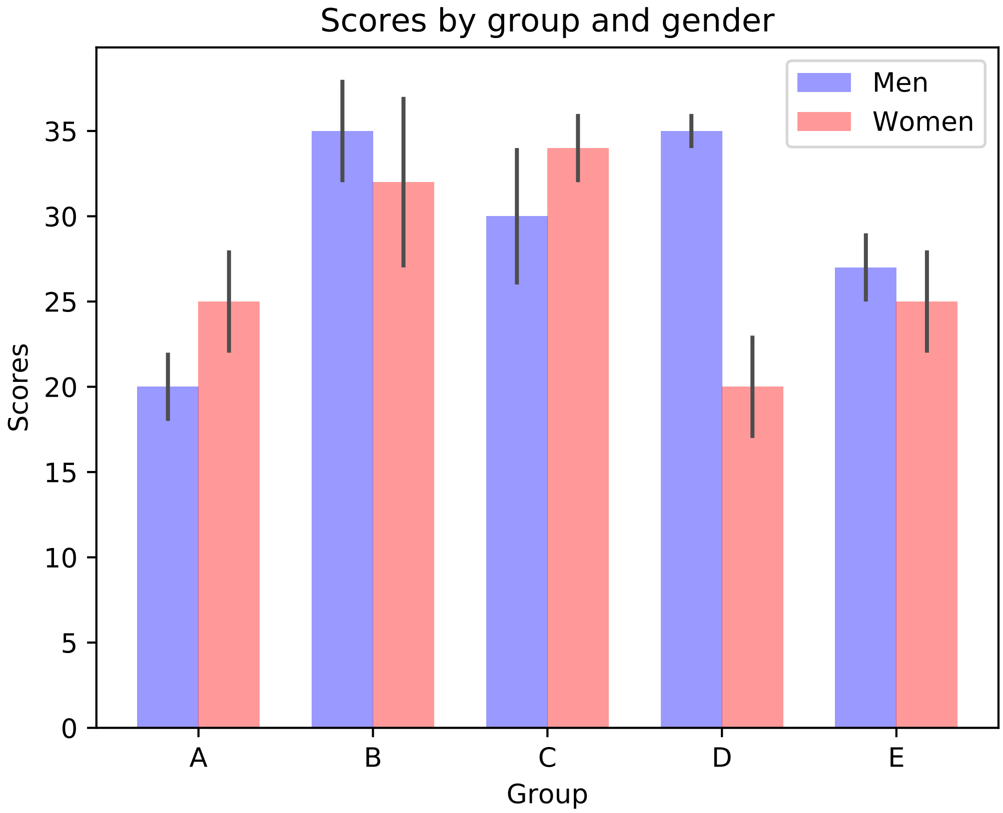
8.1.7 Ellipses

In support of the Phoenix mission to Mars (which used matplotlib to display ground tracking of spacecraft), Michael Droettboom built on work by Charlie Moad to provide an extremely accurate 8-spline approximation to elliptical arcs (see `Arc`), which are insensitive to zoom level.



8.1.8 Bar charts

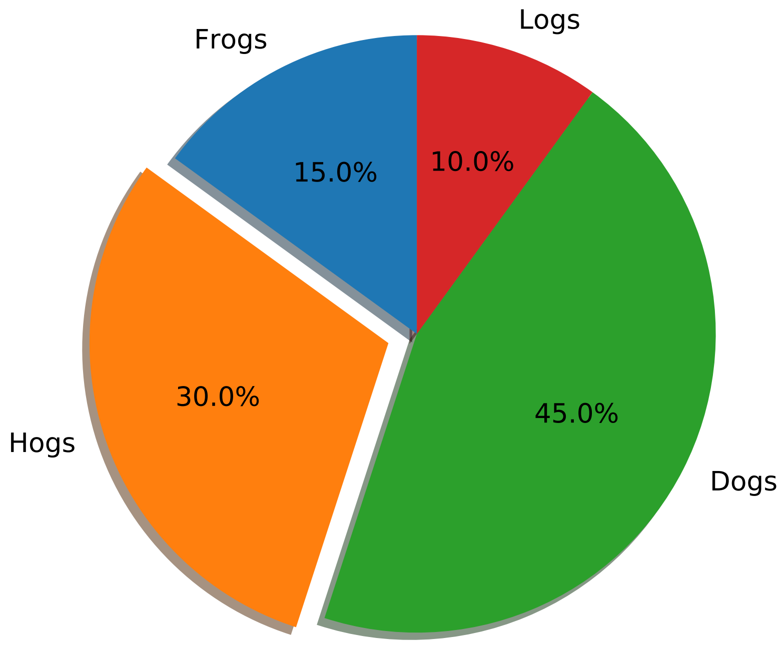
Bar charts are simple to create using the `bar()` command, which includes customizations such as error bars:



It’s also simple to create stacked bars (bar_stacked.py), or horizontal bar charts (barh_demo.py).

8.1.9 Pie charts

The `pie()` command allows you to easily create pie charts. Optional features include auto-labeling the percentage of area, exploding one or more wedges from the center of the pie, and a shadow effect. Take a close look at the attached code, which generates this figure in just a few lines of code.



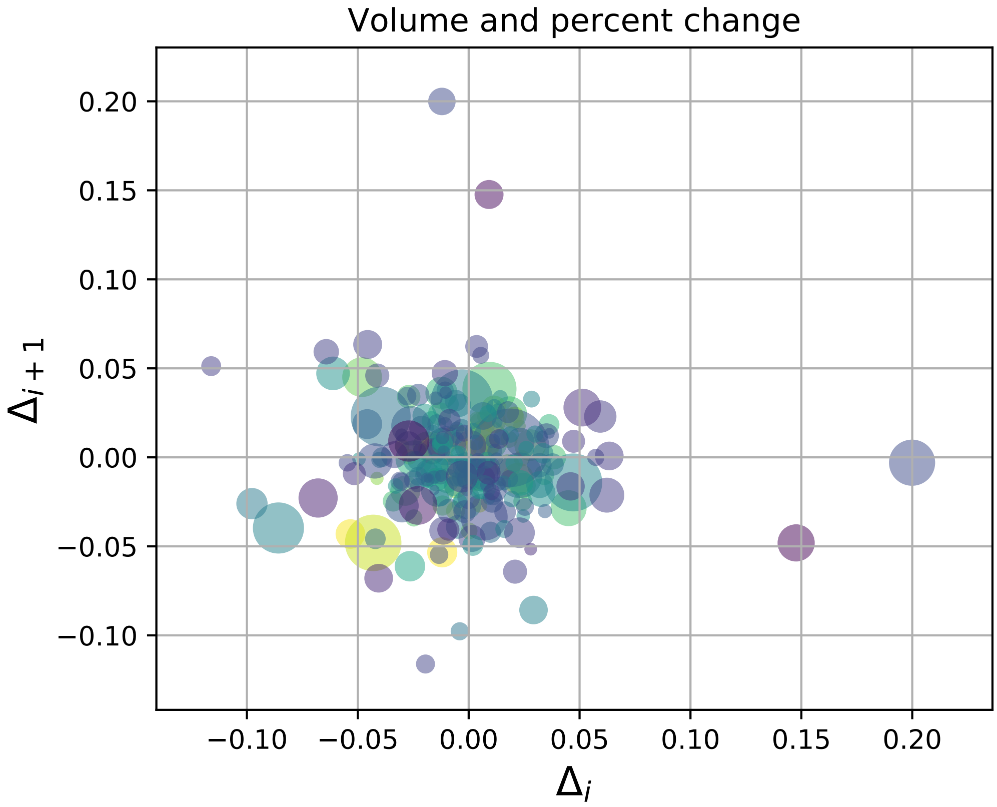
8.1.10 Table demo

The *`table()`* command adds a text table to an axes.

	Freeze	Wind	Flood	Quake	Hail
100 year	431.5	1049.4	799.6	2149.8	917.9
50 year	292.2	717.8	456.4	1368.5	865.6
20 year	213.8	636.0	305.7	1175.2	796.0
10 year	124.6	555.4	153.2	677.2	192.5
5 year	66.4	174.3	75.1	577.9	32.0

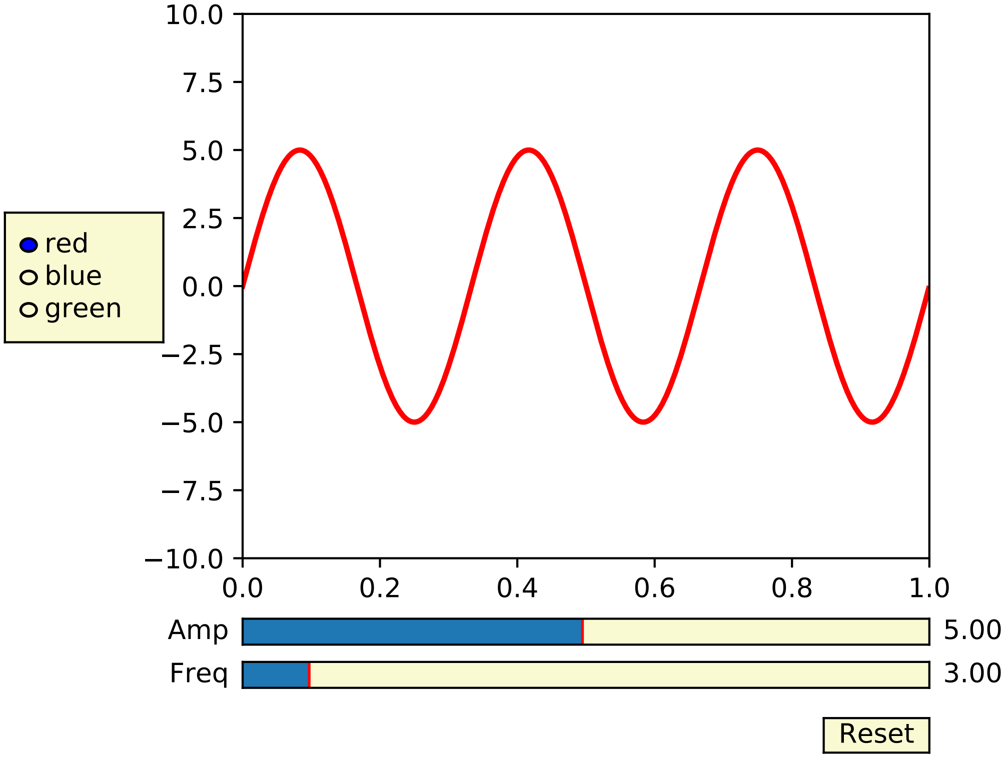
8.1.11 Scatter demo

The `scatter()` command makes a scatter plot with (optional) size and color arguments. This example plots changes in Google's stock price, with marker sizes reflecting the trading volume and colors varying with time. Here, the alpha attribute is used to make semitransparent circle markers.



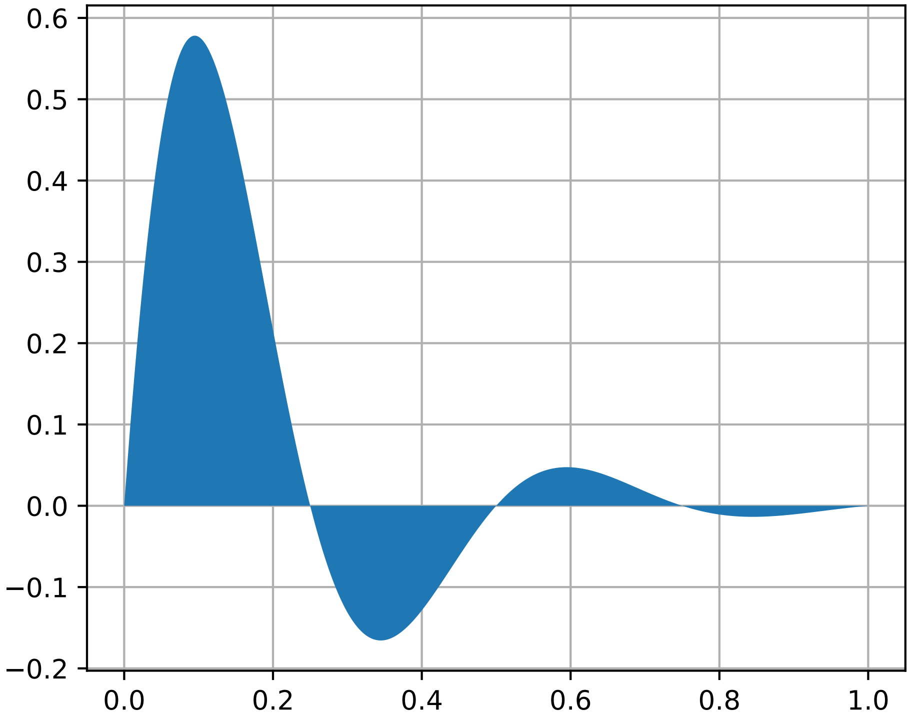
8.1.12 Slider demo

Matplotlib has basic GUI widgets that are independent of the graphical user interface you are using, allowing you to write cross GUI figures and widgets. See `matplotlib.widgets` and the widget examples.



8.1.13 Fill demo

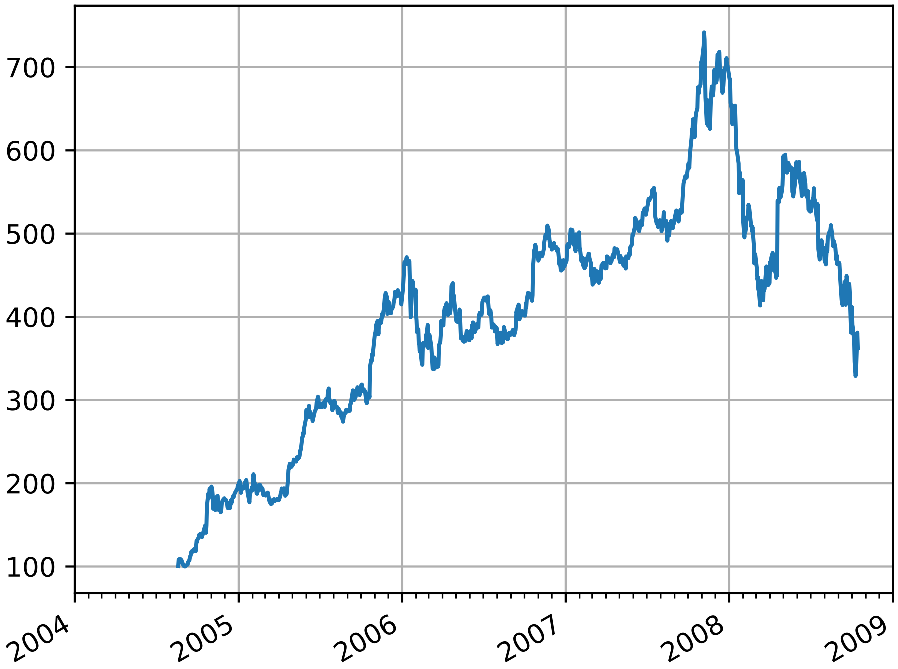
The *fill()* command lets you plot filled curves and polygons:



Thanks to Andrew Straw for adding this function.

8.1.14 Date demo

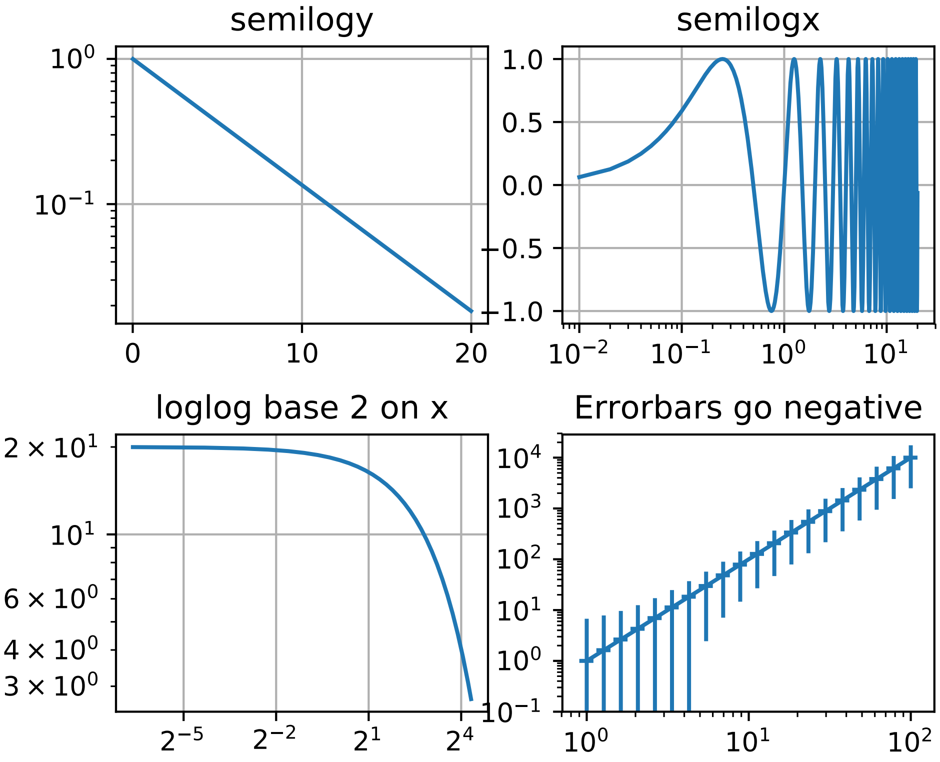
You can plot date data with major and minor ticks and custom tick formatters for both.



See *`matplotlib.ticker`* and *`matplotlib.dates`* for details and usage.

8.1.15 Log plots

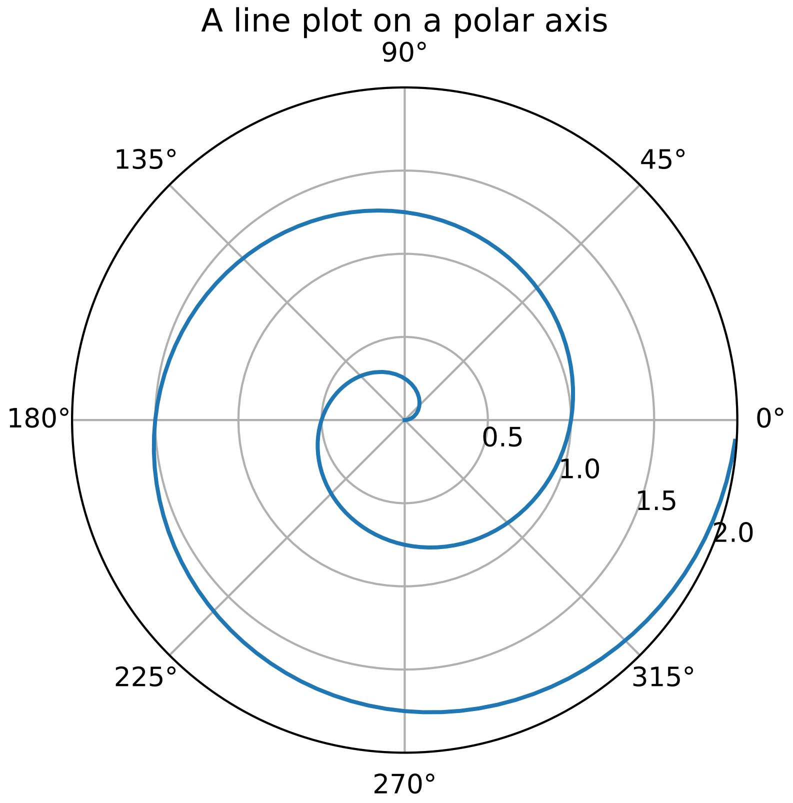
The *`semilogx()`*, *`semilogy()`* and *`loglog()`* functions simplify the creation of logarithmic plots.



Thanks to Andrew Straw, Darren Dale and Gregory Lielens for contributions log-scaling infrastructure.

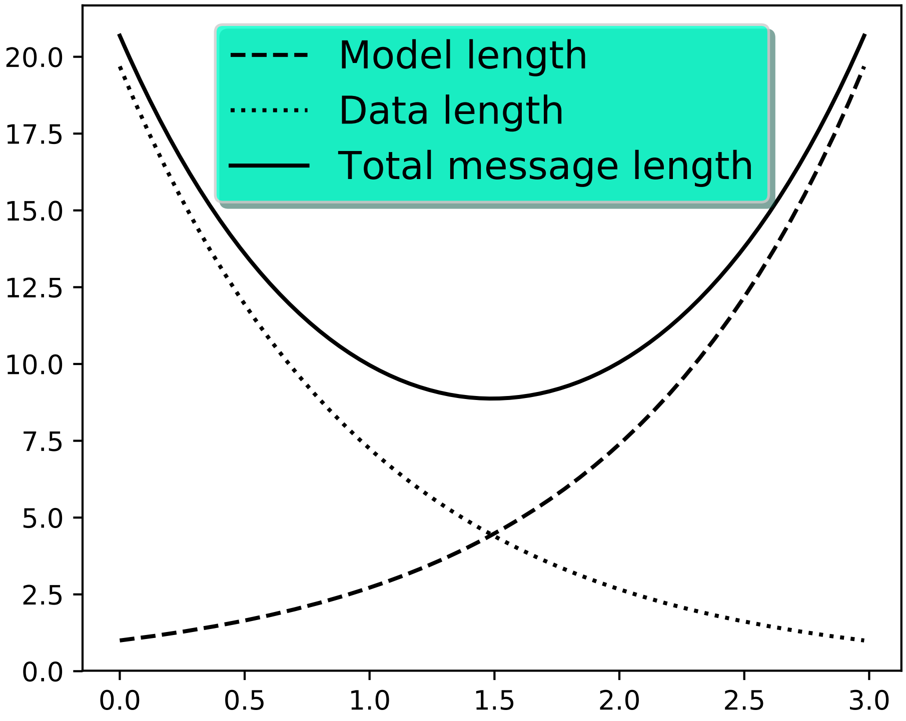
8.1.16 Polar plots

The *`polar()`* command generates polar plots.



8.1.17 Legends

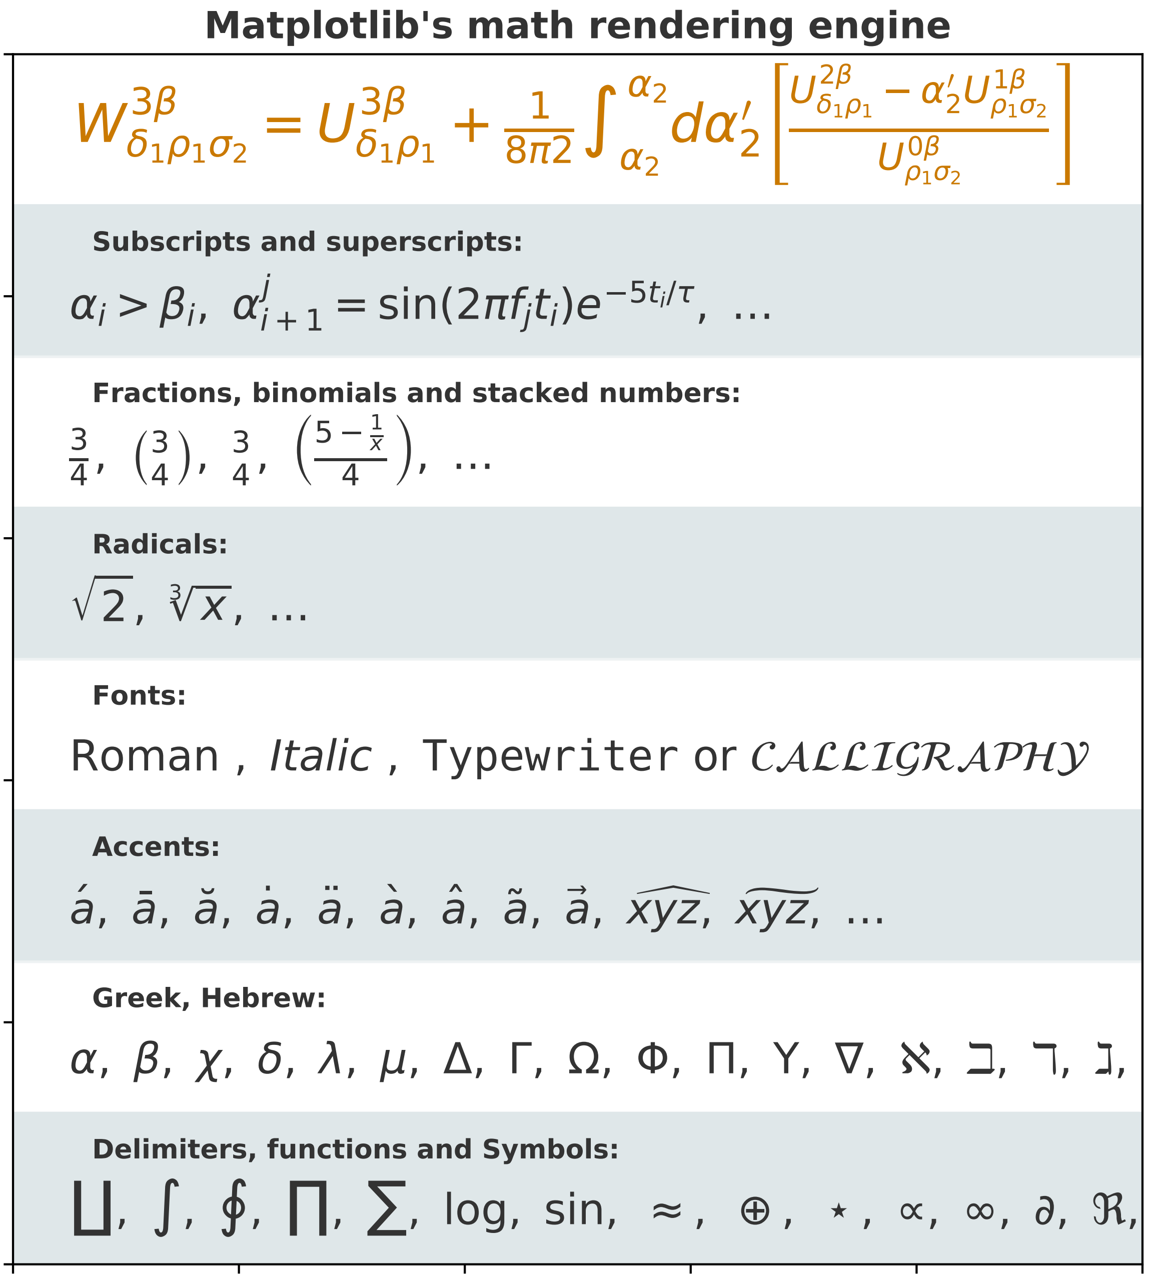
The `legend()` command automatically generates figure legends, with MATLAB-compatible legend placement commands.



Thanks to Charles Twardy for input on the legend command.

8.1.18 Mathtext_examples

Below is a sampling of the many TeX expressions now supported by matplotlib's internal mathtext engine. The mathtext module provides TeX style mathematical expressions using FreeType and the DejaVu, BaKoMa computer modern, or STIX fonts. See the `matplotlib.mathtext` module for additional details.

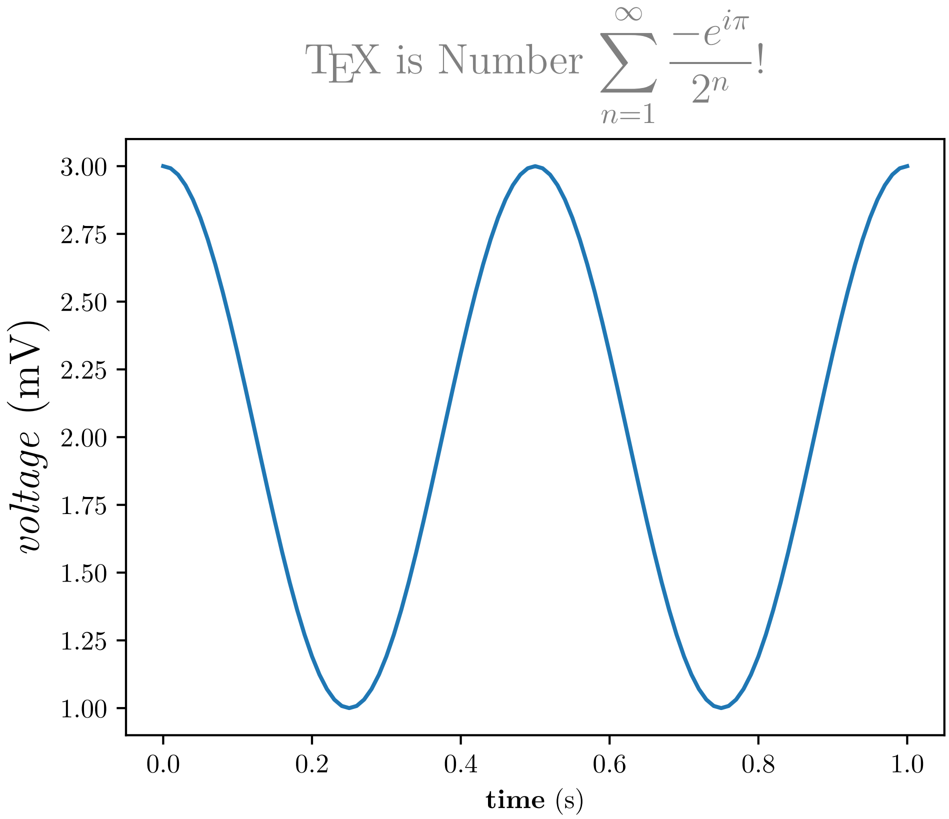


Matplotlib's math rendering engine
$W^{3\beta}_{\delta_1 \rho_1 \sigma_2} = U^{3\beta}_{\delta_1 \rho_1} + \frac{1}{8 \pi 2} \int^{\alpha_2}_{\alpha_2} d \alpha^\prime_2 \left[\frac{ U^{2\beta}_{\delta_1 \rho_1} - \alpha^\prime_2U^{1\beta}_{\rho_1 \sigma_2} }{U^{0\beta}_{\rho_1 \sigma_2}}\right]$
Subscripts and superscripts:
$\alpha_i > \beta_i,\ \alpha_{i+1}^j = \sin(2\pi f_j t_i) e^{-5 t_i/\tau},\ \ldots$
Fractions, binomials and stacked numbers:
$\frac{3}{4},\ \binom{3}{4},\ \genfrac{}{}{0}{}{3}{4},\ \left(\frac{5 - \frac{1}{x}}{4}\right),\ \ldots$
Radicals:
$\sqrt{2},\ \sqrt[3]{x},\ \ldots$
Fonts:
Roman , Italic , Typewriter or CALLIGRAPHY
Accents:
$\acute a,\ \bar a,\ \breve a,\ \dot a,\ \ddot a,\ \grave a,\ \hat a,\ \tilde a,\ \vec a,\ \widehat{xyz},\ \widetilde{xyz},\ \ldots$
Greek, Hebrew:
$\alpha,\ \beta,\ \chi,\ \delta,\ \lambda,\ \mu,\ \Delta,\ \Gamma,\ \Omega,\ \Phi,\ \Pi,\ \Upsilon,\ \nabla,\ \aleph,\ \beth,\ \daleth,\ \gimel,$
Delimiters, functions and Symbols:
$\coprod,\ \int,\ \oint,\ \prod,\ \sum,\ \log,\ \sin,\ \approx,\ \oplus,\ \star,\ \varpropto,\ \infty,\ \partial,\ \Re,$

Matplotlib's mathtext infrastructure is an independent implementation and does not require TeX or any external packages installed on your computer. See the tutorial at *Writing mathematical expressions*.

8.1.19 Native TeX rendering

Although matplotlib's internal math rendering engine is quite powerful, sometimes you need TeX. Matplotlib supports external TeX rendering of strings with the *usetex* option.



8.1.20 EEG demo

You can embed matplotlib into pygtk, wx, Tk, or Qt applications. Here is a screenshot of an EEG viewer called pbrain.

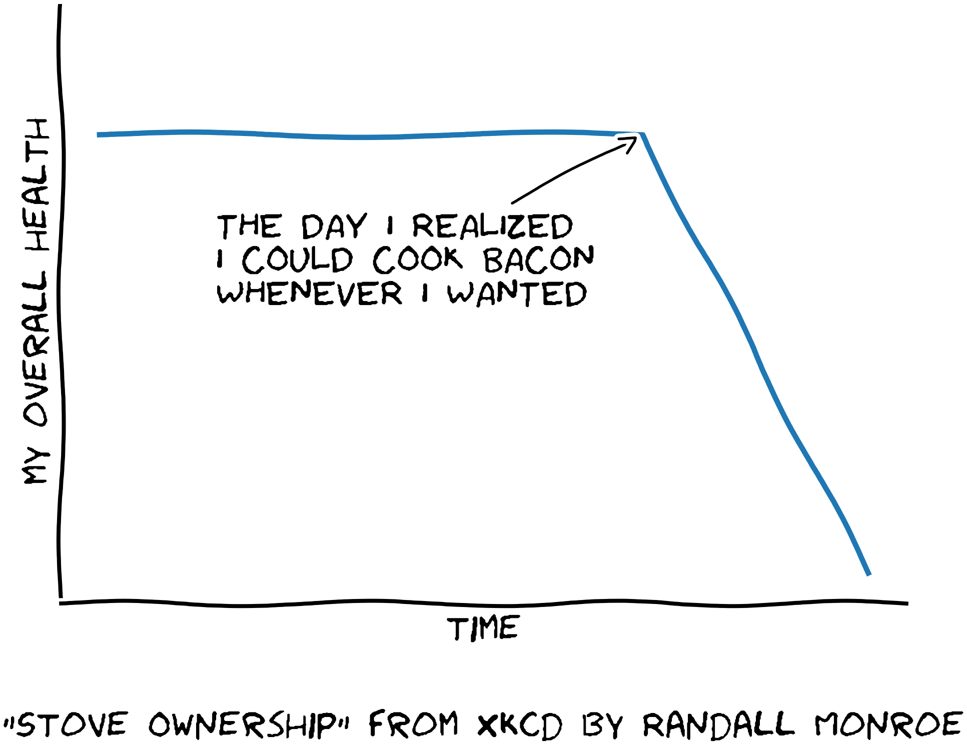
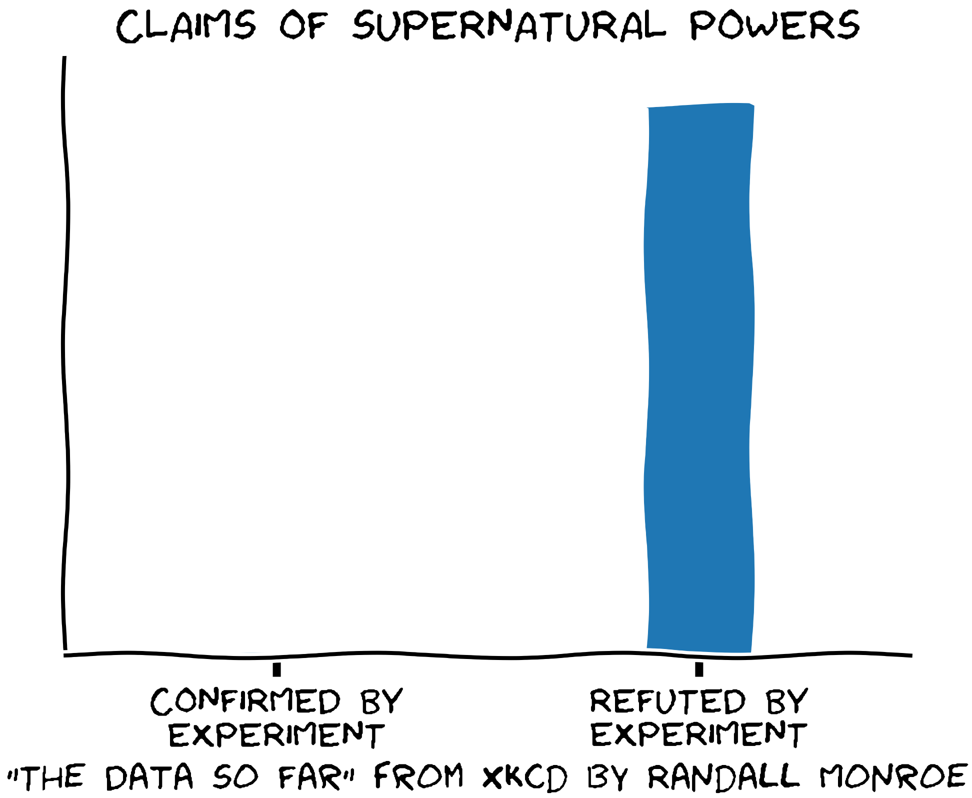
8.1.21 XKCD-style sketch plots

matplotlib supports plotting in the style of `xkcd`.



MY OVERALL HEALTH
THE DAY I REALIZED
I COULD COOK BACON
WHENEVER I WANTED
TIME
"STOVE OWNERSHIP" FROM XKCD BY RANDALL MONROE



8.2 Our Favorite Recipes

Here is a collection of short tutorials, examples and code snippets that illustrate some of the useful idioms and tricks to make snazzier figures and overcome some matplotlib warts.

8.2.1 Sharing axis limits and views

It's common to make two or more plots which share an axis, e.g., two subplots with time as a common axis. When you pan and zoom around on one, you want the other to move around with you. To facilitate this, matplotlib Axes support a `sharex` and `sharey` attribute. When you create a *`subplot()`* or *`axes()`* instance, you can pass in a keyword indicating what axes you want to share with

```
In [96]: t = np.arange(0, 10, 0.01)

In [97]: ax1 = plt.subplot(211)

In [98]: ax1.plot(t, np.sin(2*np.pi*t))
Out[98]: [<matplotlib.lines.Line2D object at 0x98719ec>]

In [99]: ax2 = plt.subplot(212, sharex=ax1)
In [100]: ax2.plot(t, np.sin(4*np.pi*t))
Out[100]: [<matplotlib.lines.Line2D object at 0xb7d8fec>]
```

8.2.2 Easily creating subplots

In early versions of matplotlib, if you wanted to use the pythonic API and create a figure instance and from that create a grid of subplots, possibly with shared axes, it involved a fair amount of boilerplate code. e.g.

```
# old style
fig = plt.figure()
ax1 = fig.add_subplot(221)
ax2 = fig.add_subplot(222, sharex=ax1, sharey=ax1)
ax3 = fig.add_subplot(223, sharex=ax1, sharey=ax1)
ax3 = fig.add_subplot(224, sharex=ax1, sharey=ax1)
```

Fernando Perez has provided a nice top level method to create in `subplots()` (note the "s" at the end) everything at once, and turn on x and y sharing for the whole bunch. You can either unpack the axes individually:

```
# new style method 1; unpack the axes
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(2, 2, sharex=True, sharey=True)
ax1.plot(x)
```

or get them back as a numrows x numcolumns object array which supports numpy indexing:

```
# new style method 2; use an axes array
fig, axs = plt.subplots(2, 2, sharex=True, sharey=True)
axs[0,0].plot(x)
```

8.2.3 Fixing common date annoyances

matplotlib allows you to natively plots python datetime instances, and for the most part does a good job picking tick locations and string formats. There are a couple of things it does not handle so gracefully, and here are some tricks to help you work around them. We'll load up some sample date data which contains datetime.date objects in a numpy record array:

```
In [63]: datafile = cbook.get_sample_data('goog.npy')

In [64]: r = np.load(datafile).view(np.recarray)

In [65]: r.dtype
Out[65]: dtype([('date', '|O4'), ('', '|V4'), ('open', '<f8'),
                ('high', '<f8'), ('low', '<f8'), ('close', '<f8'),
                ('volume', '<i8'),  ('adj_close', '<f8')])

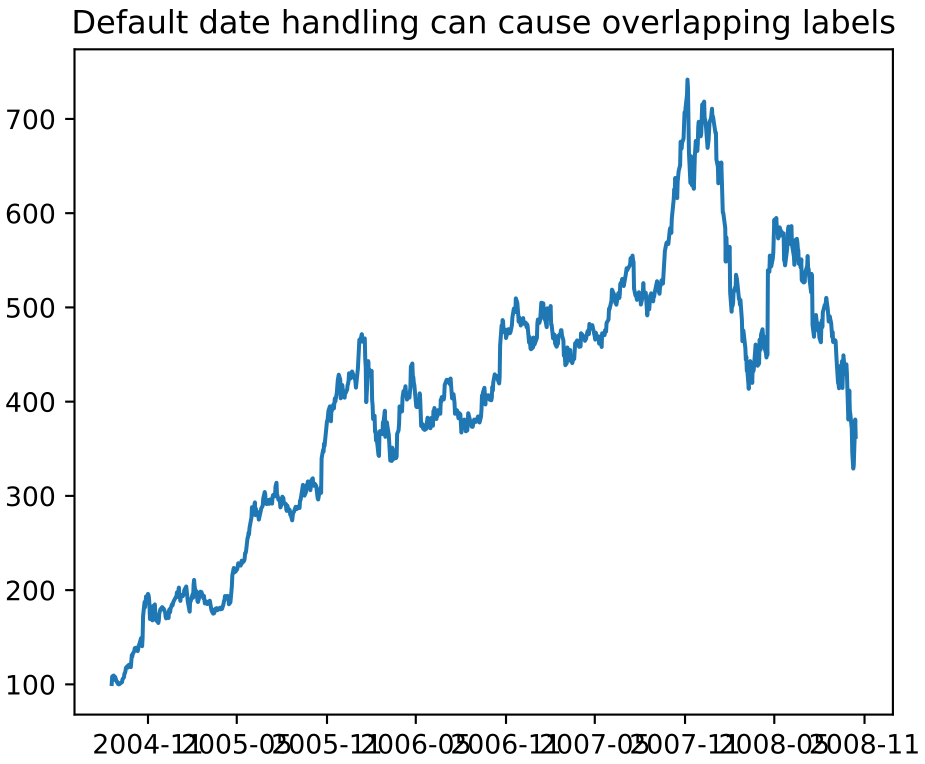
In [66]: r.date
Out[66]:
array([2004-08-19, 2004-08-20, 2004-08-23, ..., 2008-10-10, 2008-10-13,
       2008-10-14], dtype=object)
```

The dtype of the numpy record array for the field `date` is `|O4` which means it is a 4-byte python object pointer; in this case the objects are datetime.date instances, which we can see when we print some samples in the ipython terminal window.

If you plot the data,

```
In [67]: plot(r.date, r.close)
Out[67]: [<matplotlib.lines.Line2D object at 0x92a6b6c>]
```

you will see that the x tick labels are all squashed together.

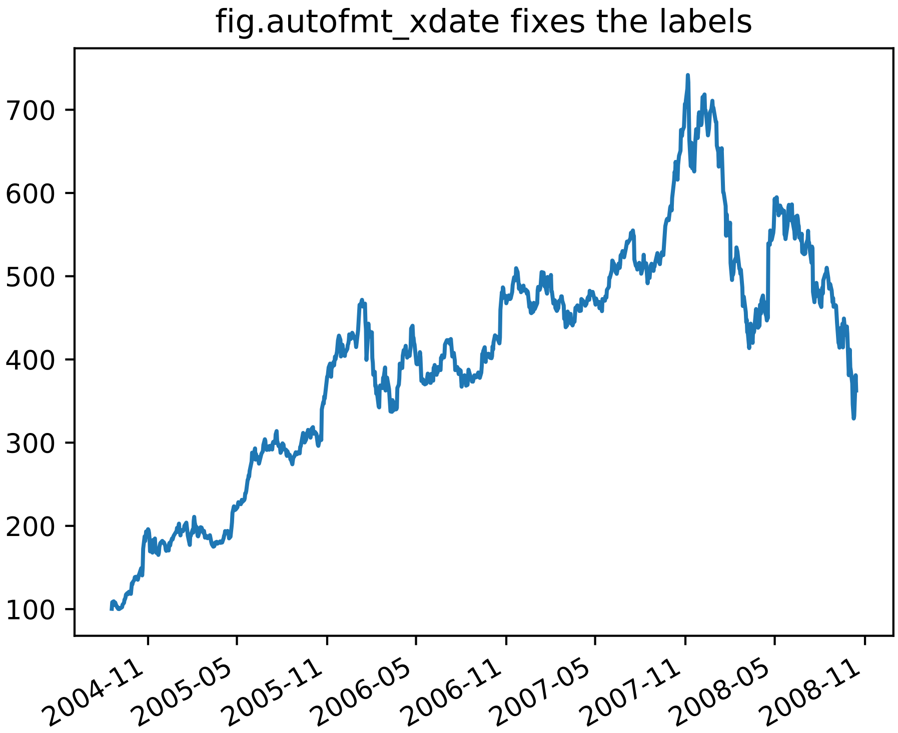


Another annoyance is that if you hover the mouse over the window and look in the lower right corner of the matplotlib toolbar (*Interactive navigation*) at the x and y coordinates, you see that the x locations are formatted the same way the tick labels are, e.g., "Dec 2004". What we'd like is for the location in the toolbar to have a higher degree of precision, e.g., giving us the exact date out mouse is hovering over. To fix the first problem, we can use `matplotlib.figure.Figure.autofmt_xdate()` and to fix the second problem we can use the `ax.fmt_xdata` attribute which can be set to any function that takes a scalar and returns a string. matplotlib has a number of date formatters built in, so we'll use one of those.

```
plt.close('all')
fig, ax = plt.subplots(1)
ax.plot(r.date, r.close)

# rotate and align the tick labels so they look better
fig.autofmt_xdate()
```

```
# use a more precise date string for the x axis locations in the
# toolbar
import matplotlib.dates as mdates
ax.fmt_xdata = mdates.DateFormatter('%Y-%m-%d')
plt.title('fig.autofmt_xdate fixes the labels')
```



Now when you hover your mouse over the plotted data, you'll see date format strings like 2004-12-01 in the toolbar.

8.2.4 Fill Between and Alpha

The *fill_between()* function generates a shaded region between a min and max boundary that is useful for illustrating ranges. It has a very handy `where` argument to combine filling with logical ranges, e.g., to just fill in a curve over some threshold value.

At its most basic level, `fill_between` can be use to enhance a graphs visual appearance. Let's compare two graphs of a financial times with a simple line plot on the left and a filled line on the right.

```
import matplotlib.pyplot as plt
import numpy as np

import matplotlib.cbook as cbook
```

```
# load up some sample financial data
datafile = cbook.get_sample_data('goog.npy')
try:
    # Python3 cannot load python2 .npy files with datetime(object) arrays
    # unless the encoding is set to bytes. Hovever this option was
    # not added until numpy 1.10 so this example will only work with
    # python 2 or with numpy 1.10 and later.
    r = np.load(datafile, encoding='bytes').view(np.recarray)
except TypeError:
    r = np.load(datafile).view(np.recarray)
# create two subplots with the shared x and y axes
fig, (ax1, ax2) = plt.subplots(1,2, sharex=True, sharey=True)

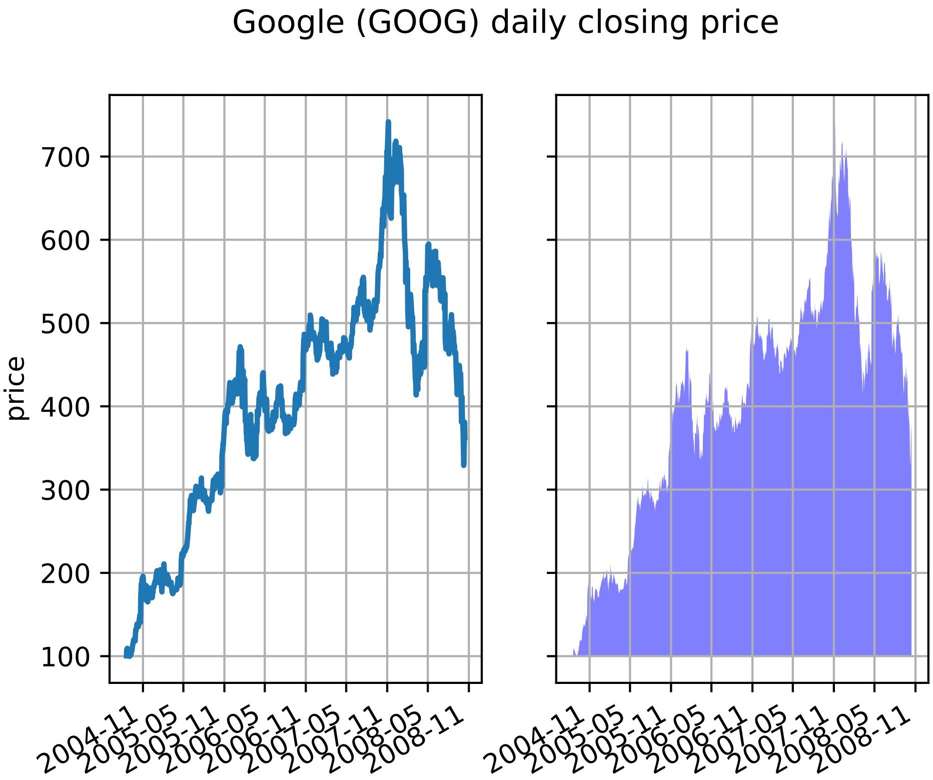
pricemin = r.close.min()

ax1.plot(r.date, r.close, lw=2)
ax2.fill_between(r.date, pricemin, r.close, facecolor='blue', alpha=0.5)

for ax in ax1, ax2:
    ax.grid(True)

ax1.set_ylabel('price')
for label in ax2.get_yticklabels():
    label.set_visible(False)

fig.suptitle('Google (GOOG) daily closing price')
fig.autofmt_xdate()
```



The alpha channel is not necessary here, but it can be used to soften colors for more visually appealing plots. In other examples, as we'll see below, the alpha channel is functionally useful as the shaded regions can overlap and alpha allows you to see both. Note that the postscript format does not support alpha (this is a postscript limitation, not a matplotlib limitation), so when using alpha save your figures in PNG, PDF or SVG.

Our next example computes two populations of random walkers with a different mean and standard deviation of the normal distributions from which the steps are drawn. We use shared regions to plot +/- one standard deviation of the mean position of the population. Here the alpha channel is useful, not just aesthetic.

```
import matplotlib.pyplot as plt
import numpy as np

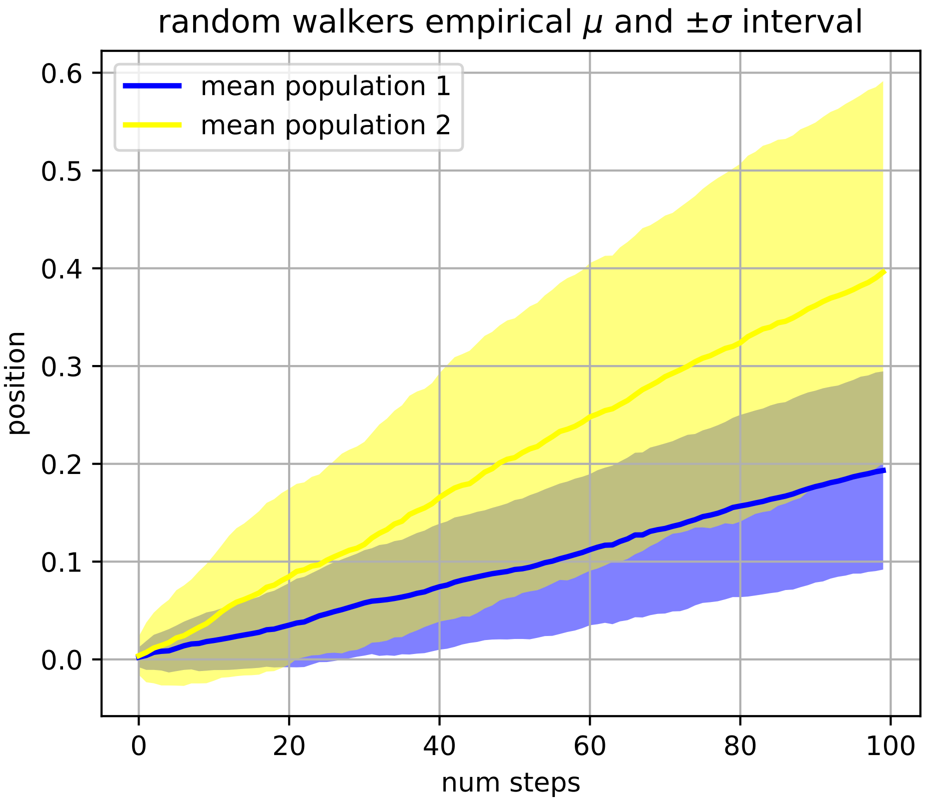
Nsteps, Nwalkers = 100, 250
t = np.arange(Nsteps)

# an (Nsteps x Nwalkers) array of random walk steps
S1 = 0.002 + 0.01*np.random.randn(Nsteps, Nwalkers)
S2 = 0.004 + 0.02*np.random.randn(Nsteps, Nwalkers)

# an (Nsteps x Nwalkers) array of random walker positions
X1 = S1.cumsum(axis=0)
X2 = S2.cumsum(axis=0)
```

```
# Nsteps length arrays empirical means and standard deviations of both
# populations over time
mu1 = X1.mean(axis=1)
sigma1 = X1.std(axis=1)
mu2 = X2.mean(axis=1)
sigma2 = X2.std(axis=1)

# plot it!
fig, ax = plt.subplots(1)
ax.plot(t, mu1, lw=2, label='mean population 1', color='blue')
ax.plot(t, mu2, lw=2, label='mean population 2', color='yellow')
ax.fill_between(t, mu1+sigma1, mu1-sigma1, facecolor='blue', alpha=0.5)
ax.fill_between(t, mu2+sigma2, mu2-sigma2, facecolor='yellow', alpha=0.5)
ax.set_title('random walkers empirical $\mu$ and $\pm \sigma$ interval')
ax.legend(loc='upper left')
ax.set_xlabel('num steps')
ax.set_ylabel('position')
ax.grid()
```



The `where` keyword argument is very handy for highlighting certain regions of the graph. `where` takes a boolean mask the same length as the x, ymin and ymax arguments, and only fills in the region where the boolean mask is True. In the example below, we simulate a single random walker and compute the analytic mean and standard deviation of the population positions. The population mean is shown as the black dashed line, and the plus/minus one sigma deviation from the mean is shown as the yellow filled region. We use the where mask `X>upper_bound` to find the region where the walker is above the one sigma boundary, and shade that region blue.

```
np.random.seed(1234)

Nsteps = 500
t = np.arange(Nsteps)

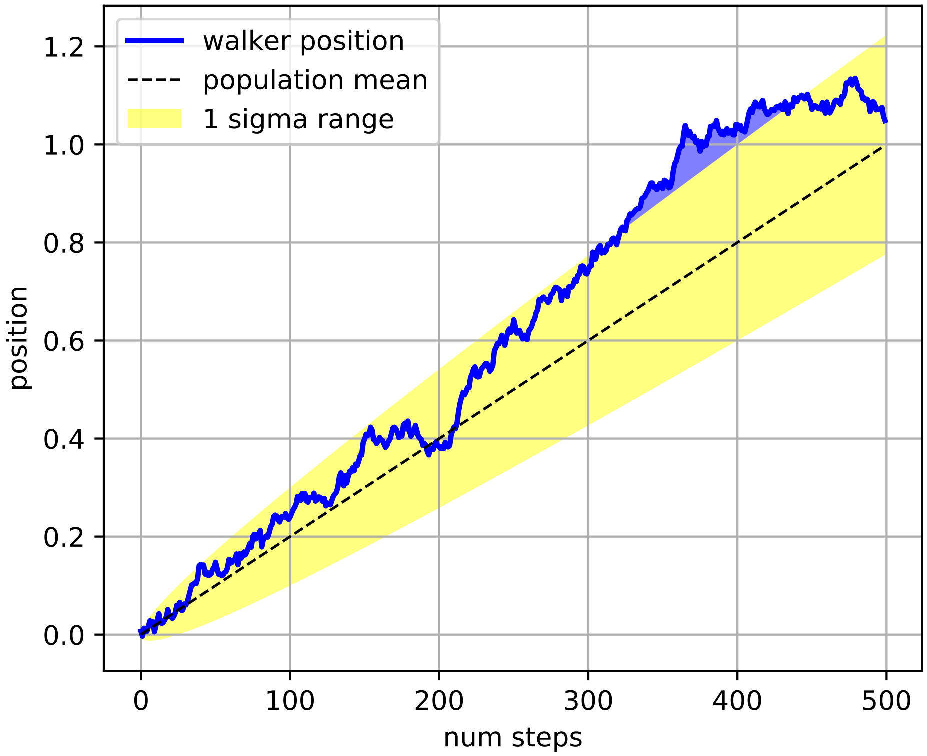
mu = 0.002
sigma = 0.01

# the steps and position
S = mu + sigma*np.random.randn(Nsteps)
X = S.cumsum()

# the 1 sigma upper and lower analytic population bounds
lower_bound = mu*t - sigma*np.sqrt(t)
upper_bound = mu*t + sigma*np.sqrt(t)

fig, ax = plt.subplots(1)
ax.plot(t, X, lw=2, label='walker position', color='blue')
ax.plot(t, mu*t, lw=1, label='population mean', color='black', ls='--')
ax.fill_between(t, lower_bound, upper_bound, facecolor='yellow', alpha=0.5,
                label='1 sigma range')
ax.legend(loc='upper left')

# here we use the where argument to only fill the region where the
# walker is above the population 1 sigma boundary
ax.fill_between(t, upper_bound, X, where=X>upper_bound, facecolor='blue', alpha=0.5)
ax.set_xlabel('num steps')
ax.set_ylabel('position')
ax.grid()
```



Another handy use of filled regions is to highlight horizontal or vertical spans of an axes – for that matplotlib has some helper functions `axhspan()` and `axvspan()` and example *pylab_examples example code: axhspan_demo.py*.

8.2.5 Transparent, fancy legends

Sometimes you know what your data looks like before you plot it, and may know for instance that there won't be much data in the upper right hand corner. Then you can safely create a legend that doesn't overlay your data:

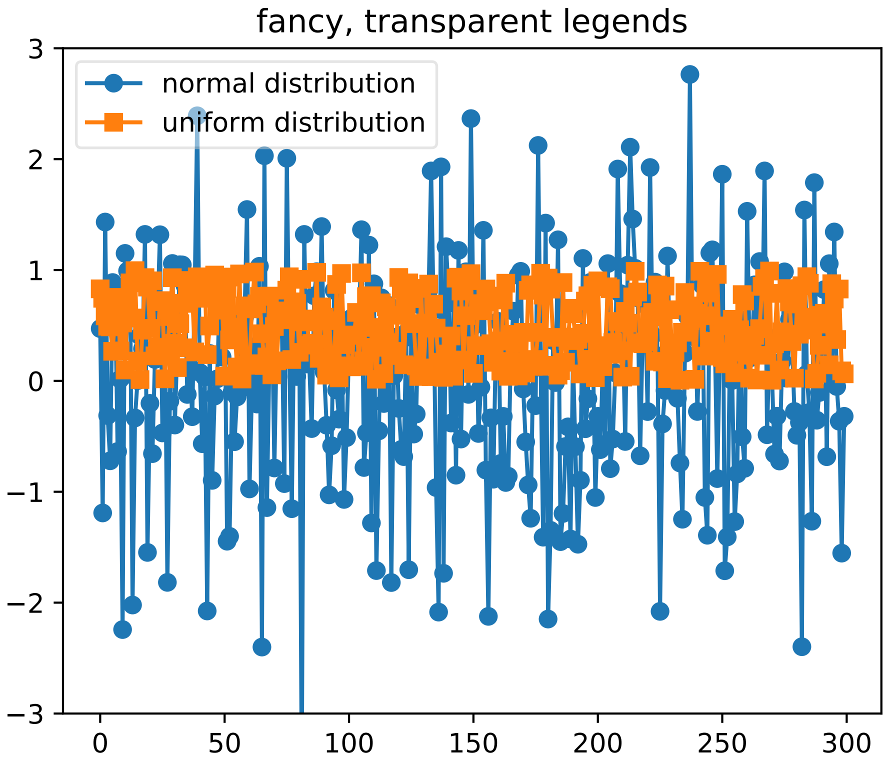
```
ax.legend(loc='upper right')
```

Other times you don't know where your data is, and loc='best' will try and place the legend:

```
ax.legend(loc='best')
```

but still, your legend may overlap your data, and in these cases it's nice to make the legend frame transparent.

```
np.random.seed(1234)
fig, ax = plt.subplots(1)
ax.plot(np.random.randn(300), 'o-', label='normal distribution')
ax.plot(np.random.rand(300), 's-', label='uniform distribution')
ax.set_ylim(-3, 3)
ax.legend(loc='best', fancybox=True, framealpha=0.5)
ax.set_title('fancy, transparent legends')
```



8.2.6 Placing text boxes

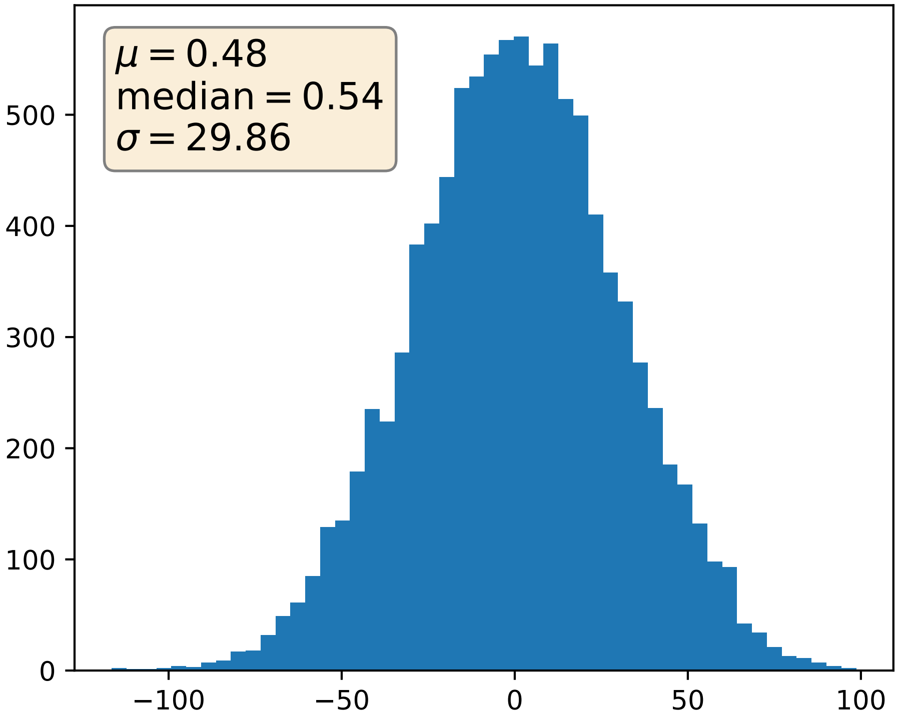
When decorating axes with text boxes, two useful tricks are to place the text in axes coordinates (see *Transformations Tutorial*), so the text doesn't move around with changes in x or y limits. You can also use the bbox property of text to surround the text with a `Patch` instance – the bbox keyword argument takes a dictionary with keys that are Patch properties.

```
np.random.seed(1234)
fig, ax = plt.subplots(1)
x = 30*np.random.randn(10000)
mu = x.mean()
median = np.median(x)
sigma = x.std()
textstr = '$\mu=%.2f$\n$\mathrm{median}=%.2f$\n$\sigma=%.2f$'%(mu, median, sigma)

ax.hist(x, 50)
# these are matplotlib.patch.Patch properties
props = dict(boxstyle='round', facecolor='wheat', alpha=0.5)

# place a text box in upper left in axes coords
```

```
ax.text(0.05, 0.95, textstr, transform=ax.transAxes, fontsize=14,
        verticalalignment='top', bbox=props)
```



CHAPTER

NINE

WHAT'S NEW IN MATPLOTLIB

For a list of all of the issues and pull requests since the last revision, see the *GitHub Stats*.

Table of Contents

- *What's new in matplotlib*
  - *New in matplotlib 2.0*
    - *Default style changes*
    - *Improved color conversion API and RGBA support*
    - *New Configuration (rcParams)*
    - *Qualitative colormaps*
    - *Axis offset label now responds to* `labelcolor`
    - *Improved offset text choice*
    - *Style parameter blacklist*
    - *Change in default font*
    - *Faster text rendering*
    - *Improvements for the Qt figure options editor*
    - *Improved image support*
    - *Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends*
    - *Change in the default animation codec*
    - *Deprecated support for mencoder in animation*
    - *Boxplot Zorder Keyword Argument*
    - *Filled + and* `x` *markers*
    - `rcount` *and* `ccount` *for* `plot_surface()`
    - *Streamplot Zorder Keyword Argument Changes*
    - *Extension to* `matplotlib.backend_bases.GraphicsContextBase`

  - *Previous Whats New*

9.1 New in matplotlib 2.0

Note: matplotlib 2.0 supports Python 2.7, and 3.4+

9.1.1 Default style changes

The major changes in v2.0 are related to overhauling the default styles.

Changes to the default style

The most important changes in matplotlib 2.0 are the changes to the default style.

While it is impossible to select the best default for all cases, these are designed to work well in the most common cases.

A 'classic' style sheet is provided so reverting to the 1.x default values is a single line of python

```
mpl.style.use('classic')
```

See *The matplotlibrc file* for details about how to persistently and selectively revert many of these changes.

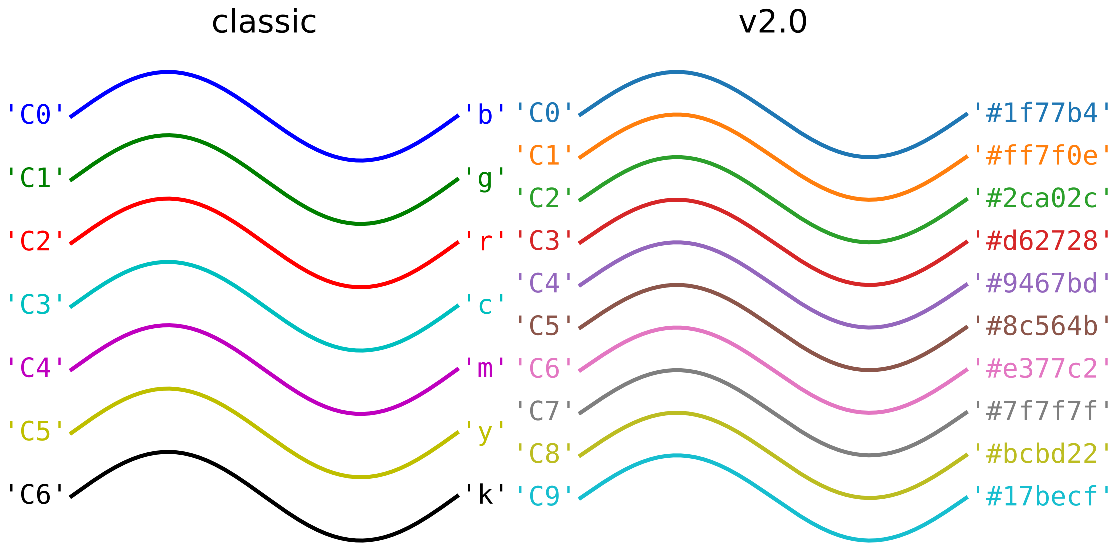
Colors, color cycles, and color maps

Colors in default property cycle

The colors in the default property cycle have been changed from `['b', 'g', 'r', 'c', 'm', 'y', 'k']` to the category10 color palette used by Vega and d3 originally developed at Tableau.



In addition to changing the colors, an additional method to specify colors was added. Previously, the default colors were the single character short-hand notations for red, green, blue, cyan, magenta, yellow, and black. This made them easy to type and usable in the abbreviated style string in `plot`, however the new default colors are only specified via hex values. To access these colors outside of the property cycling the notation for colors `'CN'`, where `N` takes values 0-9, was added to denote the first 10 colors in `mpl.rcParams['axes.prop_cycle']` See *Specifying Colors* for more details.

To restore the old color cycle use

```
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color='bgrcmyk')
```

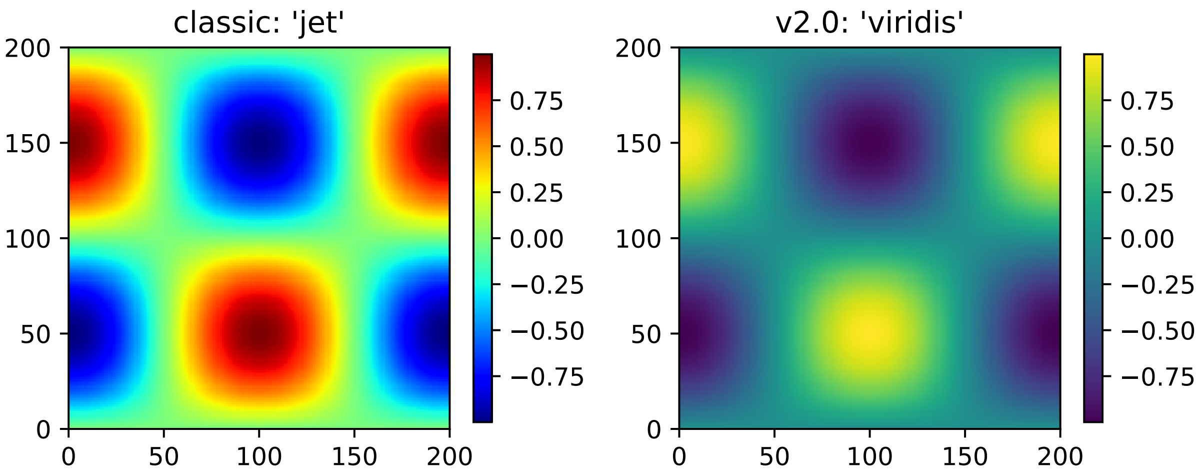
or set

```
axes.prop_cycle    : cycler('color', 'bgrcmyk')
```

in your `matplotlibrc` file.

Colormap

The new default color map used by *`matplotlib.cm.ScalarMappable`* instances is `'viridis'` (aka option D).



For an introduction to color theory and how 'viridis' was generated watch Nathaniel Smith and Stéfan van der Walt's talk from SciPy2015. See here for many more details about the other alternatives and the tools used to create the color map. For details on all of the color maps available in matplotlib see *Choosing Colormaps*.

The previous default can be restored using

```
mpl.rcParams['image.cmap'] = 'jet'
```

or setting

```
image.cmap    : 'jet'
```

in your `matplotlibrc` file; however this is strongly discouraged.

Interactive figures

The default interactive figure background color has changed from grey to white, which matches the default background color used when saving.

The previous defaults can be restored by

```
mpl.rcParams['figure.facecolor'] = '0.75'
```

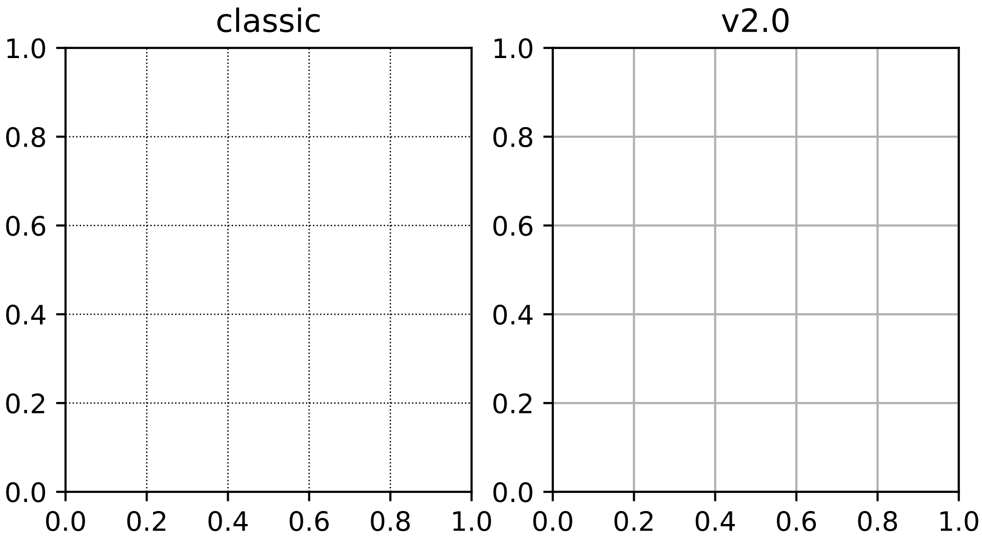
or by setting

```
figure.facecolor : '0.75'
```

in your `matplotlibrc` file.

Grid lines

The default style of grid lines was changed from black dashed lines to thicker solid light grey lines.



The previous default can be restored by using:

```
mpl.rcParams['grid.color'] = 'k'
mpl.rcParams['grid.linestyle'] = ':'
mpl.rcParams['grid.linewidth'] = 0.5
```

or by setting:

```
grid.color       :   k       # grid color
grid.linestyle   :   :       # dotted
grid.linewidth   :   0.5     # in points
```

in your `matplotlibrc` file.

Figure size, font size, and screen dpi

The default dpi used for on-screen display was changed from 80 dpi to 100 dpi, the same as the default dpi for saving files. Due to this change, the on-screen display is now more what-you-see-is-what-you-get for saved files. To keep the figure the same size in terms of pixels, in order to maintain approximately the same size on the screen, the default figure size was reduced from 8x6 inches to 6.4x4.8 inches. As a consequence of this the default font sizes used for the title, tick labels, and axes labels were reduced to maintain their size relative to the overall size of the figure. By default the dpi of the saved image is now the dpi of the *`Figure`* instance being saved.

This will have consequences if you are trying to match text in a figure directly with external text.

The previous defaults can be restored by

```
mpl.rcParams['figure.figsize'] = [8.0, 6.0]
mpl.rcParams['figure.dpi'] = 80
mpl.rcParams['savefig.dpi'] = 100

mpl.rcParams['font.size'] = 12
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['figure.titlesize'] = 'medium'
```

or by setting:

```
figure.figsize   : [8.0, 6.0]
figure.dpi       : 80
savefig.dpi      : 100

font.size        : 12.0
legend.fontsize  : 'large'
figure.titlesize : 'medium'
```

In your `matplotlibrc` file.

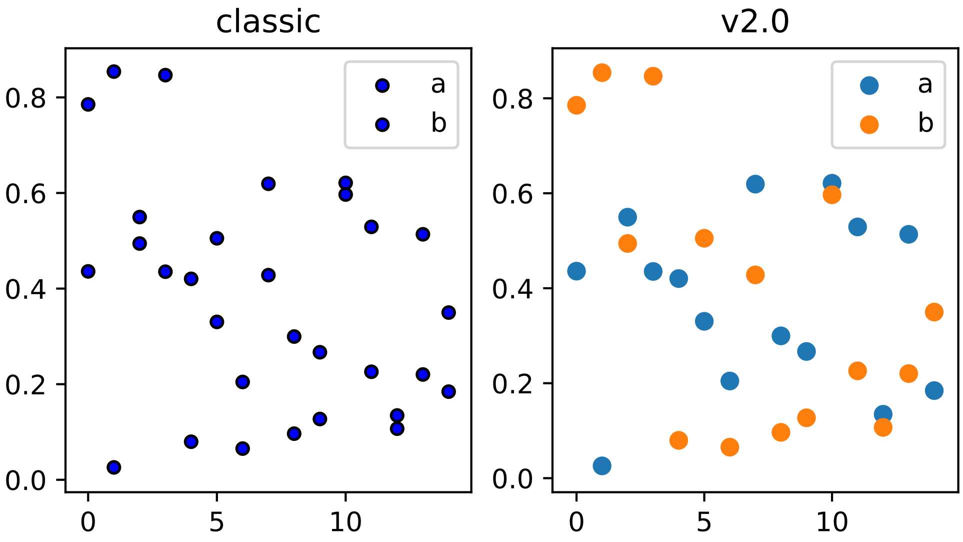
In addition, the `forward` kwarg to `set_size_inches` now defaults to `True` to improve the interactive experience. Backend canvases that adjust the size of their bound *`matplotlib.figure.Figure`* must pass `forward=False` to avoid circular behavior. This default is not configurable.

Plotting functions

`scatter`

The following changes were made to the default behavior of *`scatter`*

- The default size of the elements in a scatter plot is now based on the rcParam `lines.markersize` so it is consistent with `plot(X, Y, 'o')`. The old value was 20, and the new value is 36 (6^2).
- scatter markers no longer have a black edge.
- if the color of the markers is not specified it will follow the property cycle, pulling from the 'patches' cycle on the `Axes`.



The classic default behavior of *`scatter`* can only be recovered through `mpl.style.use('classic')`. The marker size can be recovered via

```
mpl.rcParam['lines.markersize'] = np.sqrt(20)
```

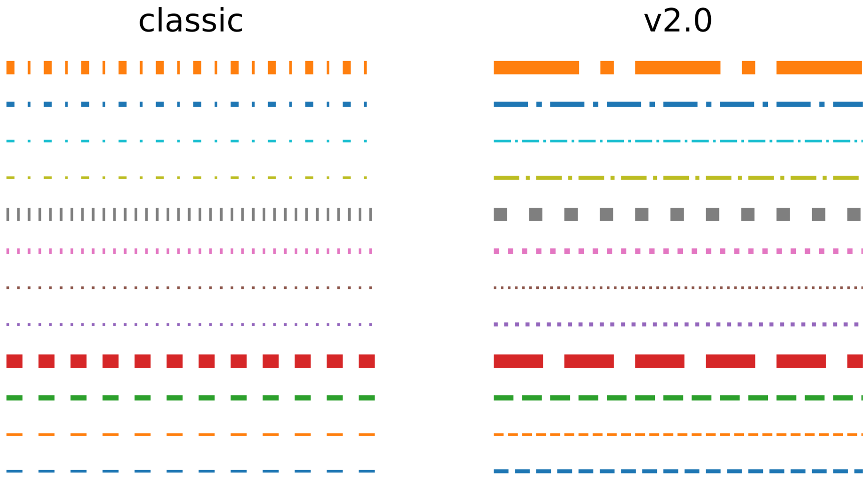
however, this will also affect the default marker size of *`plot`*. To recover the classic behavior on a per-call basis pass the following kwargs:

```
classic_kwargs = {'s': 20, 'edgecolors': 'k', 'c': 'b'}
```

`plot`

The following changes were made to the default behavior of *`plot`*

- the default linewidth increased from 1 to 1.5
- the dash patterns associated with `'--'`, `':'`, and `'-.'` have changed
- the dash patterns now scale with line width



The previous defaults can be restored by setting:

```
mpl.rcParams['lines.linewidth'] = 1.0
mpl.rcParams['lines.dashed_pattern'] = [6, 6]
mpl.rcParams['lines.dashdot_pattern'] = [3, 5, 1, 5]
mpl.rcParams['lines.dotted_pattern'] = [1, 3]
mpl.rcParams['lines.scale_dashes'] = False
```

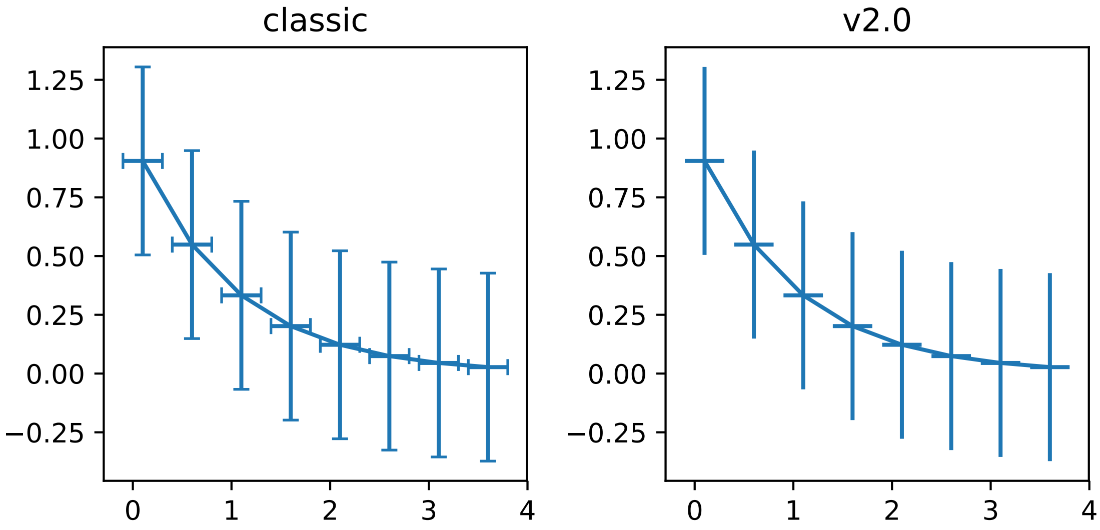
or by setting:

```
lines.linewidth   : 1.0
lines.dashed_pattern : 6, 6
lines.dashdot_pattern : 3, 5, 1, 5
lines.dotted_pattern : 1, 3
lines.scale_dashes: False
```

in your `matplotlibrc` file.

`errorbar`

By default, caps on the ends of errorbars are not present.



This also changes the return value of *`errorbar()`* as the list of 'caplines' will be empty by default.

The previous defaults can be restored by setting:

```
mpl.rcParams['errorbar.capsize'] = 3
```

or by setting

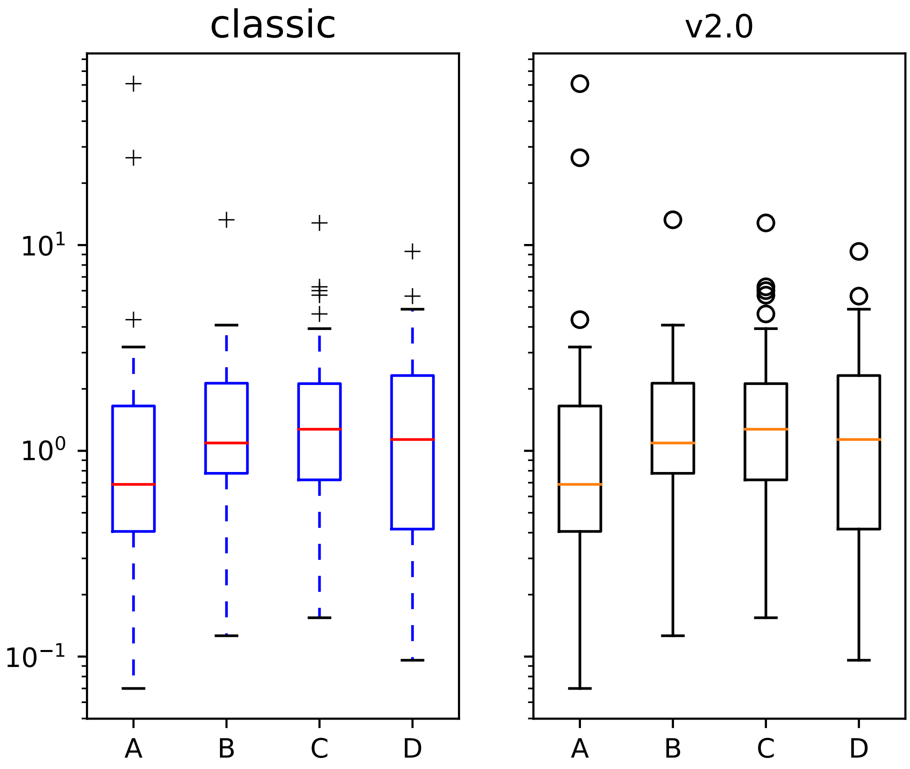
```
errorbar.capsize : 3
```

in your `matplotlibrc` file.

`boxplot`

Previously, boxplots were composed of a mish-mash of styles that were, for better for worse, inherited from Matlab. Most of the elements were blue, but the medians were red. The fliers (outliers) were black plus-symbols (+) and the whiskers were dashed lines, which created ambiguity if the (solid and black) caps were not drawn.

For the new defaults, everything is black except for the median and mean lines (if drawn), which are set to the first two elements of the current color cycle. Also, the default flier markers are now hollow circles, which maintain the ability of the plus-symbols to overlap without obscuring data too much.



The previous defaults can be restored by setting:

```
mpl.rcParams['boxplot.flierprops.color'] = 'k'
mpl.rcParams['boxplot.flierprops.marker'] = '+'
mpl.rcParams['boxplot.flierprops.markerfacecolor'] = 'none'
mpl.rcParams['boxplot.flierprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.boxprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.linestyle'] = '--'
mpl.rcParams['boxplot.medianprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.marker'] = '^'
mpl.rcParams['boxplot.meanprops.markerfacecolor'] = 'r'
mpl.rcParams['boxplot.meanprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.meanprops.markersize'] = 6
mpl.rcParams['boxplot.meanprops.linestyle'] = '--'
mpl.rcParams['boxplot.meanprops.linewidth'] = 1.0
```

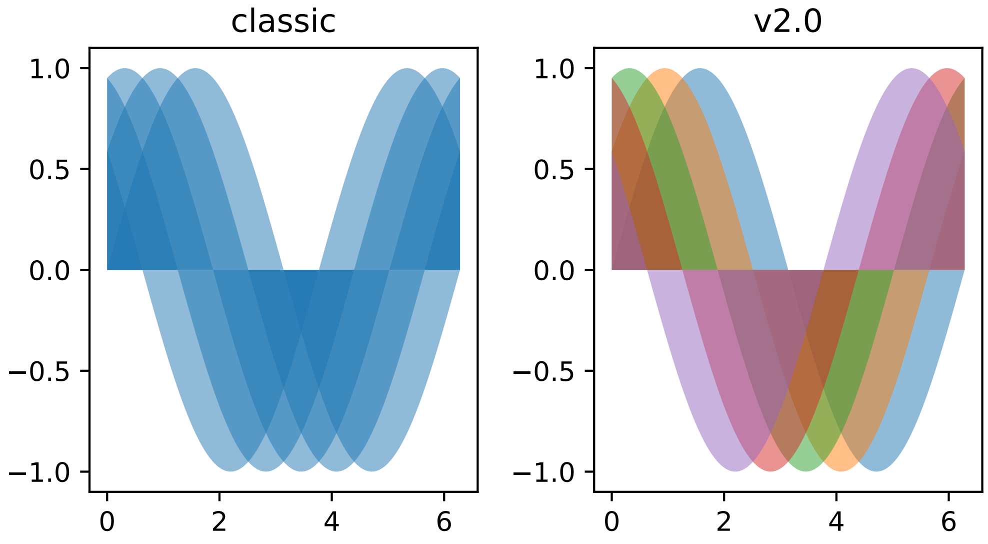
or by setting:

```
boxplot.flierprops.color:           'k'
boxplot.flierprops.marker:          '+'
boxplot.flierprops.markerfacecolor: 'none'
boxplot.flierprops.markeredgecolor: 'k'
boxplot.boxprops.color:             'b'
boxplot.whiskerprops.color:         'b'
boxplot.whiskerprops.linestyle:     '--'
boxplot.medianprops.color:          'r'
boxplot.meanprops.color:            'r'
boxplot.meanprops.marker:           '^'
boxplot.meanprops.markerfacecolor:  'r'
boxplot.meanprops.markeredgecolor:  'k'
boxplot.meanprops.markersize:        6
boxplot.meanprops.linestyle:         '--'
boxplot.meanprops.linewidth:         1.0
```

in your `matplotlibrc` file.

`fill_between` and `fill_betweenx`

`fill_between` and *`fill_betweenx`* both follow the patch color cycle.

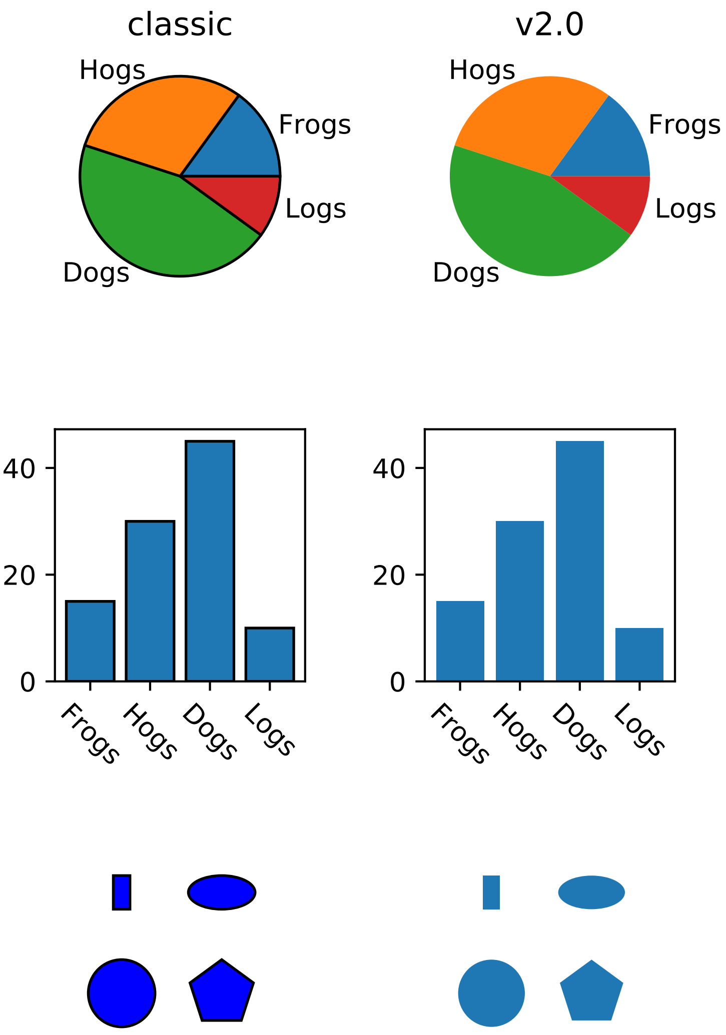


If the facecolor is set via the `facecolors` or `color` keyword argument, then the color is not cycled.

To restore the previous behavior, explicitly pass the keyword argument `facecolors='C0'` to the method call.

Patch edges and color

Most artists drawn with a patch (`~matplotlib.axes.Axes.bar`, `~matplotlib.axes.Axes.pie`, etc) no longer have a black edge by default. The default face color is now `'C0'` instead of `'b'`.



The previous defaults can be restored by setting:

```
mpl.rcParams['patch.force_edgecolor'] = True
mpl.rcParams['patch.facecolor'] = 'b'
```

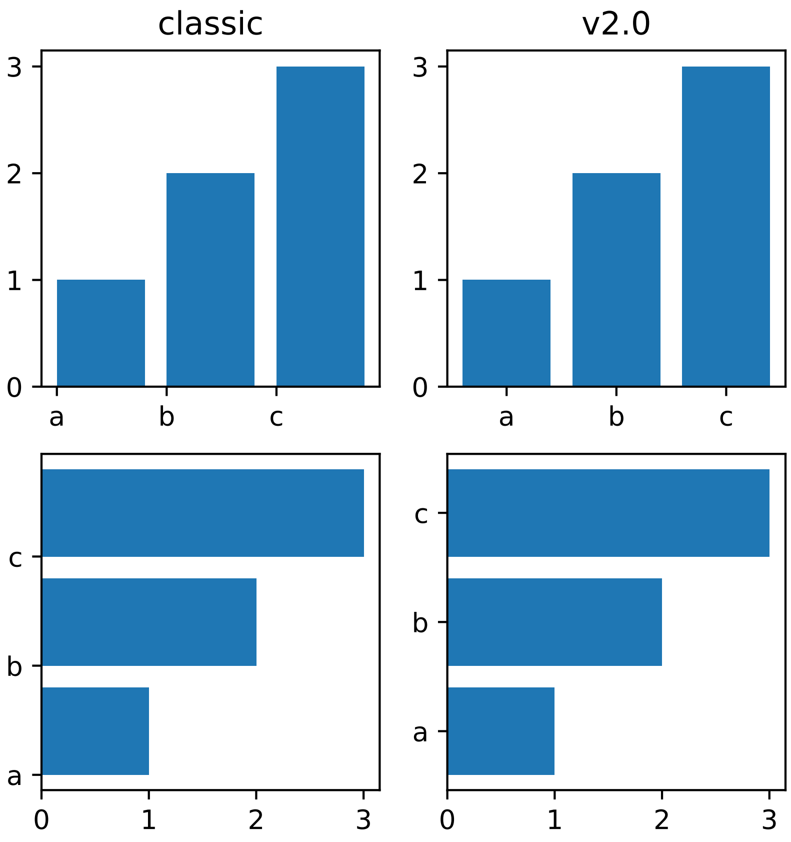
or by setting:

```
patch.facecolor         : b
patch.force_edgecolor   : True
```

in your `matplotlibrc` file.

`bar` and `barh`

The default value of the `align` kwarg for both `bar` and `barh` is changed from `'edge'` to `'center'`.



To restore the previous behavior explicitly pass the keyword argument `align='edge'` to the method call.

Hatching

The color of the lines in the hatch is now determined by

- If an edge color is explicitly set, use that for the hatch color
- If the edge color is not explicitly set, use `rcParam['hatch.color']` which is looked up at artist creation time.

The width of the lines in a hatch pattern is now configurable by the rcParams `hatch.linewidth`, which defaults to 1 point. The old behavior for the line width was different depending on backend:

- PDF: 0.1 pt
- SVG: 1.0 pt
- PS: 1 px
- Agg: 1 px

The old line width behavior can not be restored across all backends simultaneously, but can be restored for a single backend by setting:

```
mpl.rcParams['hatch.linewidth'] = 0.1  # previous pdf hatch linewidth
mpl.rcParams['hatch.linewidth'] = 1.0  # previous svg hatch linewidth
```

The behavior of the PS and Agg backends was DPI dependent, thus:

```
mpl.rcParams['figure.dpi'] = dpi
mpl.rcParams['savefig.dpi'] = dpi  # or leave as default 'figure'
mpl.rcParams['hatch.linewidth'] = 1.0 / dpi  # previous ps and Agg hatch linewidth
```

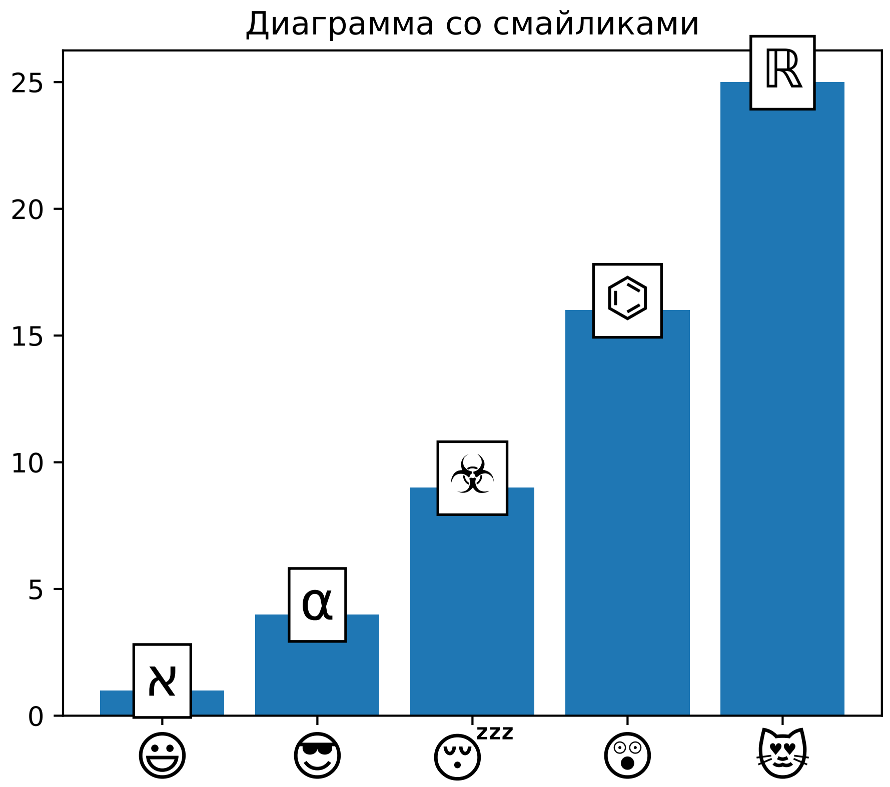
There is no direct API level control of the hatch color or linewidth.

Hatching patterns are now rendered at a consistent density, regardless of DPI. Formerly, high DPI figures would be more dense than the default, and low DPI figures would be less dense. This old behavior cannot be directly restored, but the density may be increased by repeating the hatch specifier.

Fonts

Normal text

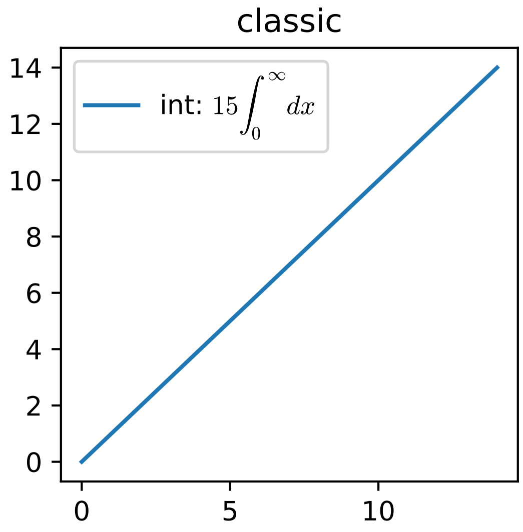
The default font has changed from “Bitstream Vera Sans” to “DejaVu Sans”. DejaVu Sans has additional international and math characters, but otherwise has the same appearance as Bitstream Vera Sans. Latin, Greek, Cyrillic, Armenian, Georgian, Hebrew, and Arabic are all supported (but right-to-left rendering is still not handled by matplotlib). In addition, DejaVu contains a sub-set of emoji symbols.

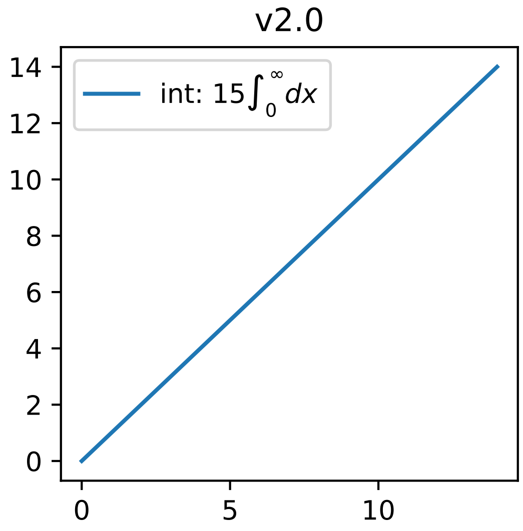


See the DejaVu Sans PDF sample for full coverage.

Math text

The default math font when using the built-in math rendering engine (mathtext) has changed from “Computer Modern” (i.e. LaTeX-like) to “DejaVu Sans”. This change has no effect if the TeX backend is used (i.e. `text.usetex` is `True`).





To revert to the old behavior set the:

```
mpl.rcParams['mathtext.fontset'] = 'cm'
mpl.rcParams['mathtext.rm'] = 'serif'
```

or set:

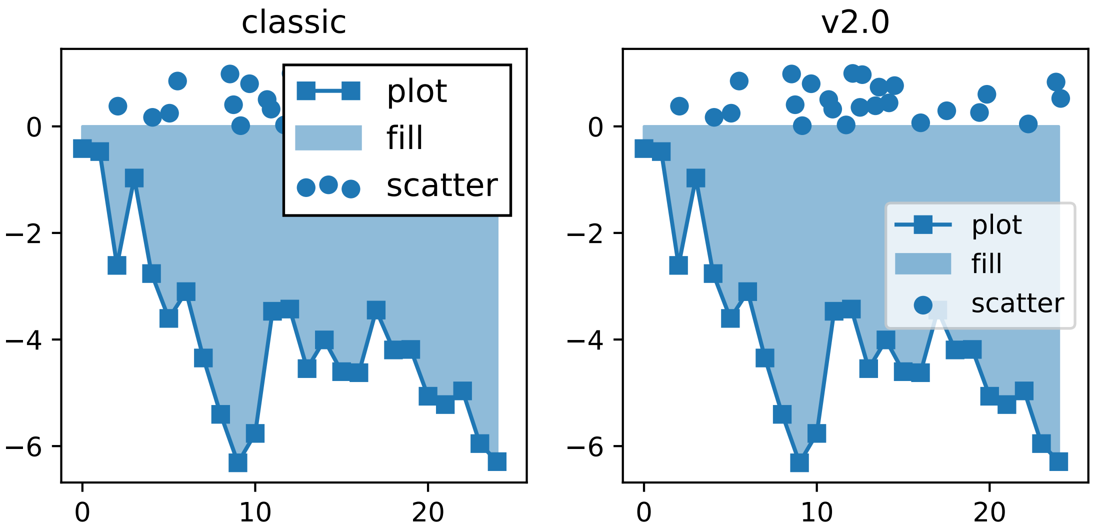
```
mathtext.fontset: cm
mathtext.rm : serif
```

in your `matplotlibrc` file.

This `rcParam` is consulted when the text is drawn, not when the artist is created. Thus all mathtext on a given `canvas` will use the same fontset.

Legends

- By default, the number of points displayed in a legend is now 1.
- The default legend location is `'best'`, so the legend will be automatically placed in a location to minimize overlap with data.
- The legend defaults now include rounded corners, a lighter boundary, and partially transparent boundary and background.



The previous defaults can be restored by setting:

```
mpl.rcParams['legend.fancybox'] = False
mpl.rcParams['legend.loc'] = 'upper right'
mpl.rcParams['legend.numpoints'] = 2
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['legend.framealpha'] = None
mpl.rcParams['legend.scatterpoints'] = 3
mpl.rcParams['legend.edgecolor'] = 'inherit'
```

or by setting:

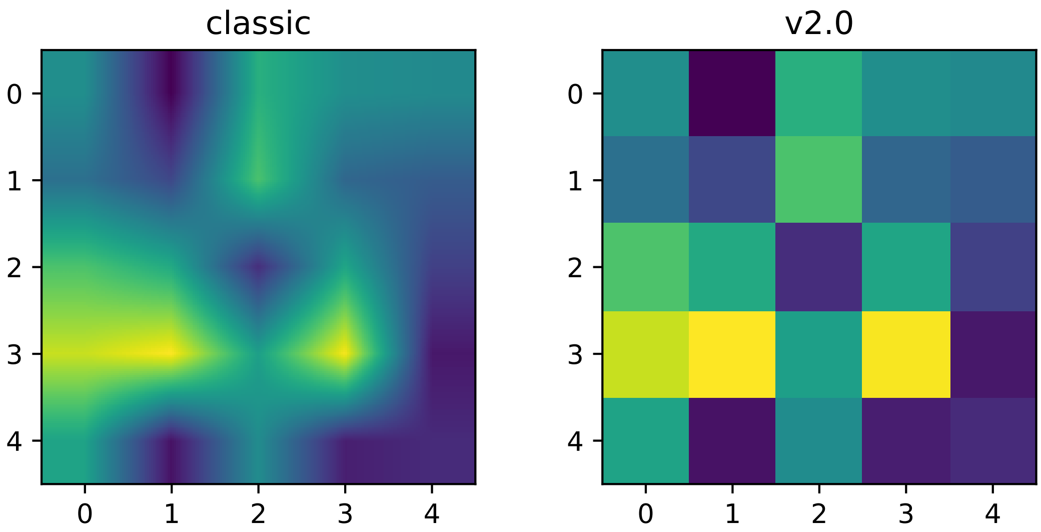
```
legend.fancybox      : False
legend.loc           : upper right
legend.numpoints     : 2      # the number of points in the legend line
legend.fontsize      : large
legend.framealpha    : None    # opacity of legend frame
legend.scatterpoints : 3 # number of scatter points
legend.edgecolor     : inherit   # legend edge color ('inherit'
                                 # means it uses axes.edgecolor)
```

in your `matplotlibrc` file.

Image

Interpolation

The default interpolation method for *imshow* is now `'nearest'` and by default it resamples the data (both up and down sampling) before color mapping.



To restore the previous behavior set:

```
mpl.rcParams['image.interpolation'] = 'bilinear'
mpl.rcParams['image.resample'] = False
```

or set:

```
image.interpolation  : bilinear  # see help(imshow) for options
image.resample  : False
```

in your `matplotlibrc` file.

Colormapping pipeline

Previously, the input data was normalized, then color mapped, and then resampled to the resolution required for the screen. This meant that the final resampling was being done in color space. Because the color maps are not generally linear in RGB space, colors not in the color map may appear in the final image. This bug was addressed by an almost complete overhaul of the image handling code.

The input data is now normalized, then resampled to the correct resolution (in normalized dataspace), and then color mapped to RGB space. This ensures that only colors from the color map appear in the final image. (If your viewer subsequently resamples the image, the artifact may reappear.)

The previous behavior cannot be restored.

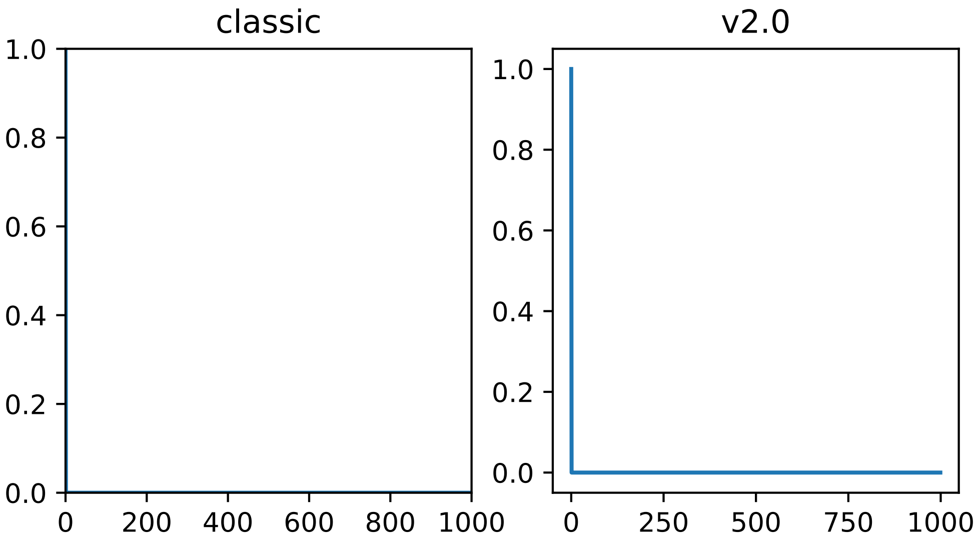
Shading

- The default shading mode for light source shading, in `matplotlib.colors.LightSource.shade`, is now `overlay`. Formerly, it was `hsv`.

Plot layout

Auto limits

The previous auto-scaling behavior was to find ‘nice’ round numbers as view limits that enclosed the data limits, but this could produce bad plots if the data happened to fall on a vertical or horizontal line near the chosen ‘round number’ limit. The new default sets the view limits to 5% wider than the data range.



The size of the padding in the x and y directions is controlled by the `'axes.xmargin'` and `'axes.ymargin'` rcParams respectively. Whether the view limits should be ‘round numbers’ is controlled by the `'axes.autolimit_mode'` rcParam. In the original `'round_number'` mode, the view limits coincide with ticks.

The previous default can be restored by using:

```
mpl.rcParams['axes.autolimit_mode'] = 'round_numbers'
mpl.rcParams['axes.xmargin'] = 0
mpl.rcParams['axes.ymargin'] = 0
```

or setting:

```
axes.autolimit_mode: round_numbers
axes.xmargin: 0
axes.ymargin: 0
```

in your `matplotlibrc` file.

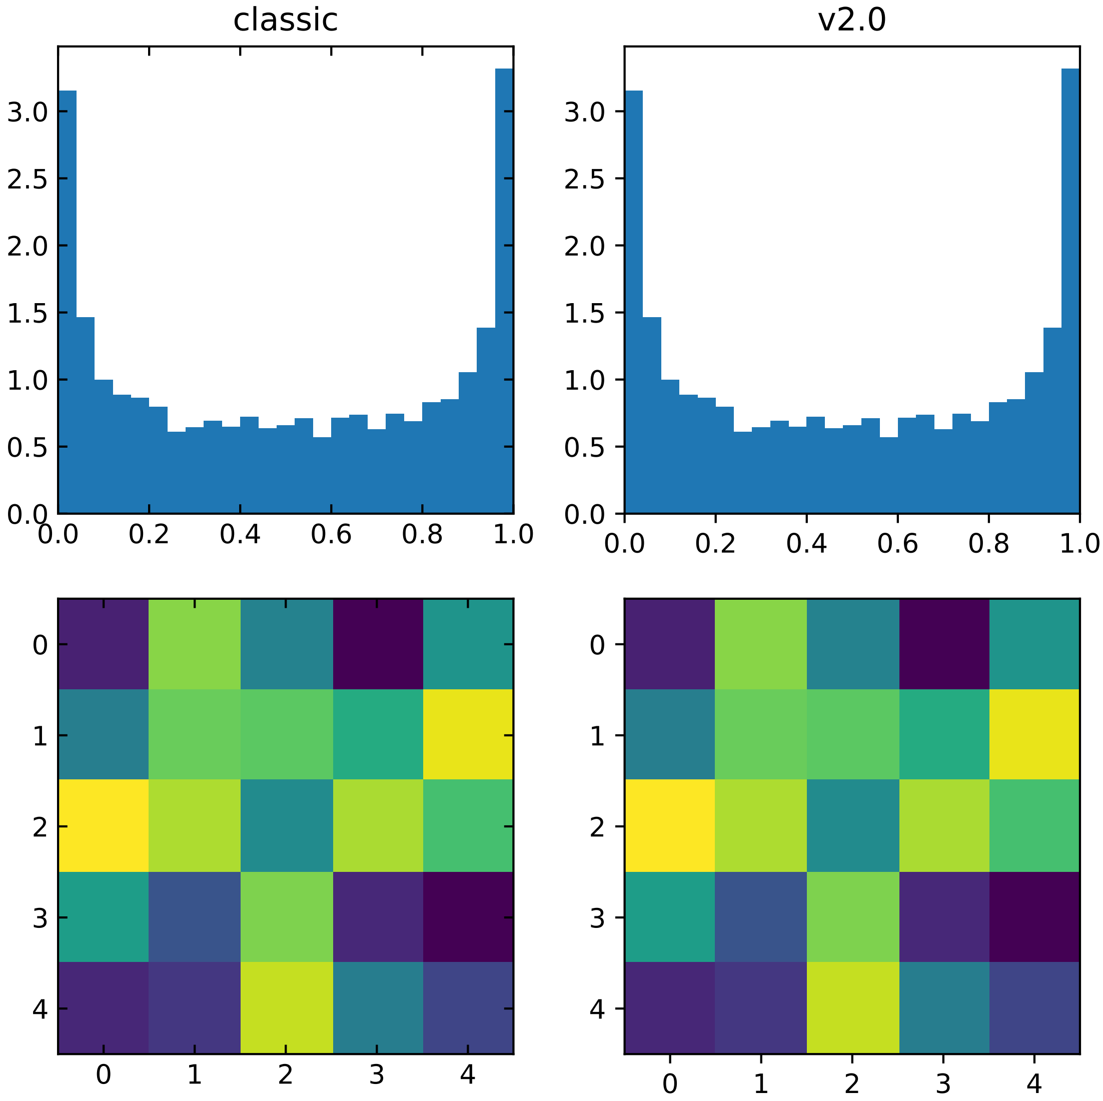
Z-order

- Ticks and grids are now plotted above solid elements such as filled contours, but below lines. To return to the previous behavior of plotting ticks and grids above lines, set `rcParams['axes.axisbelow'] = False`.

Ticks

Direction

To reduce the collision of tick marks with data, the default ticks now point outward by default. In addition, ticks are now drawn only on the bottom and left spines to prevent a porcupine appearance, and for a cleaner separation between subplots.



To restore the previous behavior set:

```
mpl.rcParams['xtick.direction'] = 'in'
mpl.rcParams['ytick.direction'] = 'in'
mpl.rcParams['xtick.top'] = True
mpl.rcParams['ytick.right'] = True
```

or set:

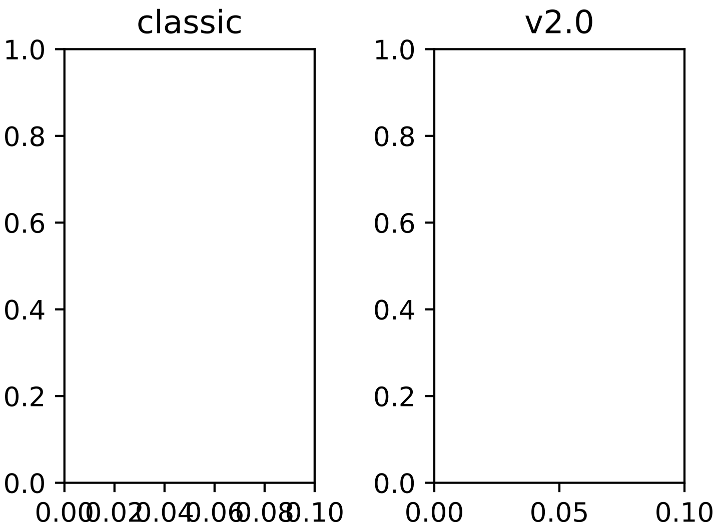
```
xtick.top: True
xtick.direction: in

ytick.right: True
ytick.direction: in
```

in your `matplotlibrc` file.

Number of ticks

The default *Locator* used for the x and y axis is *AutoLocator* which tries to find, up to some maximum number, 'nicely' spaced ticks. The locator now includes an algorithm to estimate the maximum number of ticks that will leave room for the tick labels. By default it also ensures that there are at least two ticks visible.



There is no way, other than using `mpl.style.use('classic')`, to restore the previous behavior as the default. On an axis-by-axis basis you may either control the existing locator via:

```
ax.xaxis.get_major_locator().set_params(nbins=9, steps=[1, 2, 5, 10])
```

or create a new *MaxNLocator*:

```
import matplotlib.ticker as mticker
ax.set_major_locator(mticker.MaxNLocator(nbins=9, steps=[1, 2, 5, 10])
```

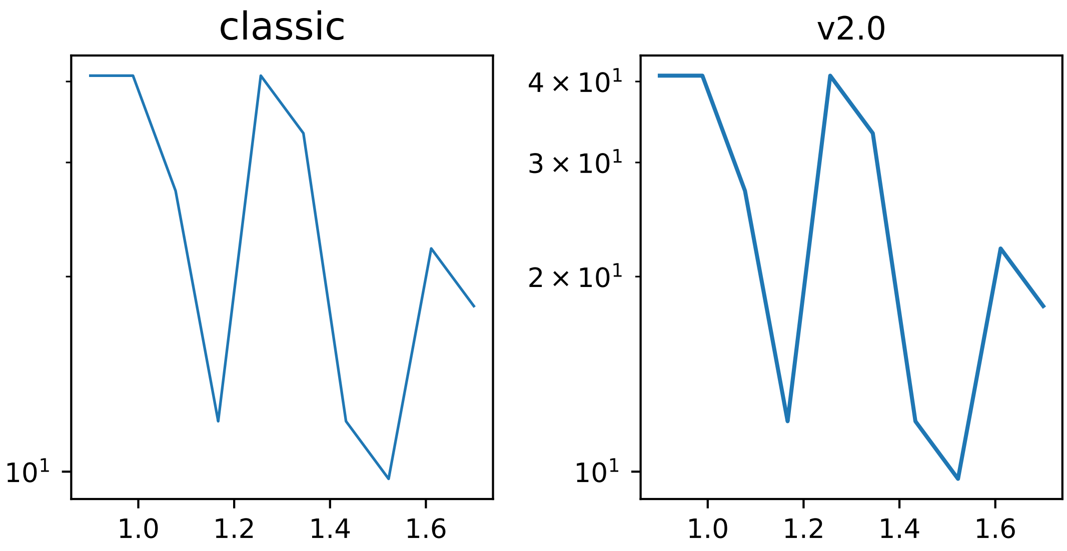
The algorithm used by *MaxNLocator* has been improved, and this may change the choice of tick locations in some cases. This also affects *AutoLocator*, which uses `MaxNLocator` internally.

For a log-scaled axis the default locator is the *LogLocator*. Previously the maximum number of ticks was set to 15, and could not be changed. Now there is a `numticks` kwarg for setting the maximum to any integer value, to the string 'auto', or to its default value of None which is equivalent to 'auto'. With the 'auto' setting the maximum number will be no larger than 9, and will be reduced depending on the length of the axis in units of the tick font size. As in the case of the AutoLocator, the heuristic algorithm reduces the incidence of overlapping tick labels but does not prevent it.

Tick label formatting

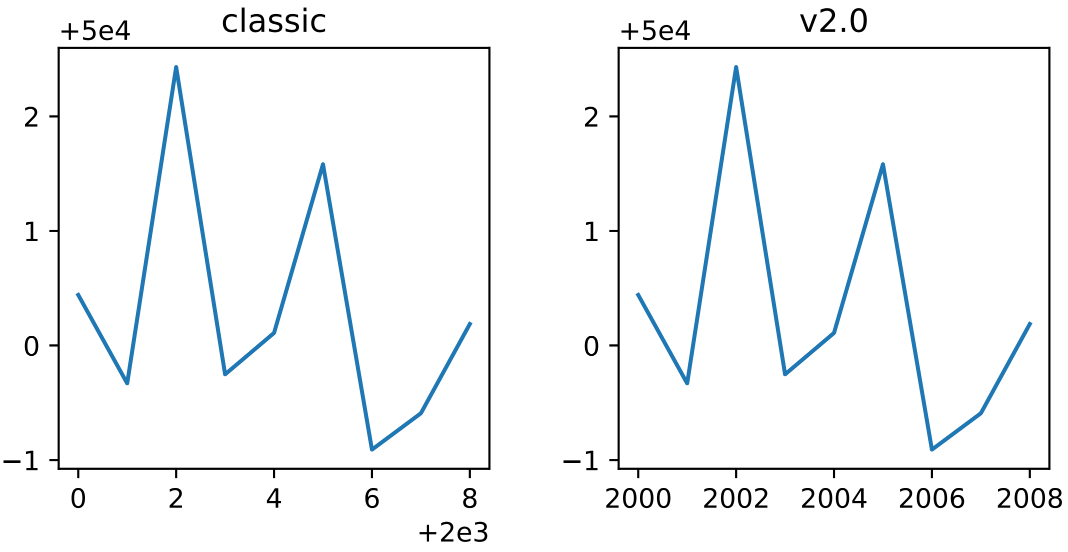
`LogFormatter` labeling of minor ticks

Minor ticks on a log axis are now labeled when the axis view limits span a range less than or equal to the interval between two major ticks. See *LogFormatter* for details. The minor tick labeling is turned off when using `mpl.style.use('classic')`, but cannot be controlled independently via `rcParams`.



`ScalarFormatter` tick label formatting with offsets

With the default of `rcParams['axes.formatter.useoffset'] = True`, an offset will be used when it will save 4 or more digits. This can be controlled with the new rcParam, `axes.formatter.offset_threshold`. To restore the previous behavior of using an offset to save 2 or more digits, use `rcParams['axes.formatter.offset_threshold'] = 2`.



`AutoDateFormatter` format strings

The default date formats are now all based on ISO format, i.e., with the slowest-moving value first. The date formatters are configurable through the `date.autoformatter.*` rcParams.

Threshold (tick interval >= than)	rcParam	classic	v2.0
365 days	`'date.autoformatter.year'`	`'%Y'`	`'%Y'`
30 days	`'date.autoformatter.month'`	`'%b %Y'`	`'%Y-%m'`
1 day	`'date.autoformatter.day'`	`'%b %d %Y'`	`'%Y-%m-%d'`
1 hour	`'date.autoformatter.hour'`	`'%H:%M:%S'`	`'%H:%M'`
1 minute	`'date.autoformatter.minute'`	`'%H:%M:%S.%f'`	`'%H:%M:%S'`
1 second	`'date.autoformatter.second'`	`'%H:%M:%S.%f'`	`'%H:%M:%S'`
1 microsecond	`'date.autoformatter.microsecond'`	`'%H:%M:%S.%f'`	`'%H:%M:%S.%f'`

Python's `%x` and `%X` date formats may be of particular interest to format dates based on the current locale.

The previous default can be restored by:

```
mpl.rcParams['date.autoformatter.year'] = '%Y'
mpl.rcParams['date.autoformatter.month'] = '%b %Y'
mpl.rcParams['date.autoformatter.day'] = '%b %d %Y'
mpl.rcParams['date.autoformatter.hour'] = '%H:%M:%S'
mpl.rcParams['date.autoformatter.minute'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.second'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.microsecond'] = '%H:%M:%S.%f'
```

or setting

```
date.autoformatter.year    : %Y
date.autoformatter.month   : %b %Y
date.autoformatter.day     : %b %d %Y
date.autoformatter.hour    : %H:%M:%S
date.autoformatter.minute : %H:%M:%S.%f
date.autoformatter.second : %H:%M:%S.%f
date.autoformatter.microsecond : %H:%M:%S.%f
```

in your `matplotlibrc` file.

mplot3d

- mplot3d now obeys some style-related rcParams, rather than using hard-coded defaults. These include:
  - xtick.major.width
  - ytick.major.width
  - xtick.color
  - ytick.color
  - axes.linewidth
  - axes.edgecolor
  - grid.color
  - grid.linewidth
  - grid.linestyle

9.1.2 Improved color conversion API and RGBA support

The *colors* gained a new color conversion API with full support for the alpha channel. The main public functions are *is_color_like()*, *matplotlib.colors.to_rgba()*, *matplotlib.colors.to_rgba_array()* and *to_hex()*. RGBA quadruplets are encoded in hex format as `#rrggbbaa`.

A side benefit is that the Qt options editor now allows setting the alpha channel of the artists as well.

9.1.3 New Configuration (rcParams)

New rcparams added

Parameter	Description
`date.autoformatter.year`	format string for 'year' scale dates
`date.autoformatter.month`	format string for 'month' scale dates
`date.autoformatter.day`	format string for 'day' scale dates
`date.autoformatter.hour`	format string for 'hour' scale times
`date.autoformatter.minute`	format string for 'minute' scale times
`date.autoformatter.second`	format string for 'second' scale times
`date.autoformatter.microsecond`	format string for 'microsecond' scale times
`scatter.marker`	default marker for scatter plot
`svg.hashsalt`	see note
`xtick.top`, `xtick.minor.top`, `xtick.major.top` `xtick.bottom`, `xtick.minor.bottom`, `xtick.major.bottom` `ytick.left`, `ytick.minor.left`, `ytick.major.left` `ytick.right`, `ytick.minor.right`, `ytick.major.right`	Control where major and minor ticks are drawn. The global values are `and` ed with the corresponding major/minor values.
`hist.bins`	The default number of bins to use in *`hist`*. This can be an `int`, a list of floats, or `'auto'` if numpy >= 1.11 is installed.
`lines.scale_dashes`	Whether the line dash patterns should scale with linewidth.
`axes.formatter.offset_threshold`	Minimum number of digits saved in tick labels that triggers using an offset.

Added `svg.hashsalt` key to rcParams

If `svg.hashsalt` is `None` (which it is by default), the svg backend uses `uuid4` to generate the hash salt. If it is not `None`, it must be a string that is used as the hash salt instead of `uuid4`. This allows for deterministic SVG output.

Removed the `svg.image_noscale` rcParam

As a result of the extensive changes to image handling, the `svg.image_noscale` rcParam has been removed. The same functionality may be achieved by setting `interpolation='none'` on individual images or globally using the `image.interpolation` rcParam.

9.1.4 Qualitative colormaps

ColorBrewer's "qualitative" colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") were intended for discrete categorical data, with no implication of value, and therefore have been converted to `ListedColormap` instead of `LinearSegmentedColormap`, so the colors will no longer be interpolated and they can be used for choropleths, labeled image features, etc.

9.1.5 Axis offset label now responds to `labelcolor`

Axis offset labels are now colored the same as axis tick markers when `labelcolor` is altered.

9.1.6 Improved offset text choice

The default offset-text choice was changed to only use significant digits that are common to all ticks (e.g. 1231..1239 -> 1230, instead of 1231), except when they straddle a relatively large multiple of a power of ten, in which case that multiple is chosen (e.g. 1999..2001->2000).

9.1.7 Style parameter blacklist

In order to prevent unexpected consequences from using a style, style files are no longer able to set parameters that affect things unrelated to style. These parameters include:

```
'interactive', 'backend', 'backend.qt4', 'webagg.port',
'webagg.port_retries', 'webagg.open_in_browser', 'backend_fallback',
'toolbar', 'timezone', 'datapath', 'figure.max_open_warning',
'savefig.directory', 'tk.window_focus', 'docstring.hardcopy'
```

9.1.8 Change in default font

The default font used by matplotlib in text has been changed to DejaVu Sans and DejaVu Serif for the sans-serif and serif families, respectively. The DejaVu font family is based on the previous matplotlib default –Bitstream Vera– but includes a much wider range of characters.

The default mathtext font has been changed from Computer Modern to the DejaVu family to maintain consistency with regular text. Two new options for the `mathtext.fontset` configuration parameter have been added: `dejavusans` (default) and `dejavuserif`. Both of these options use DejaVu glyphs whenever possible and fall back to STIX symbols when a glyph is not found in DejaVu. To return to the previous behavior, set the rcParam `mathtext.fontset` to `cm`.

9.1.9 Faster text rendering

Rendering text in the Agg backend is now less fuzzy and about 20% faster to draw.

9.1.10 Improvements for the Qt figure options editor

Various usability improvements were implemented for the Qt figure options editor, among which:

- Line style entries are now sorted without duplicates.
- The colormap and normalization limits can now be set for images.
- Line edits for floating values now display only as many digits as necessary to avoid precision loss. An important bug was also fixed regarding input validation using Qt5 and a locale where the decimal separator is ”,”.

- The axes selector now uses shorter, more user-friendly names for axes, and does not crash if there are no axes.
- Line and image entries using the default labels (“_lineX”, “_imageX”) are now sorted numerically even when there are more than 10 entries.

9.1.11 Improved image support

Prior to version 2.0, matplotlib resampled images by first applying the color map and then resizing the result. Since the resampling was performed on the colored image, this introduced colors in the output image that didn’t actually exist in the color map. Now, images are resampled first (and entirely in floating-point, if the input image is floating-point), and then the color map is applied.

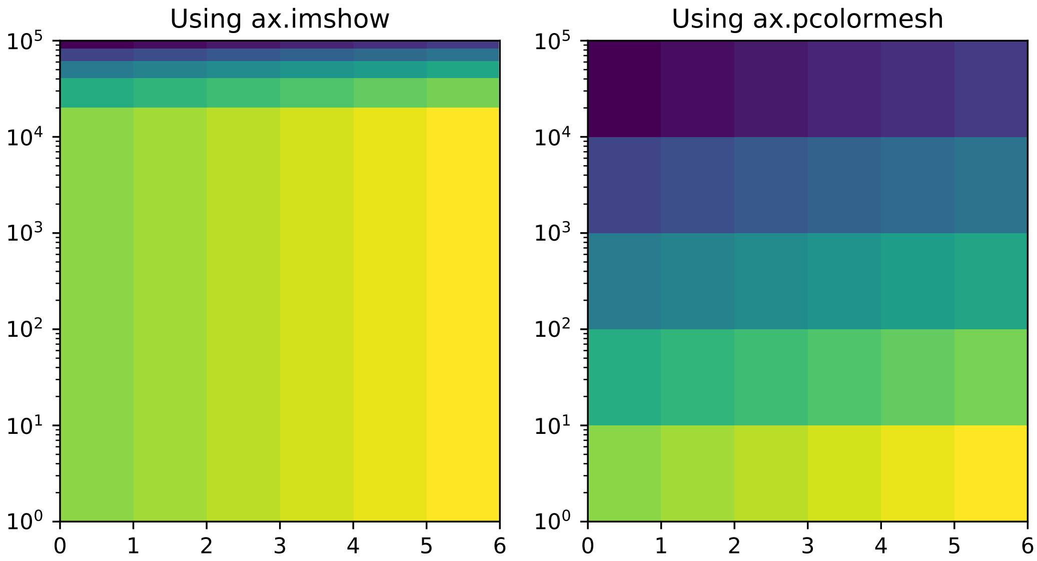
In order to make this important change, the image handling code was almost entirely rewritten. As a side effect, image resampling uses less memory and fewer datatype conversions than before.

The experimental private feature where one could “skew” an image by setting the private member `_image_skew_coordinate` has been removed. Instead, images will obey the transform of the axes on which they are drawn.

Non-linear scales on image plots

`imshow()` now draws data at the requested points in data space after the application of non-linear scales.

The image on the left demonstrates the new, correct behavior. The old behavior can be recreated using `pcolormesh()` as demonstrated on the right.



This can be understood by analogy to plotting a histogram with linearly spaced bins with a logarithmic x-axis. Equal sized bins will be displayed as wider for small *x* and narrower for large *x*.

9.1.12 Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends

The NbAgg and WebAgg backends will now use the full resolution of your high-pixel-density display.

9.1.13 Change in the default animation codec

The default animation codec has been changed from `mpeg4` to `h264`, which is more efficient. It can be set via the `animation.codec` rcParam.

9.1.14 Deprecated support for mencoder in animation

The use of mencoder for writing video files with mpl is problematic; switching to ffmpeg is strongly advised. All support for mencoder will be removed in version 2.2.

9.1.15 Boxplot Zorder Keyword Argument

The `zorder` parameter now exists for `boxplot()`. This allows the zorder of a boxplot to be set in the plotting function call.

```
boxplot(np.arange(10), zorder=10)
```

9.1.16 Filled + and x markers

New fillable *plus* and *x* markers have been added. See the `markers` module and *marker reference* examples.

9.1.17 `rcount` and `ccount` for `plot_surface()`

As of v2.0, mplot3d's `plot_surface()` now accepts `rcount` and `ccount` arguments for controlling the sampling of the input data for plotting. These arguments specify the maximum number of evenly spaced samples to take from the input data. These arguments are also the new default sampling method for the function, and is considered a style change.

The old `rstride` and `cstride` arguments, which specified the size of the evenly spaced samples, become the default when 'classic' mode is invoked, and are still available for use. There are no plans for deprecating these arguments.

9.1.18 Streamplot Zorder Keyword Argument Changes

The `zorder` parameter for `streamplot()` now has default value of `None` instead of `2`. If `None` is given as `zorder`, `streamplot()` has a default `zorder` of `matplotlib.lines.Line2D.zorder`.

9.1.19 Extension to `matplotlib.backend_bases.GraphicsContextBase`

To support standardizing hatch behavior across the backends we ship the `matplotlib.backend_bases.GraphicsContextBase.get_hatch_color` method as added to `matplotlib.backend_bases.GraphicsContextBase`. This is only used during the render process in the backends we ship so will not break any third-party backends.

If you maintain a third-party backend which extends `GraphicsContextBase` this method is now available to you and should be used to color hatch patterns.

9.2 Previous Whats New

9.2.1 New in matplotlib 0.98.4

Table of Contents

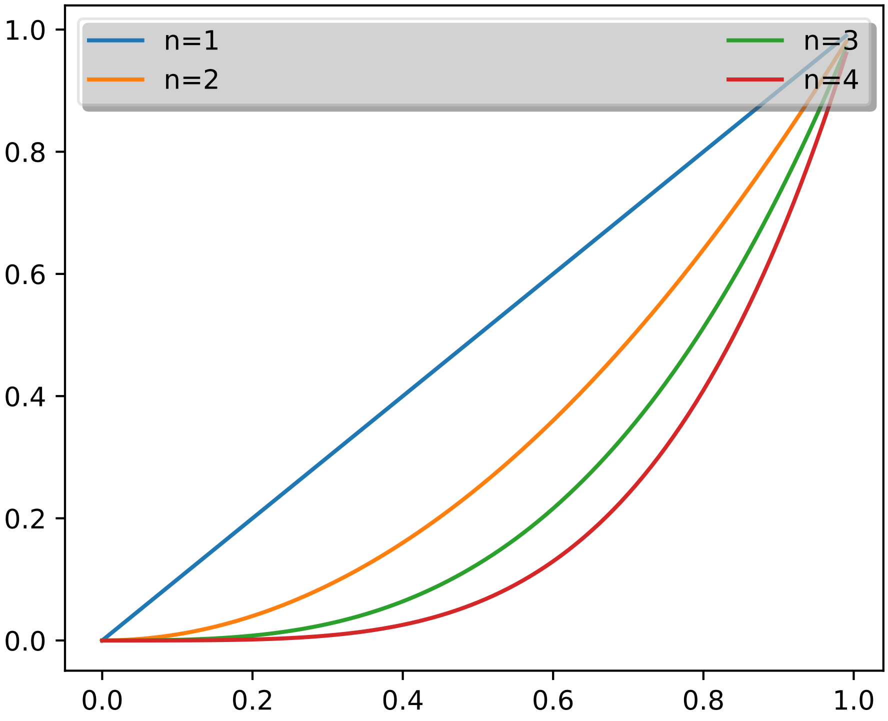
- *New in matplotlib 0.98.4*
  - *Legend enhancements*
  - *Fancy annotations and arrows*
  - *Native OS X backend*
  - *psd amplitude scaling*
  - *Fill between*
  - *Lots more*

It's been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who contributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches

Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See `legend()` and `matplotlib.legend.Legend`.



Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See *`annotate()`* and *`BoxStyle`*, *`ArrowStyle`*, and *`ConnectionStyle`*.

Native OS X backend

Michiel de Hoon has provided a native Mac OSX backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn't been tested with ipython yet, but in principle it should to work there as well. Set 'backend : macosx' in your matplotlibrc file, or run your script with:

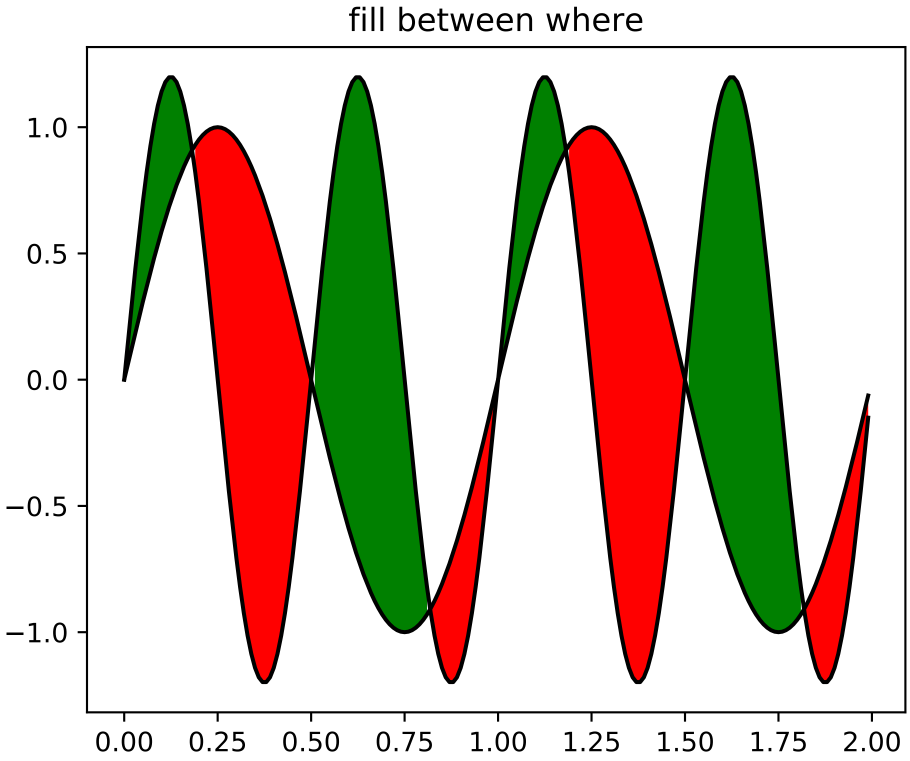
```
> python myfile.py -dmacosx
```

psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of `psd()` and friends. See *pylab_examples example code: psd_demo2.py*. and *pylab_examples example code: psd_demo3.py*. The changes should increase MATLAB compatibility and increase scaling options.

Fill between

Added a `fill_between()` function to make it easier to do shaded region plots in the presence of masked data. You can pass an *x* array and a *ylower* and *yupper* array to fill between, and an optional *where* argument which is a logical mask where you want to do the filling.



Lots more

Here are the 0.98.4 notes from the CHANGELOG:

```
Added mdehoon's native macosx backend from sf patch 2179017 - JDH

Removed the prints in the set_*style commands.  Return the list of
pretty-printed strings instead - JDH

Some of the changes Michael made to improve the output of the
```

```
property tables in the rest docs broke of made difficult to use
some of the interactive doc helpers, e.g., setp and getp.  Having all
the rest markup in the ipython shell also confused the docstrings.
I added a new rc param docstring.harcopy, to format the docstrings
differently for hardcopy and other use.  The ArtistInspector
could use a little refactoring now since there is duplication of
effort between the rest out put and the non-rest output - JDH

Updated spectral methods (psd, csd, etc.) to scale one-sided
densities by a factor of 2 and, optionally, scale all densities by
the sampling frequency.  This gives better MATLAB
compatibility. -RM

Fixed alignment of ticks in colorbars. -MGD

drop the deprecated "new" keyword of np.histogram() for numpy 1.2
or later.  -JJL

Fixed a bug in svg backend that new_figure_manager() ignores
keywords arguments such as figsize, etc. -JJL

Fixed a bug that the handlelength of the new legend class set too
short when numpoints=1 -JJL

Added support for data with units (e.g., dates) to
Axes.fill_between. -RM

Added fancybox keyword to legend. Also applied some changes for
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - JJL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH

Added scatterpoints support in Legend. patch by Erik Tollerud -
JJL
```

```
Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between.  See
examples/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim.  This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd().  In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
components, respectively.  These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

Fix a possible EINTR problem in dviread, which might help when
saving pdf files from the qt backend. - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements --
see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid
modify inplace surprises

Added image thumbnail generating function
matplotlib.image.thumbnail.  See examples/misc/image_thumbnail.py
- JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and
Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output
instead of a filename, e.g., in a wep app, we now flush the object
at the end. - JKS

Add path simplification support to paths with gaps. - EF
```

```
Fix problem with AFM files that don't specify the font's full name
or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for
easy access to the set_powerlimits method of the major
ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based
on suggestion by Jae-Joon Lee.  - EF

Allow spy to ignore zero values in sparse arrays, based on patch
by Tony Yu.  Also fixed plot to handle empty data arrays, and
fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparently split linestyles
like 'steps--' into drawstyle 'steps' and linestyle '--'.  Legends
always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when
resizing) and added additional methods for determining the arrow
angles - EF

Fix polar interpolation to handle negative values of theta - MGD

Reorganized cbook and mlab methods related to numerical
calculations that have little to do with the goals of those two
modules into a separate module numerical_methods.py Also, added
ability to select points and stop point selection with keyboard in
ginput and manual contour labeling code.  Finally, fixed contour
labeling bug. - DMK

Fix backtick in Postscript output. - MGD

[ 2089958 ] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons
to simplify certain well-behaved paths in the vector backends
(PDF, PS and SVG).  "path.simplify" must be set to True in
matplotlibrc for this to work.  - MGD

Add "filled" kwarg to Path.intersects_path and
Path.intersects_bbox. - MGD

Changed full arrows slightly to avoid an xpdf rendering problem
reported by Friedrich Hagedorn. - JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS
backends. Patch by Jae-Joon Lee. - JKS

Added 5-point star marker to plot command q- EF

Fix hatching in PS backend - MGD

Fix log with base 2 - MGD
```

```
Added support for bilinear interpolation in
NonUniformImage; patch by Gregory Lielens. - EF

Added support for multiple histograms with data of
different length - MM

Fix step plots with log scale - MGD

Fix masked arrays with markers in non-Agg backends - MGD

Fix clip_on kwarg so it actually works correctly - MGD

Fix locale problems in SVG backend - MGD

fix quiver so masked values are not plotted - JSW

improve interactive pan/zoom in qt4 backend on windows - DSD

Fix more bugs in NaN/inf handling.  In particular, path
simplification (which does not handle NaNs or infs) will be turned
off automatically when infs or NaNs are present.  Also masked
arrays are now converted to arrays with NaNs for consistent
handling of masks and NaNs - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG
backend. - MW
```

9.2.2 New in matplotlib 0.99

Table of Contents

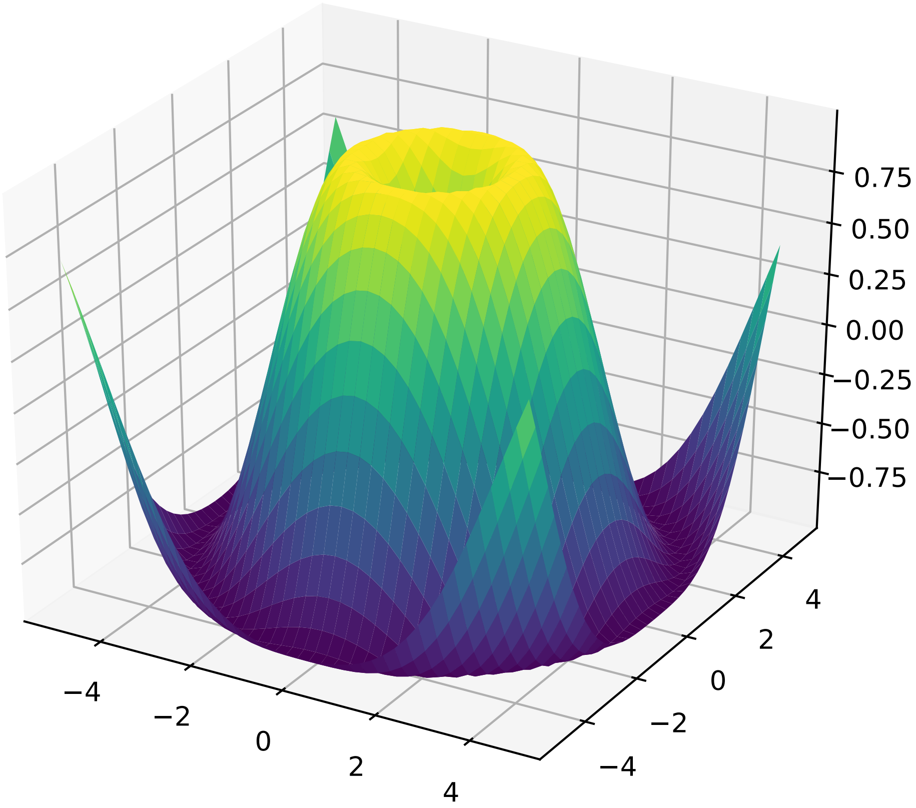
- *New in matplotlib 0.99*
  - *New documentation*
  - *mplot3d*
  - *axes grid toolkit*
  - *Axis spine placement*

New documentation

Jae-Joon Lee has written two new guides *Legend guide* and *Advanced Annotation*. Michael Sarahan has written *Image tutorial*. John Hunter has written two new tutorials on working with paths and transformations: *Path Tutorial* and *Transformations Tutorial*.

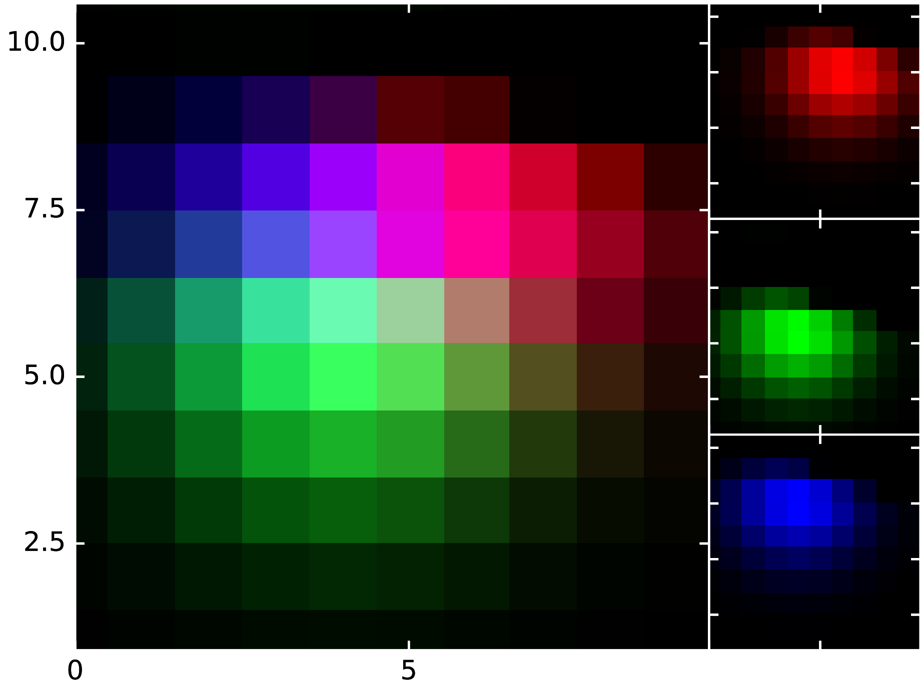
mplot3d

Reinier Heeres has ported John Porter's mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See *mplot3d Examples* and *mplot3d tutorial*



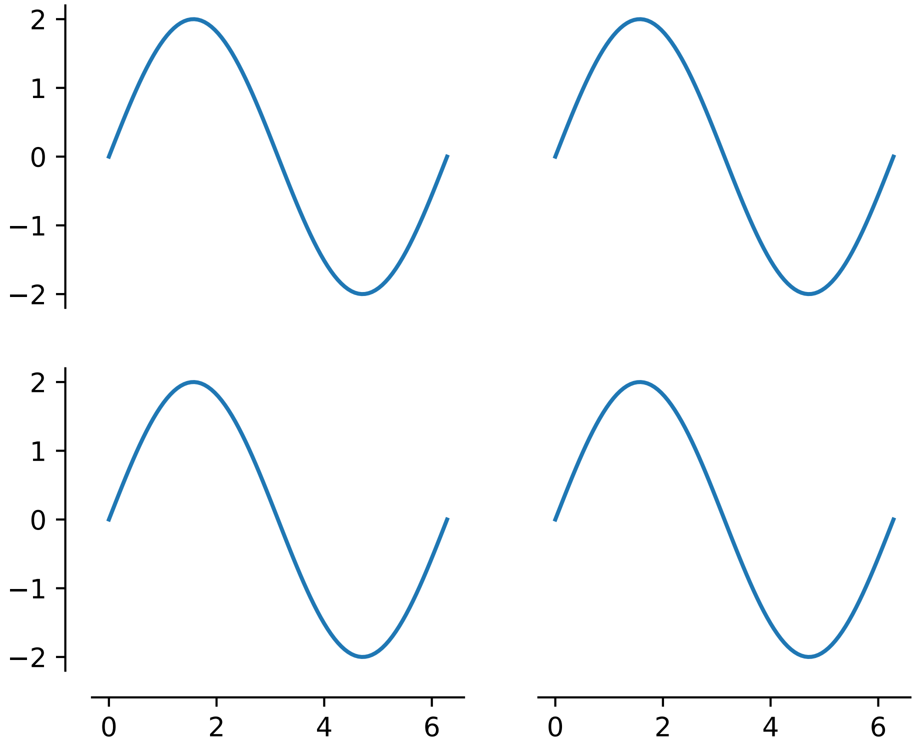
axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See *axes_grid Examples* and *The Matplotlib AxesGrid Toolkit User's Guide*.



Axis spine placement

Andrew Straw has added the ability to place "axis spines" – the lines that denote the data limits – in various arbitrary locations. No longer are your axis lines constrained to be a simple rectangle around the figure – you can turn on or off left, bottom, right and top, as well as "detach" the spine to offset it away from the data. See *pylab_examples example code: spine_placement_demo.py* and `matplotlib.spines.Spine`.



9.2.3 New in matplotlib 1.0

Table of Contents

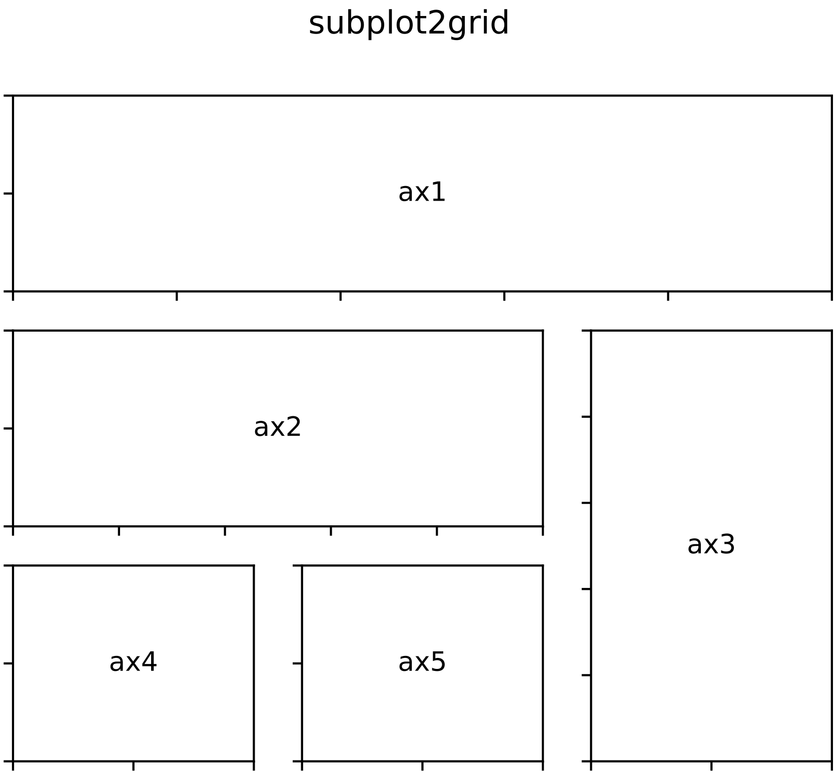
- *New in matplotlib 1.0*
    - *HTML5/Canvas backend*
    - *Sophisticated subplot grid layout*
    - *Easy pythonic subplots*
    - *Contour fixes and and triplot*
    - *multiple calls to show supported*
    - *mplot3d graphs can be embedded in arbitrary axes*
    - *tick_params*
    - *Lots of performance and feature enhancements*
    - *Much improved software carpentry*
    - *Bugfix marathon*

HTML5/Canvas backend

Simon Ratcliffe and Ludwig Schwardt have released an HTML5/Canvas backend for matplotlib. The backend is almost feature complete, and they have done a lot of work comparing their html5 rendered images with our core renderer Agg. The backend features client/server interactive navigation of matplotlib figures in an html5 compliant browser.

Sophisticated subplot grid layout

Jae-Joon Lee has written `gridspec`, a new module for doing complex subplot layouts, featuring row and column spans and more. See *Customizing Location of Subplot Using GridSpec* for a tutorial overview.



Easy pythonic subplots

Fernando Perez got tired of all the boilerplate code needed to create a figure and multiple subplots when using the matplotlib API, and wrote a `subplots()` helper function. Basic usage allows you to create the figure and an array of subplots with numpy indexing (starts with 0). e.g.:

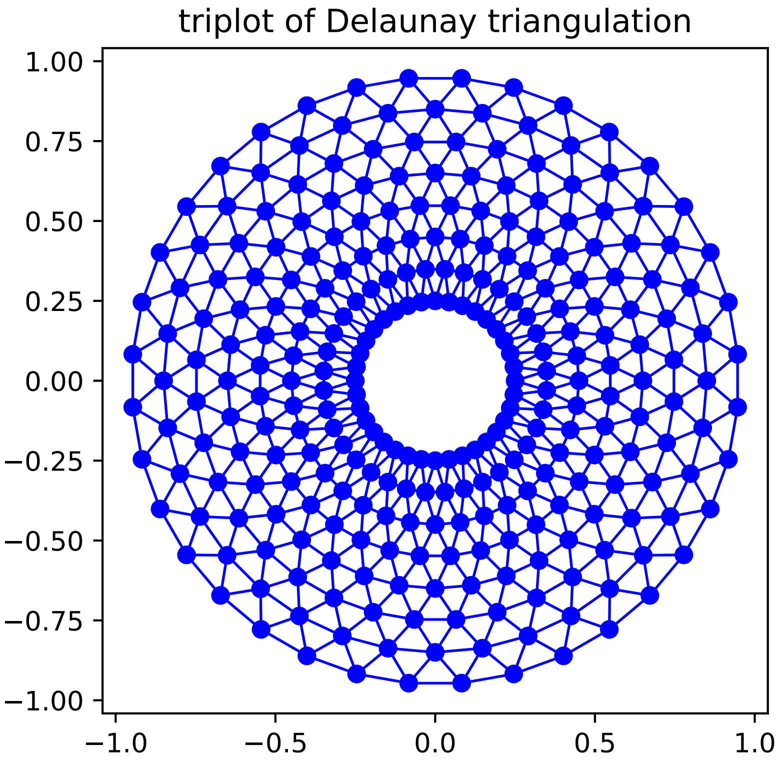
```
fig, axarr = plt.subplots(2, 2)
axarr[0,0].plot([1,2,3])   # upper, left
```

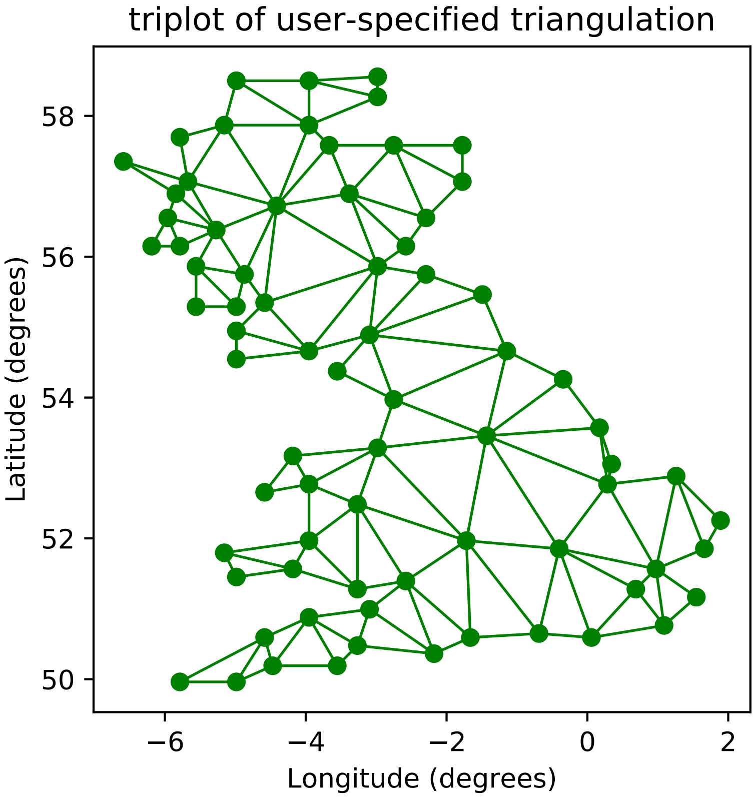
See *pylab_examples example code: subplots_demo.py* for several code examples.

Contour fixes and and triplot

Ian Thomas has fixed a long-standing bug that has vexed our most talented developers for years. `contourf()` now handles interior masked regions, and the boundaries of line and filled contours coincide.

Additionally, he has contributed a new module `tri` and helper function `triplot()` for creating and plotting unstructured triangular grids.



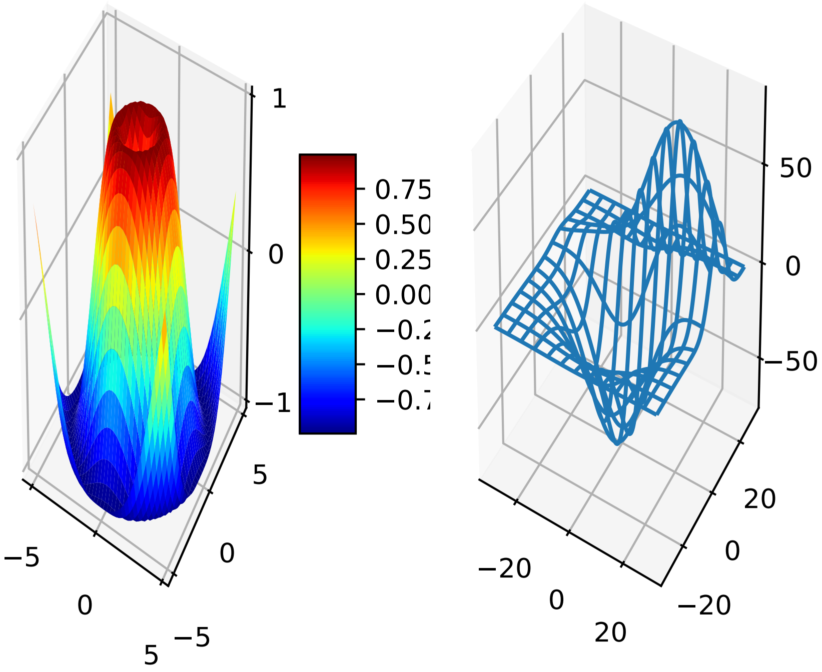


multiple calls to show supported

A long standing request is to support multiple calls to *show()*. This has been difficult because it is hard to get consistent behavior across operating systems, user interface toolkits and versions. Eric Firing has done a lot of work on rationalizing show across backends, with the desired behavior to make show raise all newly created figures and block execution until they are closed. Repeated calls to show should raise newly created figures since the last call. Eric has done a lot of testing on the user interface toolkits and versions and platforms he has access to, but it is not possible to test them all, so please report problems to the mailing list and bug tracker.

mplot3d graphs can be embedded in arbitrary axes

You can now place an mplot3d graph into an arbitrary axes location, supporting mixing of 2D and 3D graphs in the same figure, and/or multiple 3D graphs in a single figure, using the "projection" keyword argument to add_axes or add_subplot. Thanks Ben Root.



tick_params

Eric Firing wrote tick_params, a convenience method for changing the appearance of ticks and tick labels. See pyplot function `tick_params()` and associated Axes method `tick_params()`.

Lots of performance and feature enhancements

- Faster magnification of large images, and the ability to zoom in to a single pixel
- Local installs of documentation work better
- Improved "widgets" – mouse grabbing is supported
- More accurate snapping of lines to pixel boundaries
- More consistent handling of color, particularly the alpha channel, throughout the API

Much improved software carpentry

The matplotlib trunk is probably in as good a shape as it has ever been, thanks to improved software carpentry. We now have a buildbot which runs a suite of nose regression tests on every svn commit, auto-generating a set of images and comparing them against a set of known-goods, sending emails to developers on failures with a pixel-by-pixel image comparison. Releases and release bugfixes happen in branches, allowing active new feature development to happen in the trunk while keeping the release branches stable. Thanks to Andrew Straw, Michael Droettboom and other matplotlib developers for the heavy lifting.

Bugfix marathon

Eric Firing went on a bug fixing and closing marathon, closing over 100 bugs on the bug tracker with help from Jae-Joon Lee, Michael Droettboom, Christoph Gohlke and Michiel de Hoon.

9.2.4 New in matplotlib 1.1

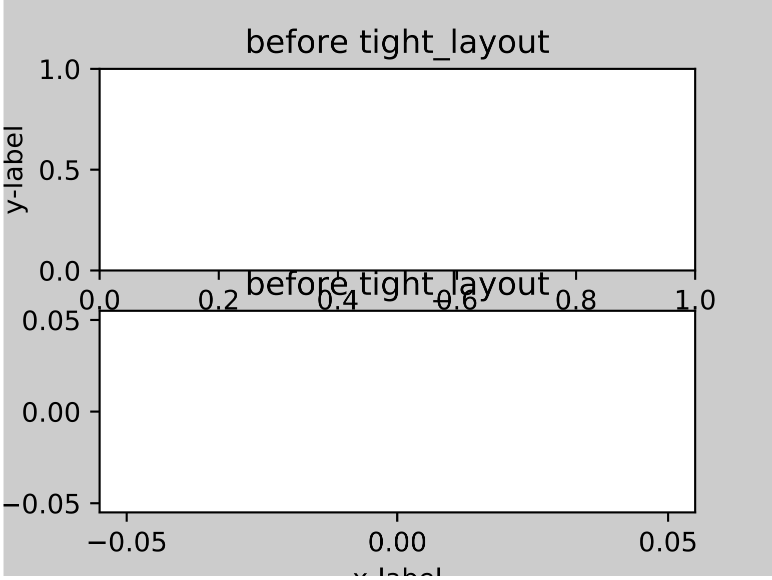
Animation

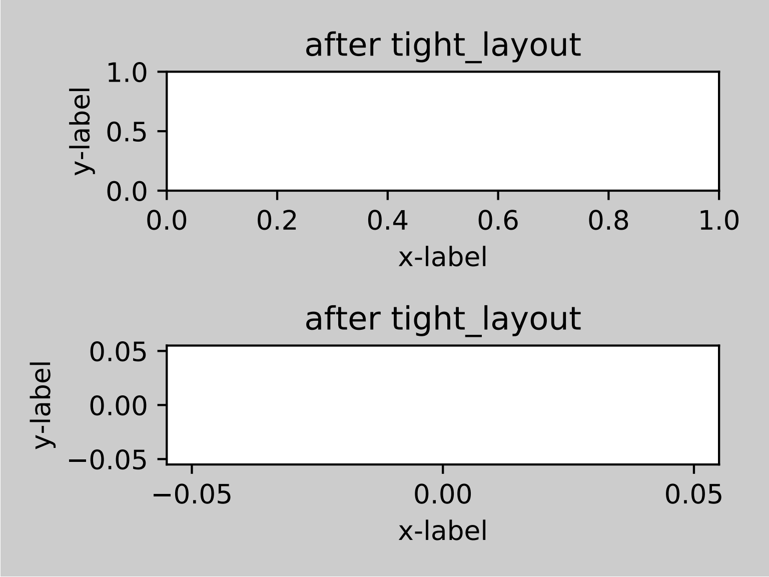
Ryan May has written a backend-independent framework for creating animated figures. The `animation` module is intended to replace the backend-specific examples formerly in the *Matplotlib Examples* listings. Examples using the new framework are in *animation Examples*; see the entrancing *double pendulum* which uses `matplotlib.animation.Animation.save()` to create the movie below.

This should be considered as a beta release of the framework; please try it and provide feedback.

Tight Layout

A frequent issue raised by users of matplotlib is the lack of a layout engine to nicely space out elements of the plots. While matplotlib still adheres to the philosophy of giving users complete control over the placement of plot elements, Jae-Joon Lee created the `tight_layout` module and introduced a new command `tight_layout()` to address the most common layout issues.





The usage of this functionality can be as simple as

```
plt.tight_layout()
```

and it will adjust the spacing between subplots so that the axis labels do not overlap with neighboring subplots. A *Tight Layout guide* has been created to show how to use this new tool.

PyQT4, PySide, and IPython

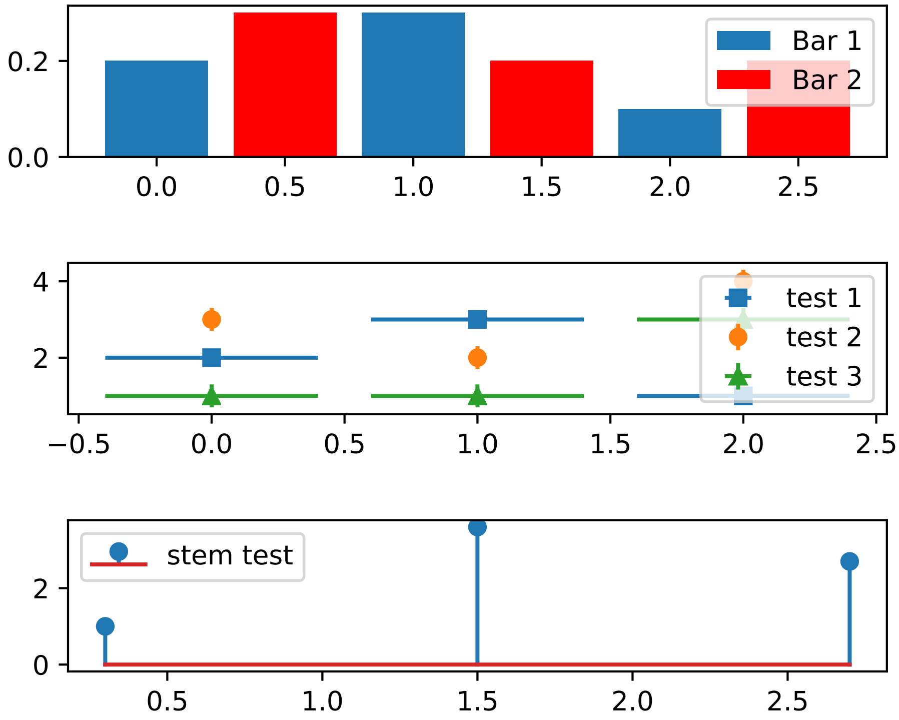
Gerald Storer made the Qt4 backend compatible with PySide as well as PyQT4. At present, however, PySide does not support the PyOS_InputHook mechanism for handling gui events while waiting for text input, so it cannot be used with the new version 0.11 of IPython. Until this feature appears in PySide, IPython users should use the PyQT4 wrapper for QT4, which remains the matplotlib default.

An rcParam entry, "backend.qt4", has been added to allow users to select PyQt4, PyQt4v2, or PySide. The latter two use the Version 2 Qt API. In most cases, users can ignore this rcParam variable; it is available to aid in testing, and to provide control for users who are embedding matplotlib in a PyQt4 or PySide app.

Legend

Jae-Joon Lee has improved plot legends. First, legends for complex plots such as *`stem()`* plots will now display correctly. Second, the 'best' placement of a legend has been improved in the presence of NANs.

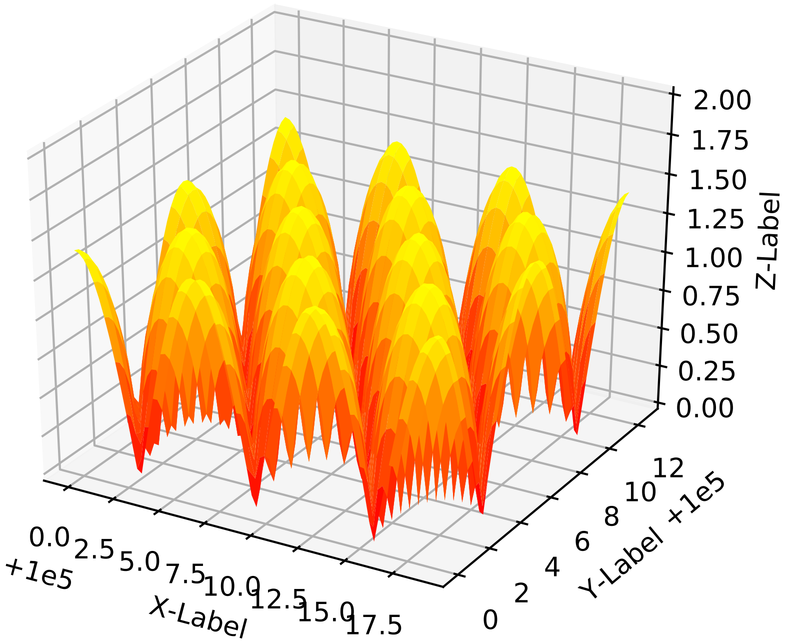
See the *Legend guide* for more detailed explanation and examples.



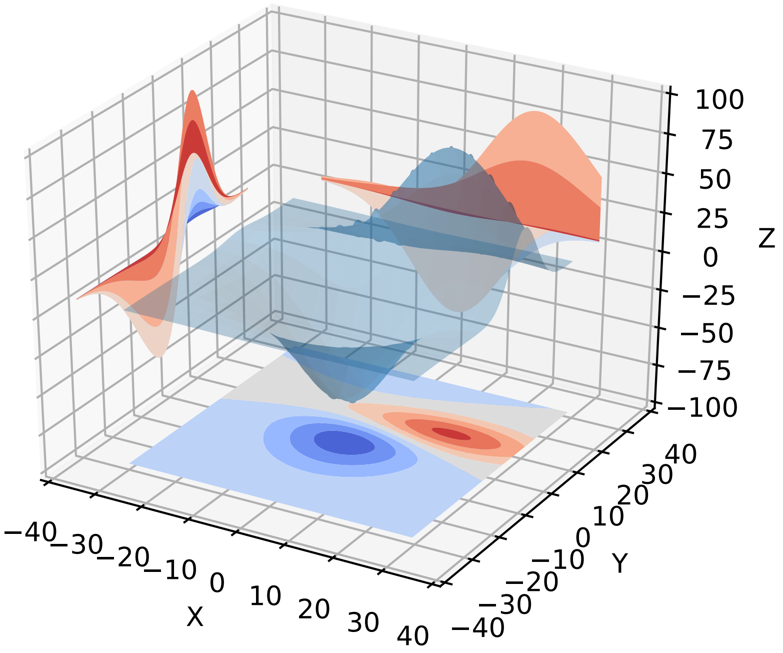
mplot3d

In continuing the efforts to make 3D plotting in matplotlib just as easy as 2D plotting, Ben Root has made several improvements to the `mplot3d` module.

- `Axes3D` has been improved to bring the class towards feature-parity with regular Axes objects
- Documentation for *mplot3d* was significantly expanded
- Axis labels and orientation improved
- Most 3D plotting functions now support empty inputs
- Ticker offset display added:



- `contourf()` gains *zdir* and *offset* kwargs. You can now do this:



Numerix support removed

After more than two years of deprecation warnings, Numerix support has now been completely removed from matplotlib.

Markers

The list of available markers for *plot()* and *scatter()* has now been merged. While they were mostly similar, some markers existed for one function, but not the other. This merge did result in a conflict for the 'd' diamond marker. Now, 'd' will be interpreted to always mean "thin" diamond while 'D' will mean "regular" diamond.

Thanks to Michael Droettboom for this effort.

Other improvements

- Unit support for polar axes and *arrow()*
- *PolarAxes* gains getters and setters for "theta_direction", and "theta_offset" to allow for theta to go in either the clock-wise or counter-clockwise direction and to specify where zero degrees should be placed. *set_theta_zero_location()* is an added convenience function.

- Fixed error in argument handling for tri-functions such as `tripcolor()`
- `axes.labelweight` parameter added to rcParams.
- For `imshow()`, *interpolation='nearest'* will now always perform an interpolation. A "none" option has been added to indicate no interpolation at all.
- An error in the Hammer projection has been fixed.
- *clabel* for `contour()` now accepts a callable. Thanks to Daniel Hyams for the original patch.
- Jae-Joon Lee added the `HBox` and `VBox` classes.
- Christoph Gohlke reduced memory usage in `imshow()`.
- `scatter()` now accepts empty inputs.
- The behavior for 'symlog' scale has been fixed, but this may result in some minor changes to existing plots. This work was refined by ssyr.
- Peter Butterworth added named figure support to `figure()`.
- Michiel de Hoon has modified the MacOSX backend to make its interactive behavior consistent with the other backends.
- Pim Schellart added a new colormap called "cubehelix". Sameer Grover also added a colormap called "coolwarm". See it and all other colormaps *here*.
- Many bug fixes and documentation improvements.

9.2.5 New in matplotlib 1.2

Table of Contents

- *New in matplotlib 1.2*
  - *Python 3.x support*
  - *PGF/TikZ backend*
  - *Locator interface*
  - *Tri-Surface Plots*
  - *Control the lengths of colorbar extensions*
  - *Figures are picklable*
  - *Set default bounding box in matplotlibrc*
  - *New Boxplot Functionality*
  - *New RC parameter functionality*
  - *Streamplot*
  - *New hist functionality*

  - *Updated shipped dependencies*
  - *Face-centred colors in tripcolor plots*
  - *Hatching patterns in filled contour plots, with legends*
  - *Known issues in the matplotlib 1.2 release*

Note: matplotlib 1.2 supports Python 2.6, 2.7, and 3.1

Python 3.x support

Matplotlib 1.2 is the first version to support Python 3.x, specifically Python 3.1 and 3.2. To make this happen in a reasonable way, we also had to drop support for Python versions earlier than 2.6.

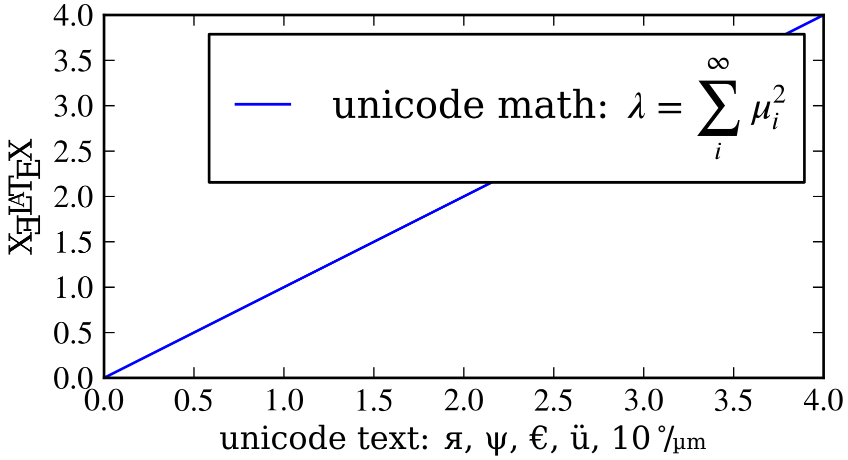
This work was done by Michael Droettboom, the Cape Town Python Users' Group, many others and supported financially in part by the SAGE project.

The following GUI backends work under Python 3.x: Gtk3Cairo, Qt4Agg, TkAgg and MacOSX. The other GUI backends do not yet have adequate bindings for Python 3.x, but continue to work on Python 2.6 and 2.7, particularly the Qt and QtAgg backends (which have been deprecated). The non-GUI backends, such as PDF, PS and SVG, work on both Python 2.x and 3.x.

Features that depend on the Python Imaging Library, such as JPEG handling, do not work, since the version of PIL for Python 3.x is not sufficiently mature.

PGF/TikZ backend

Peter Würtz wrote a backend that allows matplotlib to export figures as drawing commands for LaTeX. These can be processed by PdfLaTeX, XeLaTeX or LuaLaTeX using the PGF/TikZ package. Usage examples and documentation are found in *Typesetting With XeLaTeX/LuaLaTeX*.



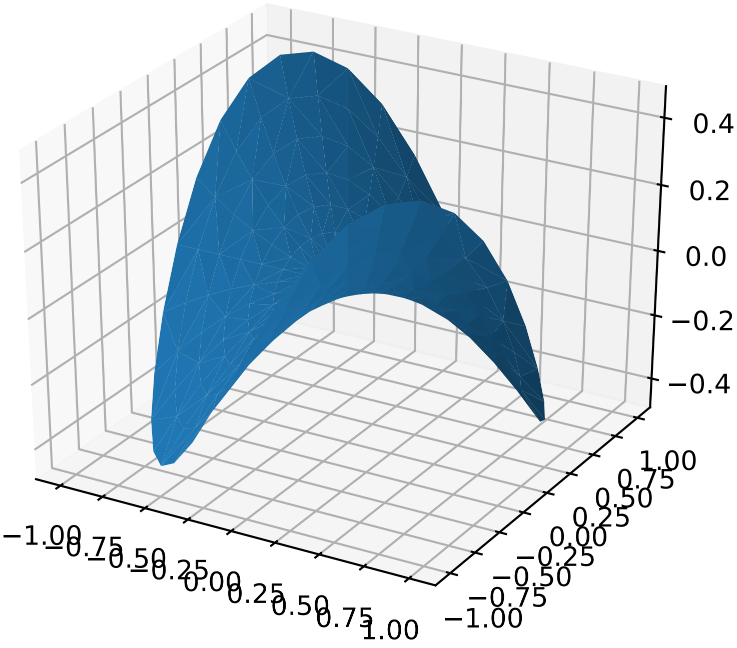
Locator interface

Philip Elson exposed the intelligence behind the tick Locator classes with a simple interface. For instance, to get no more than 5 sensible steps which span the values 10 and 19.5:

```
>>> import matplotlib.ticker as mticker
>>> locator = mticker.MaxNLocator(nbins=5)
>>> print(locator.tick_values(10, 19.5))
[ 10.   12.   14.   16.   18.   20.]
```

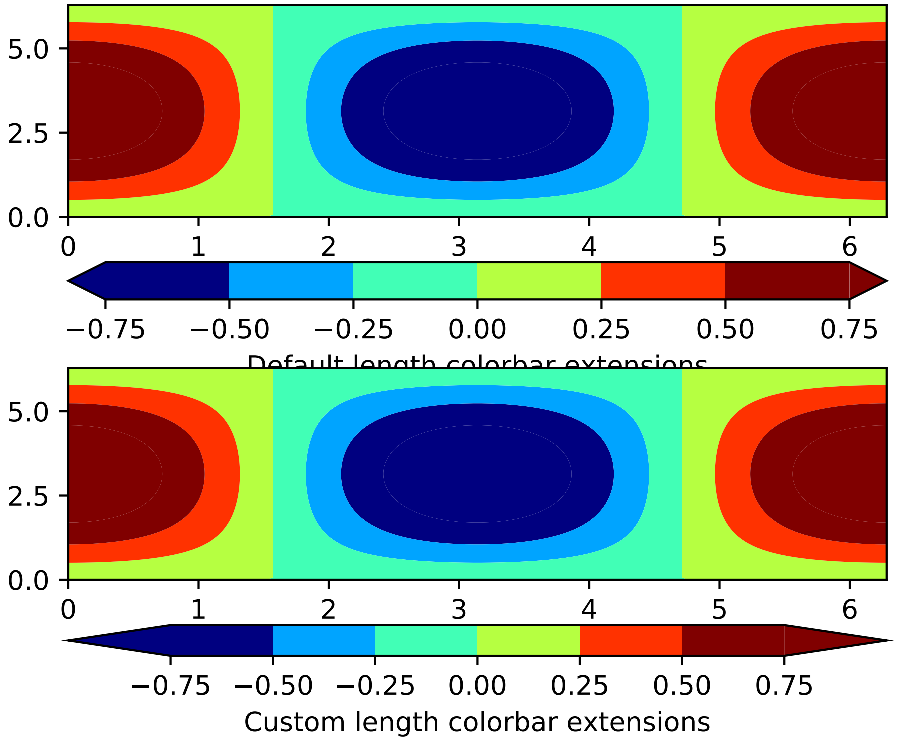
Tri-Surface Plots

Damon McDougall added a new plotting method for the `mplot3d` toolkit called *`plot_trisurf()`*.



Control the lengths of colorbar extensions

Andrew Dawson added a new keyword argument *extendfrac* to *`colorbar()`* to control the length of minimum and maximum colorbar extensions.



Figures are picklable

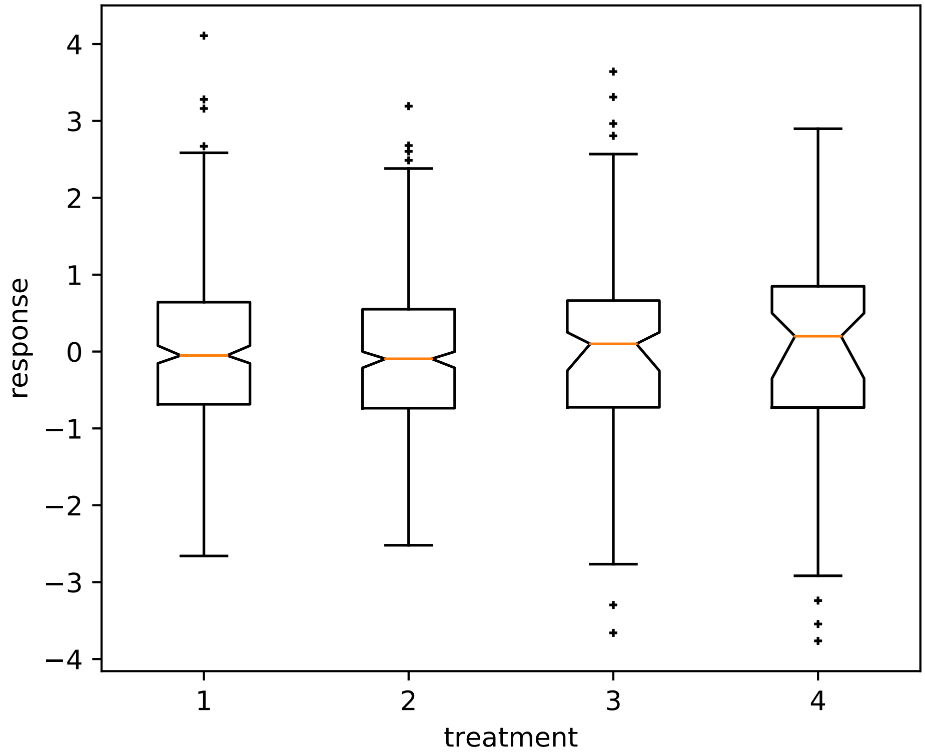
Philip Elson added an experimental feature to make figures picklable for quick and easy short-term storage of plots. Pickle files are not designed for long term storage, are unsupported when restoring a pickle saved in another matplotlib version and are insecure when restoring a pickle from an untrusted source. Having said this, they are useful for short term storage for later modification inside matplotlib.

Set default bounding box in matplotlibrc

Two new defaults are available in the matplotlibrc configuration file: `savefig.bbox`, which can be set to ‘standard’ or ‘tight’, and `savefig.pad_inches`, which controls the bounding box padding.

New Boxplot Functionality

Users can now incorporate their own methods for computing the median and its confidence intervals into the `boxplot()` method. For every column of data passed to boxplot, the user can specify an accompanying median and confidence interval.



New RC parameter functionality

Matthew Emmett added a function and a context manager to help manage RC parameters: `rc_file()` and *`rc_context`*. To load RC parameters from a file:

```
>>> mpl.rc_file('mpl.rc')
```

To temporarily use RC parameters:

```
>>> with mpl.rc_context(fname='mpl.rc', rc={'text.usetex': True}):
>>>     ...
```

Streamplot

Tom Flannaghan and Tony Yu have added a new *`streamplot()`* function to plot the streamlines of a vector field. This has been a long-requested feature and complements the existing *`quiver()`* function for plotting vector fields. In addition to simply plotting the streamlines of the vector field, *`streamplot()`* allows users to map the colors and/or line widths of the streamlines to a separate parameter, such as the speed or local intensity of the vector field.

New hist functionality

Nic Eggert added a new `stacked` kwarg to *`hist()`* that allows creation of stacked histograms using any of the histogram types. Previously, this functionality was only available by using the `barstacked` histogram type. Now, when `stacked=True` is passed to the function, any of the histogram types can be stacked. The `barstacked` histogram type retains its previous functionality for backwards compatibility.

Updated shipped dependencies

The following dependencies that ship with matplotlib and are optionally installed alongside it have been updated:

- `pytz` 2012d
- `dateutil` 1.5 on Python 2.x, and 2.1 on Python 3.x

Face-centred colors in tripcolor plots

Ian Thomas extended *`tripcolor()`* to allow one color value to be specified for each triangular face rather than for each point in a triangulation.

Known issues in the matplotlib 1.2 release

- When using the Qt4Agg backend with IPython 0.11 or later, the save dialog will not display. This should be fixed in a future version of IPython.

9.2.6 New in matplotlib 1.2.2

Table of Contents

- *New in matplotlib 1.2.2*
  - *Improved collections*
  - *Multiple images on same axes are correctly transparent*

Improved collections

The individual items of a collection may now have different alpha values and be rendered correctly. This also fixes a bug where collections were always filled in the PDF backend.

Multiple images on same axes are correctly transparent

When putting multiple images onto the same axes, the background color of the axes will now show through correctly.

9.2.7 New in matplotlib 1.3

Table of Contents

- *New in matplotlib 1.3*
  - *New in 1.3.1*
  - *New plotting features*
  - *Updated Axes3D.contour methods*
  - *Drawing*
  - *Text*
  - *Configuration (rcParams)*
  - *Backends*
  - *Documentation and examples*
  - *Infrastructure*

Note: matplotlib 1.3 supports Python 2.6, 2.7, 3.2, and 3.3

New in 1.3.1

1.3.1 is a bugfix release, primarily dealing with improved setup and handling of dependencies, and correcting and enhancing the documentation.

The following changes were made in 1.3.1 since 1.3.0.

Enhancements

- Added a context manager for creating multi-page pdfs (see `matplotlib.backends.backend_pdf.PdfPages`).
- The WebAgg backend should now have lower latency over heterogeneous Internet connections.

Bug fixes

- Histogram plots now contain the endline.
- Fixes to the Molleweide projection.
- Handling recent fonts from Microsoft and Macintosh-style fonts with non-ascii metadata is improved.
- Hatching of fill between plots now works correctly in the PDF backend.
- Tight bounding box support now works in the PGF backend.
- Transparent figures now display correctly in the Qt4Agg backend.
- Drawing lines from one subplot to another now works.
- Unit handling on masked arrays has been improved.

Setup and dependencies

- Now works with any version of pyparsing 1.5.6 or later, without displaying hundreds of warnings.
- Now works with 64-bit versions of Ghostscript on MS-Windows.
- When installing from source into an environment without Numpy, Numpy will first be downloaded and built and then used to build matplotlib.
- Externally installed backends are now always imported using a fully-qualified path to the module.
- Works with newer version of wxPython.
- Can now build with a PyCXX installed globally on the system from source.
- Better detection of Gtk3 dependencies.

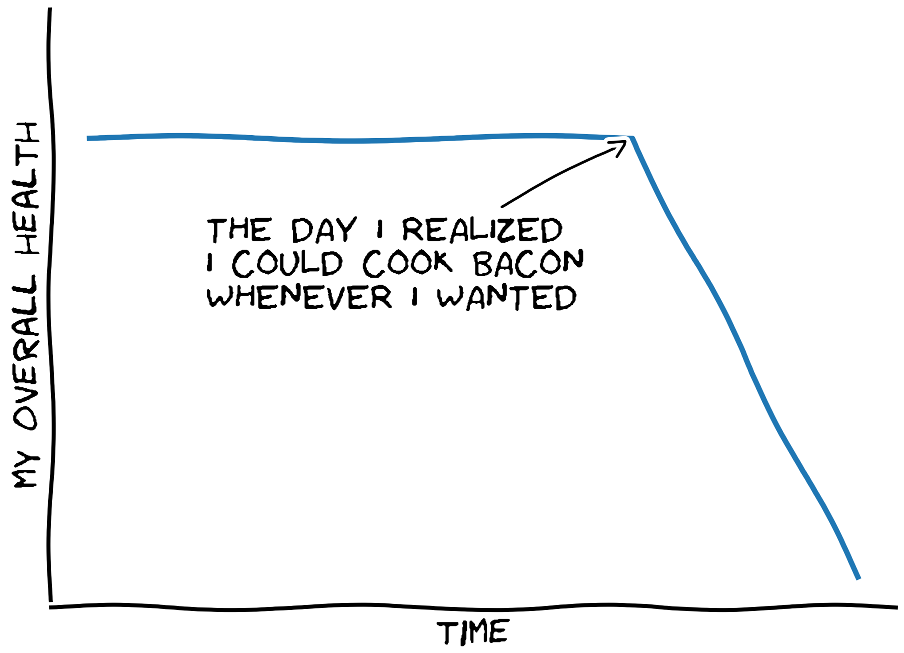
Testing

- Tests should now work in non-English locales.
- PEP8 conformance tests now report on locations of issues.

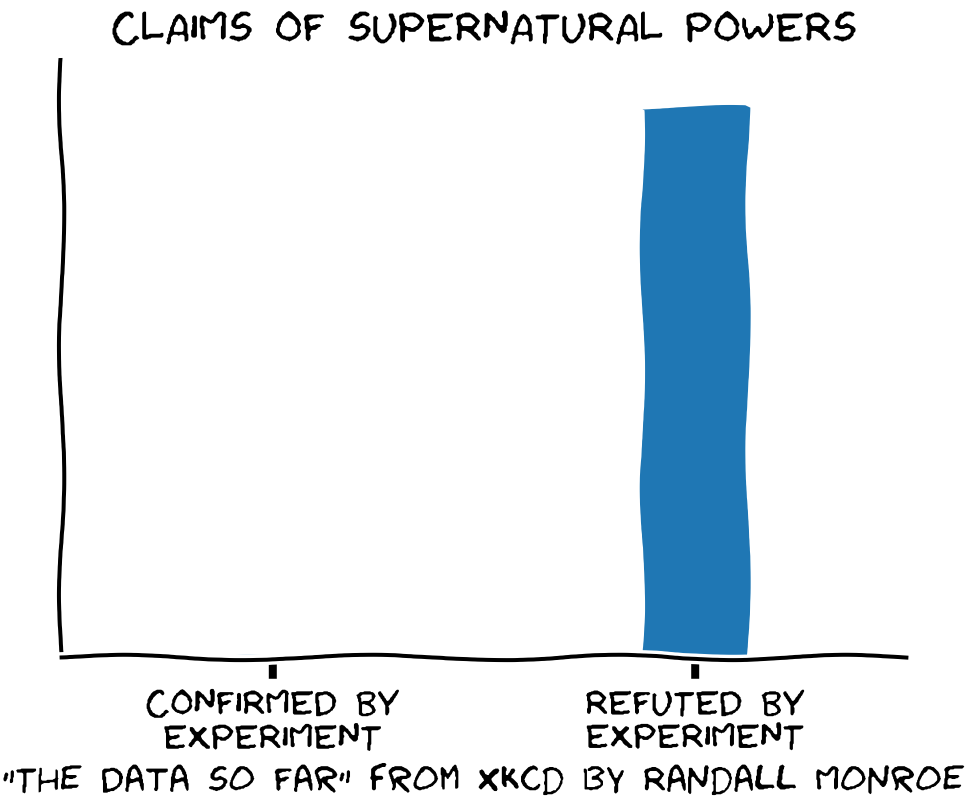
New plotting features

`xkcd`-style sketch plotting

To give your plots a sense of authority that they may be missing, Michael Droettboom (inspired by the work of many others in PR #1329) has added an xkcd-style sketch plotting mode. To use it, simply call `matplotlib.pyplot.xkcd()` before creating your plot. For really fine control, it is also possible to modify each artist's sketch parameters individually with `matplotlib.artist.Artist.set_sketch_params()`.

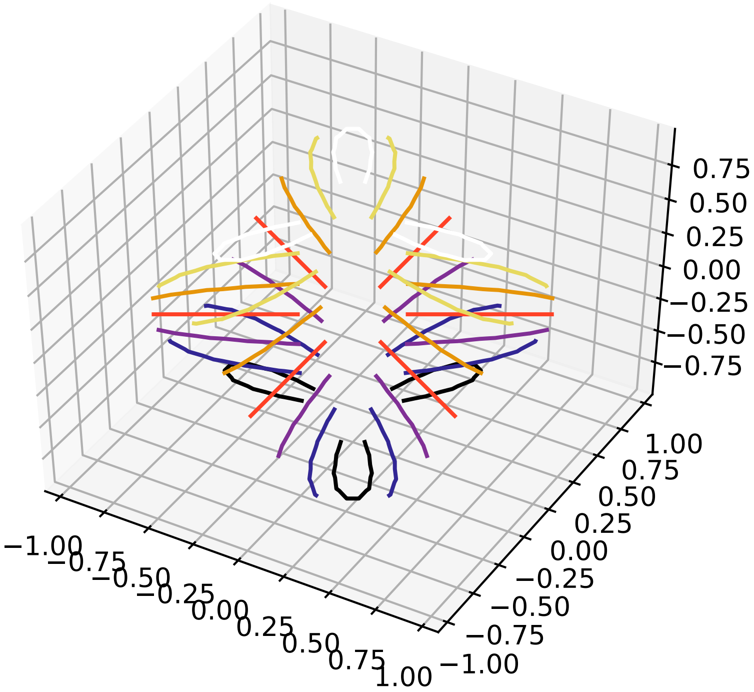


"STOVE OWNERSHIP" FROM XKCD BY RANDALL MONROE



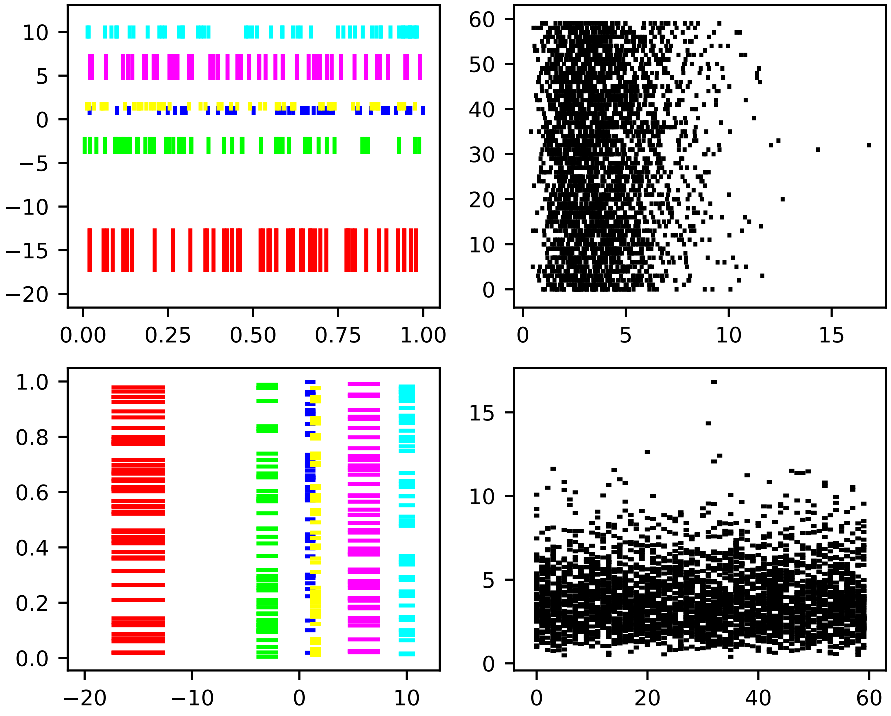
Updated Axes3D.contour methods

Damon McDougall updated the *tricontour()* and *tricontourf()* methods to allow 3D contour plots on abitrary unstructured user-specified triangulations.



New eventplot plot type

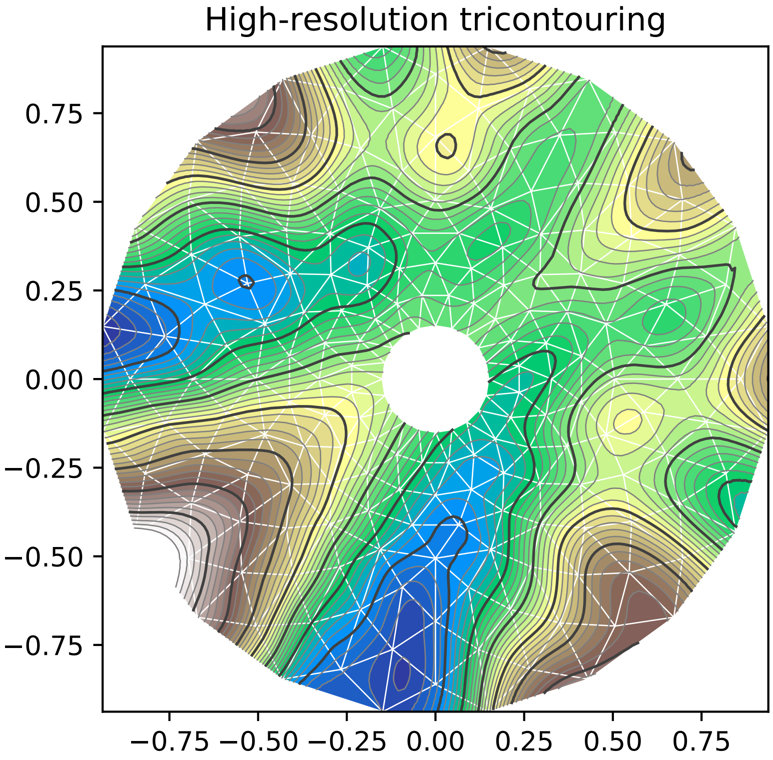
Todd Jennings added a *eventplot()* function to create multiple rows or columns of identical line segments



As part of this feature, there is a new *`EventCollection`* class that allows for plotting and manipulating rows or columns of identical line segments.

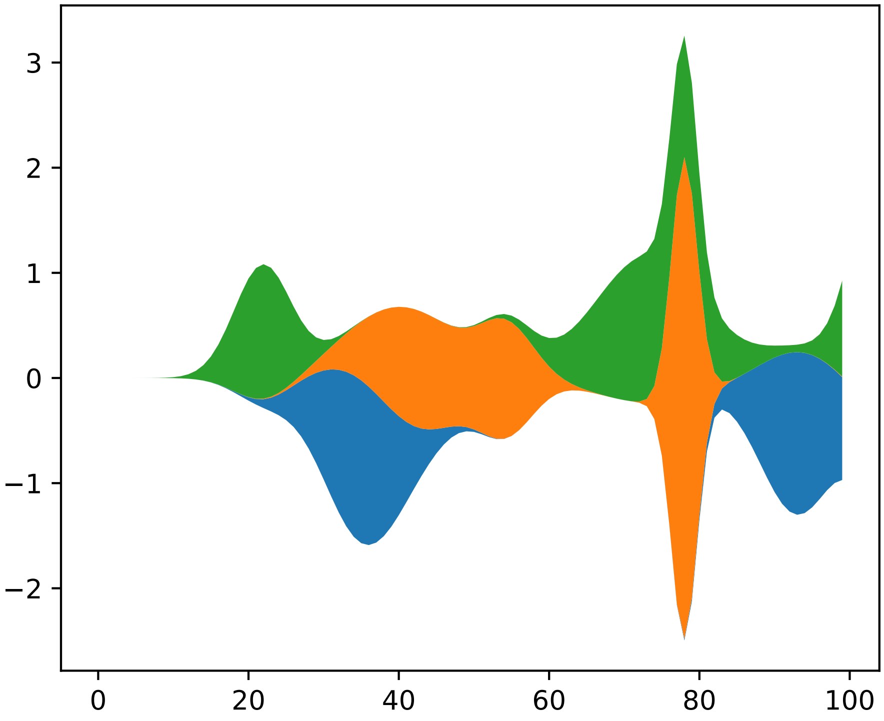
Triangular grid interpolation

Geoffroy Billotey and Ian Thomas added classes to perform interpolation within triangular grids: (*`LinearTriInterpolator`* and *`CubicTriInterpolator`*) and a utility class to find the triangles in which points lie (*`TrapezoidMapTriFinder`*). A helper class to perform mesh refinement and smooth contouring was also added (*`UniformTriRefiner`*). Finally, a class implementing some basic tools for triangular mesh improvement was added (*`TriAnalyzer`*).



Baselines for stackplot

Till Stensitzki added non-zero baselines to `stackplot()`. They may be symmetric or weighted.



Rectangular colorbar extensions

Andrew Dawson added a new keyword argument *extendrect* to *colorbar()* to optionally make colorbar extensions rectangular instead of triangular.

More robust boxplots

Paul Hobson provided a fix to the *boxplot()* method that prevent whiskers from being drawn inside the box for oddly distributed data sets.

Calling subplot() without arguments

A call to *subplot()* without any arguments now acts the same as `subplot(111)` or `subplot(1,1,1)` – it creates one axes for the whole figure. This was already the behavior for both *axes()* and *subplots()*, and now this consistency is shared with *subplot()*.

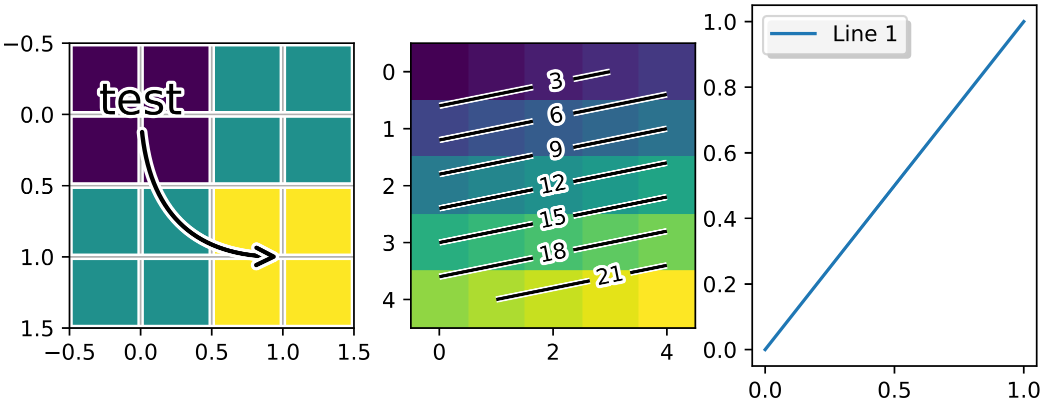
Drawing

Independent alpha values for face and edge colors

Wes Campaigne modified how *Patch* objects are drawn such that (for backends supporting transparency) you can set different alpha values for faces and edges, by specifying their colors in RGBA format. Note that if you set the alpha attribute for the patch object (e.g. using *set_alpha()* or the `alpha` keyword argument), that value will override the alpha components set in both the face and edge colors.

Path effects on lines

Thanks to Jae-Joon Lee, path effects now also work on plot lines.



Easier creation of colormap and normalizer for levels with colors

Phil Elson added the *matplotlib.colors.from_levels_and_colors()* function to easily create a colormap and normalizer for representation of discrete colors for plot types such as *matplotlib.pyplot.pcolormesh()*, with a similar interface to that of `contourf()`.

Full control of the background color

Wes Campaigne and Phil Elson fixed the Agg backend such that PNGs are now saved with the correct background color when `fig.patch.get_alpha()` is not 1.

Improved `bbox_inches="tight"` functionality

Passing `bbox_inches="tight"` through to `plt.save()` now takes into account *all* artists on a figure - this was previously not the case and led to several corner cases which did not function as expected.

Initialize a rotated rectangle

Damon McDougall extended the *Rectangle* constructor to accept an `angle` kwarg, specifying the rotation of a rectangle in degrees.

Text

Anchored text support

The `svg` and `pgf` backends are now able to save text alignment information to their output formats. This allows to edit text elements in saved figures, using Inkscape for example, while preserving their intended position. For `svg` please note that you'll have to disable the default text-to-path conversion (`mpl.rc('svg', fonttype='none')`).

Better vertical text alignment and multi-line text

The vertical alignment of text is now consistent across backends. You may see small differences in text placement, particularly with rotated text.

If you are using a custom backend, note that the `draw_text` renderer method is now passed the location of the baseline, not the location of the bottom of the text bounding box.

Multi-line text will now leave enough room for the height of very tall or very low text, such as superscripts and subscripts.

Left and right side axes titles

Andrew Dawson added the ability to add axes titles flush with the left and right sides of the top of the axes using a new keyword argument `loc` to *title()*.

Improved manual contour plot label positioning

Brian Mattern modified the manual contour plot label positioning code to interpolate along line segments and find the actual closest point on a contour to the requested position. Previously, the closest path vertex was used, which, in the case of straight contours was sometimes quite distant from the requested location. Much more precise label positioning is now possible.

Configuration (rcParams)

Quickly find rcParams

Phil Elson made it easier to search for rcParameters by passing a valid regular expression to `matplotlib.RcParams.find_all()`. *matplotlib.RcParams* now also has a pretty repr and str representation so that search results are printed prettily:

```
>>> import matplotlib
>>> print(matplotlib.rcParams.find_all('\.size'))
RcParams({'font.size': 12,
          'xtick.major.size': 4,
          'xtick.minor.size': 2,
          'ytick.major.size': 4,
          'ytick.minor.size': 2})
```

`axes.xmargin` and `axes.ymargin` added to rcParams

`rcParam` values (`axes.xmargin` and `axes.ymargin`) were added to configure the default margins used. Previously they were hard-coded to default to 0, default value of both rcParam values is 0.

Changes to font rcParams

The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

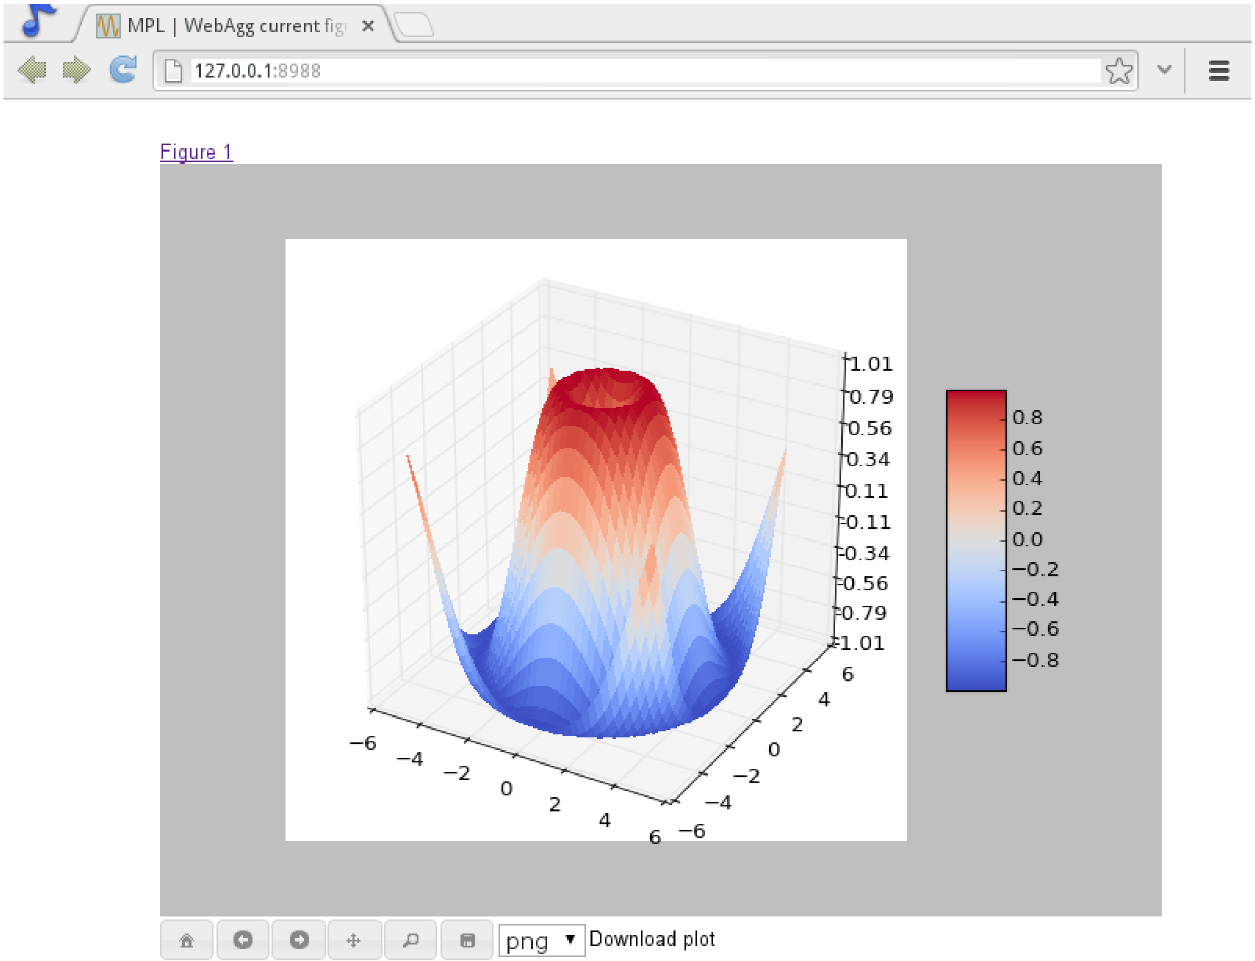
`savefig.jpeg_quality` added to rcParams

rcParam value `savefig.jpeg_quality` was added so that the user can configure the default quality used when a figure is written as a JPEG. The default quality is 95; previously, the default quality was 75. This change minimizes the artifacting inherent in JPEG images, particularly with images that have sharp changes in color as plots often do.

Backends

WebAgg backend

Michael Droettboom, Phil Elson and others have developed a new backend, WebAgg, to display figures in a web browser. It works with animations as well as being fully interactive.



MPL | WebAgg current fig

Future versions of matplotlib will integrate this backend with the IPython notebook for a fully web browser based plotting frontend.

Remember save directory

Martin Spacek made the save figure dialog remember the last directory saved to. The default is configurable with the new `savefig.directory` rcParam in `matplotlibrc`.

Documentation and examples

Numpydoc docstrings

Nelle Varoquaux has started an ongoing project to convert matplotlib's docstrings to numpydoc format. See MEP10 for more information.

Example reorganization

Tony Yu has begun work reorganizing the examples into more meaningful categories. The new gallery page is the fruit of this ongoing work. See MEP12 for more information.

Examples now use subplots()

For the sake of brevity and clarity, most of the *examples* now use the newer `subplots()`, which creates a figure and one (or multiple) axes object(s) in one call. The old way involved a call to `figure()`, followed by one (or multiple) `subplot()` calls.

Infrastructure

Housecleaning

A number of features that were deprecated in 1.2 or earlier, or have not been in a working state for a long time have been removed. Highlights include removing the Qt version 3 backends, and the FltkAgg and Emf backends. See *Changes in 1.3.x* for a complete list.

New setup script

matplotlib 1.3 includes an entirely rewritten setup script. We now ship fewer dependencies with the tarballs and installers themselves. Notably, `pytz`, `dateutil`, `pyparsing` and `six` are no longer included with matplotlib. You can either install them manually first, or let `pip` install them as dependencies along with matplotlib. It is now possible to not include certain subcomponents, such as the unit test data, in the install. See `setup.cfg.template` for more information.

XDG base directory support

On Linux, matplotlib now uses the `XDG base directory specification` to find the `matplotlibrc` configuration file. `matplotlibrc` should now be kept in `config/matplotlib`, rather than `matplotlib`. If your configuration is found in the old location, it will still be used, but a warning will be displayed.

Catch opening too many figures using pyplot

Figures created through `pyplot.figure` are retained until they are explicitly closed. It is therefore common for new users of matplotlib to run out of memory when creating a large series of figures in a loop without closing them.

matplotlib will now display a `RuntimeWarning` when too many figures have been opened at once. By default, this is displayed for 20 or more figures, but the exact number may be controlled using the `figure.max_open_warning` rcParam.

9.2.8 New in matplotlib 1.4

Thomas A. Caswell served as the release manager for the 1.4 release.

Table of Contents

- *New in matplotlib 1.4*
  - *New colormap*
  - *The nbagg backend*
  - *New plotting features*
  - *Date handling*
  - *Configuration (rcParams)*
  - `style` *package added*
  - *Backends*
  - *Text*
  - *Sphinx extensions*
  - *Legend and PathEffects documentation*
  - *Widgets*
  - *GAE integration*

Note: matplotlib 1.4 supports Python 2.6, 2.7, 3.3, and 3.4

New colormap

In heatmaps, a green-to-red spectrum is often used to indicate intensity of activity, but this can be problematic for the red/green colorblind. A new, colorblind-friendly colormap is now available at `matplotlib.cm.Wistia`. This colormap maintains the red/green symbolism while achieving deuteranopic legibility through brightness variations. See here for more information.

The nbagg backend

Phil Elson added a new backend, named "nbagg", which enables interactive figures in a live IPython notebook session. The backend makes use of the infrastructure developed for the webagg backend, which itself gives standalone server backed interactive figures in the browser, however nbagg does not require a dedicated matplotlib server as all communications are handled through the IPython Comm machinery.

As with other backends nbagg can be enabled inside the IPython notebook with:

```
import matplotlib
matplotlib.use('nbagg')
```

Once figures are created and then subsequently shown, they will placed in an interactive widget inside the notebook allowing panning and zooming in the same way as any other matplotlib backend. Because figures require a connection to the IPython notebook server for their interactivity, once the notebook is saved, each figure will be rendered as a static image - thus allowing non-interactive viewing of figures on services such as nbviewer.

New plotting features

Power-law normalization

Ben Gamari added a power-law normalization method, *PowerNorm*. This class maps a range of values to the interval [0,1] with power-law scaling with the exponent provided by the constructor's `gamma` argument. Power law normalization can be useful for, e.g., emphasizing small populations in a histogram.

Fully customizable boxplots

Paul Hobson overhauled the *boxplot()* method such that it is now completely customizable in terms of the styles and positions of the individual artists. Under the hood, *boxplot()* relies on a new function (*boxplot_stats()*), which accepts any data structure currently compatible with *boxplot()*, and returns a list of dictionaries containing the positions for each element of the boxplots. Then a second method, `bxp()` is called to draw the boxplots based on the stats.

The *boxplot()* function can be used as before to generate boxplots from data in one step. But now the user has the flexibility to generate the statistics independently, or to modify the output of *boxplot_stats()* prior to plotting with `bxp()`.

Lastly, each artist (e.g., the box, outliers, cap, notches) can now be toggled on or off and their styles can be passed in through individual kwargs. See the examples: *statistics example code: boxplot_demo.py* and *statistics example code: bxp_demo.py*

Added a bool kwarg, `manage_xticks`, which if False disables the management of the ticks and limits on the x-axis by *bxp()*.

Support for datetime axes in 2d plots

Andrew Dawson added support for datetime axes to *contour()*, *contourf()*, *pcolormesh()* and *pcolor()*.

Support for additional spectrum types

Todd Jennings added support for new types of frequency spectrum plots: *magnitude_spectrum()*, *phase_spectrum()*, and *angle_spectrum()*, as well as corresponding functions in mlab.

He also added these spectrum types to *specgram()*, as well as adding support for linear scaling there (in addition to the existing dB scaling). Support for additional spectrum types was also added to *specgram()*.

He also increased the performance for all of these functions and plot types.

Support for detrending and windowing 2D arrays in mlab

Todd Jennings added support for 2D arrays in the *detrend_mean()*, *detrend_none()*, and *detrend()*, as well as adding *apply_window()* which support windowing 2D arrays.

Support for strides in mlab

Todd Jennings added some functions to mlab to make it easier to use numpy strides to create memory-efficient 2D arrays. This includes *stride_repeat()*, which repeats an array to create a 2D array, and *stride_windows()*, which uses a moving window to create a 2D array from a 1D array.

Formatter for new-style formatting strings

Added `FormatStrFormatterNewStyle` which does the same job as `FormatStrFormatter`, but accepts new-style formatting strings instead of printf-style formatting strings

Consistent grid sizes in streamplots

streamplot() uses a base grid size of 30x30 for both `density=1` and `density=(1, 1)`. Previously a grid size of 30x30 was used for `density=1`, but a grid size of 25x25 was used for `density=(1, 1)`.

Get a list of all tick labels (major and minor)

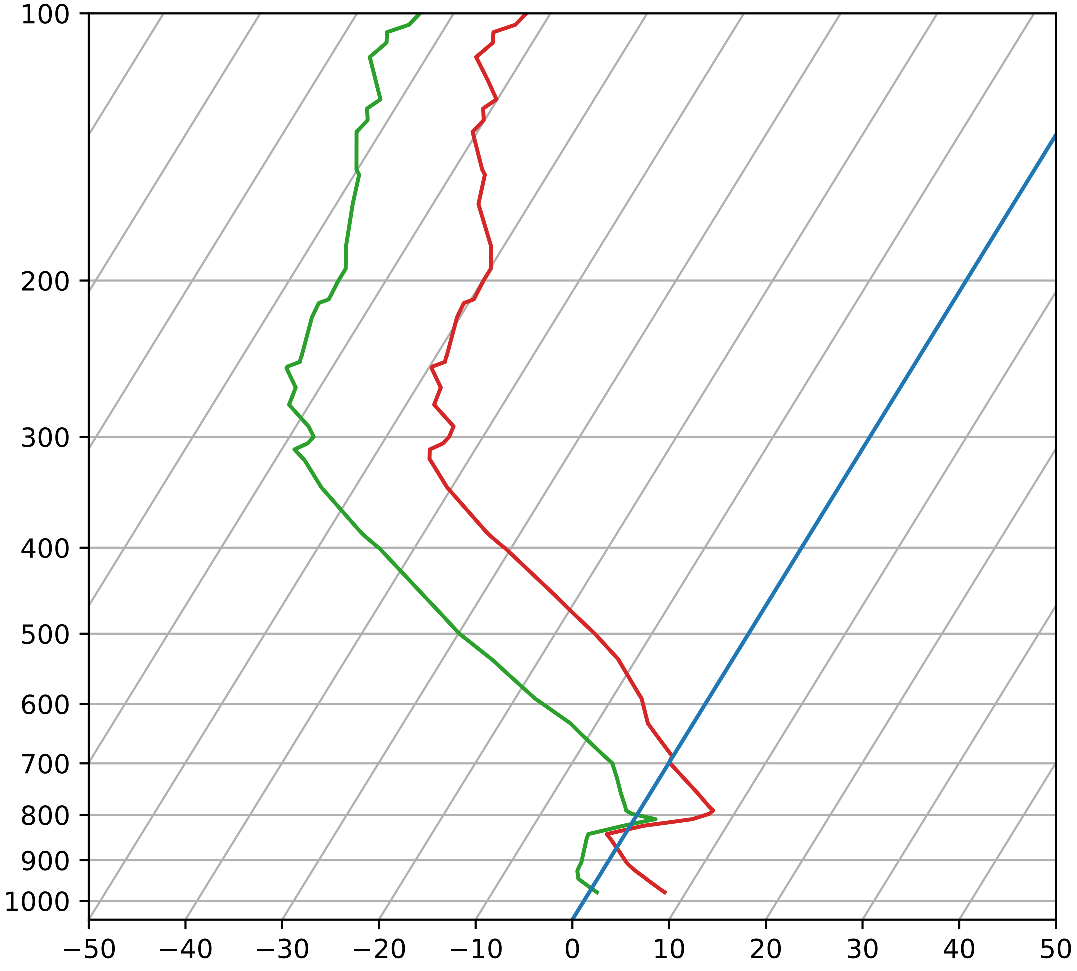
Added the `kwarg` 'which' to `get_xticklabels()`, `get_yticklabels()` and `get_ticklabels()`. 'which' can be 'major', 'minor', or 'both' select which ticks to return, like `set_ticks_position()`. If 'which' is `None` then the old behaviour (controlled by the bool `minor`).

Separate horizontal/vertical axes padding support in ImageGrid

The `kwarg` 'axes_pad' to `mpl_toolkits.axes_grid1.ImageGrid` can now be a tuple if separate horizontal/vertical padding is needed. This is supposed to be very helpful when you have a labelled legend next to every subplot and you need to make some space for legend's labels.

Support for skewed transformations

The *Affine2D* gained additional methods `skew` and `skew_deg` to create skewed transformations. Additionally, matplotlib internals were cleaned up to support using such transforms in `Axes`. This transform is important for some plot types, specifically the Skew-T used in meteorology.



Support for specifying properties of wedge and text in pie charts.

Added the `kwargs` 'wedgeprops' and 'textprops' to `pie()` to accept properties for wedge and text objects in a pie. For example, one can specify wedgeprops = {'linewidth':3} to specify the width of the borders of the wedges in the pie. For more properties that the user can specify, look at the docs for the wedge and text objects.

Fixed the direction of errorbar upper/lower limits

Larry Bradley fixed the `errorbar()` method such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.

More consistent add-object API for Axes

Added the Axes method `add_image` to put image handling on a par with artists, collections, containers, lines, patches, and tables.

Violin Plots

Per Parker, Gregory Kelsie, Adam Ortiz, Kevin Chan, Geoffrey Lee, Deokjae Donald Seo, and Taesu Terry Lim added a basic implementation for violin plots. Violin plots can be used to represent the distribution of sample data. They are similar to box plots, but use a kernel density estimation function to present a smooth approximation of the data sample used. The added features are:

`violin()` - Renders a violin plot from a collection of statistics. `violin_stats()` - Produces a collection of statistics suitable for rendering a violin plot. `violinplot()` - Creates a violin plot from a set of sample data. This method makes use of `violin_stats()` to process the input data, and `violin_stats()` to do the actual rendering. Users are also free to modify or replace the output of `violin_stats()` in order to customize the violin plots to their liking.

This feature was implemented for a software engineering course at the University of Toronto, Scarborough, run in Winter 2014 by Anya Tafliovich.

More `markevery` options to show only a subset of markers

Rohan Walker extended the `markevery` property in `Line2D`. You can now specify a subset of markers to show with an int, slice object, numpy fancy indexing, or float. Using a float shows markers at approximately equal display-coordinate-distances along the line.

Added size related functions to specialized `Collections`

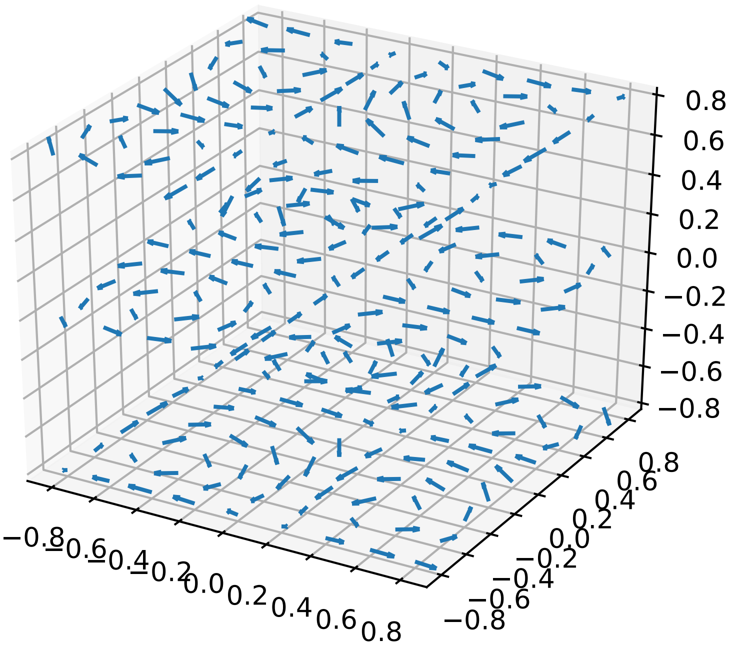
Added the `get_size` and `set_size` functions to control the size of elements of specialized collections (`AsteriskPolygonCollection` `BrokenBarHCollection` `CircleCollection` `PathCollection` `PolyCollection` `RegularPolyCollection` `StarPolygonCollection`).

Fixed the mouse coordinates giving the wrong theta value in Polar graph

Added code to `transform_non_affine()` to ensure that the calculated theta value was between the range of 0 and 2 * pi since the problem was that the value can become negative after applying the direction and rotation to the theta calculation.

Simple quiver plot for mplot3d toolkit

A team of students in an *Engineering Large Software Systems* course, taught by Prof. Anya Tafliovich at the University of Toronto, implemented a simple version of a quiver plot in 3D space for the mplot3d toolkit as one of their term project. This feature is documented in `quiver()`. The team members are: Ryan Steve D'Souza, Victor B, xbtsw, Yang Wang, David, Caradec Bisesar and Vlad Vassilovski.



polar-plot r-tick locations

Added the ability to control the angular position of the r-tick labels on a polar plot via `set_rlabel_position()`.

Date handling

n-d array support for date conversion

Andrew Dawson added support for n-d array handling to `matplotlib.dates.num2date()`, `matplotlib.dates.date2num()` and `matplotlib.dates.datestr2num()`. Support is also added to the unit conversion interfaces `matplotlib.dates.DateConverter` and `matplotlib.units.Registry`.

Configuration (rcParams)

`savefig.transparent` added

Controls whether figures are saved with a transparent background by default. Previously `savefig` always defaulted to a non-transparent background.

`axes.titleweight`

Added rcParam to control the weight of the title

`axes.formatter.useoffset` added

Controls the default value of `useOffset` in `ScalarFormatter`. If `True` and the data range is much smaller than the data average, then an offset will be determined such that the tick labels are meaningful. If `False` then the full number will be formatted in all conditions.

`nbagg.transparent` added

Controls whether nbagg figures have a transparent background. `nbagg.transparent` is `True` by default.

XDG compliance

Matplotlib now looks for configuration files (both rcparams and style) in XDG compliant locations.

`style` package added

You can now easily switch between different styles using the new `style` package:

```
>>> from matplotlib import style
>>> style.use('dark_background')
```

Subsequent plots will use updated colors, sizes, etc. To list all available styles, use:

```
>>> print style.available
```

You can add your own custom `<style name>.mplstyle` files to `~/.matplotlib/stylelib` or call `use` with a URL pointing to a file with `matplotlibrc` settings.

Note that this is an experimental feature, and the interface may change as users test out this new feature.

Backends

Qt5 backend

Martin Fitzpatrick and Tom Badran implemented a Qt5 backend. The differences in namespace locations between Qt4 and Qt5 was dealt with by shimming Qt4 to look like Qt5, thus the Qt5 implementation is the primary implementation. Backwards compatibility for Qt4 is maintained by wrapping the Qt5 implementation.

The Qt5Agg backend currently does not work with IPython's %matplotlib magic.

The 1.4.0 release has a known bug where the toolbar is broken. This can be fixed by:

```
cd path/to/installed/matplotlib
wget https://github.com/matplotlib/matplotlib/pull/3322.diff
# unix2dos 3322.diff (if on windows to fix line endings)
patch -p2 < 3322.diff
```

Qt4 backend

Rudolf Höfler changed the appearance of the subplottool. All sliders are vertically arranged now, buttons for tight layout and reset were added. Furthermore, the subplottool is now implemented as a modal dialog. It was previously a QMainWindow, leaving the SPT open if one closed the plot window.

In the figure options dialog one can now choose to (re-)generate a simple automatic legend. Any explicitly set legend entries will be lost, but changes to the curves' label, linestyle, et cetera will now be updated in the legend.

Interactive performance of the Qt4 backend has been dramatically improved under windows.

The mapping of key-signals from Qt to values matplotlib understands was greatly improved (For both Qt4 and Qt5).

Cairo backends

The Cairo backends are now able to use the cairocffi bindings which are more actively maintained than the pycairo bindings.

Gtk3Agg backend

The Gtk3Agg backend now works on Python 3.x, if the cairocffi bindings are installed.

PDF backend

Added context manager for saving to multi-page PDFs.

Text

Text URLs supported by SVG backend

The `svg` backend will now render *Text* objects' url as a link in output SVGs. This allows one to make clickable text in saved figures using the url kwarg of the *Text* class.

Anchored sizebar font

Added the `fontproperties` kwarg to `AnchoredSizeBar` to control the font properties.

Sphinx extensions

The `:context:` directive in the *plot_directive* Sphinx extension can now accept an optional `reset` setting, which will cause the context to be reset. This allows more than one distinct context to be present in documentation. To enable this option, use `:context:  reset` instead of `:context:` any time you want to reset the context.

Legend and PathEffects documentation

The *Legend guide* and *Path effects guide* have both been updated to better reflect the full potential of each of these powerful features.

Widgets

Span Selector

Added an option `span_stays` to the *SpanSelector* which makes the selector rectangle stay on the axes after you release the mouse.

GAE integration

Matplotlib will now run on google app engine.

9.2.9 New in matplotlib 1.5

Table of Contents

- *New in matplotlib 1.5*
    - *Interactive OO usage*

- *Working with labeled data like pandas DataFrames*
- *Added `axes.prop_cycle` key to rcParams*
- *New Colormaps*
- *Styles*
- *Backends*
- *Configuration (rcParams)*
- *Widgets*
- *New plotting features*
- *ToolManager*
- *cbook.is_sequence_of_strings recognizes string objects*
- *New `close-figs` argument for plot directive*
- *Support for URL string arguments to `imread`*
- *Display hook for animations in the IPython notebook*
- *Prefixed pkg-config for building*

Note: matplotlib 1.5 supports Python 2.7, 3.4, and 3.5

Interactive OO usage

All `Artists` now keep track of if their internal state has been changed but not reflected in the display ('stale') by a call to `draw`. It is thus possible to pragmatically determine if a given `Figure` needs to be re-drawn in an interactive session.

To facilitate interactive usage a `draw_all` method has been added to `pyplot` which will redraw all of the figures which are 'stale'.

To make this convenient for interactive use matplotlib now registers a function either with IPython's 'post_execute' event or with the displayhook in the standard python REPL to automatically call `plt.draw_all` just before control is returned to the REPL. This ensures that the draw command is deferred and only called once.

The upshot of this is that for interactive backends (including `%matplotlib notebook`) in interactive mode (with `plt.ion()`)

```
In [1]: import matplotlib.pyplot as plt

In [2]: fig, ax = plt.subplots()

In [3]: ln, = ax.plot([0, 1, 4, 9, 16])
In [4]: plt.show()

In [5]: ln.set_color('g')
```

will automatically update the plot to be green. Any subsequent modifications to the `Artist` objects will do likewise.

This is the first step of a larger consolidation and simplification of the pyplot internals.

Working with labeled data like pandas DataFrames

Plot methods which take arrays as inputs can now also work with labeled data and unpack such data.

This means that the following two examples produce the same plot:

Example

```
df = pandas.DataFrame({"var1":[1,2,3,4,5,6], "var2":[1,2,3,4,5,6]})
plt.plot(df["var1"], df["var2"])
```

Example

```
plt.plot("var1", "var2", data=df)
```

This works for most plotting methods, which expect arrays/sequences as inputs. `data` can be anything which supports `__getitem__` (`dict`, `pandas.DataFrame`, `h5py`, ...) to access `array` like values with string keys.

In addition to this, some other changes were made, which makes working with labeled data (ex `pandas.Series`) easier:

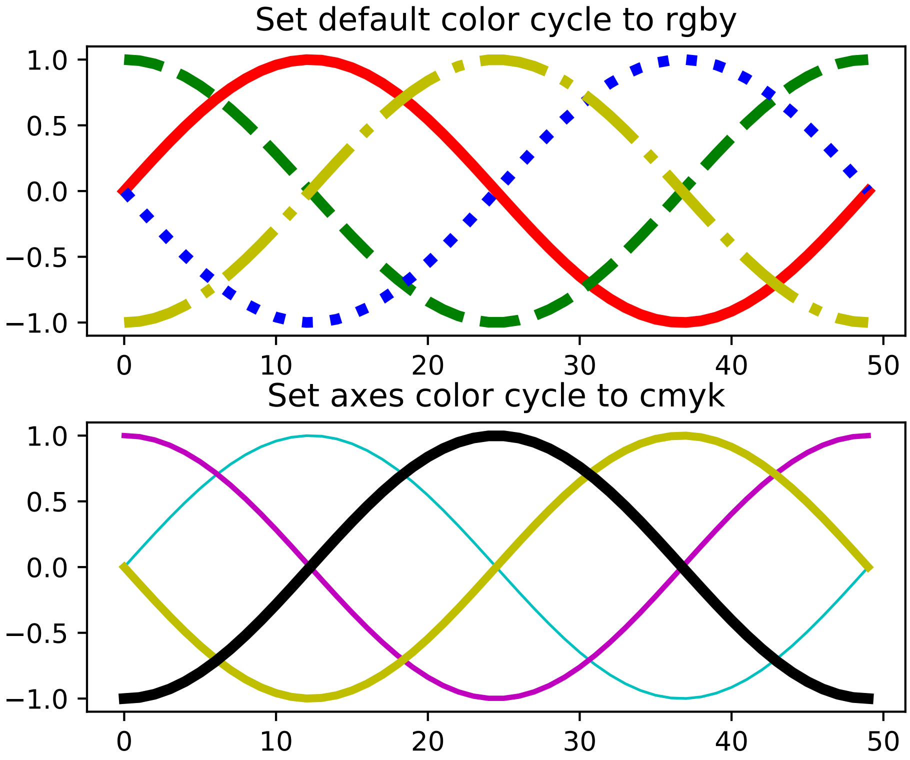
- For plotting methods with `label` keyword argument, one of the data inputs is designated as the label source. If the user does not supply a `label` that value object will be introspected for a label, currently by looking for a `name` attribute. If the value object does not have a `name` attribute but was specified by as a key into the `data` kwarg, then the key is used. In the above examples, this results in an implicit `label="var2"` for both cases.
- `plot()` now uses the index of a `Series` instead of `np.arange(len(y))`, if no `x` argument is supplied.

Added `axes.prop_cycle` key to rcParams

This is a more generic form of the now-deprecated `axes.color_cycle` param. Now, we can cycle more than just colors, but also linestyles, hatches, and just about any other artist property. Cycler notation is used for defining property cycles. Adding cyclers together will be like you are `zip()`-ing together two or more property cycles together:

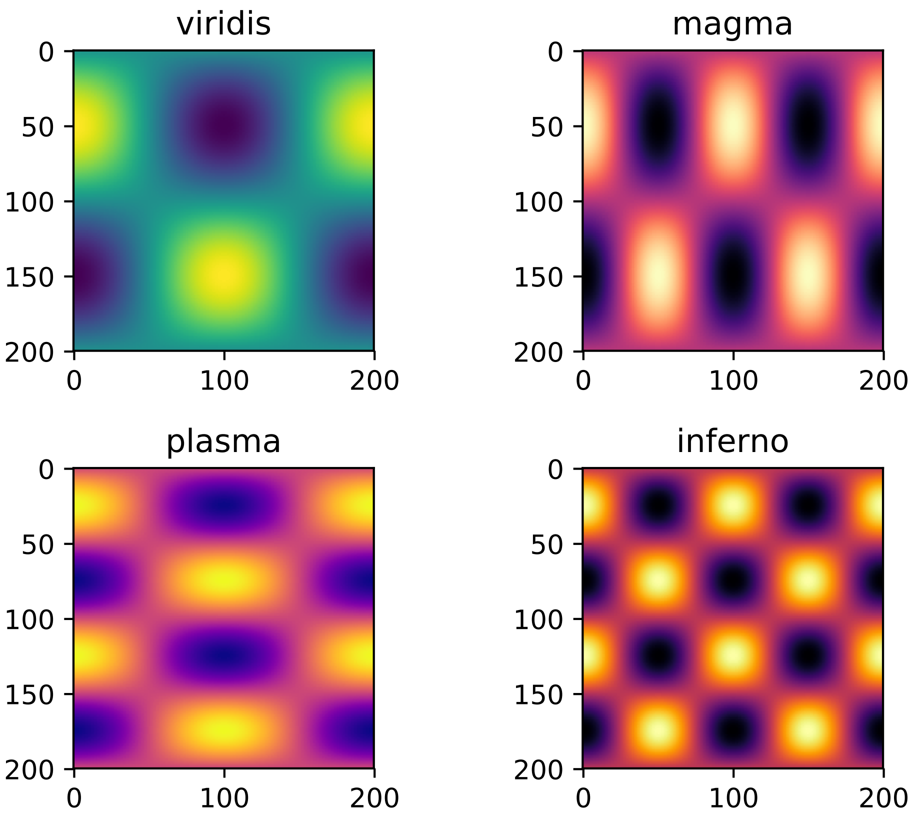
```
axes.prop_cycle: cycler('color', 'rgb') + cycler('lw', [1, 2, 3])
```

You can even multiply cyclers, which is like using `itertools.product()` on two or more property cycles. Remember to use parentheses if writing a multi-line `prop_cycle` parameter.



New Colormaps

All four of the colormaps proposed as the new default are available as `'viridis'` (the new default in 2.0), `'magma'`, `'plasma'`, and `'inferno'`



Styles

Several new styles have been added, including many styles from the Seaborn project. Additionally, in order to prep for the upcoming 2.0 style-change release, a 'classic' and 'default' style has been added. For this release, the 'default' and 'classic' styles are identical. By using them now in your scripts, you can help ensure a smooth transition during future upgrades of matplotlib, so that you can upgrade to the snazzy new defaults when you are ready!

```
import matplotlib.style
matplotlib.style.use('classic')
```

The 'default' style will give you matplotlib's latest plotting styles:

```
matplotlib.style.use('default')
```

Backends

New backend selection

The environment variable *MPLBACKEND* can now be used to set the matplotlib backend.

wx backend has been updated

The wx backend can now be used with both wxPython classic and Phoenix.

wxPython classic has to be at least version 2.8.12 and works on Python 2.x. As of May 2015 no official release of wxPython Phoenix is available but a current snapshot will work on Python 2.7+ and 3.4+.

If you have multiple versions of wxPython installed, then the user code is responsible setting the wxPython version. How to do this is explained in the comment at the beginning of the example `examplesuser_interfacesembedding_in_wx2.py`.

Configuration (rcParams)

Some parameters have been added, others have been improved.

Parameter	Description
`{x,y}axis.labelpad`	mplot3d now respects these parameters
`axes.labelpad`	Default space between the axis and the label
`errorbar.capsize`	Default length of end caps on error bars
`{x,y}tick.minor.visible`	Default visibility of minor x/y ticks
`legend.framealpha`	Default transparency of the legend frame box
`legend.facecolor`	Default facecolor of legend frame box (or `'inherit'` from `axes.facecolor`)
`legend.edgecolor`	Default edgecolor of legend frame box (or `'inherit'` from `axes.edgecolor`)
`figure.titlesize`	Default font size for figure suptitles
`figure.titleweight`	Default font weight for figure suptitles
`image.composite_image`	Whether a vector graphics backend should composite several images into a single image or not when saving. Useful when needing to edit the files further in Inkscape or other programs.
`markers.fillstyle`	Default fillstyle of markers. Possible values are `'full'` (the default), `'left'`, `'right'`, `'bottom'`, `'top'` and `'none'`
`toolbar`	Added `'toolmanager'` as a valid value, enabling the experimental `ToolManager` feature.

Widgets

Active state of Selectors

All selectors now implement `set_active` and `get_active` methods (also called when accessing the `active` property) to properly update and query whether they are active.

Moved `ignore`, `set_active`, and `get_active` methods to base class `Widget`

Pushes up duplicate methods in child class to parent class to avoid duplication of code.

Adds enable/disable feature to MultiCursor

A MultiCursor object can be disabled (and enabled) after it has been created without destroying the object. Example:

```
multi_cursor.active = False
```

Improved RectangleSelector and new EllipseSelector Widget

Adds an `interactive` keyword which enables visible handles for manipulating the shape after it has been drawn.

Adds keyboard modifiers for:

- Moving the existing shape (default key = ‘space’)
- Making the shape square (default ‘shift’)
- Make the initial point the center of the shape (default ‘control’)
- Square and center can be combined

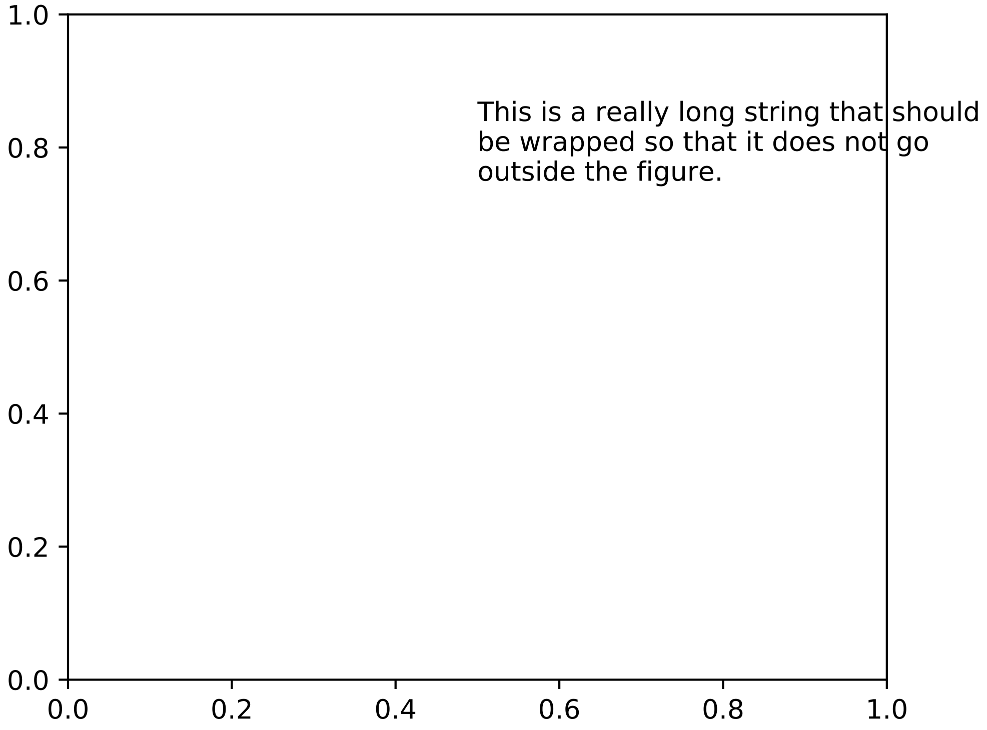
Allow Artists to Display Pixel Data in Cursor

Adds `get_pixel_data` and `format_pixel_data` methods to artists which can be used to add zdata to the cursor display in the status bar. Also adds an implementation for Images.

New plotting features

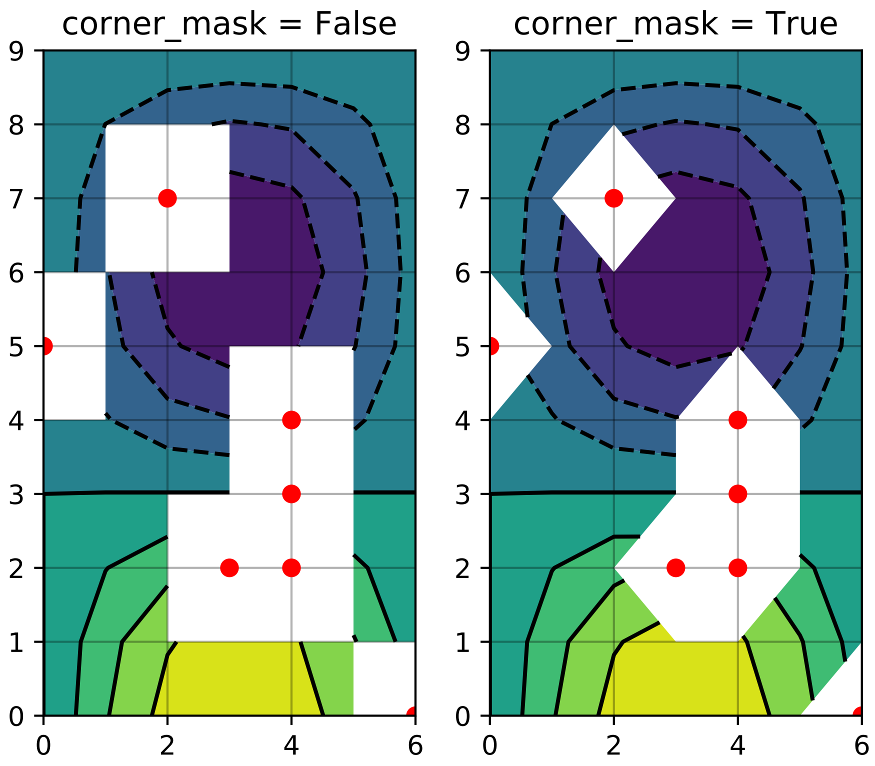
Auto-wrapping Text

Added the keyword argument “wrap” to Text, which automatically breaks long lines of text when being drawn. Works for any rotated text, different modes of alignment, and for text that are either labels or titles. This breaks at the `Figure`, not `Axes` edge.



Contour plot corner masking

Ian Thomas rewrote the C++ code that calculates contours to add support for corner masking. This is controlled by a new keyword argument `corner_mask` in the functions *`contour()`* and *`contourf()`*. The previous behaviour, which is now obtained using `corner_mask=False`, was for a single masked point to completely mask out all four quads touching that point. The new behaviour, obtained using `corner_mask=True`, only masks the corners of those quads touching the point; any triangular corners comprising three unmasked points are contoured as usual. If the `corner_mask` keyword argument is not specified, the default value is taken from rcParams.



Mostly unified linestyles for `Line2D`, `Patch` and `Collection`

The handling of linestyles for Lines, Patches and Collections has been unified. Now they all support defining linestyles with short symbols, like `"--"`, as well as with full names, like `"dashed"`. Also the definition using a dash pattern (`(0., [3., 3.])`) is supported for all methods using `Line2D`, `Patch` or `Collection`.

Legend marker order

Added ability to place the label before the marker in a legend box with `markerfirst` keyword

Support for legend for PolyCollection and stackplot

Added a `legend_handler` for *`PolyCollection`* as well as a `labels` argument to *`stackplot()`*.

Support for alternate pivots in mplot3d quiver plot

Added a `pivot` kwarg to *`quiver()`* that controls the pivot point around which the quiver line rotates. This also determines the placement of the arrow head along the quiver line.

Logit Scale

Added support for the 'logit' axis scale, a nonlinear transformation

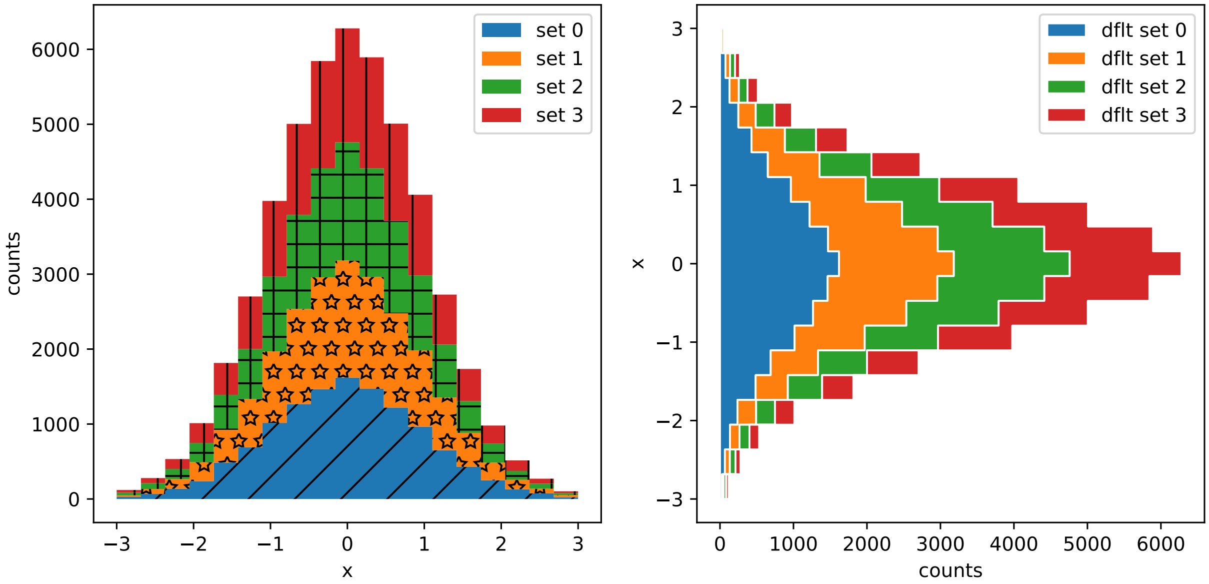
$$x- > \log 10(x/(1-x)) \tag{9.1}$$

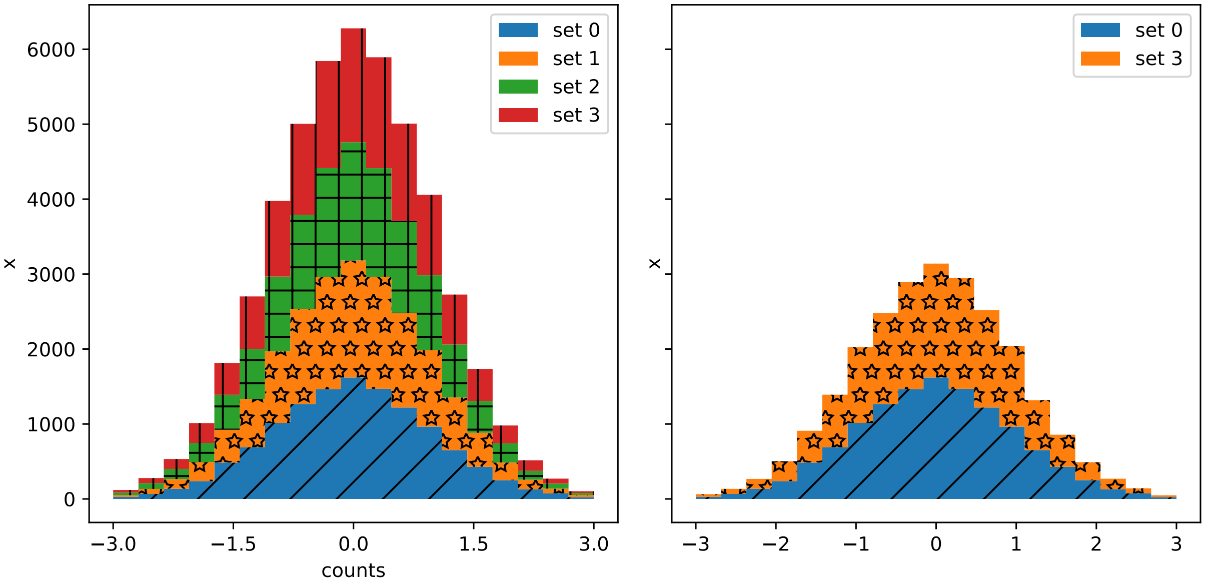
for data between 0 and 1 excluded.

Add step kwargs to fill_between

Added `step` kwarg to `Axes.fill_between` to allow to fill between lines drawn using the 'step' draw style. The values of `step` match those of the `where` kwarg of `Axes.step`. The asymmetry of of the kwargs names is not ideal, but `Axes.fill_between` already has a `where` kwarg.

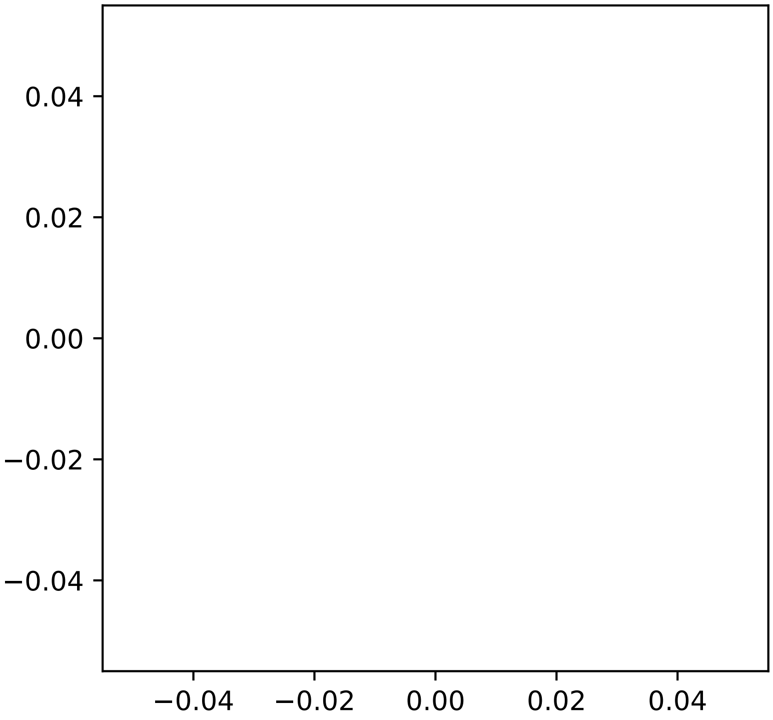
This is particularly useful for plotting pre-binned histograms.





Square Plot

Implemented square plots feature as a new parameter in the axis function. When argument 'square' is specified, equal scaling is set, and the limits are set such that `xmax-xmin == ymax-ymin`.



Updated figimage to take optional resize parameter

Added the ability to plot simple 2D-Array using `plt.figimage(X, resize=True)`. This is useful for plotting simple 2D-Array without the Axes or whitespacing around the image.

Updated Figure.savefig() can now use figure's dpi

Added support to save the figure with the same dpi as the figure on the screen using `dpi='figure'`.

Example:

```
f = plt.figure(dpi=25)               # dpi set to 25
S = plt.scatter([1,2,3],[4,5,6])
f.savefig('output.png', dpi='figure')    # output savefig dpi set to 25 (same as figure)
```

Updated Table to control edge visibility

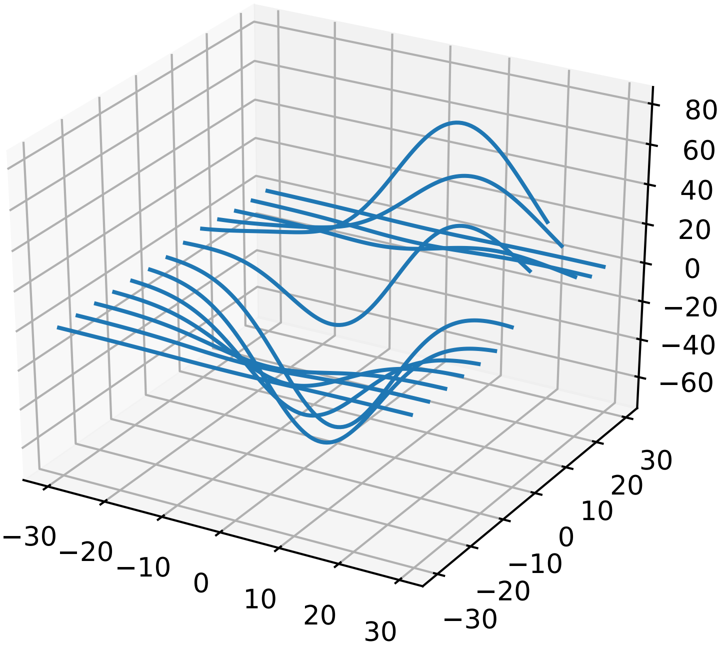
Added the ability to toggle the visibility of lines in Tables. Functionality added to the `pyplot.table()` factory function under the keyword argument "edges". Values can be the strings "open", "closed", "horizontal", "vertical" or combinations of the letters "L", "R", "T", "B" which represent left, right, top, and bottom respectively.

Example:

```
table(..., edges="open")  # No line visible
table(..., edges="closed")  # All lines visible
table(..., edges="horizontal")  # Only top and bottom lines visible
table(..., edges="LT")  # Only left and top lines visible.
```

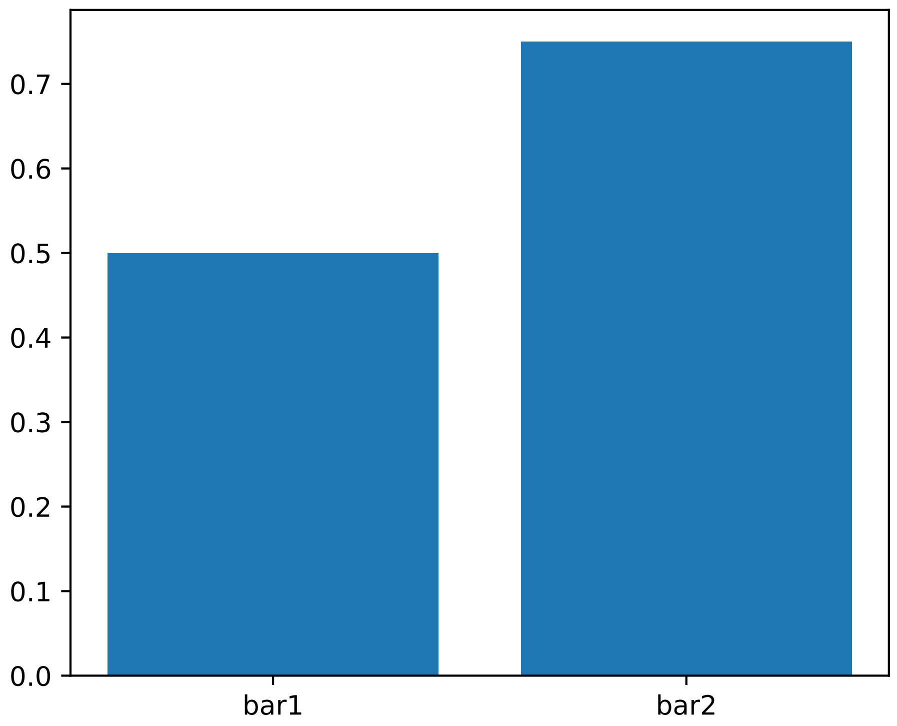
Zero r/cstride support in plot_wireframe

Adam Hughes added support to mplot3d's plot_wireframe to draw only row or column line plots.



Plot bar and barh with labels

Added kwarg `"tick_label"` to `bar` and `barh` to support plotting bar graphs with a text label for each bar.



Added center and frame kwargs to pie

These control where the center of the pie graph are and if the Axes frame is shown.

Fixed 3D filled contour plot polygon rendering

Certain cases of 3D filled contour plots that produce polygons with multiple holes produced improper rendering due to a loss of path information between *`PolyCollection`* and *`Poly3DCollection`*. A function *`set_verts_and_codes()`* was added to allow path information to be retained for proper rendering.

Dense colorbars are rasterized

Vector file formats (pdf, ps, svg) are efficient for many types of plot element, but for some they can yield excessive file size and even rendering artifacts, depending on the renderer used for screen display. This is a problem for colorbars that show a large number of shades, as is most commonly the case. Now, if a colorbar is showing 50 or more colors, it will be rasterized in vector backends.

DateFormatter strftime

`strftime` method will format a `datetime.datetime` object with the format string passed to the formatter's constructor. This method accepts datetimes with years before 1900, unlike `datetime.datetime.strftime()`.

Artist-level {get,set}_usetex for text

Add `{get,set}_usetex` methods to *`Text`* objects which allow artist-level control of LaTeX rendering vs the internal mathtex rendering.

`ax.remove()` works as expected

As with artists added to an *`Axes`*, `Axes` objects can be removed from their figure via *`remove()`*.

API Consistency fix within Locators set_params() function

`set_params()` function, which sets parameters within a *`Locator`* type instance, is now available to all `Locator` types. The implementation also prevents unsafe usage by strictly defining the parameters that a user can set.

To use, call `set_params()` on a `Locator` instance with desired arguments:

```
loc = matplotlib.ticker.LogLocator()
# Set given attributes for loc.
loc.set_params(numticks=8, numdecs=8, subs=[2.0], base=8)
# The below will error, as there is no such parameter for LogLocator
# named foo
# loc.set_params(foo='bar')
```

Date Locators

Date Locators (derived from *`DateLocator`*) now implement the `tick_values()` method. This is expected of all Locators derived from `Locator`.

The Date Locators can now be used easily without creating axes

```
from datetime import datetime
from matplotlib.dates import YearLocator
t0 = datetime(2002, 10, 9, 12, 10)
tf = datetime(2005, 10, 9, 12, 15)
loc = YearLocator()
values = loc.tick_values(t0, tf)
```

OffsetBoxes now support clipping

`Artists` draw onto objects of type `OffsetBox` through `DrawingArea` and `TextArea`. The `TextArea` calculates the required space for the text and so the text is always within the bounds, for this nothing has changed.

However, `DrawingArea` acts as a parent for zero or more `Artists` that draw on it and may do so beyond the bounds. Now child `Artists` can be clipped to the bounds of the `DrawingArea`.

OffsetBoxes now considered by tight_layout

When *`tight_layout()`* or `Figure.tight_layout()` or `GridSpec.tight_layout()` is called, `OffsetBoxes` that are anchored outside the axes will not get chopped out. The `OffsetBoxes` will also not get overlapped by other axes in case of multiple subplots.

Per-page pdf notes in multi-page pdfs (PdfPages)

Add a new method *`attach_note()`* to the PdfPages class, allowing the attachment of simple text notes to pages in a multi-page pdf of figures. The new note is visible in the list of pdf annotations in a viewer that has this facility (Adobe Reader, OSX Preview, Skim, etc.). Per default the note itself is kept off-page to prevent it to appear in print-outs.

`PdfPages.attach_note` needs to be called before `savefig()` in order to be added to the correct figure.

Updated fignum_exists to take figure name

Added the ability to check the existence of a figure using its name instead of just the figure number. Example:

```
figure('figure')
fignum_exists('figure') #true
```

ToolManager

Federico Ariza wrote the new *`ToolManager`* that comes as replacement for `NavigationToolbar2`

`ToolManager` offers a new way of looking at the user interactions with the figures. Before we had the `NavigationToolbar2` with its own tools like `zoom/pan/home/save/...` and also we had the shortcuts like `yscale/grid/quit/....` `Toolmanager` relocate all those actions as `Tools` (located in *`backend_tools`*), and defines a way to `access/trigger/reconfigure` them.

The `Toolbars` are replaced for `ToolContainers` that are just GUI interfaces to `trigger` the tools. But don't worry the default backends include a `ToolContainer` called `toolbar`

Note: At the moment, we release this primarily for feedback purposes and should be treated as experimental until further notice as API changes will occur. For the moment the `ToolManager` works only with the `GTK3` and `Tk` backends. Make sure you use one of those. Port for the rest of the backends is comming soon.

To activate the `ToolManager` include the following at the top of your file

```
>>> matplotlib.rcParams['toolbar'] = 'toolmanager'
```

Interact with the ToolContainer

The most important feature is the ability to easily reconfigure the ToolContainer (aka toolbar). For example, if we want to remove the "forward" button we would just do.

```
>>> fig.canvas.manager.toolmanager.remove_tool('forward')
```

Now if you want to programmatically trigger the "home" button

```
>>> fig.canvas.manager.toolmanager.trigger_tool('home')
```

New Tools for ToolManager

It is possible to add new tools to the ToolManager

A very simple tool that prints "You're awesome" would be:

```
from matplotlib.backend_tools import ToolBase
class AwesomeTool(ToolBase):
    def trigger(self, *args, **kwargs):
        print("You're awesome")
```

To add this tool to `ToolManager`

```
>>> fig.canvas.manager.toolmanager.add_tool('Awesome', AwesomeTool)
```

If we want to add a shortcut ("d") for the tool

```
>>> fig.canvas.manager.toolmanager.update_keymap('Awesome', 'd')
```

To add it to the toolbar inside the group 'foo'

```
>>> fig.canvas.manager.toolbar.add_tool('Awesome', 'foo')
```

There is a second class of tools, "Toggleable Tools", this are almost the same as our basic tools, just that belong to a group, and are mutually exclusive inside that group. For tools derived from `ToolToggleBase` there are two basic methods `enable` and `disable` that are called automatically whenever it is toggled.

A full example is located in *user_interfaces example code: toolmanager.py*

cbook.is_sequence_of_strings recognizes string objects

This is primarily how pandas stores a sequence of strings

```
import pandas as pd
import matplotlib.cbook as cbook

a = np.array(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(a))  # True

a = np.array(['a', 'b', 'c'], dtype=object)
print(cbook.is_sequence_of_strings(a))  # True

s = pd.Series(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(s))  # True
```

Previously, the last two prints returned false.

New `close-figs` argument for plot directive

Matplotlib has a sphinx extension `plot_directive` that creates plots for inclusion in sphinx documents. Matplotlib 1.5 adds a new option to the plot directive - `close-figs` - that closes any previous figure windows before creating the plots. This can help avoid some surprising duplicates of plots when using `plot_directive`.

Support for URL string arguments to `imread`

The *`imread()`* function now accepts URL strings that point to remote PNG files. This circumvents the generation of a HTTPResponse object directly.

Display hook for animations in the IPython notebook

`Animation` instances gained a `_repr_html_` method to support inline display of animations in the notebook. The method used to display is controlled by the `animation.html` rc parameter, which currently supports values of `none` and `html5`. `none` is the default, performing no display. `html5` converts the animation to an h264 encoded video, which is embedded directly in the notebook.

Users not wishing to use the `_repr_html_` display hook can also manually call the `to_html5_video` method to get the HTML and display using IPython's `HTML` display class:

```
from IPython.display import HTML
HTML(anim.to_html5_video())
```

Prefixed pkg-config for building

Handling of `pkg-config` has been fixed in so far as it is now possible to set it using the environment variable `PKG_CONFIG`. This is important if your toolchain is prefixed. This is done in a simpilar way as setting `CC` or `CXX` before building. An example follows.

> export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config

GitHub issues and pull requests:

Pull Requests (1003):

- PR #8594: Missing return in _num_to_string()
- PR #8584: Add pandas to python 3.6 build
- PR #8583: Fix pandas datetime test on pandas 0.20
- PR #8566: adding keyword plotting
- PR #8567: Minor pytest parametrization
- PR #8554: added basic_units download link to units examples
- PR #8545: Add tutorials
- PR #8176: Custom error message for draw_path. issues : #8131 (bad error message from pyplot.plot)
- PR #8185: Implement blocking Qt event loop.
- PR #8346: Use some more pytest plugins: warnings & rerunfailures
- PR #8536: Update doc build.
- PR #8544: updating developer docs
- PR #8548: fixing scatter doc
- PR #8546: nested pie example

- PR #8539: Fix rectangular patches to be properly transformed on polar axes
- PR #8525: Sphinx Gallery API pages + deprecating old examples folder
- PR #8538: Update doc/thirdpartypackages/index.rst
- PR #8535: Remove use of (deprecated) is_string_like in mplot3d.
- PR #8526: Clarify docs for rcdefaults and friends.
- PR #8513: Fix autoscaling with twinx and vspans: consider axis with one pair of finite limits ONLY
- PR #8523: Update conda patch for AppVeyor build.
- PR #8522: adding backreferences_dir param
- PR #8491: Remove codecov coverage targets.
- PR #8518: Discourage omitting backend in matplotlibrc
- PR #8486: changed inherited Axes calls to super
- PR #8511: Update front page so there's only one gallery
- PR #8510: MNT: update GH issue template [ci skip]
- PR #8478: Fixed Error: local variable 'xdata' referenced before assignment" in legend_handler.py
- PR #8502: Update PR template to encourage PRs off not master.
- PR #8495: Fix incorrect text line spacing.
- PR #8472: migrate examples to sphinx-gallery
- PR #8488: Build docs with oldest numpy on 2.7.
- PR #8377: Clean up unit examples
- PR #8011: Deprecate is_string_like, is_sequence_of_strings
- PR #7990: Added a workaround for Jupyter notebooks
- PR #8324: Update svg_tooltip.py
- PR #8380: Make image_comparison more pytest-y
- PR #8485: FIX markevery only accepts builtin integers, not numpy integers
- PR #8489: Fix markup in plt.subplots docstring.
- PR #8490: Clarify that Path.contains_x implicitly closes the Path.
- PR #8492: Remove useless, confusing check in hist().
- PR #7931: The font with the same weight name as the user specified weight name …
- PR #8256: [DOC] Clean up bar_demo2
- PR #8455: Added axes inversion to cla()
- PR #8474: Check for non-finite axis limits placed on converted_limit
- PR #8482: Modified PR Template

- PR #7572: Overhaul external process calls
- PR #8394: Unify WM_CLASS across backends
- PR #8447: Let imshow handle float128 data.
- PR #8476: Pull Request template
- PR #8450: Don't bother disconnecting signals in TimerQt.__del__.
- PR #8468: Clarify that Image.set_data doesn't update normalization.
- PR #8403: New Feature - PolygonSelector Widget
- PR #8157: add which kwarg to autofmt_xdate
- PR #8022: Fixed Issue #7460: Raised an error if argument to xlim is invalid
- PR #8336: Merged streamline examples
- PR #8399: Fix % formatting and Transform equality.
- PR #8319: FancyArrowPatch docstring overhaul
- PR #8452: Revert #5392
- PR #8344: Add simple ax.arrow test
- PR #8462: Add container module to API docs
- PR #8456: Migration to sphinx-gallery
- PR #8454: Finish deprecating idle_event; style cleanups to backend_bases
- PR #8326: Orthographic projection for mplot3d
- PR #8453: Manually collect lines on checkbox example
- PR #8446: Download the depsy.org badge when building the html documentation
- PR #8435: Improve hist2d docstring by inlining properties.
- PR #8376: Remove exceltools and gtktools from docs
- PR #8322: Use scalars below a certain exponent in labes of log-scales axis
- PR #8374: DOC update build dependencies
- PR #8339: Give wide code blocks a scrollbar on website
- PR #8253: Handle floating point round-off error when converting to pixels for h264 animations
- PR #8156: DOC: Add missing cmaps to perception doc (fix for #8073)
- PR #8373: [DOC] Updated the documentation
- PR #8391: DOC: Update MEP 28
- PR #8340: Refactor code duplication in `matplotlib.markers`
- PR #8396: DOC: Show off FuncFormatter as a decorator
- PR #8383: Merge v2.0.x into master

- PR #8372: MNT: cleanup whitespace around @_preprocess decorator
- PR #6310: Make checkbuttons with all plotted lines with correct visibility automatically
- PR #7786: Don't reshape offsets into the correct shape.
- PR #8254: Adding headers for examples/units for MEP12/sphinx-gallery compliance
- PR #8369: Use cbook._reshape_2D in hist.
- PR #8371: DOC: Clean up the pie docstring PR
- PR #8343: Make ArrowStyle docstrings numpydoc compatible
- PR #8368: Cleanup appveyor.yml.
- PR #8334: Fix Appveyor build.
- PR #8367: symlog + minor ticks = exception
- PR #8258: DOC: Clean up equal-aspect example
- PR #8116: Simplify _reshape_2D.
- PR #8240: DOC refactored installation instruction
- PR #8363: DOC: update link to mpl-probscale
- PR #8362: Add adjustText to the list of third party packages
- PR #7691: ENH: Optional 3d bar shading
- PR #8264: Fix leaky ps
- PR #8338: Renamed all 'mtrans' into more common 'mtransforms'
- PR #8331: Don't index into __builtins__ (not supported by PyPy).
- PR #8311: DOC api's transition to sphinx-gallery is now complete
- PR #8287: FIX: add __setstate__ function
- PR #8281: Fix testing with tests.py on Py3.6.
- PR #8149: Fix check for DISPLAY on PyQt5.
- PR #7844: Fix containment test with nonlinear transforms.
- PR #8306: DOC added titles to the rest of the 3D plots
- PR #8328: Use neutral pronoun in docs.
- PR #8295: Removes OldScalarFormatter #7956
- PR #8310: DOC shapes and collections is fully SG compatible
- PR #8304: Remove executable bit from examples and headers.
- PR #8229: MEP12 ganged example
- PR #8301: STY: fix whitespace in the tests
- PR #8248: Inkscape shell mode.

- PR #8298: Fix sphinx required version
- PR #8276: MAINT moved some maintenance and helper python scripts to tools/
- PR #8275: DOC moved changelog to the documentation
- PR #8262: TST: fail on missing baseline file
- PR #8244: BUG Ignore invisible axes in computing tight_layout
- PR #8018: Cleanup visual_tests and disable browser opening
- PR #8268: DOC moved spines examples sphinx-gallery
- PR #8239: changes in travis's build environment
- PR #8274: Removed obsolete license.py file
- PR #8165: FIX: Remove type checking for strings in '_validate_linestyle'
- PR #8261: Set __name__ for list validators in rcsetup.
- PR #8217: Add option to rotate labels in a pie chart (#2304)
- PR #8227: Contouring 1x1 array (issue #8197)
- PR #8269: Use sys.executable -msphinx instead of sphinx-build.
- PR #8252: Memoize parse_fontconfig_pattern; speeds up test suite by ~1min.
- PR #8047: Correct theta values when drawing a non-circular arc
- PR #8245: DOC: sphinx-gallery histograms
- PR #8241: Remove image with non-free color calibration profile
- PR #7878: Update vlines example with axes wide lines.
- PR #8237: Fix pep8 violation
- PR #8224: Implement Path.intersects_bbox in C++ to speed up legend positioning.
- PR #8228: MEP12 text alignment example
- PR #8179: TST: Enable cache directories on AppVeyor.
- PR #8211: Mep12 text labels and annotations
- PR #8234: fix gitter badge
- PR #8233: changes to MEP12/sphinx-gallery compliant
- PR #8196: Issue #8141: Dash validator allowing None values in addition to floats
- PR #8154: merge fill_demo and fill_demo_features
- PR #8213: TST: skip fc-list related tests if not installed
- PR #8172: [MRG+1] [DOC] Turn ginput dostring into a numpydocstring
- PR #8173: [MRG+1] Simplify and clean multicolor_line example
- PR #8221: Early check for dot binary (from graphviz) when building the doc (fixes #8207)

- PR #8215: Mep12 showcase
- PR #8212: Mep12 ticks and spines
- PR #8219: [DOC] Plural of axis is axes
- PR #7744: Added axis limit check for non-finite values
- PR #5691: Update documentation of stem to mention StemContainer
- PR #8175: Add autoclass entry for Artist API doc.
- PR #8158: Fix layout of spectrum_demo.py
- PR #8190: add gitter link in README
- PR #8007: Clean up BoundaryNorm docstring
- PR #8178: Addresses #8177, Readme badges
- PR #8166: MAINT: mappingview check for Python 3.4
- PR #8171: DOC: Fix small typos in 'eventplot' docstring
- PR #8167: Fixes typos in Artist tutorial
- PR #8161: Add a code block in 'installing' docs.
- PR #8150: Deprecate Axes.axesPatch, Figure.figurePatch.
- PR #8148: Remove support for -dbackend argv.
- PR #8137: Regenerate the gitwash docs.
- PR #6977: Handle dvi font names as ASCII bytestrings
- PR #8066: Clean up and move text rotation example
- PR #8134: Update Slider docs and type check slidermin and slidermax.
- PR #8139: DOC: Fixed x, y, docstring in errorbar
- PR #8133: Disable network tests on AppVeyor.
- PR #8065: Clean up and move accented text example
- PR #8119: Drop None from Container.get_children().
- PR #8115: Add branch coverage; exclude _version.py from coverage.
- PR #7995: Set sticky_edges correctly for negative height bar().
- PR #8118: Deprecate matplotlib.tests.assert_str_equal.
- PR #7394: Cleanup transforms.py.
- PR #8036: Tweak coverage
- PR #8110: Mrg2.0.x
- PR #8103: Use XDG config path on FreeBSD
- PR #8026: Pytest documentation + build tweaks

- PR #8101: Named Matplotlib module in windows instructions
- PR #8099: Update examples/README.txt.
- PR #8094: Remove example of matrix of size (12, 12) and (64, 64)
- PR #8040: ENH: Stricter validation of line style rcParams (and extended accepted types for `grid.linestyle`)
- PR #8097: use plt.gca instead of plt.axes for already exhisting implicit axes
- PR #8096: Improve error message for image_comparison decorator.
- PR #8085: Fix PYTHONHASHSEED setup on OS X.
- PR #8086: DOC: add SOURCELINK_SUFFIX for compatibility with Sphinx 1.5
- PR #8063: Update MovieWriter dpi default
- PR #8084: Add link to scipython book
- PR #7871: Use backports.functools_lru_cache instead of functools32
- PR #8070: Switch to suppress option to True in setup.cfg.template.
- PR #4997: The url of downloading historical prices of Yahoo Finance has changed
- PR #8043: Fix pyplot.axis(ax) when ax is in other figure.
- PR #8055: Undeprecate is_scalar_or_string.
- PR #8060: Added tight_layout() to example.
- PR #7968: Fix cohere-demo
- PR #8033: Update inline comment in set_and_get.py
- PR #7985: Catch specgram warnings during tests
- PR #7965: ENH: Fixed PercentFormatter usage with latex
- PR #8014: do not ignore “closed” parameter in Poly3DCollection
- PR #7933: Cleanup: use `is not` instead of `not ... is`, etc.
- PR #7981: Clarify backports documentation
- PR #8020: Allow choosing logit scale in qt figure options.
- PR #8003: Coverage config
- PR #7974: Switch testing to pytest completely
- PR #8001: Switch to pytest-pep8.
- PR #7993: MAINT: Updated tick and category test formatting
- PR #8002: Remove pytest_pycollect_makeitem.
- PR #7925: Fix a number of Deprecated/Invalid escape sequences
- PR #7999: More cbook deprecations.

- PR #7973: Convert test decorators to pytest fixtures
- PR #7996: Simplify implementation of is_numlike & is_string_like.
- PR #7998: Display relative image paths when tests fail.
- PR #7997: Default cmap is not jet anymore...
- PR #7809: Fix for marker verts bug
- PR #7987: Add vega deprecations to tests on master
- PR #7625: Legend autopositioning with “spiraling” lines.
- PR #7983: Remove assert_true calls from new PRs.
- PR #7980: Coding Guide Edits
- PR #7959: Allow zero sized ticks
- PR #7767: Don’t check `iterable()` before `len()`.
- PR #7913: Clean up quiver docstring + add simple quiver example
- PR #7023: Add `clf` kwarg to plt.figure()
- PR #7857: Fix/hide some deprecations
- PR #7961: Compute glyph widths similarly in Type 42 as in Type 3
- PR #7972: MAINT cleaning up of gallery examples.
- PR #7952: MEP12 of showcase’s examples + other folders.
- PR #7904: twinx / twiny inherit autoscale behavior for shared axis
- PR #7935: Finish removing nose
- PR #7859: Fix typo in Axes3D.set_autoscalez_on.
- PR #7947: MAINT testing.nose -> testing._nose to make it explicitely private
- PR #7960: Don’t try to build for py34 on appveyor
- PR #7949: Remove `sharex_foreign` example, now useless.
- PR #7843: MAINT: add ability to specify recursionlimit
- PR #7941: Cleanup: remove unused variable/assignment/expression and debug comments
- PR #7944: Improve hexbin performance
- PR #7938: Fix typo in toolkits docs
- PR #7752: bugfix for wx backend: release mouse on loss of focus and before trying to recapture
- PR #7914: Fix unpickling of CallbackRegistry on Py2.
- PR #7929: Remove a dead code (`font_manager.ttfdict_fnames`)
- PR #7932: Convert remaining tests to pytest
- PR #7926: Stop codecov from posting messages

- PR #7892: Configure AppVeyor to fail fast
- PR #7934: Run animation smoketest in a temporary directory.
- PR #7872: Convert font/text tests to pytest
- PR #7915: Convert sphinxext tests to pytest.
- PR #7898: MAINT moved g-i-l* modules to pytest
- PR #7897: MAINT moved all remaining “f” modules to pytest
- PR #7863: Convert backend tests to use pytest
- PR #7907: BUG: Add a newline separator in fc-list call
- PR #7920: Convert preprocess tests to pytest
- PR #7887: Convert mpl toolkits tests to pytest + minor cleanup
- PR #7918: Convert test_s* files to pytest and flake8 them
- PR #7916: Convert test_[ab]* files to pytest.
- PR #7923: Fix leak of filedescriptor if fontsize cannot be set.
- PR #7900: DOC MEP12: pie/polar and color examples + style sheets fix
- PR #7818: Tripcolor.py: Remove documentation rendering error
- PR #7896: Reject floatlike strings in mcolors.to_rgba.
- PR #7830: MAINT moved _backports to cbook module
- PR #7883: Convert mlab tests to pytest
- PR #7885: MAINT moved all “d” modules to pytest.
- PR #7889: Convert remaining test_t* files to pytest.
- PR #7748: MAINT: Deterministic SVG and PDF tests
- PR #7884: MAINT moved “c” modules to pytest
- PR #7890: DOC Convert style sheet examples to MEP12
- PR #7888: Transform test updates (pytest + cleanup)
- PR #7882: MAINT pytest now exit on first failure on travis
- PR #7327: DOC MEP12 - converted lines, bars and markers to SG/MEP12 compatible
- PR #7811: Allow figure.legend to be called without arguments
- PR #7854: !B [#7852] fix for _rrule maximum recursion depth exceeded on multiprocessing usage
- PR #7861: Make radio and check buttons visible
- PR #7868: MNT: reference the proper variable in bootstrapper
- PR #7817: better input validation on `fill_between`
- PR #7864: Minor simplification of inset_locator_demo.

- PR #7865: FIX Preserve title case when saving through GUI (issue #7824)
- PR #7850: Allow AnchoredOffset to take a string-like location code
- PR #7845: Fixed bug with default parameters NFFT and noverlap in specgram()
- PR #7800: DOC: explain non-linear scales and imshow (closes #7661)
- PR #7639: Enh color names
- PR #7829: MAINT tests should not use relative imports
- PR #7828: MAINT added early checks for dependencies for doc building
- PR #7424: Numpy Doc Format
- PR #7821: DOC: Changes to screenshots plots.
- PR #7644: Allow scalar height for plt.bar
- PR #7838: Merge v2.x
- PR #7823: MAINT matplotlib -> Matplotlib
- PR #7833: Deprecate unused verification code.
- PR #7827: Cast stackplot input to float when required.
- PR #7834: Remove deprecated get_example_data.
- PR #7826: Remove invalid dimension checking in axes_rgb.
- PR #7831: Function wrapper for examples/api/two_scales.py
- PR #7801: Add short-circuit return to matplotlib.artist.setp if input is length 0
- PR #7740: Beautified frontpage plots and two pylab examples
- PR #7730: Fixed GraphicsContextBase linestyle getter
- PR #7747: Update qhull to 2015.2
- PR #7645: Clean up stock sample data.
- PR #7753: Clarify the uses of whiskers float parameter.
- PR #7765: TST: Clean up figure tests
- PR #7729: For make raw_input compatible with python3
- PR #7783: Raise exception if negative height or width is passed to axes()
- PR #7727: DOC: Fix invalid nose argument in testing.rst
- PR #7731: Check origin when saving image to PNG
- PR #7782: Fix some more integer type inconsistencies in Freetype code
- PR #7781: Fix integer types for font metrics in PyGlyph class
- PR #7791: Use reliable int type for mesh size in draw_quad_mesh (#7788)
- PR #7796: Only byte-swap 16-bit PNGs on little-endian (#7792)

- PR #7794: Ignore images that doc build produces
- PR #7790: Adjust markdown and text in ISSUE_TEMPLATE.md
- PR #7773: Fix more invalid escapes sequences.
- PR #7769: Remove redundant pep8 entry in .travis.yml.
- PR #7760: DOC: Correct subplot() doc
- PR #7768: Convert unicode index to long, not int, in get_char_index
- PR #7770: BUG: improve integer step selection in MaxNLocator
- PR #7766: Invalid escape sequences are deprecated in Py3.6.
- PR #7758: fix axes barh default align option document
- PR #7749: DOC: Sync keyboard shortcuts for fullscreen toggle
- PR #7757: By default, don't include tests in binary distributions.
- PR #7762: DOC: Fix finance depr docs to point to mpl_finance
- PR #7737: Ensure that pyenv command is in a literal block
- PR #7732: Add rcsetup_api.rst, fix typo for rcsetup.cycler
- PR #7726: FIX: Clean up in the new quiverkey test; make new figs in scale tests
- PR #7620: Add warning context
- PR #7719: Add angle kwarg to quiverkey
- PR #7701: DOC: Add bug report reqs and template to contributing guide
- PR #7723: Use mplDeprecation class for all deprecations.
- PR #7676: Makes eventplot legend work
- PR #7714: TST: switch from 3.6-dev to 3.6
- PR #7713: Declare Python 3.6 support via classifier in setup.py
- PR #7693: Change majority of redirected links in docs
- PR #7705: Fixes tzname return type
- PR #7703: BF: Convert namespace path to list
- PR #7702: DOC: Add link to bokeh/colorcet in colormaps.rst
- PR #7700: DOC: Add gitter to home page
- PR #7692: Corrected default values of xextent in specgram(). Fixes Bug #7666.
- PR #7698: Update INSTALL for Python 3.6
- PR #7694: Fix a few broken links in docs
- PR #7349: Add support for png_text metadata, allow to customize metadata for other backends.
- PR #7670: Decode error messages from image converters.

- PR #7677: Make new default style examples consistent
- PR #7674: Serialize comparison of multiple baseline images.
- PR #7665: FIX: Fix super call for Python 2.7
- PR #7668: Save SVG test directly to file instead of its name.
- PR #7549: Cleanup: sorted, dict iteration, array.{ndim,size}, ...
- PR #7667: FIX: Fix missing package
- PR #7651: BUG,ENH: make deprecated decorator work (and more flexibly)
- PR #7658: Avoid comparing numpy array to strings in two places
- PR #7657: Fix warning when setting markeredgecolor to a numpy array
- PR #7659: DOC: Original documentation was misleading
- PR #6780: Call _transform_vmin_vmax during SymLogNorm.__init__
- PR #7646: Improve deprecation documentation. Closes #7643
- PR #7604: Warn if different axis projection requested
- PR #7568: Deprecate unused functions in cbook.
- PR #6428: Give a better error message on missing PostScript fonts
- PR #7585: Fix a bug in TextBox where shortcut keys were not being reenabled
- PR #7628: picker may not be callable.
- PR #7464: ENH: _StringFuncParser to get numerical functions callables from strings
- PR #7622: Mrg animation merge
- PR #7618: DOC: fixed typo in mlab.py
- PR #7596: Delay fc-list warning by 5s.
- PR #7607: TST: regenerate patheffect2
- PR #7608: Don’t call np.min on generator.
- PR #7570: Correctly skip colors for nan points given to scatter
- PR #7605: Make bars stick to explicitly-specified edges.
- PR #6597: Reproducible PS/PDF output (master)
- PR #7546: Deprecate update_datalim_numerix&update_from_data.
- PR #7574: Docs edits
- PR #7538: Don’t work out packages to install if user requests information from setup.p
- PR #7577: Spelling fix: corosponding -> corresponding
- PR #7536: Rectangle patch angle attribute and patch __str__ improvements
- PR #7547: Additional cleanups

- PR #7544: Cleanups
- PR #7548: Clarify to_rgba docstring.
- PR #7476: Sticky margins
- PR #7552: Correctly extend a lognormed colorbar
- PR #7499: Improve the the marker table in markers_api documentation
- PR #7468: TST: Enable pytest-xdist
- PR #7530: MAINT: TkAgg default backend depends on tkinter
- PR #7531: double tolerance for test_png.py/pngsuite on Windows
- PR #7533: FIX chinese character are hard to deal with in latex
- PR #7525: Avoid division by zero if headlength=0 for quiver
- PR #7522: Check at least one argument is provided for plt.table
- PR #7520: Fix table.py bug
- PR #7397: Numpydoc for backends
- PR #7513: Doc: Typo in gridspec example subtitle
- PR #7494: Remove some numpy 1.6 workarounds
- PR #7500: Set hexbin default linecolor to 'face'
- PR #7498: Fix double running of explicitly chosen tests.
- PR #7475: Remove deprecated "shading" option to pcolor.
- PR #7436: DOC: Fixed Unicode error in gallery template cache
- PR #7496: Commit to fix a broken link
- PR #6062: Add maximum streamline length property.
- PR #7470: Clarify cross correlation documentation #1835
- PR #7481: Minor cleanup of hist().
- PR #7474: FIX/API: regenerate test figure due to hatch changes
- PR #7469: TST: Added codecov
- PR #7467: TST: Fixed part of a test that got displaced in all the changes somehow
- PR #7447: Showcase example: (kind of mandatory) Mandelbrot set
- PR #7463: Added additional coverage excludes
- PR #7449: Clarify documentation of pyplot.draw
- PR #7454: Avoid temporaries when preparing step plots.
- PR #7455: Update two_scales.py example.
- PR #7456: Add pytest's .cache to .gitignore.

- PR #7453: TST: Fixed `test_log_margins` test
- PR #7144: Cleanup scales
- PR #7442: Added spacer to Tk toolbar
- PR #7444: Enhance `annotation_demoX` examples
- PR #7439: MEP12 API examples
- PR #7416: MAINT deprecated ‘spectral’ in favor of ‘nipy_spectral’
- PR #7435: restore test that was inadvertently removed by 5901b38
- PR #7363: Add appropriate error on color size mismatch in `scatter`
- PR #7433: FIX: search for tkinter first in builtins
- PR #7362: Added `-j` shortcut for `--processes=`
- PR #7408: Handle nan/masked values Axes.vlines and hlines
- PR #7409: FIX: MPL should not use new tool manager unless explicited asked for. Closes #7404
- PR #7389: DOC Convert axes docstrings to numpydoc: #7205
- PR #7417: Merge from v2.x
- PR #7398: Moved python files from doc/pyplots to examples folder
- PR #7291: MEP 29: Markup text
- PR #6560: Fillbetween
- PR #7399: Clarify wspace/hspace in documentation/comments
- PR #7400: fix ReST tag
- PR #7381: Updating the readme
- PR #7384: change hardcopy.docstring to docstring.hardcopy
- PR #7386: ENH examples are now reproducible
- PR #7395: Drop code that supports numpy pre-1.6.
- PR #7385: remove unused random import
- PR #7236: ENH Improving the contribution guidelines
- PR #7370: Add example use of axes.spines.SIDE prop in matplotlibrc
- PR #7367: Warn on invalid log axis limits, per issue #7299
- PR #7360: Updated violin plot example as per suggestions in issue #7251
- PR #7357: Added notes on how to use matplotlib in pyenv
- PR #7329: DOC MEP12 - converted animation to SG/MEP12 compatible
- PR #7337: FIX symlog scale now shows negative labels.
- PR #7354: fix small error in poly_editor example

- PR #7310: TST: Make proj3d tests into real tests
- PR #7331: MEP12 improvments for statistics plots
- PR #7340: DOC: Normalize symlink target
- PR #7328: TST: Fixed rcparams `test_Issue_1713` test
- PR #7303: Traceback to help fixing double-calls to mpl.use.
- PR #7346: DOC: Fix annotation position (issue #7345)
- PR #5392: BUG: arrowhead drawing code
- PR #7318: Convert a few test files to Pytest
- PR #7323: Fix #6448: set xmin/ymin even without non-zero bins in 'step' hist
- PR #7326: Enable coverage sending on pytest build
- PR #7321: Remove bundled virtualenv module
- PR #7290: Remove deprecated stuff schedule for removal.
- PR #7324: DOC: Boxplot color demo update
- PR #6476: Add a common example to compare style sheets
- PR #7309: MEP28: fix rst syntax for code blocks
- PR #7250: Adds docstrings to demo_curvelinear_grid.py and demo_curvelinear_grid…
- PR #4128: Code removal for post 1.5/2.1
- PR #7308: Fix travis nightly build
- PR #7282: Draft version of MEP28: Simplification of boxplots
- PR #7304: DOC: Remove duplicate documentation from last merge.
- PR #7249: add docstring to example: axisartist/demo_floating_axes.py
- PR #7296: MAINT removing docstring dedent_interpd when possible
- PR #7298: Changed Examples for Pep8 Compliance
- PR #7295: MAINT finance module is deprecated
- PR #7214: FIX: Only render single patch for scatter
- PR #7297: MAINT docstring appending doesn't mess with rendering anymore.
- PR #6907: Filled + and x markers
- PR #7288: Style typos fixes
- PR #7277: MEP12 - added sphinx-gallery docstrings
- PR #7286: DOC: Fix for #7283 by adding a trailing underscore to misrendered URLs
- PR #7285: added some fixes to the documentation of the functions
- PR #6690: Tidying up and tweaking mplot3d examples [MEP12]

- PR #7273: Fix image watermark example where image was hidden by axes (#7265)
- PR #7276: FIX: don't compute flier positions if not showing
- PR #7267: DOC: changed documentation for axvspan to numpydoc format
- PR #7268: DOC Numpydoc documentation for def fill()
- PR #7272: Don't use __builtins__ (an impl. detail) in pylab.
- PR #7241: Categorical support for NumPy string arrays.
- PR #7232: DOC improved subplots' docstring
- PR #7256: CI: skip failing test on appveyor
- PR #7255: CI: pin to qt4
- PR #7229: DOC: instructions on installing matplotlib for dev
- PR #7252: ENH: improve PySide2 loading
- PR #7245: TST: Always produce image comparison test result images
- PR #6677: Remove a copy in pcolormesh.
- PR #6814: Customize violin plot demo, see #6723
- PR #7067: DOC: OO interface in api and other examples
- PR #6790: BUG: fix C90 warning -> error in new tkagg code
- PR #7242: Add mplcursors to third-party packages.
- PR #7222: Catch IO errors when building font cache
- PR #7220: Fix innocent typo in comments
- PR #7192: DOC: switch pylab example `mri_with_eeg.py` to OO interface + cosmetick fixes
- PR #6583: Fix default parameters of FancyArrow
- PR #7195: remove check under linux for ~/.matplotlib
- PR #6753: Don't warn when legend() finds no labels.
- PR #7178: Boxplot zorder kwarg
- PR #6327: Fix captions for plot directive in latex target
- PR #7188: Remove hard-coded streamplot zorder kwarg
- PR #7170: DOC updated hexbin documentation to numpydoc format.
- PR #7031: DOC Replaced documentation with numpydoc for semilogx
- PR #7029: [WIP] DOC Updated documentation of arrow function to numpy docs format.
- PR #7167: Less stringent normalization test for float128.
- PR #7169: Remove unused variable.
- PR #7066: DOC: switch to O-O interface in basic examples

- PR #7084: [DOC] Tick locators & formatters examples
- PR #7152: Showcase example: Bézier curves & SVG
- PR #7019: Check for fontproperties in figure.suptitle.
- PR #7145: Add `style` to api doc; fix capitalization.
- PR #7097: `image_comparison` decorator refactor
- PR #7096: DOC refer to plot in the scatter plot doc
- PR #7140: FIX added matplotlib.testing.nose.plugins to setupext.py
- PR #5112: OffsetImage: use dpi_cor in get_extent
- PR #7136: DOC: minor fix in development_workflow.rst
- PR #7137: DOC: improve engineering formatter example
- PR #7131: Fix branch name in "Deleting a branch on GitHub_" section
- PR #6521: Issue #6429 fix
- PR #7111: [DOC] Fix example following comments in issue #6865
- PR #7118: PR # 7038 rebased (DOC specgram() documentation now in numpy style)
- PR #7117: PR #7030 rebased
- PR #6618: Small improvements to legend's docstring.
- PR #7102: Adding the artist data on mouse move event message
- PR #7110: [DOC] Apply comments from issue #7017
- PR #7087: [DOC] Example of user-defined linestyle (TikZ linestyle)
- PR #7108: Typos in ticker.py
- PR #7035: DOC Update semilogy docstring to numpy doc format
- PR #7033: DOC Updated plot_date to NumPy/SciPy style
- PR #7032: DOC: Updating docstring to numpy doc format for errorbar
- PR #7094: TST: Restore broken `test_use14corefonts`
- PR #6995: Turn off minor grids when interactively turning off major grids.
- PR #7072: [DOC] New figure for the gallery (showcase section)
- PR #7077: label_outer() should remove inner minor ticks too.
- PR #7037: DOC change axhspan to numpydoc format
- PR #7047: DOC - SpanSelector widget documentation
- PR #7049: Documentated dependencies to the doc and remove unecessary dependencies.
- PR #7063: Tweek tol for test_hist_steplog to fix tests on appveyor
- PR #7055: FIX: testings.nose was not installed

- PR #7058: Minor animation fixes
- PR #7057: FIX: Removed financial demos that stalled because of yahoo requests
- PR #7052: Uncaught exns are fatal for PyQt5, so catch them.
- PR #7048: FIX: remove unused variable
- PR #7042: FIX: ticks filtered by Axis, not in Tick.draw
- PR #7026: Merge 2.x to master
- PR #6988: Text box widget, take over of PR5375
- PR #6957: DOC: clearing out some instances of using pylab in the docs
- PR #7012: Don't blacklist test_usetex using pytest
- PR #7011: TST: Fixed `skip_if_command_unavailable` decorator problem
- PR #6918: enable previously leftout test_usetex
- PR #7006: FIX: sphinx 1.4.0 details
- PR #6900: Enh: break website screenshot banner into 4 pieces and introduce a responsive layout
- PR #6997: FIX: slow plots of pandas objects (Second try)
- PR #6792: PGF Backend: Support interpolation='none'
- PR #6983: Catch invalid interactive switch to log scale.
- PR #6491: Don't warn in Collections.contains if picker is not numlike.
- PR #6978: Add link to O'Reilly video course covering matplotlib
- PR #6930: BUG: PcolorImage handles non-contiguous arrays, provides data readout
- PR #6889: support for updating axis ticks for categorical data
- PR #6974: Fixed wrong expression
- PR #6730: Add Py.test testing framework support
- PR #6904: Use edgecolor rather than linewidth to control edge display.
- PR #6919: Rework MaxNLocator, eliminating infinite loop; closes #6849
- PR #6955: Add parameter checks to DayLocator initiator
- PR #5161: Proposed change to default log scale tick formatting
- PR #6875: Add keymap (default: G) to toggle minor grid.
- PR #6920: Prepare for cross-framework test suite
- PR #6944: Restore cbook.report_memory, which was deleted in d063dee.
- PR #6961: remove extra "a"
- PR #6947: Changed error message. Issue #6933
- PR #6923: Make sure nose is only imported when needed

- PR #6851: Do not restrict coverage to `matplotlib` module only
- PR #6938: Image interpolation selector in Qt figure options.
- PR #6787: Python3.5 dictview support
- PR #6407: adding default toggled state for toggle tools
- PR #6898: Fix read mode when loading cached AFM fonts
- PR #6892: Don’t force anncoords to fig coords upon dragging.
- PR #6895: Prevent forced alpha in figureoptions.
- PR #6877: Fix Path deepcopy signature
- PR #6822: Use travis native cache
- PR #6821: Break reference cycle Line2D <-> Line2D._lineFunc.
- PR #6879: Delete font cache in one of the configurations
- PR #6832: Fix for ylabel title in example tex_unicode_demo.py
- PR #6848: `test_tinypages`: pytest compatible module level setup
- PR #6881: add doi to bibtex entry for Hunter (2007)
- PR #6842: Clarify Axes.hexbin *extent* docstring
- PR #6861: Update ggplot URLs
- PR #6878: DOC: use venv instead of virtualenv on python 3
- PR #6837: Fix Normalize(<signed integer array>).
- PR #6874: Update bachelors_degree_by_gender example.
- PR #6867: Mark `make_all_2d_testfuncs` as not a test
- PR #6854: Fix for PyQt5.7 support.
- PR #6862: Change default doc image format to png and pdf
- PR #6819: Add mpl_toolkits to coveragerc.
- PR #6840: Fixed broken `test_pickle.test_complete` test
- PR #6841: DOC: Switch to OO code style & ensure fixed y-range in `psd_demo3`
- PR #6843: DOC: Fix `psd_demo_complex` similarly to `psd_demo3`
- PR #6829: Tick label rotation via `set_tick_params`
- PR #6799: Allow creating annotation arrows w/ default props.
- PR #6262: Properly handle UTC conversion in date2num.
- PR #6777: Raise lock timeout as actual exception
- PR #6817: DOC: Fix a few typos and formulations
- PR #6826: Clarify doc for “norm” kwarg to `imshow`.

- PR #6807: Deprecate `{get,set}_cursorprops`.
- PR #6811: Add xkcd font as one of the options
- PR #6815: Rename tests in `test_mlab.py`
- PR #6808: Don't forget to disconnect callbacks for dragging.
- PR #6803: better freetype version checking
- PR #6778: Added contribute information to readme
- PR #6786: 2.0 Examples fixes. See #6762
- PR #6774: Appveyor: use newer conda packages and only run all tests on one platform
- PR #6779: Fix tutorial pyplot scales (issue #6775)
- PR #6768: Takeover #6535
- PR #6763: Invalidate test cache on gs/inkscape version
- PR #6765: Get more rcParams for 3d
- PR #6764: Support returning polylines from to_polygons
- PR #6760: DOC: clean up of demo_annotation_box.py
- PR #6735: Added missing side tick rcParams
- PR #6761: Fixed warnings catching and counting with `warnings.catch_warnings`
- PR #5349: Add a Gitter chat badge to README.rst
- PR #6755: PEP: fix minor formatting issues
- PR #6699: Warn if MPLBACKEND is invalid.
- PR #6754: Fixed error handling in `ImageComparisonTest.setup_class`
- PR #6734: register IPython's eventloop integration in plt.install_repl_displayhook
- PR #6745: DOC: typo in broken_axis pylab example
- PR #6747: Also output the actual error on svg backend tests using subprocess
- PR #6744: Add workaround for failures due to newer miktex
- PR #6741: Missing `cleanup` decorator in `test_subplots.test_exceptions`
- PR #6736: doc: fix unescaped backslash
- PR #6733: Mergev2.x to master
- PR #6729: Fix crash if byte-compiled level 2
- PR #6575: setup.py: Recommend installation command for pkgs
- PR #6645: Fix containment and subslice optim. for steps.
- PR #6619: Hide "inner" {x,y}labels in label_outer too.
- PR #6639: Simplify get_legend_handler method

- PR #6694: Improve Line2D and MarkerStyle instantiation
- PR #6692: Remove explicit children invalidation in update_position method
- PR #6703: DOC: explain behavior of notches beyond quartiles
- PR #6707: Call `gc.collect` after each test only if the user asks for it
- PR #6711: Added support for `mgs` to Ghostscript dependecy checker
- PR #6700: Don't convert vmin, vmax to floats.
- PR #6714: fixed font_manager.is_opentype_cff_font()
- PR #6701: Colours like 'XeYYYY' don't get recognised properly if X, Y's are numbers
- PR #6512: Add computer modern font family
- PR #6383: Qt editor alpha
- PR #6381: Fix canonical name for "None" linestyle.
- PR #6689: Str Categorical Axis Support
- PR #6686: Merged _bool from axis into cbook._string_to_bool
- PR #6683: New entry in `.mailmap`
- PR #6520: Appveyor overhaul
- PR #6697: Fixed path caching bug in `Path.unit_regular_star`
- PR #6688: DOC: fix radial increase of size & OO style in polar_scatter_demo
- PR #6681: Fix #6680 (minor typo in IdentityTransform docstring)
- PR #6676: Fixed AppVeyor building script
- PR #6672: Fix example of streamplot `start_points` option
- PR #6601: BF: protect against locale in sphinext text
- PR #6662: adding from_list to custom cmap tutorial
- PR #6666: Guard against too-large figures
- PR #6659: Fix image alpha
- PR #6642: Fix rectangle selector release bug
- PR #6652: Minor doc updates.
- PR #6653: DOC: Incorrect rendering of dashes
- PR #6648: adding a new color and editing an existing color in fivethirtyeight.mplstyle
- PR #6548: Fix typo.
- PR #6628: fix the swab bug to compile on solaris system
- PR #6622: colors: ensure masked array data is an ndarray
- PR #6625: DOC: Found a typo.

- PR #6614: Fix docstring for PickEvent.
- PR #6554: Update mpl_toolkits.gtktools.
- PR #6564: Cleanup for drawstyles.
- PR #6577: Fix mlab.rec_join.
- PR #6596: Added a new example to create error boxes using a PatchCollection
- PR #2370: Implement draw_markers in the cairo backend.
- PR #6599: Drop conditional import of figureoptions.
- PR #6573: Some general cleanups
- PR #6568: Add OSX to travis tests
- PR #6600: Typo: markeredgewith -> markeredgewidth
- PR #6526: ttconv: Also replace carriage return with spaces.
- PR #6530: Update make.py
- PR #6405: ToolManager/Tools adding methods to set figure after initialization
- PR #6553: Drop prettyplotlib from the list of toolkits.
- PR #6557: Merge 2.x to master
- PR #5626: New toolbar icons
- PR #6555: Fix docstrings for `warn_deprecated`.
- PR #6544: Fix typo in margins handling.
- PR #6014: Patch for issue #6009
- PR #6517: Fix conversion of string grays with alpha.
- PR #6522: DOC: made sure boxplot demos share y-axes
- PR #6529: TST Remove plt.show() from test_axes.test_dash_offset
- PR #6519: Fix FigureCanvasAgg.print_raw(...)
- PR #6481: Default boxplot style rebase
- PR #6504: Patch issue 6035 rebase
- PR #5593: ENH: errorbar color cycle clean up
- PR #6497: Line2D._path obeys drawstyle.
- PR #6487: Added docstring to scatter_with_legend.py [MEP12]
- PR #6485: Barchart demo example clean up [MEP 12]
- PR #6472: Install all dependencies from pypi
- PR #6482: Skip test broken with numpy 1.11
- PR #6475: Do not turn on interactive mode on in example script

- PR #6442: loading TCL / Tk symbols dynamically
- PR #6467: ENH: add unified seaborn style sheet
- PR #6465: updated boxplot figure
- PR #6462: CI: Use Miniconda already installed on AppVeyor.
- PR #6456: FIX: unbreak master after 2.x merge
- PR #6445: Offset text colored by labelcolor param
- PR #6417: Showraise gtk gtk3
- PR #6423: TST: splitlines in rec2txt test
- PR #6427: Output pdf dicts in deterministic order
- PR #6431: Merge from v2.x
- PR #6433: Make the frameworkpython script compatible with Python 3
- PR #6358: Stackplot weighted_wiggle zero-area fix
- PR #6382: New color conversion machinery.
- PR #6372: DOC: add whats_new for qt configuration editor.
- PR #6415: removing unused DialogLineprops from gtk3
- PR #6390: Use xkcd: prefix to avoid color name clashes.
- PR #6397: key events handler return value to True to stop propagation
- PR #6402: more explicit message for missing image
- PR #5785: Better choice of offset-text.
- PR #6302: FigureCanvasQT key auto repeat
- PR #6334: ENH: webagg: Handle ioloop shutdown correctly
- PR #5267: AutoMinorLocator and and logarithmic axis
- PR #6386: Minor improvements concerning #6353 and #6357
- PR #6388: Remove wrongly commited test.txt
- PR #6379: Install basemap from git trying to fix build issue with docs
- PR #6369: Update demo_floating_axes.py with comments
- PR #6377: Remove unused variable in GeoAxes class
- PR #6373: Remove misspelled and unused variable in GeoAxes class
- PR #6376: Update index.rst - add Windrose as third party tool
- PR #6371: Set size of static figure to match widget on hidp displays
- PR #6370: Restore webagg backend following the merge of widget nbagg backend
- PR #6366: Sort default labels numerically in Qt editor.

- PR #6367: Remove stray nonascii char from nbagg
- PR #5754: IPython Widget
- PR #6146: ticker.LinearLocator view_limits algorithm improvement closes #6142
- PR #6287: ENH: add axisbelow option 'line', make it the default
- PR #6339: Fix #6335: Queue boxes to update
- PR #6347: Allow setting image clims in Qt options editor.
- PR #6354: Update events handling documentation to work with Python 3.
- PR #6356: Merge 2.x to master
- PR #6304: Updating animation file writer to allow keywork arguments when using `with` construct
- PR #6328: Add default scatter marker option to rcParams
- PR #6342: Remove shebang lines from all examples. [MEP12]
- PR #6337: Add a 'useMathText' param to method 'ticklabel_format'
- PR #6346: Avoid duplicate cmap in image options.
- PR #6253: MAINT: Updates to formatters in `matplotlib.ticker`
- PR #6291: Color cycle handling
- PR #6340: BLD: make minimum cycler version 0.10.0
- PR #6322: Typo fixes and wording modifications (minor)
- PR #6319: Add PyUpSet as extension
- PR #6314: Only render markers on a line when markersize > 0
- PR #6303: DOC Clean up on about half the Mplot3d examples
- PR #6311: Seaborn sheets
- PR #6300: Remake of #6286
- PR #6297: removed duplicate word in Choosing Colormaps documentation
- PR #6200: Tick vertical alignment
- PR #6203: Fix #5998: Support fallback font correctly
- PR #6198: Make hatch linewidth an rcParam
- PR #6275: Fix cycler validation
- PR #6283: Use `figure.stale` instead of internal member in macosx
- PR #6247: DOC: Clarify fillbetween_x example.
- PR #6251: ENH: Added a `PercentFormatter` class to `matplotlib.ticker`
- PR #6267: MNT: trap inappropriate use of color kwarg in scatter; closes #6266
- PR #6249: Adjust test tolerance to pass for me on OSX

- PR #6263: TST: skip broken test
- PR #6260: Bug fix and general touch ups for hist3d_demo example (#1702)
- PR #6239: Clean warnings in examples
- PR #6170: getter for ticks for colorbar
- PR #6246: Merge v2.x into master
- PR #6238: Fix sphinx 1.4.0 issues
- PR #6241: Force Qt validator to use C locale.
- PR #6234: Limit Sphinx to 1.3.6 for the time being
- PR #6178: Use Agg for rendering in the Mac OSX backend
- PR #6232: MNT: use stdlib tools in allow_rasterization
- PR #6211: A method added to Colormap classes to reverse the colormap
- PR #6205: Use io.BytesIO instead of io.StringIO in examples
- PR #6229: Add a locator to AutoDateFormatters example code
- PR #6222: ENH: Added `file` keyword to `setp` to redirect output
- PR #6217: BUG: Made `setp` accept arbitrary iterables
- PR #6154: Some small cleanups based on Quantified code
- PR #4446: Label outer offset text
- PR #6218: DOC: fix typo
- PR #6202: Fix #6136: Don't hardcode default scatter size
- PR #6195: Documentation bug #6180
- PR #6194: Documentation bug fix: #5517
- PR #6011: Fix issue #6003
- PR #6179: Issue #6105: Adds targetfig parameter to the subplot2grid function
- PR #6185: Fix to csv2rec bug for review
- PR #6192: More precise choice of axes limits.
- PR #6176: DOC: Updated docs for rc_context
- PR #5617: Legend tuple handler improve
- PR #6188: Merge 2x into master
- PR #6158: Fix: pandas series of strings
- PR #6156: Bug: Fixed regression of `drawstyle=None`
- PR #5343: Boxplot stats w/ equal quartiles
- PR #6132: Don't check if in range if the caller passed norm

- PR #6091: Fix for issue 5575 along with testing
- PR #6123: docstring added
- PR #6145: BUG: Allowing unknown drawstyles
- PR #6148: Fix: Pandas indexing Error in collections
- PR #6140: clarified color argument in scatter
- PR #6137: Fixed outdated link to thirdpartypackages, and simplified the page
- PR #6095: Bring back the module level 'backend'
- PR #6124: Fix about dialog on Qt 5
- PR #6110: Fixes matplotlib/matplotlib#1235
- PR #6122: MNT: improve image array argument checking in to_rgba. Closes #2499.
- PR #6047: bug fix related #5479
- PR #6119: added comment on "usetex=False" to ainde debugging when latex not ava…
- PR #6073: fixed bug 6028
- PR #6116: CI: try explicitly including msvc_runtime
- PR #6100: Update INSTALL
- PR #6099: Fix #6069. Handle image masks correctly
- PR #6079: Fixed Issue 4346
- PR #6102: Update installing_faq.rst
- PR #6101: Update INSTALL
- PR #6074: Fixes an error in the documentation, linestyle is dash_dot and should be dashdot
- PR #6068: Text class: changed __str__ method and added __repr__ method
- PR #6018: Added get_status() function to the CheckButtons widget
- PR #6013: Mnt cleanup pylab setup
- PR #5984: Suggestion for Rasterization to docs pgf-backend
- PR #5911: Fix #5895: Properly clip MOVETO commands
- PR #6039: DOC: added missing import to navigation_toolbar.rst
- PR #6036: BUG: fix ListedColormap._resample, hence plt.get_cmap; closes #6025
- PR #6029: TST: Always use / in URLs for visual results.
- PR #6022: Make @cleanup *really* support generative tests.
- PR #6024: Add Issue template with some guidelines
- PR #5718: Rewrite of image infrastructure
- PR #3973: WIP: BUG: Convert qualitative colormaps to ListedColormap

- PR #6005: FIX: do not short-cut all white-space strings
- PR #5727: Refresh pgf baseline images.
- PR #5975: ENH: add kwarg normalization function to cbook
- PR #5931: use `locale.getpreferredencoding()` to prevent OS X locale issues
- PR #5972: add support for PySide2, #5971
- PR #5625: DOC: add FAQ about np.datetime64
- PR #5131: fix #4854: set default numpoints of legend entries to 1
- PR #5926: Fix #5917. New dash patterns. Scale dashes by lw
- PR #5976: Lock calls to latex in texmanager
- PR #5628: Reset the available animation movie writer on rcParam change
- PR #5951: tkagg: raise each new window; partially addresses #596
- PR #5958: TST: add a test for tilde in tempfile for the PS backend
- PR #5957: Win: add mgs as a name for ghostscript executable
- PR #5928: fix for latex call on PS backend (Issue #5895)
- PR #5954: Fix issues with getting tempdir when unknown uid
- PR #5922: Fixes for Windows test failures on appveyor
- PR #5953: Fix typos in Axes.boxplot and Axes.bxp docstrings
- PR #5947: Fix #5944: Fix PNG writing from notebook backend
- PR #5936: Merge 2x to master
- PR #5629: WIP: more windows build and CI changes
- PR #5914: Make barbs draw correctly (Fixes #5803)
- PR #5906: Merge v2x to master
- PR #5809: Support generative tests in @cleanup.
- PR #5910: Fix reading/writing from urllib.request objects
- PR #5882: mathtext: Fix comma behaviour at start of string
- PR #5880: mathtext: Fix bugs in conversion of apostrophes to primes
- PR #5872: Fix issue with Sphinx 1.3.4
- PR #5894: Boxplot concept figure update
- PR #5870: Docs / examples fixes.
- PR #5892: Fix gridspec.Gridspec: check ratios for consistency with rows and columns
- PR #5901: Fixes incorrect ipython sourcecode
- PR #5893: Show significant digits by default in QLineEdit.

- PR #5881: Allow build children to run
- PR #5886: Revert "Build the docs with python 3.4 which should fix the Traitlets…
- PR #5877: DOC: added blurb about external mpl-proscale package
- PR #5879: Build the docs with python 3.4 which should fix the Traitlets/IPython…
- PR #5871: Fix sized delimiters for regular-sized mathtext (#5863)
- PR #5852: FIX: create _dashSeq and _dashOfset before use
- PR #5832: Rewordings for normalizations docs.
- PR #5849: Update setupext.py to solve issue #5846
- PR #5853: Typo: fix some typos in patches.FancyArrowPatch
- PR #5842: Allow image comparison outside tests module
- PR #5845: V2.x merge to master
- PR #5813: mathtext: no space after comma in brackets
- PR #5828: FIX: overzealous clean up of imports
- PR #5826: Strip spaces in properties doc after newline.
- PR #5815: Properly minimize the rasterized layers
- PR #5752: Reorganise mpl_toolkits documentation
- PR #5788: Fix ImportError: No module named 'StringIO' on Python 3
- PR #5797: Build docs on python3.5 with linkcheck running on python 2.7
- PR #5778: Fix #5777. Don't warn when applying default style
- PR #4857: Toolbars keep history if axes change (navtoolbar2 + toolmanager)
- PR #5790: Fix ImportError: No module named 'Tkinter' on Python 3
- PR #5789: Index.html template. Only insert snippet if found
- PR #5783: MNT: remove reference to deleted example
- PR #5780: Choose offset text from ticks, not axes limits.
- PR #5776: Add .noseids to .gitignore.
- PR #5466: Fixed issue with `rasterized` not working for errorbar
- PR #5773: Fix eb rasterize
- PR #5440: Fix #4855: Blacklist rcParams that aren't style
- PR #5764: BUG: make clabel obey fontsize kwarg
- PR #5771: Remove no longer used Scikit image code
- PR #5766: Deterministic LaTeX text in SVG images
- PR #5762: Don't fallback to old ipython_console_highlighting

- PR #5728: Use custom RNG for sketch path
- PR #5454: ENH: Create an abstract base class for movie writers.
- PR #5600: Fix #5572: Allow passing empty range to broken_barh
- PR #4874: Document mpl_toolkits.axes_grid1.anchored_artists
- PR #5746: Clarify that easy_install may be used to install all dependencies
- PR #5739: Silence labeled data warning in tests
- PR #5732: RF: fix annoying parens bug
- PR #5735: Correct regex in filterwarnings
- PR #5640: Warning message prior to fc-list command
- PR #5686: Remove banner about updating styles in 2.0
- PR #5676: Fix #5646: bump the font manager version
- PR #5719: Fix #5693: Implemented is_sorted in C
- PR #5721: Remove unused broken doc example axes_zoom_effect
- PR #5664: Low-hanging performance improvements
- PR #5709: Addresses issue #5704. Makes usage of parameters clearer
- PR #5716: Fix #5715.
- PR #5690: Fix #5687: Don't pass unicode to QApplication()
- PR #5707: Fix string format substitution key missing error
- PR #5706: Fix SyntaxError on Python 3
- PR #5700: BUG: handle colorbar ticks with boundaries and NoNorm; closes #5673
- PR #5702: Add missing substitution value
- PR #5701: str.formatter invalid
- PR #5697: TST: add missing decorator
- PR #5683: Include outward ticks in bounding box
- PR #5688: Improved documentation for FuncFormatter formatter class
- PR #5469: Image options
- PR #5677: Fix #5573: Use SVG in docs
- PR #4864: Add documentation for mpl_toolkits.axes_grid1.inset_locator
- PR #5434: Remove setup.py tests and adapt docs to use tests.py
- PR #5586: Fix errorbar extension arrows
- PR #5653: Update banner logo on main website
- PR #5667: Nicer axes names in selector for figure options.

- PR #5672: Fix #5670. No double endpoints in Path.to_polygon
- PR #5553: qt: raise each new window
- PR #5594: FIX: formatting in LogFormatterExponent
- PR #5588: Adjust number of ticks based on length of axis
- PR #5671: Deterministic svg
- PR #5659: Change `savefig.dpi` and `figure.dpi` defaults
- PR #5662: Bugfix for test_triage tool on Python 2
- PR #5661: Fix #5660. No FileNotFoundError on Py2
- PR #4921: Add a quit_all key to the default keymap
- PR #5651: Shorter svg files
- PR #5656: Fix #5495. Combine two tests to prevent race cond
- PR #5383: Handle HiDPI displays in WebAgg/NbAgg backends
- PR #5307: Lower test tolerance
- PR #5631: WX/WXagg backend add code that zooms properly on a Mac with a Retina display
- PR #5644: Fix typo in pyplot_scales.py
- PR #5639: Test if a frame is not already being deleted before trying to Destroy.
- PR #5583: Use data limits plus a little padding by default
- PR #4702: sphinxext/plot_directive does not accept a caption
- PR #5612: mathtext: Use DejaVu display symbols when available
- PR #5374: MNT: Mailmap fixes and simplification
- PR #5516: OSX virtualenv fixing by creating a simple alias
- PR #5546: Fix #5524: Use large, but finite, values for contour extensions
- PR #5621: Tst up coverage
- PR #5620: FIX: quiver key pivot location
- PR #5607: Clarify error when plot() args have bad shapes.
- PR #5604: WIP: testing on windows and conda packages/ wheels for master
- PR #5611: Update colormap user page
- PR #5587: No explicit mathdefault in log formatter
- PR #5591: fixed ordering of lightness plots and changed from getting lightness …
- PR #5605: Fix DeprecationWarning in stackplot.py
- PR #5603: Draw markers around center of pixels
- PR #5596: No edges on filled things by default

- PR #5249: Keep references to modules required in pgf LatexManager destructor
- PR #5589: return extension metadata
- PR #5566: DOC: Fix typo in Axes.bxp.__doc__
- PR #5570: use base64.encodestring on python2.7
- PR #5578: Fix #5576: Handle CPLUS_INCLUDE_PATH
- PR #5555: Use shorter float repr in figure options dialog.
- PR #5552: Dep contourset vminmax
- PR #5433: ENH: pass dash_offset through to gc for Line2D
- PR #5342: Sort and uniquify style entries in figure options.
- PR #5484: fix small typo in documentation about CheckButtons.
- PR #5547: Fix #5545: Fix collection scale in data space
- PR #5500: Fix #5475: Support tolerance when picking patches
- PR #5501: Use facecolor instead of axisbg/axis_bgcolor
- PR #5544: Revert "Fix #5524. Use finfo.max instead of np.inf"
- PR #5146: Move impl. of plt.subplots to Figure.add_subplots.
- PR #5534: Fix #5524. Use finfo.max instead of np.inf
- PR #5521: Add test triage tool
- PR #5537: Fix for broken maplotlib.test function
- PR #5539: Fix docstring of violin{,plot} for return value.
- PR #5515: Fix some theoretical problems with png reading
- PR #5526: Add boxplot params to rctemplate
- PR #5533: Fixes #5522, bug in custom scale example
- PR #5514: adding str to force string in format
- PR #5512: V2.0.x
- PR #5465: Better test for isarray in figaspect(). Closes #5464.
- PR #5503: Fix #4487: Take hist bins from rcParam
- PR #5485: Contour levels must be increasing
- PR #4678: TST: Enable coveralls/codecov code coverage
- PR #5437: Make "classic" style have effect
- PR #5458: Removed normalization of arrows in 3D quiver
- PR #5480: make sure an autoreleasepool is in place
- PR #5451: [Bug] masking of NaN Z values in pcolormesh

- PR #5453: Force frame rate of FFMpegFileWriter input
- PR #5452: Fix axes.set_prop_cycle to handle any generic iterable sequence.
- PR #5448: Fix #5444: do not access subsuper nucleus _metrics if not available
- PR #5439: Use DejaVu Sans as default fallback font
- PR #5204: Minor cleanup work on navigation, text, and customization files.
- PR #5432: Don't draw text when it's completely clipped away
- PR #5426: MNT: examples: Set the aspect ratio to "equal" in the double pendulum animation.
- PR #5214: Use DejaVu fonts as default for text and mathtext
- PR #5306: Use a specific version of Freetype for testing
- PR #5410: Remove uses of font.get_charmap
- PR #5407: DOC: correct indentation
- PR #4863: [mpl_toolkits] Allow "figure" kwarg for host functions in parasite_axes
- PR #5166: [BUG] Don't allow 1d-arrays in plot_surface.
- PR #5360: Add a new memleak script that does everything
- PR #5361: Fix #347: Faster text rendering in Agg
- PR #5373: Remove various Python 2.6 related workarounds
- PR #5398: Updating 2.0 schedule
- PR #5389: Faster image generation in WebAgg/NbAgg backends
- PR #4970: Fixed ZoomPanBase to work with log plots
- PR #5387: Fix #3314 assert mods.pop(0) fails
- PR #5385: Faster event delegation in WebAgg/NbAgg backends
- PR #5384: BUG: Make webagg work without IPython installed
- PR #5358: Fix #5337. Turn off –no-capture (-s) on nose
- PR #5379: DOC: Fix typo, broken link in references
- PR #5371: DOC: Add what's new entry for TransformedPatchPath.
- PR #5299: Faster character mapping
- PR #5356: Replace numpy funcs for scalars.
- PR #5359: Fix memory leaks found by memleak_hawaii3.py
- PR #5357: Fixed typo
- PR #4920: ENH: Add TransformedPatchPath for clipping.

Issues (1130):

- #8599: Pie Chart from CSV File

- #8586: update errorbar in Matplotlib 2.0.0
- #8463: wrong hatch color in legend
- #8558: Rendering really large image
- #8312: Matplotlib attempts to import PyQt4 when PyQt5 is not available
- #3528: PS backend is not tested
- #4389: Windows installer does not run -> restarts itself continually
- #8592: Qt4 backend (PySide) seemingly tries to use Qt5
- #8579: Python 2.7 travis build failing
- #8349: [feature request] Accepting `slice` arguments in `ax.set_xlim()` (Python 3)
- #4379: for the root example page, please provide more description
- #8571: plt.subplots return is inconsistent
- #8570: release 2.0.1 has qt4-incompatible code in backend_qt5.py
- #8569: Superimposed markers when scatterpoints=1
- #8565: Unexpected mixing of qt4backend and qt5backend
- #8563: mpl2.0.1 seems to have broken Qt4Agg
- #8562: ‘QPixmap’ object has no attribute ‘setDevicePixelRatio’
- #8560: Calling close() on a figure doesn’t seem to close it
- #8174: Update list of dependencies to build docs
- #8557: Log scale on pcolor plot with only one tick
- #7412: Documentation guidelines improvements 2
- #8541: Generate a `tutorials` sphinx gallery
- #8223: need to backport docathon PRs
- #7793: Add pillow and graphviz to doc build dependencies
- #8501: Remove false deprication warning
- #7206: All examples should be MEP12/sphinx-gallery compliant
- #6457: The first subplot is missized after `savefig` to a png file.
- #8521: Rectangle patch not transformed correctly in polar plot
- #8542: Inconsistent image size with savefig(...,type=’png’)
- #8445: Cannot display np.array with dtype = np.float128
- #8508: `%matplotlib notebook` show nothing, both 2d and 3d plot
- #7289: ipython loses auto-show/auto-redraw behavior after call to `plt.rcdefaults()`
- #6284: ax.twinx().plot() will reset the x_limits if only an axvspan was used on ax

- #8527: Confusing docstring in matplotlib.pyplot.bar() in version 2.0.0
- #8316: Matplotlib User Interface Example Breaks With More Than Three Patches
- #7835: Deprecate is_string_like
- #8524: Errorbar limits arrow heads point in wrong direction on inverted axis
- #8520: Documentation builds are failing due to sphinx-gallery changes
- #8514: Can't plot with empty markers
- #8516: .set_data() errors if number of points change
- #8517: Log-scale ignores Formatter
- #8506: text object clipping
- #6921: "Error: local variable 'xdata' referenced before assignment" in legend_handler.py
- #8505: plot window hangs and/or is generally unresponsive
- #8500: plot disappears when moved to second monitor
- #7523: Multi-line text instances differing in linespacing not rendered correctly
- #7725: `is_string_like` returns True for numpy `object` arrays
- #8057: markevery only accepts builtin integers, not numpy integers
- #8078: plt.subplots crashes when handed fig_kw argument
- #8038: Question on Path.contains_point/s
- #7688: Edit axis with multiple figures causes freeze with Qt5 on Windows
- #7754: Forgotten restore bounds?
- #5510: autoscale context manager
- #6649: UnboundLocalError in hist(x, bins, histtype='step', normed=1) on double entries in bins
- #6805: Axes.hist with no data in range raises UnboundLocalError
- #7512: ImportError: No module named Tkinter
- #6704: Spacing in math text is broken (AIX specific)
- #8050: Version 2.0.0_1 breaks OpenType font character spacing on PDF save
- #7924: Python 3.6 deprecated escape sequences.
- #8030: Unable to intall matpotlib package using whl
- #8079: Inconsistency between " and ' in the code
- #8128: figure.Figure.autofmt_xdate applied to major xtick labels only
- #8168: From matplotlib.font_manager, ImportError: cannot import name get_font
- #8220: "search" doesn't find cmocean
- #8296: Remove idle_event from examples/event_handling/idle_and_timeout.py

- #8242: Investigate alternative svg renderers for the test suite
- #8424: does matplotlib install in virtual environment work ?
- #8460: matplotlib API docs missing container module
- #8467: initialise imshow with zero array has unexpected side effects
- #7460: Raise error if argument to xlim is invalid, e.g., nan
- #8465: zorder values as a sequence are not respected by LineCollection
- #8457: Allow to change base of LogNorm?
- #8406: FancyArrow, error in the polygon coordinates for shape 'full'
- #8431: Hatches filling an empty color contour not saved in pdf
- #7989: 300% CPU on Raspberry Pi
- #537: Orthogonal projection for mplot3d
- #8443: No version when building from github archive
- #8444: Matplotlib hangs with runtime error
- #8441: ImportError: No module named _backend_gdk
- #8302: Invalid certificate at https://matplotlib.org.
- #8432: asd
- #8153: Long lines in literal blocks run off the edge of the page
- #8160: Using plt.ion with startup commands
- #8428: Documentation: matplotlibrc example file confuses x and yticks.
- #8425: MaxNLocator prune isn't working with decimals
- #8421: Consistent deprecation of the hold kwarg of hlines and vlines
- #8427: Matplotlib cannot find default matplotlib fonts on Scientific linux
- #7903: Regression: imshow on geo axes produces an empty plot in matplotlib 2.0.0
- #8419: Incorrect display of minor ticks in Log Scale plot with large font size
- #8418: Matplotlib defaults to and bundles vera fonts that do not contain Greek letters
- #8073: Please add Vega in perception documentation
- #8272: Convert docstring of Axes.pie() into numpydoc
- #8416: Python 3.4 image comparison test failure for `mathtext_cm_52-expected.png`
- #8402: plotting with TkAgg backend becomes unresponsive after a certain qt5agg backend import command
- #8412: Data points not rendered for figures saved in vector formats
- #8397: pyplot.subplots did not return the type of object specified in the documentation

- #8409: loading pickled figure gives: AttributeError: ‘CallbackRegistry’ object has no attribute ‘callbacks’
- #8111: Issue with sub-setting minor-ticks at intermediate number of decades
- #8401: weird bug when using custom formatter; tick labels overlapping
- #8398: restore rebase documenation
- #7227: Path effects for text outline is missing corners
- #3517: Issue with non-ascii paths in font look up
- #8208: make.py should not use `os.system("sphinx-build ...")`
- #8386: setting log major ticks leaves interfering minor tick labels
- #8370: Simpler code for common plot setting (e.g. legend, lable, title, figsize)?
- #8385: Make checkbox rectangles in CheckButtons widget have an edge outline
- #7785: Passing a transposed array to patch.set_offsets()
- #8378: ColorbarBase() is dpi dependent
- #8342: Make ArrowStyle docstrings numpydoc compatible
- #7683: Please add <shade = True> parameter to bar3d
- #8337: axes set_position ignored if using tight_layout
- #8260: test_backend_ps.py leaves temporary files in /tmp
- #8355: Artifact at border with tricontourf and float32 positions
- #8330: PyPy compatibility - __builtin__ is not iterable
- #8017: Font family is not set on log-scaled tick labels
- #8317: Fonts not changed in LaTeX mode (since version 2.0.0)
- #7293: Isolated points missing in pdf
- #8348: style.use not working for some cases
- #7655: Event picking does not seem to work on polar bar plots
- #3540: Pick events broken in log axes
- #8124: Actually deprecate Axes.axesPatch, Figure.figurePatch
- #8290: six environment polluted when misuse of matplotlib import
- #8230: cache local freetype source
- #8332: Importing Issue: “No module named externals”
- #8327: Inconsistency between documentation and actual effect of the bar plot function
- #8197: Matplotlib 2.0.0 crashes on plotting contour of array with two dimensions of size 1 in Python 3.4
- #8054: is_scalar_or_string deprecated too early

- #8284: Markers have compression artifacts
- #8294: x marker is too big
- #8288: che
- #7951: matplotlib 2.0.0 not using matplotlibrc file in IPython
- #8012: imshow interpolation uses masked values
- #8117: Trying to plot only error bars (with no line connecting data points) results in empty plot
- #7953: Cannot import _tkagg on windows 64 bits on 2.7
- #8225: tight_layout does not work with set_visible(False)
- #8145: Warning treated as error while generating docs
- #2304: Add an argument rotate_labels to pie chart
- #8046: Arc patch with starting and ending angle
- #8263: error saving pcolormesh with shading=gouraud to eps
- #8034: necked_tensile_specimen.png contains non-free color calibration profile
- #8231: gitter badge at top of README.rst is broken
- #8141: breaking change in dash verification in 2.0.0
- #8207: Add early check for “dot” binary (graphviz) when building docs
- #8194: Sample data not found
- #8186: Put back gitter plain text link on README.rst
- #8198: ticklabel font changes when using logscale
- #7616: make ‘dpi’ optional for animation.MovieWriter.setup
- #8192: %matplotlib inline doesn’t work well with ipywidgets 6.0 interact
- #8189: pip install matploblib broken
- #8177: Add badges to README.rst
- #8180: icu version problem with matplotlib 2
- #8169: Autowrapping text doesn’t work in “What’s New in Matplotlib 1.5” example
- #8164: Remove yield tests (now deprecated in pytest)
- #8159: Doc: Restructure environment variables in `Installing from source` docs
- #8123: Regenerate gitwash docs for improved syntax highlighting of non-python code sections
- #8147: Use Agg backend by default if DISPLAY is not set
- #8146: How to display D-stroke symbol in matplotlib
- #7905: ytick locations different for 1.5.3 and 2.0.0
- #8121: PNG output with PGF backend fails with pdftocairo exit code 99

- #8136: If division by zero, python cannot convert float infinity to integer in `get_tick_space()`
- #8067: Coordinates of text not properly set in pgf files
- #8112: Deprecate assert_str_equal
- #8122: keyword labelrotation is not recognized
- #5151: Horizontal lines in colorbars in PDF
- #4984: errorbar incorrectly accepts and plots Nx2 shaped yerr
- #6593: Feature request: filled error bar
- #7992: Hatching doesn't respect alpha
- #7991: Dotted grid lines in matplotlib v2.0.0 appear dashed
- #8015: Document new testing procedure
- #8106: Error in demo scripts: to_rgba: Invalid rgba arg "2" in style_sheets_reference.py
- #8105: calling plt.hist() with np.nan value raises confusing error massage
- #5320: Some searches in documentation result in no results
- #6042: return `_text` property as __repr__ for Text class
- #7171: `axes.boxplot` does not have zorder kwarg
- #8098: matplotlibrc doesen't work
- #8091: Bug with plt.hist when min==max and values are >= 2**53
- #8087: zorder is not respected by all parts of `errorbar` #1622 problem in matplotlib 2.0.0
- #7877: add link to scipython book
- #8053: save animation to mp4 fail
- #8076: Matplotlib hatch color broken
- #8077: ImportError: No module named 'matplotlib.rcsetup'
- #7686: 'Extend' keyword produces colorbar of zero width
- #7886: empty imshow crashes python
- #7901: Allow multiple hatch colors in same figure
- #6708: KnownFailure becomes an error with `--processes=1` flag
- #7899: Behaviour of c=None is inconsistent in 2.0
- #8058: Updating matplotlib to 2.0.0 causing problems when plotting: error/warning message "failed to get the current screen resources"
- #8051: includes not-really-free BaKoMa fonts
- #8049: Matplotlib 3D projection axis cannot be created because of missing rcParam[u'_internal.classic_mode']
- #6285: `plt.subplots()` does not remove existing subplots when called on existing figure

- #8023: numpy array not accepted for log scaled minor ticks
- #7967: Catch or stop specgram warnings during tests
- #7813: Qt5Agg backend not rendering nicely on Windows HiDPI display
- #6891: Greek letter display error [1.5.1]
- #6393: Pair of floats breaks plotting renderer (weirdest bug I've ever seen)
- #8027: Log Scale Ticklabels Refuse to Die (Data Dependent)
- #5859: savefig() as PNG get a different result than the image shown in ipython notebook(SVG probably)
- #5210: Unexpected replacement of right) with exlamation point in MathTextParser output
- #6902: Include test files in coverage report
- #7756: Cannot install the matplotlib 1.5.3 or 2.0.0rc2 on Mac OS Sierra, Python 3.6.0
- #5325: Migrate to py.test
- #8016: Unexpected HOME behavior after axis change
- #8009: Need Python 3.6 wheels for matplotlib 1.5.1 on PyPI
- #8005: Hex colours with alpha
- #7807: ValueError when specifying marker vertices
- #7937: Large TrueType font does not render correctly when saving in .pdf
- #7615: Subscript/superscript sequence is too long with $left. X right|$
- #5287: Warnings in doc build
- #6860: The original xlim changed by twinx
- #6064: specgram(x) should warn if x.size < 256
- #7964: BUG: AxesImage.set_data([[]]) causes FloatingPointException
- #7963: savefig PDF removing the negative sign from yticklabels
- #7955: Failed install with "OSError: [Errno 12] Cannot allocate memory"
- #7958: Matplotlib 2.0 cannot find PyQt5 (Windows)
- #7943: ValueError when plotting Pandas Dataframe Summary
- #7940: saving a square image constrained to the extent of axis without any border doesn't work
- #7636: WX mouseevent assertion errors
- #7902: Saving an unpickled figure.
- #6048: AttributeError (no attribute 'callbacks') when setting attributes on pickle-loaded PatchCollection
- #7930: KeyboardInterrupt while Matplotlib is displaying >= 2 figures causes X server crash
- #7874: wheels not picking correct default backend

- #7906: font_manager.get_fontconfig_fonts() reports a single item of all fonts concatenated
- #7922: FT2Font do not close open file, leads to delayed ResourceWarning
- #7803: tripcolor documentation rendering error .
- #7891: pyplot.bar does not cycle through colors (>2.0.0b1)
- #7912: matplotlib doesn’t work with numpy+mkl
- #7921: Text rendered with MathText looks really ugly (version 2.0 vs. 1.5)
- #7919: ~/.matplotlib/matplotlibrc not being read
- #7909: Unit length quiver arrow not drawn with a unit length
- #7852: _rrule maximum recursion depth exceeded on multiprocessing usage
- #7501: Segmentation fault in QuadMeshGenerator on ppc64
- #7879: UTF-8 error on import of matplotlib 1.5.1
- #7601: color_cycle deprecation warning could provide more context to user
- #7875: qt shims: QFontMetrics missing on PyQt5
- #7860: widget radio buttons and check buttons no longer display outlines
- #7870: DOC: FAQ out-of-date
- #7510: better input validation on `fill_between`
- #7867: pyplot import error when current directory contains a file named sip.py
- #7248: Adding names to the color in the new (Vega) default color cycle
- #6207: axes_grid1.zoomed_inset_axes does not accept location as string
- #7775: Locator tick_values for images
- #7810: Dimensions sanity check in axes_rgb swaps x and y of shape when checking, prevents use with non-square images.
- #7704: screenshots in the front page of devdocs are ugly
- #7746: imshow should silence warnings on invalid values, at least when masked
- #7661: document that imshow now respects scale
- #6820: nonsensical error message for invalid input to plt.bar
- #7814: Legend for lines created using `LineCollection` show different handle line scale.
- #7816: re-enable or delete xmllint tests
- #7802: plt.stackplot not working for integer input with non-default ‘baseline’ parameters
- #6149: travis dedup
- #7822: Weird stroke join with patheffects
- #7784: Simple IndexError in artist.setp if empty list is passed

- #3354: Unecessary arguement in GraphicsContextBase get_linestyle
- #7820: Figure.savefig() not respecting bbox_inches='tight' when dpi specified
- #7715: Can't import pyplot in matplotlib 2.0 rc2
- #7745: Wheel distributables include unnecessary files
- #7812: On MacOS Sierra with IPython, inconsistent results with %gui, %matplotlib magic commands and –gui, and –matplotlib command-line options for ipython and qtconsole; complete failure of qtconsole inline figures
- #7808: Basemap uses deprecated methods
- #7487: Funny things happen when a rectangle with negative width/height is passed to `axes()`
- #7649: –nose-verbose isn't a correct option for nose
- #7656: imsave ignores origin option
- #7792: test_png.test_pngsuite.test fails on ppc64 (big-endian)
- #7788: Colorbars contain no colors when created on ppc64 (big-endian)
- #4285: plt.yscale("log") gives FloatingPointError: underflow encountered in multiply
- #7724: Can't import Matplotlib.widgets.TextBox
- #7798: `test_psd_csd_equal` fails for 12 (but not all) of the `test_mlab.spectral_testcase` s on ppc64 (big-endian)
- #7778: Different font size between math mode and regular text
- #7777: mpl_toolkits.basemap: ValueError: level must be >= 0
- #4353: different behaviour of zoom while using ginput with MouseEvent vs KeyEvent
- #4380: horizontalalignment 'left' and 'right' do not handle spacing consistently
- #7393: `subplot()`: incorrect description of deletion of overlapping axes in the docs
- #7759: matplotlib dynamic plotting
- #2025: TkAgg build seems to favor Framework Tcl/Tk on OS-X
- #3991: SIGINT is ignored by MacOSX backend
- #2722: limited number of grid lines in matplotlib?
- #3983: Issue when trying to plot points with transform that requires more/fewer coordinates than it returns
- #7734: inconsistent doc regarding keymap.fullscreen default value
- #7761: Deprecation warning for finance is very unclear
- #7223: matplotlib.rcsetup docs
- #3917: OS X Cursor Not working on command line
- #4038: Hist Plot Normalization should allow a 'Per Bin' Normalization

- #3486: Update Selection Widgets
- #7457: Improvements to pylab_examples/stock_demo.py
- #7755: Can't open figure
- #7299: Raise an error or a warning when ylim's min == 0 and yscale == "log"
- #4977: Improve resolution of canvas on HiDPI with PyQt5 backend
- #7495: Missing facecolor2d attribute
- #3727: plot_date() does not work with x values of type pandas.Timestamp (pandas version 0.15.0)?
- #3368: Variable number of ticks with LogLocator for a fixed number of tick labels displayed
- #1835: docstrings of cross-correlation functions (acorr and xcorr) need clarification
- #6972: quiverkey problem when angles=array
- #6617: Problem of fonts with LaTeX rendering due to fonts-lyx package
- #7717: make all deprecation warnings be `mplDeprecation` instances
- #7662: eventplot legend fails (linewidth)
- #7673: Baseline image reuse breaks parallel testing
- #7666: Default scaling of x-axis in specgram() is incorrect (i.e. the default value for the `xextent` parameter)
- #7709: Running into problems in seaborn after upgrading matpltolib
- #7684: 3-D scatter plot disappears when overlaid over a 3-D surface plot.
- #7630: Unicode issue in matplotlib.dates
- #7678: add link to bokeh/colorcet
- #2078: linespacing of multiline texts.
- #6727: scipy 2016 sprint ideas
- #3212: Why are numpoints and scatterpoints two different keywords?
- #7697: Update INSTALL file to include py3.6
- #4428: Hyphen as a subscript doesn't appear at certain font sizes
- #2886: The wrong Game symbol is used
- #7603: scatter `color` vs `c`
- #7660: 2.0rc2: title too close to frame?
- #7672: standardize classic/v2.x order is docs
- #7680: OverflowError: Python int too large to convert to C long during ploting simple numbers on debian testing
- #7664: BUG: `super` requires at least 1 argument
- #7669: rc on conda-forge

- #5363: Warnings from test_contour.test_corner_mask
- #7663: BUG: Can't import `matplotlib._backports`
- #7647: Decorator for deprecation ignores arguments other than 'message'
- #5806: FutureWarning with Numpy 1.10
- #6480: Setting markeredgecolor raises a warning
- #7653: legend doesn't show all markers
- #7643: Matplotlib 2.0 deprecations
- #7642: imshow seems to "shift" grid.
- #7633: All attempts to plot fail with "OverflowError: Python int too large to convert to C long"
- #7637: Stacked 2D plots with interconnections in Matplotlib
- #7353: auto legend position changes upon saving the figure
- #7626: Saturation mask for imshow()
- #7623: potential bug with plt.arrow and plt.annotate when setting linestyle via tuples
- #7005: rcParams['font.size'] is consulted at render time
- #7587: BUG: shared log axes lose _minpos and revert to default
- #7493: Plotting zero values with logarithmic axes triggers OverflowError, Matplotlib hangs permanently
- #7595: math domain error using symlog norm
- #7588: 2.0.0rc1 cannot import name '_macosx'
- #2051: Consider making default verticalalignment `baseline`
- #4867: Add additional minor labels in log axis with a span less than two decades
- #7489: Too small axis arrow when savefig to png
- #7611: UnicodeDecodeError when using matplotlib save SVG file and open it again
- #7592: font cache: a possibility to disable building it
- #5836: Repeated warning about fc-list
- #7609: The best channel to ask questions related to using matplotlib
- #7141: Feature request: auto locate minor ticks on log scaled color bar
- #3489: matplotlib scatter shifts color codes when NaN is present
- #4414: Specifying histtype='stepfilled' and normed=True when using plt.hist causes ymax to be set incorrectly
- #7597: python complain about "This application failed to start because it could not find or load the Qt platform plugin 'xcb' " after an update of matplotlib
- #7578: Validate steps input to `MaxNLocator`

- #7590: Subtick labels are not disabled in classic style
- #6317: PDF file generation is not deterministic - results in different outputs on the same input
- #6543: Why does fill_betweenx not have interpolate?
- #7437: Broken path to example with strpdate2num
- #7593: Issue: Applying Axis Limits
- #7591: Number of subplots in mpl.axes.Subplot object
- #7056: setup.py –name and friends broken
- #7044: location of convert in rcparams on windows
- #6813: avoid hiding edge pixels of images
- #7579: OS X libpng incompatability
- #7576: v2.0.0rc1 conda-forge dependency issue
- #7558: Colorbar becomes 0 to 1 after colorbar ax.yaxis.set_major_formatter
- #7526: Cannot Disable TkAgg Backend
- #6565: Questionable margin-cancellation logic
- #7175: new margin system doesn't handle negative values in bars
- #5201: issue with colorbar using LogNorm and extend='min'
- #6580: Ensure install requirements in documentation are up to date before release
- #5654: Update static images in docs to reflect new style
- #7553: frange returns a last value greater than limit
- #5961: track bdist_wheel release and remove the workaround when 0.27 is released
- #7554: TeX formula rendering broken
- #6885: Check if ~/.matplotlib/ is a symlink to ~/.config/matplotlib/
- #7202: Colorbar with SymmetricalLogLocator : issue when handling only negative values
- #7542: Plotting masked array lose data points
- #6678: dead links in docs
- #7534: nbagg doesn't change figure's facecolor
- #7535: Set return of type Axes in Numpydoc docstring return type hint for Figure.add_subplot and Figure.add_axes to help jedi introspection
- #7443: pdf doc build is sort of broken
- #7521: Figure.show() fails with Qt5Agg on Windows (plt.show() works)
- #7423: Latex cache error when building docs
- #7519: plt.table() without any kwargs throws exception

- #3070: remove hold logic from library
- #1910: Pylab contourf plot using Mollweide projection create artefacts
- #5350: Minor Bug on table.py
- #7518: Incorrect transData in a simple plot
- #6985: Animation of contourf becomes extremely slow
- #7508: Legend not displayed
- #7484: Remove numpy 1.6 specific work-arounds
- #6746: Matplotlib.pyplot 2.0.0b2 fails to import with Conda Python 3.5 on OS X
- #7505: Default color cycler for plots should have more than 8 colors
- #7185: Hexbin default edgecolors kwarg is misnamed
- #7478: ‘alpha’ kwarg overrides facecolor=’none’ when plotting circle
- #7375: Patch edgecolor of a legend item does not follow look of figure
- #6873: examples/api/skewt.py is not displaying the right part of the grid by default
- #6773: Shifted image extents in 2.0.0.b3
- #7350: Colors drawn outside axis for hist2d

- #6514: LaTeX axis labels can no longer have custom fonts
- #2663: Multi Cursor disable broken
- #6083: Figure linewidth default in rcparams
- #1069: Add a donation information page
- #6035: Issue(?): head size of FancyArrowPatch changes between interactive figure and picture export
- #6495: new figsize is bad for subplots with fontsize 12
- #6493: Stepfilled color cycle for background and edge different
- #6380: Implicit addition of "color" to property_cycle breaks semantics
- #6447: Line2D.contains does not take drawstyle into account.
- #6257: option for default space between title and axes
- #5868: tight_layout doesn't leave enough space between outwards ticks and axes title
- #5987: Outward ticks cause labels to be clipped by default
- #5269: Default changes: legend
- #6489: Test errors with numpy 1.11.1rc1
- #5960: Misplaced shadows when using FilteredArtistList
- #6452: Please add a generic "seaborn" style
- #6469: Test failures testing matplotlib 1.5.1 manylinux wheels
- #5854: New cycler does not work with bar plots
- #5977: legend needs logic to deal with new linestyle scaling by linewidth
- #6365: Default format time series xtick labels changed
- #6104: docs: latex required for PDF plotting?
- #6451: Inequality error on web page http://matplotlib.org/faq/howto_faq.html
- #6459: use conda already installed on appveyor
- #6043: Advanced hillshading example looks strange with new defaults.
- #6440: BUG: set_tick_params labelcolor should apply to offset
- #6458: Wrong package name in INSTALL file
- #2842: matplotlib.tests.test_basic.test_override_builtins() fails with Python >=3.4
- #2375: matplotlib 1.3.0 doesn't compile with Solaris Studio 12.1 CC
- #2667: matplotlib.tests.test_mathtext.test_mathtext_{cm,stix,stixsans}_{37,53}.test are failing

- #2243: axes limits with aspect='equal'
- #1758: y limit with dashed or dotted lines hangs with somewhat big data
- #5994: Points annotation coords not working in 2.x
- #6444: matplotlib.path.contains_points is a LOT slower in 1.51
- #5461: Feature request: allow a default line alpha to be set in mpl.rcParams
- #5132: ENH: Set the alpha value for plots in rcParams
- #6449: axhline and axvline linestyle as on-off seq doesn't work if set directly in function call
- #6416: animation with 'ffmpeg' backend and 'savefig.bbox = tight' garbles video
- #6437: Improperly spaced time axis
- #5974: scatter is not changing color in Axes3D
- #6436: clabels plotting outside of projection limb
- #6438: Cant get emoji working in Pie chart legend with google app engine. Need help.
- #6362: greyscale scatter points appearing blue
- #6301: tricky bug in ticker due to special behaviour of numpy
- #6276: Ticklabel format not preserved after editing plot limits
- #6173: `linestyle` parameter does not support default cycler through `None`, crashes instead.
- #6109: colorbar _ticker +_locate bug
- #6231: Segfault when figures are deleted in random order
- #6432: micro sign doesn't show in EngFormatter
- #6057: Infinite Loop: LogLocator Colorbar & update_ticks
- #6270: pyplot.contour() not working with matplotlib.ticker.LinearLocator()
- #6058: "Configure subplots" tool is initialized very inefficiently in the Qt backends
- #6363: Change `legend` to accept `alpha` instead of (only) `framealpha`.
- #6394: Severe bug in ``imshow`` when plotting images with small values
- #6368: Bug: matplotlib.pyplot.spy: does not work correctly for sparse matrices with many entries (>= 2**32)
- #6419: Imshow does not copy data array but determines colormap values upon call
- #3615: mouse scroll event in Gtk3 backend
- #3373: add link to gtk embedding cookbook to website
- #6121: opening the configure subplots menu moves the axes by a tiny amount
- #2511: NavigationToolbar breaks if axes are added during use.
- #6349: Down arrow on GTK3 backends selects toolbar, which eats furthur keypress events

- #6408: minor ticks don't respect rcParam xtick.top / ytick.right
- #6398: sudden install error with pip (pyparsing 2.1.2 related)
- #5819: 1.5.1rc1: dont use absolute links in the "new updates" on the homepage
- #5969: urgent bug after 1.5.0: offset of LineCollection when apply agg_filter
- #5767: axes limits (in old "round_numbers" mode) affected by floating point issues
- #5755: Better choice of axes offset value
- #5938: possible bug with ax.set_yscale('log') when all values in array are zero
- #6399: pyparsing version 2.1.2 not supported (2.1.1 works though)
- #5884: `numpy` as no Attribute `string0`
- #6395: Deprecation warning for axes.color_cycle
- #6385: Possible division by zero in new `get_tick_space()` methods; is rotation ignored?
- #6344: Installation issue
- #6315: Qt properties editor could sort lines labels using natsort
- #5219: Notebook backend: possible to remove javascript/html when figure is closed?
- #5111: nbagg backend captures exceptions raised by callbacks
- #4940: NBAgg figure management issues
- #4582: Matplotlib IPython Widget
- #6142: matplotlib.ticker.LinearLocator view_limits algorithm improvement?
- #6326: Unicode invisible after image saved
- #5980: Gridlines on top of plot by default in 2.0?
- #6272: Ability to set default scatter marker in matplotlibrc
- #6335: subplots animation example is broken on OS X with qt4agg
- #6357: pyplot.hist: normalization fails
- #6352: clim doesn't update after draw
- #6353: hist won't norm for small numbers
- #6343: prop_cycle breaks keyword aliases
- #6226: Issue saving figure as eps when using gouraud shaded triangulation
- #6330: ticklabel_format reset to default by ScalarFormatter
- #4975: Non-default `color_cycle` not working in Pie plot
- #5990: Scatter markers do not follow new colour cycle
- #5577: Handling of "next color in cycle" should be handled differently
- #5489: Special color names to pull colors from the currently active color cycle

- #6325: Master requires cycler 0.10.0
- #6278: imshow with pgf backend does not render transparency
- #5945: Figures in the notebook backend are too large following DPI changes
- #6332: Animation with blit broken
- #6331: matplotlib pcolormesh seems to slide some data around on the plot
- #6307: Seaborn style sheets don't edit `patch.facecolor`
- #6294: Zero size ticks show up as single pixels in rendered pdf
- #6318: Cannot import mpl_toolkits in Python3
- #6316: Viridis exists but not in plt.cm.datad.keys()
- #6082: Cannot interactively edit axes limits using Qt5 backend
- #6309: Make CheckButtons based on subplots automatically
- #6306: Can't show images when plt.show() was executed
- #2527: Vertical alignment of text is too high
- #4827: Pickled Figure Loses sharedx Properties

- #4706: Documentation - Basemap
- #6255: Can't build matplotlib.ft2font in cygwin
- #5792: Not easy to get colorbar tick mark locations
- #6233: ImportError from Sphinx plot_directive from Cython
- #6235: Issue with building docs with Sphinx 1.4.0
- #4383: xkcd color names

- #6219: Example embedding_in_tk.py freezes in Python3.5.1
- #5067: improve whats_new entry for prop cycler
- #4614: Followup items from the matplotlib 2.0 BoF
- #5986: mac osx backend does not scale dashes by linewidth
- #4680: Set forward=True by default when setting the figure size
- #4597: use mkdtemp in _create_tmp_config_dir
- #3437: Interactive save should respect 'savefig.facecolor' rcParam.
- #2467: Improve default colors and layouts
- #4194: matplotlib crashes on OS X when saving to JPEG and then displaying the plot
- #4320: Pyplot.imshow() "None" interpolation is not supported on Mac OSX
- #1266: Draggable legend results RuntimeError and AttributeError on Mac OS 10.8.1
- #5442: xkcd plots rendered as regular plots on Mac OS X
- #2697: Path snapping does not respect quantization scale appropriate for Retina displays
- #6049: Incorrect TextPath display under interactive mode
- #1319: macosx backend lacks support for cursor-type widgets
- #531: macosx backend does not work with blitting
- #5964: slow rendering with backend_macosx on El Capitan
- #5847: macosx backend color rendering
- #6224: References to non-existing class FancyBoxPatch
- #781: macosx backend doesn't find fonts the same way as other backends
- #4271: general colormap reverser
- #6201: examples svg_histogram.html failes with UnicodeEncodeError
- #6212: ENH? BUG? `pyplot.setp`/`Artist.setp` does not accept non-indexable iterables of handles.
- #4445: Two issues with the axes offset indicator
- #6209: Qt4 backend uses Qt5 backend
- #6136: Feature request: configure default scatter plot marker size
- #6180: Minor typos in the style sheets users' guide
- #5517: "interactive example" not working with PySide
- #4607: bug in font_manager.FontManager.score_family()
- #4400: Setting annotation background covers arrow
- #596: Add "bring window to front" functionality

- #4674: Default marker edge width in plot vs. scatter
- #5988: rainbow_text example is missing some text
- #6165: MacOSX backend hangs drawing lines with many dashes/dots
- #6155: Deprecation warnings with Dateutil 2.5
- #6003: In ‘pyplot.streamplot’, starting points near the same streamline raise ‘InvalidIndexError’
- #6105: Accepting figure argument in subplot2grid
- #6184: csv2rec handles dates differently to datetimes when datefirst is specified.
- #6164: Unable to use PySide with gui=qt
- #6166: legends do not refresh
- #3897: bug: inconsistent types accepted in DateLocator subclasses
- #6160: EPS issues with rc parameters used in seaborn library on Win 8.1
- #6163: Can´t make matplotlib run in my computer
- #5331: Boxplot with zero IQR sets whiskers to max and min and leaves no outliers
- #5575: plot_date() ignores timezone
- #6143: drawstyle accepts anything as default rather than raising
- #6151: Matplotlib 1.5.1 ignores annotation_clip parameter
- #6147: colormaps issue
- #5916: Headless get_window_extent or equivalent
- #6141: Matplotlib subplots and datetime x-axis functionality not working as intended?
- #6138: No figure shows, no error
- #6134: Cannot plot a line of width=1 without antialiased
- #6120: v2.x failures on travis
- #6092: %matplotlib notebook broken with current matplotlib master
- #1235: Legend placement bug
- #2499: Showing np.uint16 images of the form (h,w,3) is broken
- #5479: Table: auto_set_column_width not working
- #6028: Appearance of non-math hyphen changes with math in text
- #6113: ValueError after moving legend and rcParams.update
- #6111: patches fails when data are array, not list
- #6108: Plot update issue within event callback for multiple updates
- #6069: imshow no longer correctly handles ‘bad’ (`nan`) values
- #6103: ticklabels empty when not interactive

- #6084: Despined figure is cropped
- #6067: pyplot.savefig doesn't expand ~ (tilde) in path
- #4754: Change default color cycle
- #6063: Axes.relim() seems not to work when copying Line2D objects
- #6065: Proposal to change color – 'indianred'
- #6056: quiver plot in polar projection - how to make the quiver density latitude-dependent ?
- #6051: Matplotlib v1.5.1 apparently not compatible with python-dateutil 2.4.2

- #5967: savefig SVG and PDF output for scatter plots is excessively complex, crashses Inkscape
- #1943: legend doesn't work with stackplot

- #5923: Windows usetex=True error in long usernames
- #5940: KeyError: ‘getpwuid(): uid not found: 5001’
- #5748: Windows test failures on appveyor
- #5944: Notebook backend broken on Master
- #5946: Calling subplots_adjust breaks savefig output
- #5929: Fallback font doesn’t work on windows?
- #5925: Data points beyond axes range plotted when saved to SVG
- #5918: Pyplot.savefig is very slow with some combinations of data/ylim scales
- #5919: Error when trying to import matplotlib into IPython notebook
- #5803: Barbs broken
- #5846: setupext.py: problems parsing setup.cfg (not updated to changes in configparser)
- #5309: Differences between function and keywords for savefig.bbox and axes.facecolor
- #5889: Factual errors in HowTo FAQ Box Plot Image
- #5618: New rcParams requests
- #5810: Regression in test_remove_shared_axes
- #5281: plt.tight_layout(pad=0) cuts away outer ticks
- #5909: The documentation for LinearLocator’s presets keyword is unclear
- #5864: mathtext mishandling of certain exponents
- #5869: doc build fails with mpl-1.5.1 and sphinx-1.3.4 (sphinx-1.3.3 is fine)
- #5835: gridspec.Gridspec doesn’t check for consistency in arguments
- #5867: No transparency in *.pgf file when using pgf Backend.
- #5863: left(... right) are too small
- #5850: prop_cycler for custom dashes – linestyle such as (<offset>, (<on>, <off>)) throws error
- #5861: Marker style request
- #5851: Bar and box plots use the ‘default’ matplotlib colormap, even if the style is changed
- #5857: FAIL: matplotlib.tests.test_coding_standards.test_pep8_conformance_examples
- #5831: tests.py is missing from pypi tarball
- #5829: test_rasterize_dpi fails with 1.5.1
- #5843: what is the source code of ax.pcolormesh(T, R, Z,vmin=0,vmax=255,cmap=’jet’) ?
- #5799: mathtext kerning around comma
- #2841: There is no set_linestyle_cycle in the matplotlib axes API
- #5821: Consider using an offline copy of Raleway font

- #5822: FuncAnimation.save() only saving 1 frame
- #5449: Incomplete dependency list for installation from source
- #5793: GTK backends
- #5814: Adding colorbars to row subplots doesn't render the main plots when saving to .eps in 1.5.0
- #5816: matplotlib.pyplot.boxplot ignored showmeans keyword
- #5086: Default date format for axis formatting
- #4808: AutoDateFormatter shows too much precision
- #5812: Widget event issue
- #5794: –no-network not recognized as valid option for tests.py
- #5801: No such file or directory: '/usr/share/matplotlib/stylelib'
- #5777: Using default style raises warnings about non style parameters
- #5738: Offset text should be computed based on lowest and highest ticks, not actual axes limits
- #5403: Document minimal MovieWriter sub-class
- #5558: The link to the John Hunter Memorial fund is a 404
- #5757: Several axes_grid1 and axisartist examples broken on master
- #5557: plt.hist throws KeyError when passed a pandas.Series without 0 in index
- #5550: Plotting datetime values from Pandas dataframe
- #4855: Limit what `style.use` can affect?
- #5765: import matplotlib._png as _png ImportError: libpng16.so.16: cannot open shared object
- #5753: Handling of zero in log shared axes depends on whether axes are shared
- #5756: 3D rendering, scatterpoints disapear near edges of surfaces
- #5747: Figure.suptitle does not respect `size` argument
- #5641: plt.errorbar error with empty list
- #5476: annotate doesn't trigger redraw
- #5572: Matplotlib 1.5 broken_barh fails on empty data.
- #5089: axes.properties calls get_axes internally
- #5745: Using internal qhull despite the presence of pyqhull installed in the system
- #5744: cycler is required, is missing, yet build succeeds.
- #5592: Problem with _init_func in ArtistAnimation
- #5729: Test matplotlib.tests.test_backend_svg.test_determinism fails on OSX in virtual envs.
- #4756: font_manager.py takes multiple seconds to import
- #5435: Unable to upgrade matplotlib 1.5.0 through pip

- #5636: Generating legend from figure options panel of qt backend raise exception for large number of plots
- #5365: Warning in test_lines.test_nan_is_sorted
- #5646: Version the font cache
- #5692: Can't remove StemContainer
- #5635: RectangleSelector creates not wanted lines in axes
- #5427: BUG? Normalize modifies pandas Series inplace
- #5693: Invalid caching of long lines with nans
- #5705: doc/users/plotting/examples/axes_zoom_effect.py is not a Python file
- #4359: savefig crashes with malloc error on os x
- #5715: Minor error in set up fork
- #5687: Segfault on plotting with PySide as backend.qt4
- #5708: Segfault with Qt4Agg backend in 1.5.0
- #5704: Issue with xy and xytext
- #5673: colorbar labelling bug (1.5 regression)
- #4491: Document how to get a framework build in a virtual env
- #5468: axes selection in axes editor
- #5684: AxesGrid demo exception with LogNorm: 'XAxis' object has no attribute 'set_scale'
- #5663: AttributeError: 'NoneType' object has no attribute 'canvas'
- #5573: Support HiDPI (retina) displays in docs
- #5680: SpanSelector span_stays fails with use_blit=True
- #5679: Y-axis switches to log scale when an X-axis is shared multiple times.
- #5655: Problems installing basemap behind a proxy
- #5670: Doubling of coordinates in polygon clipping
- #4725: change set_adjustable for share axes with aspect ratio of 1
- #5488: The default number of ticks should be based on the length of the axis
- #5543: num2date ignoring tz in v1.5.0
- #305: Change canvas.print_figure default resolution
- #5660: Cannot raise FileNotFoundError in python2
- #5658: A way to remove the image of plt.figimage()?
- #5495: Something fishy in png reading
- #5549: test_streamplot:test_colormap test broke unintentionally

- #5381: HiDPI support in Notebook backend
- #5531: test_mplot3d:test_quiver3d broke unintentionally
- #5530: test_axes:test_polar_unit broke unintentionally
- #5525: Comparison failure in text_axes:test_phase_spectrum_freqs
- #5650: Wrong backend selection with PyQt4
- #5649: Documentation metadata (release version) does not correspond with some of the 'younger' documentation content
- #5648: Some tests require non-zero tolerance
- #3980: zoom in wx with retnia behaves badly
- #5642: Mistype in pyplot_scales.py of pyplot_tutorial.rst :: a minor bug in docs
- #3316: wx crashes on exit if figure not shown and not explicitly closed
- #5624: Cannot manually close matplotlib plot window in Mac OS X Yosemite
- #4891: Better auto-selection of axis limits
- #5633: No module named externals
- #5634: No module named 'matplotlib.tests'
- #5473: Strange OS warning when import pyplot after upgrading to 1.5.0
- #5524: Change in colorbar extensions
- #5627: Followup for Windows CI stuff
- #5613: Quiverkey() positions arrow incorrectly with labelpos 'N' or 'S'
- #5615: tornado now a requirement?
- #5582: FuncAnimation crashes the interpreter (win7, 64bit)
- #5610: Testfailures on windows
- #5595: automatically build windows conda packages and wheels in master
- #5535: test_axes:test_rc_grid image comparison test has always been broken
- #4396: Qt5 is not mentioned in backends list in doc
- #5205: pcolor does not handle non-array C data
- #4839: float repr in axes parameter editing window (aka the green tick button)
- #5542: Bad superscript positioning for some fonts
- #3791: Update colormap examples.
- #4679: Relationship between line-art markers and the markeredgewidth parameter
- #5601: Scipy/matplotlib recipe with plt.connect() has trouble in python 3 (AnnoteFinder)
- #4211: Axes3D quiver: variable length arrows

- #773: mplot3d enhancement
- #395: need 3D examples for tricontour and tricontourf
- #186: Axes3D with PolyCollection broken
- #178: Incorrect mplot3d contourf rendering
- #5508: Animation.to_html5_video requires python3 base64 module
- #5576: Improper reliance upon pkg-config when C_INCLUDE_PATH is set
- #5369: Change in zorder of streamplot between 1.3.1 and 1.4.0
- #5569: Stackplot does not handle NaNs
- #5565: label keyword is not interpreted proporly in errorbar() for pandas.DataFrame-like objects
- #5561: interactive mode doesn't display images with standard python interpreter
- #5559: Setting window titles when in interactive mode
- #5554: Cropping text to axes
- #5545: EllipseCollection renders incorrectly when passed a sequence of widths
- #5475: artist picker tolerance has no effect
- #5529: Wrong image/code for legend_demo (pylab)
- #5139: plt.subplots for already existing Figure
- #5497: violin{,plot} return value
- #5441: boxplot rcParams are not in matplotlibrc.template
- #5522: axhline fails on custom scale example
- #5528: rho in text for plots erroring
- #4799: Probability axes scales
- #5487: Trouble importing image_comparison decorator in v1.5
- #5464: figaspect not working with numpy floats
- #4487: Should default hist() bins be changed in 2.0?
- #5499: UnicodeDecodeError in IPython Notebook caused by negative numbers in plt.legend()
- #5498: Labels' collisions while plotting named DataFrame iterrows
- #5491: clippedline.py example should be removed
- #5482: RuntimeError: could not open display
- #5481: value error : unknown locale: UTF-8
- #4780: Non-interactive backend calls draw more than 100 times
- #5470: colorbar values could take advantage of offsetting and/or scientific notation
- #5471: FuncAnimation video saving results in one frame file

- #5457: Example of new colormaps is misleading
- #3920: Please fix pip install, so that plt.show() etc works correctly
- #5418: install backend gtk in Cygwin
- #5368: New axes.set_prop_cycle method cannot handle any generic iterable
- #5446: Tests fail to run (killed manually after 7000 sec)
- #5225: Rare race condition in makedirs with parallel processes
- #5444: overline and subscripts/superscripts in mathtext
- #4859: Call `tight_layout()` by default
- #5429: Segfault in matplotlib.tests.test_image:test_get_window_extent_for_AxisImage on python3.5
- #5431: Matplotlib 1.4.3 broken on Windows
- #5409: Match zdata cursor display scalling with colorbar ?
- #5128: ENH: Better default font
- #5420: [Mac OS X 10.10.5] Macports install error :unknown locale: UTF-8
- #3867: OSX compile broken since CXX removal (conda only?)
- #5411: XKCD style fails except for inline mode
- #5406: Hangs on OS X 10.11.1: No such file or directory: '~/.matplotlib/fontList.json'
- #3116: mplot3d: argument checking in plot_surface should be improved.
- #347: Faster Text drawing needed
- #5399: FuncAnimation w/o init_func breaks when saving
- #5395: Style changes doc has optimistic release date
- #5393: wrong legend in errorbar plot for pandas series
- #5396: fill_between() with gradient
- #5221: infinite range for hist(histtype="step")
- #4901: Error running double pendulum animation example
- #3314: assert mods.pop(0) == 'tests' errors for multiprocess tests on OSX
- #5337: Remove –nocapture from nosetests on .travis.yml?
- #5378: errorbar fails with pandas data frame
- #5367: histogram and digitize do not agree on the definition of a bin
- #5314: ValueError: insecure string pickle
- #5347: Problem with importing matplotlib.animation
- #4788: Modified axes patch will not re-clip artists
- #4968: Lasso-ing in WxAgg causes flickering of the entire figure

CHAPTER

ELEVEN

LICENSE

Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see *Licenses*.

11.1 Copyright Policy

John Hunter began matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of matplotlib, but, as has always been the case, matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

11.2 License agreement for matplotlib 2.0.2

1. This LICENSE AGREEMENT is between the Matplotlib Development Team ("MDT"), and the Individual or Organization ("Licensee") accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 2.0.2 alone or in any derivative version, provided, however, that MDT's License Agreement and MDT's notice of copyright, i.e., "Copyright (c) 2012-2013

Matplotlib Development Team; All Rights Reserved" are retained in matplotlib 2.0.2 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 2.0.2 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 2.0.2.

4. MDT is making matplotlib 2.0.2 available to Licensee on an "AS IS" basis. MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 2.0.2 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 2.0.2 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 2.0.2, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between MDT and Licensee. This License Agreement does not grant permission to use MDT trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 2.0.2, Licensee agrees to be bound by the terms and conditions of this License Agreement.

11.3 License agreement for matplotlib versions prior to 1.3.0

1. This LICENSE AGREEMENT is between John D. Hunter ("JDH"), and the Individual or Organization ("Licensee") accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, JDH hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 2.0.2 alone or in any derivative version, provided, however, that JDH's License Agreement and JDH's notice of copyright, i.e., "Copyright (c) 2002-2009 John D. Hunter; All Rights Reserved" are retained in matplotlib 2.0.2 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 2.0.2 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 2.0.2.

4. JDH is making matplotlib 2.0.2 available to Licensee on an "AS IS" basis. JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 2.0.2 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 2.0.2 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 2.0.2, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between JDH and Licensee. This License Agreement does not grant permission to use JDH trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 2.0.2, Licensee agrees to be bound by the terms and conditions of this License Agreement.

TWELVE

CREDITS

Matplotlib was written by John D. Hunter, with contributions from an ever-increasing number of users and developers. The current co-lead developers are Michael Droettboom and Thomas A. Caswell; they are assisted by many active developers.

The following is a list of contributors extracted from the git revision control history of the project:

4over7, Aaron Boushley, Acanthostega, Adam Ginsburg, Adam Heck, Adam Ortiz, Adrian Price-Whelan, Adrien F. Vincent, Ahmet Bakan, Alan Du, Alejandro Dubrovsky, Alex C. Szatmary, Alex Loew, Alexander Taylor, Alexei Colin, Ali Mehdi, Alistair Muldal, Allan Haldane, Amit Aronovitch, Amy, AmyTeegarden, Andrea Bedini, Andreas Hilboll, Andreas Wallner, Andrew Dawson, Andrew Merrill, Andrew Straw, Andy Zhu, Anton Akhmerov, Antony Lee, Arie, Ariel Hernán Curiale, Arnaud Gardelein, Arpad Horvath, Aseem Bansal, Behram Mistree, Ben Cohen, Ben Gamari, Ben Keller, Ben Root, Benjamin Reedlunn, Binglin Chang, Bradley M. Froehle, Brandon Liu, Brett Cannon, Brett Graham, Brian Mattern, Brian McLaughlin, Bruno Beltran, CJ Carey, Cameron Bates, Cameron Davidson-Pilon, Carissa Brittain, Carl Michal, Carwyn Pelley, Casey Webster, Casper van der Wel, Charles Moad, Chris Beaumont, Chris G, Christian Brueffer, Christian Stade-Schuldt, Christoph Dann, Christoph Gohlke, Christoph Hoffmann, Cimarron Mittelsteadt, Corey Farwell, Craig M, Craig Tenney, Damon McDougall, Dan Hickstein, Daniel Hyams, Daniel O'Connor, Dara Adib, Darren Dale, David Anderson, David Haberthür, David Huard, David Kaplan, David Kua, David Trémouilles, Dean Malmgren, Dmitry Lupyan, DonaldSeo, Dora Fraeman, Duncan Macleod, Edin Salkovic, Elena Glassman, Elias Pipping, Elliott Sales de Andrade, Emil Mikulic, Eric Dill, Eric Firing, Eric Ma, Eric O. LEBIGOT (EOL), Erik Bray, Eugen Beck, Eugene Yurtsev, Evan Davey, Ezra Peisach, Fabien Maussion, Fabio Zanini, Federico Ariza, Felipe, Fernando Perez, Filipe Fernandes, Florian Rhiem, Francesco Montesano, Francis Colas, François Magimel, Gaute Hope, Gellule Xg, Geoffroy Billotey, Gerald Storer, Giovanni, Graham Poulter, Gregory Ashton, Gregory R. Some earlier contributors not included above are (with apologies to any we have missed):

Charles Twardy, Gary Ruben, John Gill, David Moore, Paul Barrett, Jared Wahlstrand, Jim Benson, Paul Mcguire, Andrew Dalke, Nadia Dencheva, Baptiste Carvello, Sigve Tjoraand, Ted Drain, James Amundson, Daishi Harada, Nicolas Young, Paul Kienzle, John Porter, and Jonathon Taylor.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib's development and usefulness.

Part II

The Matplotlib API

CHAPTER

THIRTEEN

PLOTTING COMMANDS SUMMARY

`matplotlib.pyplot.`**`plotting`**`()`

Function	Description
acorr	Plot the autocorrelation of `x`.
angle_spectrum	Plot the angle spectrum.
annotate	Annotate the point `xy` with text `s`.
arrow	Add an arrow to the axes.
autoscale	Autoscale the axis view to the data (toggle).
axes	Add an axes to the figure.
axhline	Add a horizontal line across the axis.
axhspan	Add a horizontal span (rectangle) across the axis.
axis	Convenience method to get or set axis properties.
axvline	Add a vertical line across the axes.
axvspan	Add a vertical span (rectangle) across the axes.
bar	Make a bar plot.
barbs	Plot a 2-D field of barbs.
barh	Make a horizontal bar plot.
box	Turn the axes box on or off.
boxplot	Make a box and whisker plot.
broken_barh	Plot horizontal bars.
cla	Clear the current axes.
clabel	Label a contour plot.
clf	Clear the current figure.
clim	Set the color limits of the current image.
close	Close a figure window.
cohere	Plot the coherence between x and y.
colorbar	Add a colorbar to a plot.
contour	Plot contours.
contourf	Plot contours.
csd	Plot the cross-spectral density.
delaxes	Remove an axes from the current figure.
draw	Redraw the current figure.
errorbar	Plot an errorbar graph.

Table 13.1 – continue

Function	Description
eventplot	Plot identical parallel lines at specific positions.
figimage	Adds a non-resampled image to the figure.
figlegend	Place a legend in the figure.
fignum_exists	
figtext	Add text to figure.
figure	Creates a new figure.
fill	Plot filled polygons.
fill_between	Make filled polygons between two curves.
fill_betweenx	Make filled polygons between two horizontal curves.
findobj	Find artist objects.
gca	Get the current *Axes* instance on the current figure matching the given keyword args,
gcf	Get a reference to the current figure.
gci	Get the current colorable artist.
get_figlabels	Return a list of existing figure labels.
get_fignums	Return a list of existing figure numbers.
grid	Turn the axes grids on or off.
hexbin	Make a hexagonal binning plot.
hist	Plot a histogram.
hist2d	Make a 2D histogram plot.
hlines	Plot horizontal lines at each `y` from `xmin` to `xmax`.
hold	
imread	Read an image from a file into an array.
imsave	Save an array as in image file.
imshow	Display an image on the axes.
install_repl_displayhook	Install a repl display hook so that any stale figure are automatically redrawn when co
ioff	Turn interactive mode off.
ion	Turn interactive mode on.
ishold	
isinteractive	Return status of interactive mode.
legend	Places a legend on the axes.
locator_params	Control behavior of tick locators.
loglog	Make a plot with log scaling on both the x and y axis.
magnitude_spectrum	Plot the magnitude spectrum.
margins	Set or retrieve autoscaling margins.
matshow	Display an array as a matrix in a new figure window.
minorticks_off	Remove minor ticks from the current plot.
minorticks_on	Display minor ticks on the current plot.
over	
pause	Pause for *interval* seconds.
pcolor	Create a pseudocolor plot of a 2-D array.
pcolormesh	Plot a quadrilateral mesh.
phase_spectrum	Plot the phase spectrum.
pie	Plot a pie chart.

Table 13.1 – continue

Function	Description
plot	Plot lines and/or markers to the Axes.
plot_date	A plot with data that contains dates.
plotfile	Plot the data in in a file.
polar	Make a polar plot.
psd	Plot the power spectral density.
quiver	Plot a 2-D field of arrows.
quiverkey	Add a key to a quiver plot.
rc	Set the current rc params.
rc_context	Return a context manager for managing rc settings.
rcdefaults	Restore the rc params from Matplotlib's internal defaults.
rgrids	Get or set the radial gridlines on a polar plot.
savefig	Save the current figure.
sca	Set the current Axes instance to *ax*.
scatter	Make a scatter plot of `x` vs `y` Marker size is scaled by `s` and marker color is mapped t
sci	Set the current image.
semilogx	Make a plot with log scaling on the *x* axis.
semilogy	Make a plot with log scaling on the y axis.
set_cmap	Set the default colormap.
setp	Set a property on an artist object.
show	Display a figure.
specgram	Plot a spectrogram.
spy	Plot the sparsity pattern on a 2-D array.
stackplot	Draws a stacked area plot.
stem	Create a stem plot.
step	Make a step plot.
streamplot	Draws streamlines of a vector flow.
subplot	Return a subplot axes positioned by the given grid definition.
subplot2grid	Create a subplot in a grid.
subplot_tool	Launch a subplot tool window for a figure.
subplots	Create a figure and a set of subplots This utility wrapper makes it convenient to create
subplots_adjust	Tune the subplot layout.
suptitle	Add a centered title to the figure.
switch_backend	Switch the default backend.
table	Add a table to the current axes.
text	Add text to the axes.
thetagrids	Get or set the theta locations of the gridlines in a polar plot.
tick_params	Change the appearance of ticks and tick labels.
ticklabel_format	Change the ScalarFormatter used by default for linear axes.
tight_layout	Automatically adjust subplot parameters to give specified padding.
title	Set a title of the current axes.
tricontour	Draw contours on an unstructured triangular grid.
tricontourf	Draw contours on an unstructured triangular grid.
tripcolor	Create a pseudocolor plot of an unstructured triangular grid.

Table 13.1 – continue

Function	Description
triplot	Draw a unstructured triangular grid as lines and/or markers.
twinx	Make a second axes that shares the x-axis.
twiny	Make a second axes that shares the y-axis.
uninstall_repl_displayhook	Uninstalls the matplotlib display hook.
violinplot	Make a violin plot.
vlines	Plot vertical lines.
xcorr	Plot the cross correlation between x and y.
xkcd	Turns on xkcd sketch-style drawing mode.
xlabel	Set the x axis label of the current axis.
xlim	Get or set the x limits of the current axes.
xscale	Set the scaling of the x-axis.
xticks	Get or set the x-limits of the current tick locations and labels.
ylabel	Set the y axis label of the current axis.
ylim	Get or set the y-limits of the current axes.
yscale	Set the scaling of the y-axis.
yticks	Get or set the y-limits of the current tick locations and labels.

`matplotlib.pyplot.colormaps()`

Matplotlib provides a number of colormaps, and others can be added using *register_cmap()*. This function documents the built-in colormaps, and will also return a list of all registered colormaps if called.

You can set the colormap for an image, pcolor, scatter, etc, using a keyword argument:

```
imshow(X, cmap=cm.hot)
```

or using the *set_cmap()* function:

```
imshow(X)
pyplot.set_cmap('hot')
pyplot.set_cmap('jet')
```

In interactive mode, *set_cmap()* will update the colormap post-hoc, allowing you to see which one works best for your data.

All built-in colormaps can be reversed by appending `_r`: For instance, `gray_r` is the reverse of `gray`.

There are several common color schemes used in visualization:

Sequential schemes for unipolar data that progresses from low to high

Diverging schemes for bipolar data that emphasizes positive or negative deviations from a central value

Cyclic schemes meant for plotting values that wrap around at the endpoints, such as phase angle, wind direction, or time of day

Qualitative schemes for nominal data that has no inherent ordering, where color is used only to distinguish categories

The base colormaps are derived from those of the same name provided with Matlab:

Colormap	Description
autumn	sequential linearly-increasing shades of red-orange-yellow
bone	sequential increasing black-white color map with a tinge of blue, to emulate X-ray film
cool	linearly-decreasing shades of cyan-magenta
copper	sequential increasing shades of black-copper
flag	repetitive red-white-blue-black pattern (not cyclic at endpoints)
gray	sequential linearly-increasing black-to-white grayscale
hot	sequential black-red-yellow-white, to emulate blackbody radiation from an object at increasing temperatures
hsv	cyclic red-yellow-green-cyan-blue-magenta-red, formed by changing the hue component in the HSV color space
inferno	perceptually uniform shades of black-red-yellow
jet	a spectral map with dark endpoints, blue-cyan-yellow-red; based on a fluid-jet simulation by NCSA[1]
magma	perceptually uniform shades of black-red-white
pink	sequential increasing pastel black-pink-white, meant for sepia tone colorization of photographs
plasma	perceptually uniform shades of blue-red-yellow
prism	repetitive red-yellow-green-blue-purple-...-green pattern (not cyclic at endpoints)
spring	linearly-increasing shades of magenta-yellow
summer	sequential linearly-increasing shades of green-yellow
viridis	perceptually uniform shades of blue-green-yellow
winter	linearly-increasing shades of blue-green

For the above list only, you can also set the colormap using the corresponding pylab shortcut interface function, similar to Matlab:

```
imshow(X)
hot()
jet()
```

The next set of palettes are from the Yorick scientific visualisation package, an evolution of the GIST package, both by David H. Munro:

---

[1] Rainbow colormaps, `jet` in particular, are considered a poor choice for scientific visualization by many researchers: Rainbow Color Map (Still) Considered Harmful

Colormap	Description
gist_earth	mapmaker’s colors from dark blue deep ocean to green lowlands to brown highlands to white mountains
gist_heat	sequential increasing black-red-orange-white, to emulate blackbody radiation from an iron bar as it grows hotter
gist_ncar	pseudo-spectral black-blue-green-yellow-red-purple-white colormap from National Center for Atmospheric Research[2]
gist_rainbow	runs through the colors in spectral order from red to violet at full saturation (like *hsv* but not cyclic)
gist_stern	“Stern special” color table from Interactive Data Language software

The following colormaps are based on the ColorBrewer color specifications and designs developed by Cynthia Brewer:

ColorBrewer Diverging (luminance is highest at the midpoint, and decreases towards differently-colored endpoints):

Colormap	Description
BrBG	brown, white, blue-green
PiYG	pink, white, yellow-green
PRGn	purple, white, green
PuOr	orange, white, purple
RdBu	red, white, blue
RdGy	red, white, gray
RdYlBu	red, yellow, blue
RdYlGn	red, yellow, green
Spectral	red, orange, yellow, green, blue

ColorBrewer Sequential (luminance decreases monotonically):

---

[2] Resembles “BkBlAqGrYeOrReViWh200” from NCAR Command Language. See Color Table Gallery

Colormap	Description
Blues	white to dark blue
BuGn	white, light blue, dark green
BuPu	white, light blue, dark purple
GnBu	white, light green, dark blue
Greens	white to dark green
Greys	white to black (not linear)
Oranges	white, orange, dark brown
OrRd	white, orange, dark red
PuBu	white, light purple, dark blue
PuBuGn	white, light purple, dark green
PuRd	white, light purple, dark red
Purples	white to dark purple
RdPu	white, pink, dark purple
Reds	white to dark red
YlGn	light yellow, dark green
YlGnBu	light yellow, light green, dark blue
YlOrBr	light yellow, orange, dark brown
YlOrRd	light yellow, orange, dark red

ColorBrewer Qualitative:

(For plotting nominal data, `ListedColormap` is used, not `LinearSegmentedColormap`. Different sets of colors are recommended for different numbers of categories.)

- Accent
- Dark2
- Paired
- Pastel1
- Pastel2
- Set1
- Set2
- Set3

Other miscellaneous schemes:

Colormap	Description
afmhot	sequential black-orange-yellow-white blackbody spectrum, commonly used in atomic force microscopy
brg	blue-red-green
bwr	diverging blue-white-red
coolwarm	diverging blue-gray-red, meant to avoid issues with 3D shading, color blindness, and ordering of colors[3]
CMRmap	"Default colormaps on color images often reproduce to confusing grayscale images. The proposed colormap maintains an aesthetically pleasing color image that automatically reproduces to a monotonic grayscale with discrete, quantifiable saturation levels."[4]
cubehelix	Unlike most other color schemes cubehelix was designed by D.A. Green to be monotonically increasing in terms of perceived brightness. Also, when printed on a black and white postscript printer, the scheme results in a greyscale with monotonically increasing brightness. This color scheme is named cubehelix because the r,g,b values produced can be visualised as a squashed helix around the diagonal in the r,g,b color cube.
gnuplot	gnuplot's traditional pm3d scheme (black-blue-red-yellow)
gnuplot2	sequential color printable as gray (black-blue-violet-yellow-white)
ocean	green-blue-white
rainbow	spectral purple-blue-green-yellow-orange-red colormap with diverging luminance
seismic	diverging blue-white-red
nipy_spectral	black-purple-blue-green-yellow-red-white spectrum, originally from the Neuroimaging in Python project
terrain	mapmaker's colors, blue-green-yellow-brown-white, originally from IGOR Pro

The following colormaps are redundant and may be removed in future versions. It's recommended to use the names in the descriptions instead, which produce identical output:

Colormap	Description
gist_gray	identical to *gray*
gist_yarg	identical to *gray_r*
binary	identical to *gray_r*
spectral	identical to *nipy_spectral*[5]

---

[3] See Diverging Color Maps for Scientific Visualization by Kenneth Moreland.

[4] See A Color Map for Effective Black-and-White Rendering of Color-Scale Images by Carey Rappaport

[5] Changed to distinguish from ColorBrewer's *Spectral* map. `spectral()` still works, but `set_cmap('nipy_spectral')` is recommended for clarity.

CHAPTER

FOURTEEN

API CHANGES

Log of changes to Matplotlib that affect the outward-facing API. If updating Matplotlib breaks your scripts, this list may help you figure out what caused the breakage and how to fix it by updating your code.

For new features that were added to Matplotlib, please see *What's new in matplotlib*.

14.1 API Changes in 2.0.1

14.1.1 Extensions to `matplotlib.backend_bases.GraphicsContextBase`

To better support controlling the color of hatches, the method *`matplotlib.backend_bases.GraphicsContextBase.set_hatch_color`* was added to the expected API of `GraphicsContext` classes. Calls to this method are currently wrapped with a `try:...except Attribute:` block to preserve back-compatibility with any third-party backends which do not extend *`GraphicsContextBase`*.

This value can be accessed in the backends via *`matplotlib.backend_bases.GraphicsContextBase.get_hatch_color`* (which was added in 2.0 see *Extension to matplotlib.backend_bases.GraphicsContextBase*) and should be used to color the hatches.

In the future there may also be `hatch_linewidth` and `hatch_density` related methods added. It is encouraged, but not required that third-party backends extend *`GraphicsContextBase`* to make adapting to these changes easier.

14.1.2 `afm.get_fontconfig_fonts` returns a list of paths and does not check for existence

`afm.get_fontconfig_fonts` used to return a set of paths encoded as a `{key:  1, ...}` dict, and checked for the existence of the paths. It now returns a list and dropped the existence check, as the same check is performed by the caller (`afm.findSystemFonts`) as well.

14.1.3 bar now returns rectangles of negative height or width if the corresponding input is negative

`plt.bar` used to normalize the coordinates of the rectangles that it created, to keep their height and width positives, even if the corresponding input was negative. This normalization has been removed to permit a simpler computation of the correct `sticky_edges` to use.

14.1.4 Do not clip line width when scaling dashes

The algorithm to scale dashes was changed to no longer clip the scaling factor: the dash patterns now continue to shrink at thin line widths. If the line width is smaller than the effective pixel size, this may result in dashed lines turning into solid gray-ish lines. This also required slightly tweaking the default patterns for ‘–‘, ‘:’, and ‘.-‘ so that with the default line width the final patterns would not change.

There is no way to restore the old behavior.

14.1.5 Deprecate ‘Vega’ color maps

The “Vega” colormaps are deprecated in Matplotlib 2.0.1 and will be removed in Matplotlib 2.2. Use the “tab” colormaps instead: “tab10”, “tab20”, “tab20b”, “tab20c”.

14.2 API Changes in 2.0.0

14.2.1 Deprecation and removal

Color of Axes

The `axisbg` and `axis_bgcolor` properties on `Axes` have been deprecated in favor of `facecolor`.

GTK and GDK backends deprecated

The GDK and GTK backends have been deprecated. These obsolete backends allow figures to be rendered via the GDK API to files and GTK2 figures. They are untested and known to be broken, and their use has been discouraged for some time. Instead, use the `GTKAgg` and `GTKCairo` backends for rendering to GTK2 windows.

WX backend deprecated

The WX backend has been deprecated. It is untested, and its use has been discouraged for some time. Instead, use the `WXAgg` backend for rendering figures to WX windows.

CocoaAgg backend removed

The deprecated and not fully functional CocoaAgg backend has been removed.

`round` removed from TkAgg Backend

The TkAgg backend had its own implementation of the `round` function. This was unused internally and has been removed. Instead, use either the `round` builtin function or `numpy.round`.

'hold' functionality deprecated

The 'hold' keyword argument and all functions and methods related to it are deprecated, along with the 'axes.hold' `rcParams` entry. The behavior will remain consistent with the default `hold=True` state that has long been in place. Instead of using a function or keyword argument (`hold=False`) to change that behavior, explicitly clear the axes or figure as needed prior to subsequent plotting commands.

14.2.2 `Artist.update` has return value

The methods *`matplotlib.artist.Artist.set`*, `matplotlib.Artist.update`, and the function *`matplotlib.artist.setp`* now use a common codepath to look up how to update the given artist properties (either using the setter methods or an attribute/property).

The behavior of `matplotlib.Artist.update` is slightly changed to return a list of the values returned from the setter methods to avoid changing the API of `matplotlib.Artist.set` and *`matplotlib.artist.setp`*.

The keys passed into `matplotlib.Artist.update` are now converted to lower case before being processed, to match the behavior of `matplotlib.Artist.set` and *`matplotlib.artist.setp`*. This should not break any user code because there are no set methods with capitals in their names, but this puts a constraint on naming properties in the future.

14.2.3 Legend initializers gain edgecolor and facecolor kwargs

The *`Legend`* background patch (or 'frame') can have its `edgecolor` and `facecolor` determined by the corresponding keyword arguments to the *`matplotlib.legend.Legend`* initializer, or to any of the methods or functions that call that initializer. If left to their default values of `None`, their values will be taken from `matplotlib.rcParams`. The previously-existing `framealpha` kwarg still controls the alpha transparency of the patch.

14.2.4 Qualitative colormaps

Colorbrewer's qualitative/discrete colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") are now implemented as `ListedColormap` instead of `LinearSegmentedColormap`.

To use these for images where categories are specified as integers, for instance, use:

```
plt.imshow(x, cmap='Dark2', norm=colors.NoNorm())
```

14.2.5 Change in the `draw_image` backend API

The `draw_image` method implemented by backends has changed its interface.

This change is only relevant if the backend declares that it is able to transform images by returning `True` from `option_scale_image`. See the `draw_image` docstring for more information.

14.2.6 `matplotlib.ticker.LinearLocator` algorithm update

The `matplotlib.ticker.LinearLocator` is used to define the range and location of axis ticks when the user wants an exact number of ticks. `LinearLocator` thus differs from the default locator `MaxNLocator`, for which the user specifies a maximum number of intervals rather than a precise number of ticks.

The view range algorithm in `matplotlib.ticker.LinearLocator` has been changed so that more convenient tick locations are chosen. The new algorithm returns a plot view range that is a multiple of the user-requested number of ticks. This ensures tick marks will be located at whole integers more consistently. For example, when both y-axes of a``twinx`` plot use `matplotlib.ticker.LinearLocator` with the same number of ticks, their y-tick locations and grid lines will coincide.

14.2.7 `matplotlib.ticker.LogLocator` gains numticks kwarg

The maximum number of ticks generated by the *`LogLocator`* can now be controlled explicitly via setting the new 'numticks' kwarg to an integer. By default the kwarg is None which internally sets it to the 'auto' string, triggering a new algorithm for adjusting the maximum according to the axis length relative to the ticklabel font size.

14.2.8 `matplotlib.ticker.LogFormatter`: two new kwargs

Previously, minor ticks on log-scaled axes were not labeled by default. An algorithm has been added to the *`LogFormatter`* to control the labeling of ticks between integer powers of the base. The algorithm uses two parameters supplied in a kwarg tuple named 'minor_thresholds'. See the docstring for further explanation.

To improve support for axes using `SymmetricLogLocator`, a 'linthresh' kwarg was added.

14.2.9 New defaults for 3D quiver function in mpl_toolkits.mplot3d.axes3d.py

Matplotlib has both a 2D and a 3D `quiver` function. These changes affect only the 3D function and make the default behavior of the 3D function match the 2D version. There are two changes:

1. The 3D quiver function previously normalized the arrows to be the same length, which makes it unusable for situations where the arrows should be different lengths and does not match the behavior of the 2D function. This normalization behavior is now controlled with the `normalize` keyword, which defaults to False.
2. The `pivot` keyword now defaults to `tail` instead of `tip`. This was done in order to match the default behavior of the 2D quiver function.

To obtain the previous behavior with the 3D quiver function, one can call the function with

```
ax.quiver(x, y, z, u, v, w, normalize=True, pivot='tip')
```

where “ax” is an `Axes3d` object created with something like

```
import mpl_toolkits.mplot3d.axes3d
ax = plt.sublot(111, projection='3d')
```

14.2.10 Stale figure behavior

Attempting to draw the figure will now mark it as not stale (independent if the draw succeeds). This change is to prevent repeatedly trying to re-draw a figure which is raising an error on draw. The previous behavior would only mark a figure as not stale after a full re-draw succeeded.

14.2.11 The spectral colormap is now nipy_spectral

The colormaps formerly known as `spectral` and `spectral_r` have been replaced by `nipy_spectral` and `nipy_spectral_r` since Matplotlib 1.3.0. Even though the colormap was deprecated in Matplotlib 1.3.0, it never raised a warning. As of Matplotlib 2.0.0, using the old names raises a deprecation warning. In the future, using the old names will raise an error.

14.2.12 Default install no longer includes test images

To reduce the size of wheels and source installs, the tests and baseline images are no longer included by default.

To restore installing the tests and images, use a `setup.cfg` with

```
[packages]
tests = True
toolkits_tests = True
```

in the source directory at build/install time.

14.3 Changes in 1.5.3

14.3.1 `ax.plot(..., marker=None)` gives default marker

Prior to 1.5.3 kwargs passed to `plot` were handled in two parts – default kwargs generated internal to `plot` (such as the cycled styles) and user supplied kwargs. The internally generated kwargs were passed to the `matplotlib.lines.Line2D.__init__` and the user kwargs were passed to `ln.set(**kwargs)` to update the artist after it was created. Now both sets of kwargs are merged and passed to `__init__`. This change was made to allow `None` to be passed in via the user kwargs to mean ‘do the default thing’ as is the convention through out mpl rather than raising an exception.

Unlike most *`Line2D`* setter methods *`set_marker`* did accept `None` as a valid input which was mapped to 'no marker'. Thus, by routing this `marker=None` through `__init__` rather than `set(...)` the meaning of `ax.plot(..., marker=None)` changed from 'no markers' to 'default markers from rcparams'.

This is change is only evident if `mpl.rcParams['lines.marker']` has a value other than `'None'` (which is string `'None'` which means 'no marker').

14.4 Changes in 1.5.2

14.4.1 Default Behavior Changes

Changed default `autorange` behavior in boxplots

Prior to v1.5.2, the whiskers of boxplots would extend to the mininum and maximum values if the quartiles were all equal (i.e., Q1 = median = Q3). This behavior has been disabled by default to restore consistency with other plotting packages.

To restore the old behavior, simply set `autorange=True` when calling `plt.boxplot`.

14.5 Changes in 1.5.0

14.5.1 Code Changes

Reversed `matplotlib.cbook.ls_mapper`, added `ls_mapper_r`

Formerly, `matplotlib.cbook.ls_mapper` was a dictionary with the long-form line-style names (`"solid"`) as keys and the short forms (`"-"`) as values. This long-to-short mapping is now done by `ls_mapper_r`, and the short-to-long mapping is done by the `ls_mapper`.

Prevent moving artists between Axes, Property-ify Artist.axes, deprecate Artist.{get,set}_axes

This was done to prevent an Artist that is already associated with an Axes from being moved/added to a different Axes. This was never supported as it causes havoc with the transform stack. The apparent support for this (as it did not raise an exception) was the source of multiple bug reports and questions on SO.

For almost all use-cases, the assignment of the axes to an artist should be taken care of by the axes as part of the `Axes.add_*` method, hence the deprecation of {get,set}_axes.

Removing the `set_axes` method will also remove the 'axes' line from the ACCEPTS kwarg tables (assuming that the removal date gets here before that gets overhauled).

Tightened input validation on 'pivot' kwarg to quiver

Tightened validation so that only {'tip', 'tail', 'mid', and 'middle'} (but any capitalization) are valid values for the 'pivot' kwarg in the `Quiver.__init__` (and hence `Axes.quiver` and `plt.quiver` which both fully delegate to `Quiver`). Previously any input matching 'mid.*' would be interpreted as 'middle', 'tip.*' as 'tip' and any string not matching one of those patterns as 'tail'.

The value of `Quiver.pivot` is normalized to be in the set {'tip', 'tail', 'middle'} in `Quiver.__init__`.

Reordered `Axes.get_children`

The artist order returned by `Axes.get_children` did not match the one used by `Axes.draw`. They now use the same order, as `Axes.draw` now calls `Axes.get_children`.

Changed behaviour of contour plots

The default behaviour of *`contour()`* and *`contourf()`* when using a masked array is now determined by the new keyword argument `corner_mask`, or if this is not specified then the new rcParam `contour.corner_mask` instead. The new default behaviour is equivalent to using `corner_mask=True`; the previous behaviour can be obtained using `corner_mask=False` or by changing the rcParam. The example http://matplotlib.org/examples/pylab_examples/contour_corner_mask.html demonstrates the difference. Use of the old contouring algorithm, which is obtained with `corner_mask='legacy'`, is now deprecated.

Contour labels may now appear in different places than in earlier versions of Matplotlib.

In addition, the keyword argument `nchunk` now applies to *`contour()`* as well as *`contourf()`*, and it subdivides the domain into subdomains of exactly `nchunk` by `nchunk` quads, whereas previously it was only roughly `nchunk` by `nchunk` quads.

The C/C++ object that performs contour calculations used to be stored in the public attribute QuadContourSet.Cntr, but is now stored in a private attribute and should not be accessed by end users.

Added set_params function to all Locator types

This was a bug fix targeted at making the api for Locators more consistent.

In the old behavior, only locators of type MaxNLocator have set_params() defined, causing its use on any other Locator to raise an AttributeError *(aside: set_params(args) is a function that sets the parameters of a Locator instance to be as specified within args)*. The fix involves moving set_params() to the Locator class such that all subtypes will have this function defined.

Since each of the Locator subtypes have their own modifiable parameters, a universal set_params() in Locator isn't ideal. Instead, a default no-operation function that raises a warning is implemented in Locator. Subtypes extending Locator will then override with their own implementations. Subtypes that do not have a need for set_params() will fall back onto their parent's implementation, which raises a warning as intended.

In the new behavior, Locator instances will not raise an AttributeError when set_params() is called. For Locators that do not implement set_params(), the default implementation in Locator is used.

Disallow `None` as x or y value in ax.plot

Do not allow `None` as a valid input for the `x` or `y` args in `ax.plot`. This may break some user code, but this was never officially supported (ex documented) and allowing `None` objects through can lead to confusing exceptions downstream.

To create an empty line use

```
ln1, = ax.plot([], [], ...)
ln2, = ax.plot([], ...)
```

In either case to update the data in the `Line2D` object you must update both the `x` and `y` data.

Removed `args` and `kwargs` from `MicrosecondLocator.__call__`

The call signature of `__call__()` has changed from `__call__(self, *args, **kwargs)` to `__call__(self)`. This is consistent with the superclass *`Locator`* and also all the other Locators derived from this superclass.

No `ValueError` for the MicrosecondLocator and YearLocator

The *`MicrosecondLocator`* and *`YearLocator`* objects when called will return an empty list if the axes have no data or the view has no interval. Previously, they raised a `ValueError`. This is consistent with all the Date Locators.

'OffsetBox.DrawingArea' respects the 'clip' keyword argument

The call signature was `OffsetBox.DrawingArea(..., clip=True)` but nothing was done with the `clip` argument. The object did not do any clipping regardless of that parameter. Now the object can and does clip the child `Artists` if they are set to be clipped.

You can turn off the clipping on a per-child basis using `child.set_clip_on(False)`.

Add salt to clipPath id

Add salt to the hash used to determine the id of the `clipPath` nodes. This is to avoid conflicts when two svg documents with the same clip path are included in the same document (see https://github.com/ipython/ipython/issues/8133 and https://github.com/matplotlib/matplotlib/issues/4349), however this means that the svg output is no longer deterministic if the same figure is saved twice. It is not expected that this will affect any users as the current ids are generated from an md5 hash of properties of the clip path and any user would have a very difficult time anticipating the value of the id.

Changed snap threshold for circle markers to inf

When drawing circle markers above some marker size (previously 6.0) the path used to generate the marker was snapped to pixel centers. However, this ends up distorting the marker away from a circle. By setting the snap threshold to inf snapping is never done on circles.

This change broke several tests, but is an improvement.

Preserve units with Text position

Previously the ‘get_position’ method on Text would strip away unit information even though the units were still present. There was no inherent need to do this, so it has been changed so that unit data (if present) will be preserved. Essentially a call to ‘get_position’ will return the exact value from a call to ‘set_position’.

If you wish to get the old behaviour, then you can use the new method called ‘get_unitless_position’.

New API for custom Axes view changes

Interactive pan and zoom were previously implemented using a Cartesian-specific algorithm that was not necessarily applicable to custom Axes. Three new private methods, `_get_view()`, `_set_view()`, and `_set_view_from_bbox()`, allow for custom `Axes` classes to override the pan and zoom algorithms. Implementors of custom `Axes` who override these methods may provide suitable behaviour for both pan and zoom as well as the view navigation buttons on the interactive toolbars.

14.5.2 MathTex visual changes

The spacing commands in mathtext have been changed to more closely match vanilla TeX.

Improved spacing in mathtext

The extra space that appeared after subscripts and superscripts has been removed.

No annotation coordinates wrap

In #2351 for 1.4.0 the behavior of [’axes points’, ‘axes pixel’, ‘figure points’, ‘figure pixel’] as coordinates was change to no longer wrap for negative values. In 1.4.3 this change was reverted for ‘axes points’ and ‘axes pixel’ and in addition caused ‘axes fraction’ to wrap. For 1.5 the behavior has been reverted to as it was in 1.4.0-1.4.2, no wrapping for any type of coordinate.

14.5.3 Deprecation

Deprecated `GraphicsContextBase.set_graylevel`

The `GraphicsContextBase.set_graylevel` function has been deprecated in 1.5 and will be removed in 1.6. It has been unused. The `GraphicsContextBase.set_foreground` could be used instead.

deprecated idle_event

The `idle_event` was broken or missing in most backends and causes spurious warnings in some cases, and its use in creating animations is now obsolete due to the animations module. Therefore code involving it has been removed from all but the wx backend (where it partially works), and its use is deprecated. The animations module may be used instead to create animations.

`color_cycle` deprecated

In light of the new property cycling feature, the Axes method *set_color_cycle* is now deprecated. Calling this method will replace the current property cycle with one that cycles just the given colors.

Similarly, the rc parameter *axes.color_cycle* is also deprecated in lieu of the new *axes.prop_cycle* parameter. Having both parameters in the same rc file is not recommended as the result cannot be predicted. For compatibility, setting *axes.color_cycle* will replace the cycler in *axes.prop_cycle* with a color cycle. Accessing *axes.color_cycle* will return just the color portion of the property cycle, if it exists.

Timeline for removal has not been set.

14.5.4 Bundled jquery

The version of jquery bundled with the webagg backend has been upgraded from 1.7.1 to 1.11.3. If you are using the version of jquery bundled with webagg you will need to update your html files as such

```
-    <script src="_static/jquery/js/jquery-1.7.1.min.js"></script>
+    <script src="_static/jquery/js/jquery-1.11.3.min.js"></script>
```

14.5.5 Code Removed

Removed `Image` from main namespace

`Image` was imported from PIL/pillow to test if PIL is available, but there is no reason to keep `Image` in the namespace once the availability has been determined.

Removed `lod` from Artist

Removed the method *set_lod* and all references to the attribute *_lod* as the are not used anywhere else in the code base. It appears to be a feature stub that was never built out.

Removed threading related classes from cbook

The classes `Scheduler`, `Timeout`, and `Idle` were in cbook, but are not used internally. They appear to be a prototype for the idle event system which was not working and has recently been pulled out.

Removed `Lena` images from sample_data

The `lena.png` and `lena.jpg` images have been removed from Matplotlib's sample_data directory. The images are also no longer available from *`matplotlib.cbook.get_sample_data`*. We suggest using `matplotlib.cbook.get_sample_data('grace_hopper.png')` or `matplotlib.cbook.get_sample_data('grace_hopper.jpg')` instead.

Legend

Removed handling of `loc` as a positional argument to `Legend`

Legend handlers

Remove code to allow legend handlers to be callable. They must now implement a method `legend_artist`.

Axis

Removed method `set_scale`. This is now handled via a private method which should not be used directly by users. It is called via `Axes.set_{x,y}scale` which takes care of ensuring the related changes are also made to the Axes object.

finance.py

Removed functions with ambiguous argument order from finance.py

Annotation

Removed `textcoords` and `xytext` proprieties from Annotation objects.

spinxext.ipython_*.py

Both `ipython_console_highlighting` and `ipython_directive` have been moved to `IPython`.

Change your import from 'matplotlib.sphinxext.ipython_directive' to 'IPython.sphinxext.ipython_directive' and from 'matplotlib.sphinxext.ipython_directive' to 'IPython.sphinxext.ipython_directive'

LineCollection.color

Deprecated in 2005, use `set_color`

remove `'faceted'` as a valid value for shading in `tri.tripcolor`

Use `edgecolor` instead. Added validation on `shading` to only be valid values.

Remove `faceted` kwarg from scatter

Remove support for the `faceted` kwarg. This was deprecated in d48b34288e9651ff95c3b8a071ef5ac5cf50bae7 (2008-04-18!) and replaced by `edgecolor`.

Remove `set_colorbar` method from `ScalarMappable`

Remove `set_colorbar` method, use `colorbar` attribute directly.

patheffects.svg

- remove `get_proxy_renderer` method from `AbstarctPathEffect` class
- remove `patch_alpha` and `offset_xy` from `SimplePatchShadow`

Remove `testing.image_util.py`

Contained only a no-longer used port of functionality from PIL

Remove `mlab.FIFOBuffer`

Not used internally and not part of core mission of mpl.

Remove `mlab.prepca`

Deprecated in 2009.

Remove `NavigationToolbar2QTAgg`

Added no functionality over the base `NavigationToolbar2Qt`

mpl.py

Remove the module `matplotlib.mpl`. Deprecated in 1.3 by PR #1670 and commit 78ce67d161625833cacff23cfe5d74920248c5b2

14.6 Changes in 1.4.x

14.6.1 Code changes

- A major refactoring of the axes module was made. The axes module has been split into smaller modules:
  - the `_base` module, which contains a new private _AxesBase class. This class contains all methods except plotting and labelling methods.
  - the `axes` module, which contains the Axes class. This class inherits from _AxesBase, and contains all plotting and labelling methods.

  - the `_subplot` module, with all the classes concerning subplotting.

There are a couple of things that do not exists in the `axes` module's namespace anymore. If you use them, you need to import them from their original location:

- math -> `import math`
- ma -> `from numpy import ma`
- cbook -> `from matplotlib import cbook`
- docstring -> `from matplotlib import docstring`
- is_sequence_of_strings -> `from matplotlib.cbook import is_sequence_of_strings`
- is_string_like -> `from matplotlib.cbook import is_string_like`
- iterable -> `from matplotlib.cbook import iterable`
- itertools -> `import itertools`
- martist -> `from matplotlib import artist as martist`
- matplotlib -> `import matplotlib`
- mcoll -> `from matplotlib import collections as mcoll`
- mcolors -> `from matplotlib import colors as mcolors`
- mcontour -> `from matplotlib import contour as mcontour`
- mpatches -> `from matplotlib import patches as mpatches`
- mpath -> `from matplotlib import path as mpath`
- mquiver -> `from matplotlib import quiver as mquiver`
- mstack -> `from matplotlib import stack as mstack`
- mstream -> `from matplotlib import stream as mstream`
- mtable -> `from matplotlib import table as mtable`
- As part of the refactoring to enable Qt5 support, the module `matplotlib.backends.qt4_compat` was renamed to `matplotlib.qt_compat`. `qt4_compat` is deprecated in 1.4 and will be removed in 1.5.
- The `errorbar()` method has been changed such that the upper and lower limits (*lolims*, *uplims*, *xlolims*, *xuplims*) now point in the correct direction.
- The *fmt* kwarg for `plot()` defaults.
- A bug has been fixed in the path effects rendering of fonts, which now means that the font size is consistent with non-path effect fonts. See https://github.com/matplotlib/matplotlib/issues/2889 for more detail.
- The Sphinx extensions `ipython_directive` and `ipython_console_highlighting` have been moved to the IPython project itself. While they remain in Matplotlib for this release, they have been deprecated. Update your extensions in `conf.py` to point to `IPython.sphinxext.ipython_directive` instead of `matplotlib.sphinxext.ipython_directive`.

- In *finance*, almost all functions have been deprecated and replaced with a pair of functions name `*_ochl` and `*_ohlc`. The former is the 'open-close-high-low' order of quotes used previously in this module, and the latter is the 'open-high-low-close' order that is standard in finance.
- For consistency the `face_alpha` keyword to *matplotlib.patheffects.SimplePatchShadow* has been deprecated in favour of the `alpha` keyword. Similarly, the keyword `offset_xy` is now named `offset` across all `_Base`` has been renamed to *matplotlib.patheffects.AbstractPathEffect*. `matplotlib.patheffect.ProxyRenderer` has been renamed to *matplotlib.patheffects.PathEffectRenderer* and is now a full RendererBase subclass.
- The artist used to draw the outline of a `colorbar` has been changed from a *matplotlib.lines.Line2D* to *matplotlib.patches.Polygon*, thus `colorbar.ColorbarBase.outline` is now a *matplotlib.patches.Polygon* object.
- The legend handler interface has changed from a callable, to any object which implements the `legend_artists` method (a deprecation phase will see this interface be maintained for v1.4). See *Legend guide* for further details. Further legend changes include:
  - `matplotlib.axes.Axes._get_legend_handles()` now returns a generator of handles, rather than a list.
  - The *legend()* function's "loc" positional argument has been deprecated. Use the "loc" keyword instead.
- The rcParams `savefig.transparent` has been added to control default transparency when saving figures.
- Slightly refactored the `Annotation` family. The text location in `Annotation` is now handled entirely handled by the underlying `Text` object so `set_position` works as expected. The attributes `xytext` and `textcoords` have been deprecated in favor of `xyann` and `anncoords` so that `Annotation` and `AnnotaionBbox` can share a common sensibly named api for getting/setting the location of the text or box.
  - `xyann` -> set the location of the annotation
  - `xy` -> set where the arrow points to
  - `anncoords` -> set the units of the annotation location
  - `xycoords` -> set the units of the point location
  - `set_position()` -> `Annotation` only set location of annotation
- *matplotlib.mlab.specgram*, *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, *matplotlib.mlab.cohere_pairs*, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere* now raise ValueError where they previously raised AssertionError.
- For *matplotlib.mlab.psd*, *matplotlib.mlab.csd*, *matplotlib.mlab.cohere*, *matplotlib.mlab.cohere_pairs*, *matplotlib.pyplot.specgram*, *matplotlib.pyplot.psd*, *matplotlib.pyplot.csd*, and *matplotlib.pyplot.cohere*, in cases where a shape (n, 1) array is returned, this is now converted to a (n,) array. Previously, (n, m) arrays were averaged to an (n,) array, but (n, 1) arrays were returend unchanged. This change makes the dimensions consistent in both cases.

- Added the rcParam `axes.fromatter.useoffset` to control the default value of `useOffset` in `ticker.ScalarFormatter`
- Added `Formatter` sub-class `StrMethodFormatter` which does the exact same thing as `FormatStrFormatter`, but for new-style formatting strings.
- Deprecated `matplotlib.testing.image_util` and the only function within, `matplotlib.testing.image_util.autocontrast`. These will be removed completely in v1.5.0.
- The `fmt` argument of *`plot_date()`* has been changed from `bo` to just `o`, so color cycling can happen by default.
- Removed the class `FigureManagerQTAgg` and deprecated `NavigationToolbar2QTAgg` which will be removed in 1.5.
- Removed formerly public (non-prefixed) attributes `rect` and `drawRect` from `FigureCanvasQTAgg`; they were always an implementation detail of the (preserved) `drawRectangle()` function.
- The function signatures of `tight_bbox.adjust_bbox` and `tight_bbox.process_figure_for_rasterizing` have been changed. A new `fixed_dpi` parameter allows for overriding the `figure.dpi` setting instead of trying to deduce the intended behaviour from the file format.
- Added support for horizontal/vertical axes padding to `mpl_toolkits.axes_grid1.ImageGrid` — argument `axes_pad` can now be tuple-like if separate axis padding is required. The original behavior is preserved.
- Added support for skewed transforms to *`matplotlib.transforms.Affine2D`*, which can be created using the `skew` and `skew_deg` methods.
- Added clockwise parameter to control sectors direction in `axes.pie`
- In *`matplotlib.lines.Line2D`* the `markevery` functionality has been extended. Previously an integer start-index and stride-length could be specified using either a two-element-list or a two-element-tuple. Now this can only be done using a two-element-tuple. If a two-element-list is used then it will be treated as numpy fancy indexing and only the two markers corresponding to the given indexes will be shown.
- removed prop kwarg from *`mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`* call. It was passed through to the base-class `__init__` and is only used for setting padding. Now `fontproperties` (which is what is really used to set the font properties of `AnchoredSizeBar`) is passed through in place of `prop`. If `fontpropreties` is not passed in, but `prop` is, then `prop` is used inplace of `fontpropreties`. If both are passed in, `prop` is silently ignored.
- The use of the index 0 in `plt.subplot` and related commands is deprecated. Due to a lack of validation calling `plt.subplots(2, 2, 0)` does not raise an exception, but puts an axes in the _last_ position. This is due to the indexing in subplot being 1-based (to mirror MATLAB) so before indexing into the `GridSpec` object used to determine where the axes should go, 1 is subtracted off. Passing in 0 results in passing -1 to `GridSpec` which results in getting the last position back. Even though this behavior is clearly wrong and not intended, we are going through a deprecation cycle in an abundance of caution that any users are exploiting this ‘feature’. The use of 0 as an index will raise a warning in 1.4 and an exception in 1.5.
- Clipping is now off by default on offset boxes.

- Matplotlib now uses a less-aggressive call to `gc.collect(1)` when closing figures to avoid major delays with large numbers of user objects in memory.
- The default clip value of *all* pie artists now defaults to `False`.

14.6.2 Code removal

- Removed `mlab.levypdf`. The code raised a numpy error (and has for a long time) and was not the standard form of the Levy distribution. `scipy.stats.levy` should be used instead

14.7 Changes in 1.3.x

14.7.1 Changes in 1.3.1

It is rare that we make an API change in a bugfix release, however, for 1.3.1 since 1.3.0 the following change was made:

- `text.Text.cached` (used to cache font objects) has been made into a private variable. Among the obvious encapsulation benefit, this removes this confusing-looking member from the documentation.
- The method *`hist()`* now always returns bin occupancies as an array of type `float`. Previously, it was sometimes an array of type `int`, depending on the call.

14.7.2 Code removal

- The following items that were deprecated in version 1.2 or earlier have now been removed completely.
  - The Qt 3.x backends (`qt` and `qtagg`) have been removed in favor of the Qt 4.x backends (`qt4` and `qt4agg`).
  - The FltkAgg and Emf backends have been removed.
  - The `matplotlib.nxutils` module has been removed. Use the functionality on *`matplotlib.path.Path.contains_point`* and friends instead.
  - Instead of `axes.Axes.get_frame`, use `axes.Axes.patch`.
  - The following `kwargs` to the `legend` function have been renamed:
    - `pad` -> `borderpad`
    - `labelsep` -> `labelspacing`
    - `handlelen` -> `handlelength`
    - `handletextsep` -> `handletextpad`
    - `axespad` -> `borderaxespad`

    Related to this, the following rcParams have been removed:

    - `legend.pad`, `legend.labelsep`, `legend.handlelen`, `legend.handletextsep` and `legend.axespad`
  - For the `hist` function, instead of `width`, use `rwidth` (relative width).
  - On `patches.Circle`, the `resolution` kwarg has been removed. For a circle made up of line segments, use `patches.CirclePolygon`.
  - The printing functions in the Wx backend have been removed due to the burden of keeping them up-to-date.
  - `mlab.liaupunov` has been removed.
  - `mlab.save`, `mlab.load`, `pylab.save` and `pylab.load` have been removed. We recommend using `numpy.savetxt` and `numpy.loadtxt` instead.
  - `widgets.HorizontalSpanSelector` has been removed. Use `widgets.SpanSelector` instead.

14.7.3 Code deprecation

- The CocoaAgg backend has been deprecated, with the possibility for deletion or resurrection in a future release.
- The top-level functions in *`matplotlib.path`* that are implemented in C++ were never meant to be public. Instead, users should use the Pythonic wrappers for them in the `path.Path` and `collections.Collection` classes. Use the following mapping to update your code:
  - `point_in_path` -> `path.Path.contains_point`
  - `get_path_extents` -> `path.Path.get_extents`
  - `point_in_path_collection` -> `collection.Collection.contains`
  - `path_in_path` -> `path.Path.contains_path`
  - `path_intersects_path` -> `path.Path.intersects_path`
  - `convert_path_to_polygons` -> `path.Path.to_polygons`
  - `cleanup_path` -> `path.Path.cleaned`
  - `points_in_path` -> `path.Path.contains_points`
  - `clip_path_to_rect` -> `path.Path.clip_to_bbox`
- `matplotlib.colors.normalize` and `matplotlib.colors.no_norm` have been deprecated in favour of *`matplotlib.colors.Normalize`* and *`matplotlib.colors.NoNorm`* respectively.
- The `ScalarMappable` class' `set_colorbar` is now deprecated. Instead, the *`matplotlib.cm.ScalarMappable.colorbar`* attribute should be used. In previous Matplotlib versions this attribute was an undocumented tuple of `(colorbar_instance, colorbar_axes)` but is now just `colorbar_instance`. To get the colorbar axes it is possible to just use the *`ax`* attribute on a colorbar instance.

- The `mpl` module is now deprecated. Those who relied on this module should transition to simply using `import matplotlib as mpl`.

14.7.4 Code changes

- *Patch* now fully supports using RGBA values for its `facecolor` and `edgecolor` attributes, which enables faces and edges to have different alpha values. If the *Patch* object's `alpha` attribute is set to anything other than `None`, that value will override any alpha-channel value in both the face and edge colors. Previously, if *Patch* had `alpha=None`, the alpha component of `edgecolor` would be applied to both the edge and face.
- The optional `isRGB` argument to *set_foreground()* (and the other GraphicsContext classes that descend from it) has been renamed to `isRGBA`, and should now only be set to `True` if the `fg` color argument is known to be an RGBA tuple.
- For *Patch*, the `capstyle` used is now `butt`, to be consistent with the default for most other objects, and to avoid problems with non-solid `linestyle` appearing solid when using a large `linewidth`. Previously, *Patch* used `capstyle='projecting'`.
- `Path` objects can now be marked as `readonly` by passing `readonly=True` to its constructor. The built-in path singletons, obtained through `Path.unit*` class methods return readonly paths. If you have code that modified these, you will need to make a deepcopy first, using either:

```
import copy
path = copy.deepcopy(Path.unit_circle())

# or

path = Path.unit_circle().deepcopy()
```

  Deep copying a `Path` always creates an editable (i.e. non-readonly) `Path`.

- The list at `Path.NUM_VERTICES` was replaced by a dictionary mapping Path codes to the number of expected vertices at *NUM_VERTICES_FOR_CODE*.
- To support XKCD style plots, the `matplotlib.path.cleanup_path()` method's signature was updated to require a sketch argument. Users of `matplotlib.path.cleanup_path()` are encouraged to use the new *cleaned()* Path method.
- Data limits on a plot now start from a state of having "null" limits, rather than limits in the range (0, 1). This has an effect on artists that only control limits in one direction, such as `axvline` and `axhline`, since their limits will not longer also include the range (0, 1). This fixes some problems where the computed limits would be dependent on the order in which artists were added to the axes.
- Fixed a bug in setting the position for the right/top spine with data position type. Previously, it would draw the right or top spine at +1 data offset.
- In *FancyArrow*, the default arrow head width, `head_width`, has been made larger to produce a visible arrow head. The new value of this kwarg is `head_width = 20 * width`.
- It is now possible to provide `number of levels + 1` colors in the case of `extend='both'` for contourf (or just `number of levels` colors for an extend value `min` or `max`) such that the resulting

colormap's `set_under` and `set_over` are defined appropriately. Any other number of colors will continue to behave as before (if more colors are provided than levels, the colors will be unused). A similar change has been applied to contour, where `extend='both'` would expect `number of levels + 2` colors.

- A new keyword *extendrect* in `colorbar()` and `ColorbarBase` allows one to control the shape of colorbar extensions.
- The extension of `MultiCursor` to both vertical (default) and/or horizontal cursor implied that `self.line` is replaced by `self.vline` for vertical cursors lines and `self.hline` is added for the horizontal cursors lines.
- On POSIX platforms, the `report_memory()` function raises `NotImplementedError` instead of `OSError` if the **ps** command cannot be run.
- The `matplotlib.cbook.check_output()` function has been moved to `matplotlib.compat.subprocess()`.

14.7.5 Configuration and rcParams

- On Linux, the user-specific `matplotlibrc` configuration file is now located in `config/matplotlib/matplotlibrc` to conform to the XDG Base Directory Specification.
- The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.
- Removed call of `grid()` in `plotfile()`. To draw the axes grid, set the `axes.grid` rcParam to *True*, or explicitly call `grid()`.

14.8 Changes in 1.2.x

- The `classic` option of the rc parameter `toolbar` is deprecated and will be removed in the next release.
- The `isvector()` method has been removed since it is no longer functional.
- The `rasterization_zorder` property on `Axes` a zorder below which artists are rasterized. This has defaulted to -30000.0, but it now defaults to `None`, meaning no artists will be rasterized. In order to rasterize artists below a given zorder value, `set_rasterization_zorder` must be explicitly called.
- In `scatter()`, and `scatter`, when specifying a marker using a tuple, the angle is now specified in degrees, not radians.
- Using `twinx()` or `twiny()` no longer overrides the current locaters and formatters on the axes.
- In `contourf()`, the handling of the *extend* kwarg has changed. Formerly, the extended ranges were mapped after to 0, 1 after being normed, so that they always corresponded to the extreme values of the colormap. Now they are mapped outside this range so that they correspond to the special colormap values determined by the `set_under()` and `set_over()` methods, which default to the colormap end points.

- The new rc parameter `savefig.format` replaces `cairo.format` and `savefig.extension`, and sets the default file format used by *`matplotlib.figure.Figure.savefig()`*.
- In *`pie()`* and `pie()`, one can now set the radius of the pie; setting the *radius* to 'None' (the default value), will result in a pie with a radius of 1 as before.
- Use of `projection_factory()` is now deprecated in favour of axes class identification using *`process_projection_requirements()`* followed by direct axes class invocation (at the time of writing, functions which do this are: *`add_axes()`*, *`add_subplot()`* and *`gca()`*). Therefore:

```
key = figure._make_key(*args, **kwargs)
ispolar = kwargs.pop('polar', False)
projection = kwargs.pop('projection', None)
if ispolar:
    if projection is not None and projection != 'polar':
        raise ValueError('polar and projection args are inconsistent')
    projection = 'polar'
ax = projection_factory(projection, self, rect, **kwargs)
key = self._make_key(*args, **kwargs)

# is now

projection_class, kwargs, key = \
                   process_projection_requirements(self, *args, **kwargs)
ax = projection_class(self, rect, **kwargs)
```

  This change means that third party objects can expose themselves as Matplotlib axes by providing a `_as_mpl_axes` method. See *Developer's guide for creating scales and transformations* for more detail.

- A new keyword *extendfrac* in *`colorbar()`* and *`ColorbarBase`* allows one to control the size of the triangular minimum and maximum extensions on colorbars.
- A new keyword *capthick* in *`errorbar()`* has been added as an intuitive alias to the *markeredgewidth* and *mew* keyword arguments, which indirectly controlled the thickness of the caps on the errorbars. For backwards compatibility, specifying either of the original keyword arguments will override any value provided by *capthick*.
- Transform subclassing behaviour is now subtly changed. If your transform implements a non-affine transformation, then it should override the `transform_non_affine` method, rather than the generic `transform` method. Previously transforms would define `transform` and then copy the method into `transform_non_affine`:

```
class MyTransform(mtrans.Transform):
    def transform(self, xy):
        ...
    transform_non_affine = transform
```

  This approach will no longer function correctly and should be changed to:

```
class MyTransform(mtrans.Transform):
    def transform_non_affine(self, xy):
        ...
```

- Artists no longer have `x_isdata` or `y_isdata` attributes; instead any artist's transform can be interrogated with `artist_instance.get_transform().contains_branch(ax.transData)`
- Lines added to an axes now take into account their transform when updating the data and view limits. This means transforms can now be used as a pre-transform. For instance:

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.transforms as mtrans
>>> ax = plt.axes()
>>> ax.plot(range(10), transform=mtrans.Affine2D().scale(10) + ax.transData)
>>> print(ax.viewLim)
Bbox('array([[  0.,   0.],\n       [ 90.,  90.]])')
```

- One can now easily get a transform which goes from one transform's coordinate system to another, in an optimized way, using the new subtract method on a transform. For instance, to go from data coordinates to axes coordinates:

```
>>> import matplotlib.pyplot as plt
>>> ax = plt.axes()
>>> data2ax = ax.transData - ax.transAxes
>>> print(ax.transData.depth, ax.transAxes.depth)
3, 1
>>> print(data2ax.depth)
2
```

  for versions before 1.2 this could only be achieved in a sub-optimal way, using `ax.transData + ax.transAxes.inverted()` (depth is a new concept, but had it existed it would return 4 for this example).

- `twinx` and `twiny` now returns an instance of SubplotBase if parent axes is an instance of SubplotBase.
- All Qt3-based backends are now deprecated due to the lack of py3k bindings. Qt and QtAgg backends will continue to work in v1.2.x for py2.6 and py2.7. It is anticipated that the Qt3 support will be completely removed for the next release.
- `ColorConverter`, *`Colormap`* and *`Normalize`* now subclasses `object`
- ContourSet instances no longer have a `transform` attribute. Instead, access the transform with the `get_transform` method.

14.9 Changes in 1.1.x

- Added new *`matplotlib.sankey.Sankey`* for generating Sankey diagrams.
- In *`imshow()`*, setting *interpolation* to 'nearest' will now always mean that the nearest-neighbor interpolation is performed. If you want the no-op interpolation to be performed, choose 'none'.
- There were errors in how the tri-functions were handling input parameters that had to be fixed. If your tri-plots are not working correctly anymore, or you were working around apparent mistakes, please see issue #203 in the github tracker. When in doubt, use kwargs.

- The 'symlog' scale had some bad behavior in previous versions. This has now been fixed and users should now be able to use it without frustrations. The fixes did result in some minor changes in appearance for some users who may have been depending on the bad behavior.
- There is now a common set of markers for all plotting functions. Previously, some markers existed only for `scatter()` or just for `plot()`. This is now no longer the case. This merge did result in a conflict. The string 'd' now means "thin diamond" while 'D' will mean "regular diamond".

14.10 Changes beyond 0.99.x

- The default behavior of `matplotlib.axes.Axes.set_xlim()`, `matplotlib.axes.Axes.set_ylim()`, and `matplotlib.axes.Axes.axis()`, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new *auto* kwarg is available to control this behavior. The limit kwargs have been renamed to *left* and *right* instead of *xmin* and *xmax*, and *bottom* and *top* instead of *ymin* and *ymax*. The old names may still be used, however.
- There are five new Axes methods with corresponding pyplot functions to facilitate autoscaling, tick location, and tick label formatting, and the general appearance of ticks and tick labels:
  - `matplotlib.axes.Axes.autoscale()` turns autoscaling on or off, and applies it.
  - `matplotlib.axes.Axes.margins()` sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
  - `matplotlib.axes.Axes.locator_params()` allows one to adjust axes locator parameters such as *nbins*.
  - `matplotlib.axes.Axes.ticklabel_format()` is a convenience method for controlling the `matplotlib.ticker.ScalarFormatter` that is used by default with linear axes.
  - `matplotlib.axes.Axes.tick_params()` controls direction, size, visibility, and color of ticks and their labels.
- The `matplotlib.axes.Axes.bar()` method accepts a *error_kw* kwarg; it is a dictionary of kwargs to be passed to the errorbar function.
- The `matplotlib.axes.Axes.hist()` *color* kwarg now accepts a sequence of color specs to match a sequence of datasets.
- The `EllipseCollection` has been changed in two ways:
  - There is a new *units* option, 'xy', that scales the ellipse with the data units. This matches the :class:'~matplotlib.patches.Ellipse' scaling.
  - The *height* and *width* kwargs have been changed to specify the height and width, again for consistency with `Ellipse`, and to better match their names; previously they specified the half-height and half-width.
- There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle()` is deprecated.

- You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class `matplotlib.backends.backend_pdf.PdfPages` for more information.
- Removed configobj and enthought.traits packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.
- The new rc parameter `savefig.extension` sets the filename extension that is used by `matplotlib.figure.Figure.savefig()` if its *fname* argument lacks an extension.
- In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```
draw_path_collection(self, master_transform, cliprect, clippath,
                     clippath_trans, paths, all_transforms, offsets,
                     offsetTrans, facecolors, edgecolors, linewidths,
                     linestyles, antialiaseds, urls)

# is now

draw_path_collection(self, gc, master_transform, paths, all_transforms,
                     offsets, offsetTrans, facecolors, edgecolors,
                     linewidths, linestyles, antialiaseds, urls)

draw_quad_mesh(self, master_transform, cliprect, clippath,
               clippath_trans, meshWidth, meshHeight, coordinates,
               offsets, offsetTrans, facecolors, antialiased,
               showedges)

# is now

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
               coordinates, offsets, offsetTrans, facecolors,
               antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

# is now

draw_image(self, gc, x, y, im)
```

- There are four new Axes methods with corresponding pyplot functions that deal with unstructured triangular grids:
  - `matplotlib.axes.Axes.tricontour()` draws contour lines on a triangular grid.
  - `matplotlib.axes.Axes.tricontourf()` draws filled contours on a triangular grid.
  - `matplotlib.axes.Axes.tripcolor()` draws a pseudocolor plot on a triangular grid.
  - `matplotlib.axes.Axes.triplot()` draws a triangular grid as lines and/or markers.

14.11 Changes in 0.99

- pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays.
- User-generated colormaps can now be added to the set recognized by *`matplotlib.cm.get_cmap()`*. Colormaps can be made the default and applied to the current image using *`matplotlib.pyplot.set_cmap()`*.
- changed use_mrecords default to False in mlab.csv2rec since this is partially broken
- Axes instances no longer have a "frame" attribute. Instead, use the new "spines" attribute. Spines is a dictionary where the keys are the names of the spines (e.g., 'left','right' and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are Line2D instances. For other axes (such as polar axes), these artists may be Patch instances.
- Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change – if interpolation of data is required, that should be done before passing it to Matplotlib.

14.12 Changes for 0.98.x

- psd(), csd(), and cohere() will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with specgram(). The previous behavior was more of an oversight than a design decision.
- Added new keyword parameters *nonposx*, *nonposy* to `matplotlib.axes.Axes` methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept 'clip', which causes non-positive values to be replaced with a very small positive value.
- Added new *`matplotlib.pyplot.fignum_exists()`* and *`matplotlib.pyplot.get_fignums()`*; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.
- Deprecated numerix package.
- Added new *`matplotlib.image.imsave()`* and exposed it to the *`matplotlib.pyplot`* interface.
- Remove support for pyExcelerator in exceltools – use xlwt instead
- Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
- Following keyword parameters for `matplotlib.label.Label` are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, *scatteryoffsets*, *fancybox* and *columnspacing* are added as keyword parameters.

Deprecated	New
pad	borderpad
labelsep	labelspacing
handlelen	handlelength
handlestextsep	handletextpad
axespad	borderaxespad

- Removed the configobj and experimental traits rc support
- Modified *matplotlib.mlab.psd()*, *matplotlib.mlab.csd()*, *matplotlib.mlab.cohere()*, and *matplotlib.mlab.specgram()* to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding *matplotlib.axes.Axes* methods and *matplotlib.pyplot* functions were updated as well.
- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.
- *matplotlib.axes.Axes.set_xlim()*, *matplotlib.axes.Axes.set_ylim()* now return a copy of the `viewlim` array to avoid modify-in-place surprises.
- *matplotlib.afm.AFM.get_fullname()* and *matplotlib.afm.AFM.get_familyname()* no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.
- Changed precision kwarg in *matplotlib.pyplot.spy()*; default is 0, and the string value 'present' is used for sparse arrays only to show filled locations.
- *matplotlib.collections.EllipseCollection* added.
- Added `angles` kwarg to *matplotlib.pyplot.quiver()* for more flexible specification of the arrow angles.
- Deprecated (raise NotImplementedError) all the mlab2 functions from *matplotlib.mlab* out of concern that some of them were not clean room implementations.
- Methods *matplotlib.collections.Collection.get_offsets()* and *matplotlib.collections.Collection.set_offsets()* added to *Collection* base class.
- `matplotlib.figure.Figure.figurePatch` renamed `matplotlib.figure.Figure.patch`; `matplotlib.axes.Axes.axesPatch` renamed `matplotlib.axes.Axes.patch`; `matplotlib.axes.Axes.axesFrame` renamed `matplotlib.axes.Axes.frame`. `matplotlib.axes.Axes.get_frame()`, which returns `matplotlib.axes.Axes.patch`, is deprecated.
- Changes in the `matplotlib.contour.ContourLabeler` attributes (*matplotlib.pyplot.clabel()* function) so that they all have a form like `.labelAttribute`. The three attributes that are most likely to be used by end users, `.cl`, `.cl_xy` and `.cl_cvalues` have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.
- Moved several functions in *matplotlib.mlab* and *matplotlib.cbook* into a separate module `matplotlib.numerical_methods` because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

14.13 Changes for 0.98.1

- Removed broken `matplotlib.axes3d` support and replaced it with a non-implemented error pointing to 0.91.x

14.14 Changes for 0.98.0

- `matplotlib.image.imread()` now no longer always returns RGBA data—if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.
- Rewrote the `matplotlib.cm.ScalarMappable` callback infrastructure to use `matplotlib.cbook.CallbackRegistry` rather than custom callback handling. Any users of `matplotlib.cm.ScalarMappable.add_observer()` of the `ScalarMappable` should use the `matplotlib.cm.ScalarMappable.callbacks` `CallbackRegistry` instead.
- New axes function and Axes method provide control over the plot color cycle: `matplotlib.axes.set_default_color_cycle()` and `matplotlib.axes.Axes.set_color_cycle()`.
- Matplotlib now requires Python 2.4, so `matplotlib.cbook` will no longer provide `set`, `enumerate()`, `reversed()` or `izip()` compatibility functions.
- In Numpy 1.0, bins are specified by the left edges only. The axes method `matplotlib.axes.Axes.hist()` now uses future Numpy 1.3 semantics for histograms. Providing `binedges`, the last value gives the upper-right edge now, which was implicitly set to +infinity in Numpy 1.0. This also means that the last bin doesn't contain upper outliers any more by default.
- New axes method and pyplot function, `hexbin()`, is an alternative to `scatter()` for large datasets. It makes something like a `pcolor()` of a 2-D histogram, but uses hexagonal bins.
- New kwarg, `symmetric`, in `matplotlib.ticker.MaxNLocator` allows one require an axis to be centered around zero.
- Toolkits must now be imported from `mpl_toolkits` (not `matplotlib.toolkits`)

14.14.1 Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See `matplotlib.transforms` for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method copy().

The view intervals are now stored only in one place – in the `matplotlib.axes.Axes` instance, not in the locator instances as well. This means locators must get their limits from their `matplotlib.axis.Axis`, which in turn looks up its limits from the `Axes`. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in `matplotlib.contour`), a dummy axis must be created to store its bounds. Call `matplotlib.ticker.Locator.create_dummy_axis()` to do so.

The functionality of `Pbox` has been merged with *Bbox*. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

`matplotlib.transforms`

Old method	New method
`Bbox.get_bounds()`	`transforms.Bbox.bounds`
`Bbox.width()`	`transforms.Bbox.width`
`Bbox.height()`	`transforms.Bbox.height`
`Bbox.intervalx().get_bounds()`	`transforms.Bbox.intervalx`
`Bbox.intervalx().set_bounds()`	[`Bbox.intervalx` is now a property.]
`Bbox.intervaly().get_bounds()`	`transforms.Bbox.intervaly`
`Bbox.intervaly().set_bounds()`	[`Bbox.intervaly` is now a property.]
`Bbox.xmin()`	`transforms.Bbox.x0` or `transforms.Bbox.xmin`[1]
`Bbox.ymin()`	`transforms.Bbox.y0` or `transforms.Bbox.ymin`[1]
`Bbox.xmax()`	`transforms.Bbox.x1` or `transforms.Bbox.xmax`[1]
`Bbox.ymax()`	`transforms.Bbox.y1` or `transforms.Bbox.ymax`[1]
`Bbox.overlaps(bboxes)`	`Bbox.count_overlaps(bboxes)`
`bbox_all(bboxes)`	`Bbox.union(bboxes)` [`transforms.Bbox.union()` is a staticmethod.]
`lbwh_to_bbox(l, b, w, h)`	`Bbox.from_bounds(x0, y0, w, h)` [`transforms.Bbox.from_bounds()` is a staticmethod.]
`inverse_transform_bbox(trans, bbox)`	`Bbox.inverse_transformed(trans)`
`Interval.contains_open(v)`	`interval_contains_open(tuple, v)`
`Interval.contains(v)`	`interval_contains(tuple, v)`
`identity_transform()`	*`matplotlib.transforms.IdentityTransform`*
`blend_xy_sep_transform(xtrans, ytrans)`	`blended_transform_factory(xtrans, ytrans)`
`scale_transform(xs, ys)`	`Affine2D().scale(xs[, ys])`
`get_bbox_transform(boxin, boxout)`	`BboxTransform(boxin, boxout)` or `BboxTransformFrom(boxin)` or `BboxTransformTo(boxout)`
`Transform.seq_xy_tup(points)`	`Transform.transform(points)`
`Transform.inverse_xy_tup(points)`	`Transform.inverted().transform(points)`

---

[1] The *`Bbox`* is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the `Bbox`, use the read-only property `xmin`.

`matplotlib.axes`

Old method	New method
`Axes.get_position()`	*`matplotlib.axes.Axes.get_position()`*[2]
`Axes.set_position()`	*`matplotlib.axes.Axes.set_position()`*[3]
`Axes.toggle_log_lineary()`	*`matplotlib.axes.Axes.set_yscale()`*[4]
`Subplot` class	removed.

The `Polar` class has moved to *`matplotlib.projections.polar`*.

`matplotlib.artist`

Old method	New method
`Artist.set_clip_path(path)`	`Artist.set_clip_path(path, transform)`[5]

`matplotlib.collections`

Old method	New method
`linestyle`	`linestyles`[6]

`matplotlib.colors`

Old method	New method
`ColorConvertor.to_rgba_list(c)`	`ColorConvertor.to_rgba_array(c)` [`matplotlib.colors.ColorConvertor.to_rgba_array()` returns an Nx4 Numpy array of RGBA color quadruples.]

`matplotlib.contour`

Old method	New method
`Contour._segments`	`matplotlib.contour.Contour.get_paths`` () [Returns a list of *`matplotlib.path.Path`* instances.]

`matplotlib.figure`

Old method	New method
`Figure.dpi.get()` / `Figure.dpi.set()`	*`matplotlib.figure.Figure.dpi`* *(a property)*

---

[2] *`matplotlib.axes.Axes.get_position()`* used to return a list of points, now it returns a *`matplotlib.transforms.Bbox`* instance.

[3] *`matplotlib.axes.Axes.set_position()`* now accepts either four scalars or a *`matplotlib.transforms.Bbox`* instance.

[4] Since the recfactoring allows for more than two scale types ('log' or 'linear'), it no longer makes sense to have a toggle. `Axes.toggle_log_lineary()` has been removed.

[5] *`matplotlib.artist.Artist.set_clip_path()`* now accepts a *`matplotlib.path.Path`* instance and a *`matplotlib.transforms.Transform`* that will be applied to the path immediately before clipping.

[6] Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.

`matplotlib.patches`

Old method	New method
`Patch.get_verts()`	*`matplotlib.patches.Patch.get_path()`* [Returns a *`matplotlib.path.Path`* instance]

`matplotlib.backend_bases`

Old method	New method
`GraphicsContext.set_clip_rectangle(tuple)`	`GraphicsContext.set_clip_rectangle(bbox)`
`GraphicsContext.get_clip_path()`	`GraphicsContext.get_clip_path()`[7]
`GraphicsContext.set_clip_path()`	`GraphicsContext.set_clip_path()`[8]

`RendererBase`

New methods:

- *`draw_path(self, gc, path, transform, rgbFace)`*
- *`draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)`*
- *`draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds)`* *[optional]*

Changed methods:

- `draw_image(self, x, y, im, bbox)` is now *`draw_image(self, x, y, im, bbox, clippath, clippath_trans)`*

Removed methods:

- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`

---

[7] `matplotlib.backend_bases.GraphicsContext.get_clip_path()` returns a tuple of the form (*path*, *affine_transform*), where *path* is a *`matplotlib.path.Path`* instance and *affine_transform* is a *`matplotlib.transforms.Affine2D`* instance.

[8] `matplotlib.backend_bases.GraphicsContext.set_clip_path()` now only accepts a *`matplotlib.transforms.TransformedPath`* instance.

- `draw_rectangle`
- `draw_regpoly_collection`

14.15 Changes for 0.91.2

- For `csv2rec()`, checkrows=0 is the new default indicating all rows will be checked for type inference
- A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.
- Moved `rec2gtk()` to `matplotlib.toolkits.gtktools`
- Moved `rec2excel()` to `matplotlib.toolkits.exceltools`
- Removed, dead/experimental ExampleInfo, Namespace and Importer code from `matplotlib.__init__`

14.16 Changes for 0.91.1

14.17 Changes for 0.91.0

- Changed `cbook.is_file_like()` to `cbook.is_writable_file_like()` and corrected behavior.
- Added ax kwarg to `pyplot.colorbar()` and `Figure.colorbar()` so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed `cbook.reversed()` so it yields a tuple rather than a (index, tuple). This agrees with the python reversed builtin, and cbook only defines reversed if python doesn't provide the builtin.
- Made skiprows=1 the default on `csv2rec()`
- The gd and paint backends have been deleted.
- The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.
- The *`matplotlib.dviread`* file now has a parser for files like psfonts.map and pdftex.map, to map TeX font names to external files.
- The file *`matplotlib.type1font`* contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.
- `matplotlib.FT2Font` now supports `FT_Attach_File()`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.
- The `AFM` class now supports querying CapHeight and stem widths. The get_name_char method now has an isord kwarg like get_width_char.

- Changed `pcolor()` default to shading='flat'; but as noted now in the docstring, it is preferable to simply use the edgecolor kwarg.
- The mathtext font commands (`\cal`, `\rm`, `\it`, `\tt`) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of `$\cal{R}$` should be changed to `${\cal R}$`. Alternatively, you may use the new LaTeX-style font commands (`\mathcal`, `\mathrm`, `\mathit`, `\mathtt`) which do affect the following group, e.g., `$\mathcal{R}$`.
- Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.
- Changed default kwarg in `matplotlib.colors.Normalize.__init__`()` to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.
- Made the emit property of *`set_xlim()`* and *`set_ylim()`* `True` by default; removed the Axes custom callback handling into a 'callbacks' attribute which is a *`CallbackRegistry`* instance. This now supports the 'xlim_changed' and 'ylim_changed' Axes events.

14.18 Changes for 0.90.1

```
The file dviread.py has a (very limited and fragile) dvi reader
for usetex support. The API might change in the future so don't
depend on it yet.

Removed deprecated support for a float value as a gray-scale;
now it must be a string, like '0.5'.  Added alpha kwarg to
ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets
the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.

Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced
by orig=True.  When True, it returns the original data, otherwise
the processed data (masked, converted)

Some modifications to the units interface.
units.ConversionInterface.tickers renamed to
units.ConversionInterface.axisinfo and it now returns a
units.AxisInfo object rather than a tuple.  This will make it
easier to add axis info functionality (e.g., I added a default label
on this iteration) w/o having to change the tuple length and hence
the API of the client code every time new functionality is added.
Also, units.ConversionInterface.convert_to_value is now simply
named units.ConversionInterface.convert.

Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error
```

```
limits int he vertical and horizontal direction.  As you'll see
in the changes below, these functions now return a LineCollection
rather than a list of lines.  The new return signature for
errorbar is  ylins, caplines, errorcollections where
errorcollections is a xerrcollection, yerrcollection

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list
of lines.  This is much faster.  The kwarg signature has changed,
so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force
ticks to integer locations.

Commands that pass an argument to the Text constructor or to
Text.set_text() now accept any object that can be converted
with '%s'.  This affects xlabel(), title(), etc.

Barh now takes a **kwargs dict instead of most of the old
arguments. This helps ensure that bar and barh are kept in sync,
but as a side effect you can no longer pass e.g., color as a
positional argument.

ft2font.get_charmap() now returns a dict that maps character codes
to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop
mode works. Re-organized the mpl-data layout so that this source
structure is maintained in the installation. (i.e., the 'fonts' and
'images' sub-directories are maintained in site-packages.).
Suggest removing site-packages/matplotlib/mpl-data and
~/.matplotlib/ttffont.cache before installing
```

14.19 Changes for 0.90.0

```
All artists now implement a "pick" method which users should not
call.  Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback.  See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.

Added linewidth kwarg to bar and barh.
```

```
Made the default Artist._transform None (rather than invoking
identity_transform for each artist only to have it overridden
later).  Use artist.get_transform() rather than artist._transform,
even in derived classes, so that the default transform will be
created lazily as needed

New LogNorm subclass of Normalize added to colors.py.
All Normalize subclasses have new inverse() method, and
the __call__() method has a new clip kwarg.

Changed class names in colors.py to match convention:
normalize -> Normalize, no_norm -> NoNorm.  Old names
are still available for now.

Removed obsolete pcolor_classic command and method.

Removed lineprops and markerprops from the Annotation code and
replaced them with an arrow configurable with kwarg arrowprops.
See examples/annotation_demo.py - JDH
```

14.20 Changes for 0.87.7

```
Completely reworked the annotations API because I found the old
API cumbersome.  The new design is much more legible and easy to
read.  See matplotlib.text.Annotation and
examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in
matplotlibrc any more. Instead, markers are generally colored
automatically based on the color of the line, unless marker colors
are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns
width, height, svg_elements. svg_elements is an instance of Bunch (
cmbook.py) and has the attributes svg_glyphs and svg_lines, which are both
lists.

Renderer.draw_arc now takes an additional parameter, rotation.
It specifies to draw the artist rotated in degrees anti-
clockwise.  It was added for rotated ellipses.

Renamed Figure.set_figsize_inches to Figure.set_size_inches to
better match the get method, Figure.get_size_inches.

Removed the copy_bbox_transform from transforms.py; added
shallowcopy methods to all transforms.  All transforms already
had deepcopy methods.
```

```
FigureManager.resize(width, height): resize the window
specified in pixels

barh: x and y args have been renamed to width and bottom
respectively, and their order has been swapped to maintain
a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can
now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center
aligned bars

bar, barh and hist: Added a keyword arg 'align' that
controls between edge or center bar alignment.

Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
form.  The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring.  The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
    Removed aspect kwarg from imshow
    Axes methods:
        set_aspect(self, aspect, adjustable=None, anchor=None)
        set_adjustable(self, adjustable)
        set_anchor(self, anchor)
    Pylab interface:
        axis('image')

 Backend developers: ft2font's load_char now takes a flags
 argument, which you can OR together from the LOAD_XXX
```

```
constants.
```

14.21 Changes for 0.86

```
Matplotlib data is installed into the matplotlib module.
This is similar to package_data.  This should get rid of
having to check for many possibilities in _get_data_path().
The MATPLOTLIBDATA env key is still checked first to allow
for flexibility.

1) Separated the color table data from cm.py out into
a new file, _cm.py, to make it easier to find the actual
code in cm.py and to add new colormaps. Everything
from _cm.py is imported by cm.py, so the split should be
transparent.
2) Enabled automatic generation of a colormap from
a list of colors in contour; see modified
examples/contour_demo.py.
3) Support for imshow of a masked array, with the
ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
below the normally mapped region.  See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added
a clip kwarg to the normalize class.
```

14.22 Changes for 0.85

```
Made xtick and ytick separate props in rc

made pos=None the default for tick formatters rather than 0 to
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from
overlapping major ticks.  Often you want major and minor ticks at
the same place, and can offset the major ticks with the pad.  This
could be made configurable

Changed the internal structure of contour.py to a more OO style.
Calls to contour or contourf in axes.py or pylab.py now return
a ContourSet object which contains references to the
LineCollections or PolyCollections created by the call,
as well as the configuration variables that were used.
The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:
```

```
         * clip_ends = True
           If False, the limits for color scaling are set to the
           minimum and maximum contour levels.
           True (default) clips the scaling limits.  Example:
           if the contour boundaries are V = [-100, 2, 1, 0, 1, 2, 100],
           then the scaling limits will be [-100, 100] if clip_ends
           is False, and [-3, 3] if clip_ends is True.
Added kwargs linewidths, antialiased, and nchunk to contourf.  These
are experimental; see the docstring.

Changed Figure.colorbar():
    kw argument order changed;
    if mappable arg is a non-filled ContourSet, colorbar() shows
            lines instead hof polygons.
    if mappable arg is a filled ContourSet with clip_ends=True,
            the endpoints are not labelled, so as to give the
            correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for
consistency.
```

14.23 Changes for 0.84

```
Unified argument handling between hlines and vlines.  Both now
take optionally a fmt argument (as in plot) and a keyword args
that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since
these were not used and not optimized.  I'm sure they'll be
resurrected later with a better implementation when needed.

'set' removed - no more deprecation warnings.  Use 'setp' instead.

Backend developers: Added flipud method to image and removed it
from to_str.  Removed origin kwarg from backend.draw_image.
origin is handled entirely by the frontend now.
```

14.24 Changes for 0.83

```
- Made HOME/.matplotlib the new config dir where the matplotlibrc
  file, the ttf.cache, and the tex.cache live.  The new default
  filenames in .matplotlib have no leading dot and are not hidden.
  e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache.
  This is how ipython does it so it must be right.

  If old files are found, a warning is issued and they are moved to
  the new location.
```

```
- backends/__init__.py no longer imports new_figure_manager,
  draw_if_interactive and show from the default backend, but puts
  these imports into a call to pylab_setup.  Also, the Toolbar is no
  longer imported from WX/WXAgg.  New usage:

    from backends import pylab_setup
    new_figure_manager, draw_if_interactive, show = pylab_setup()

- Moved Figure.get_width_height() to FigureCanvasBase. It now
  returns int instead of float.
```

14.25 Changes for 0.82

```
- toolbar import change in GTKAgg, GTKCairo and WXAgg

- Added subplot config tool to GTK* backends -- note you must now
  import the NavigationToolbar2 from your backend of choice rather
  than from backend_gtk because it needs to know about the backend
  specific canvas -- see examples/embedding_in_gtk2.py.  Ditto for
  wx backend -- see examples/embedding_in_wxagg.py

- hist bin change

    Sean Richards notes there was a problem in the way we created
    the binning for histogram, which made the last bin
    underrepresented.  From his post:

      I see that hist uses the linspace function to create the bins
      and then uses searchsorted to put the values in their correct
      bin. That's all good but I am confused over the use of linspace
      for the bin creation. I wouldn't have thought that it does
      what is needed, to quote the docstring it creates a "Linear
      spaced array from min to max". For it to work correctly
      shouldn't the values in the bins array be the same bound for
      each bin? (i.e. each value should be the lower bound of a
      bin). To provide the correct bins for hist would it not be
      something like

      def bins(xmin, xmax, N):
        if N==1: return xmax
        dx = (xmax-xmin)/N # instead of N-1
        return xmin + dx*arange(N)

     This suggestion is implemented in 0.81.  My test script with these
     changes does not reveal any bias in the binning

      from matplotlib.numerix.mlab import randn, rand, zeros, Float
      from matplotlib.mlab import hist, mean
```

```
Nbins = 50
Ntests = 200
results = zeros((Ntests,Nbins), typecode=Float)
for i in range(Ntests):
    print 'computing', i
    x = rand(10000)
    n, bins = hist(x, Nbins)
    results[i] = n
print mean(results)
```

14.26 Changes for 0.81

```
- pylab and artist "set" functions renamed to setp to avoid clash
  with python2.4 built-in set.  Current version will issue a
  deprecation warning which will be removed in future versions

- imshow interpolation arguments changes for advanced interpolation
  schemes.  See help imshow, particularly the interpolation,
  filternorm and filterrad kwargs

- Support for masked arrays has been added to the plot command and
  to the Line2D object.  Only the valid points are plotted.  A
  "valid_only" kwarg was added to the get_xdata() and get_ydata()
  methods of Line2D; by default it is False, so that the original
  data arrays are returned. Setting it to True returns the plottable
  points.

- contour changes:

  Masked arrays: contour and contourf now accept masked arrays as
    the variable to be contoured.  Masking works correctly for
    contour, but a bug remains to be fixed before it will work for
    contourf.  The "badmask" kwarg has been removed from both
    functions.

   Level argument changes:

     Old version: a list of levels as one of the positional
     arguments specified the lower bound of each filled region; the
     upper bound of the last region was taken as a very large
     number.  Hence, it was not possible to specify that z values
     between 0 and 1, for example, be filled, and that values
     outside that range remain unfilled.

     New version: a list of N levels is taken as specifying the
     boundaries of N-1 z ranges.  Now the user has more control over
     what is colored and what is not.  Repeated calls to contourf
     (with different colormaps or color specifications, for example)
     can be used to color different ranges of z.  Values of z
    outside an expected range are left uncolored.

    Example:
      Old: contourf(z, [0, 1, 2]) would yield 3 regions: 0-1, 1-2, and >2.
      New: it would yield 2 regions: 0-1, 1-2.  If the same 3 regions were
      desired, the equivalent list of levels would be [0, 1, 2,
      1e38].
```

14.27 Changes for 0.80

```
- xlim/ylim/axis always return the new limits regardless of
  arguments.  They now take kwargs which allow you to selectively
  change the upper or lower limits while leaving unnamed limits
  unchanged.  See help(xlim) for example
```

14.28 Changes for 0.73

```
- Removed deprecated ColormapJet and friends

- Removed all error handling from the verbose object

- figure num of zero is now allowed
```

14.29 Changes for 0.72

```
- Line2D, Text, and Patch copy_properties renamed update_from and
  moved into artist base class

- LineCollecitons.color renamed to LineCollections.set_color for
  consistency with set/get introspection mechanism,

- pylab figure now defaults to num=None, which creates a new figure
  with a guaranteed unique number

- contour method syntax changed - now it is MATLAB compatible

    unchanged: contour(Z)
    old: contour(Z, x=Y, y=Y)
    new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#-contour

 - Increased the default resolution for save command.
 - Renamed the base attribute of the ticker classes to _base to avoid conflict
   with the base method.  Sitt for subs

 - subs=none now does autosubbing in the tick locator.

 - New subplots that overlap old will delete the old axes.  If you
   do not want this behavior, use fig.add_subplot or the axes
   command
```

14.30 Changes for 0.71

```
Significant numerix namespace changes, introduced to resolve
namespace clashes between python built-ins and mlab names.
Refactored numerix to maintain separate modules, rather than
folding all these names into a single namespace.  See the following
mailing list threads for more information and background

  http://sourceforge.net/mailarchive/forum.php?thread_id=6398890&forum_id=36187
  http://sourceforge.net/mailarchive/forum.php?thread_id=6323208&forum_id=36187

OLD usage

  from matplotlib.numerix import array, mean, fft

NEW usage

  from matplotlib.numerix import array
  from matplotlib.numerix.mlab import mean
  from matplotlib.numerix.fft import fft

numerix dir structure mirrors numarray (though it is an incomplete
implementation)

  numerix
  numerix/mlab
  numerix/linear_algebra
  numerix/fft
  numerix/random_array

but of course you can use 'numerix : Numeric' and still get the
symbols.

pylab still imports most of the symbols from Numerix, MLab, fft,
etc, but is more cautious.  For names that clash with python names
(min, max, sum), pylab keeps the builtins and provides the numeric
versions with an a* prefix, e.g., (amin, amax, asum)
```

14.31 Changes for 0.70

```
MplEvent factored into a base class Event and derived classes
MouseEvent and KeyEvent

Removed definct set_measurement in wx toolbar
```

14.32 Changes for 0.65.1

```
removed add_axes and add_subplot from backend_bases.  Use
figure.add_axes and add_subplot instead.  The figure now manages the
current axes with gca and sca for get and set current axes.  If you
have code you are porting which called, e.g., figmanager.add_axes, you
can now simply do figmanager.canvas.figure.add_axes.
```

14.33 Changes for 0.65

```
mpl_connect and mpl_disconnect in the MATLAB interface renamed to
connect and disconnect

Did away with the text methods for angle since they were ambiguous.
fontangle could mean fontstyle (oblique, etc) or the rotation of the
text.  Use style and rotation instead.
```

14.34 Changes for 0.63

```
Dates are now represented internally as float days since 0001-01-01,
UTC.

All date tickers and formatters are now in matplotlib.dates, rather
than matplotlib.tickers

converters have been abolished from all functions and classes.
num2date and date2num are now the converter functions for all date
plots

Most of the date tick locators have a different meaning in their
constructors.  In the prior implementation, the first argument was a
base and multiples of the base were ticked.  e.g.,

  HourLocator(5)  # old: tick every 5 minutes

In the new implementation, the explicit points you want to tick are
provided as a number or sequence
```

```
   HourLocator(range(0,5,61))  # new: tick every 5 minutes

This gives much greater flexibility.  I have tried to make the
default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme.
The difference between the YearLocator and the other locators is
that years are not recurrent.

Financial functions:

  matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

   date1, date2 are now datetime instances.  Return value is a list
   of quotes where the quote time is a float - days since gregorian
   start, as returned by date2num

   See examples/finance_demo.py for example usage of new API
```

14.35 Changes for 0.61

```
canvas.connect is now deprecated for event handling.  use
mpl_connect and mpl_disconnect instead.  The callback signature is
func(event) rather than func(widget, event)
```

14.36 Changes for 0.60

```
ColormapJet and Grayscale are deprecated.  For backwards
compatibility, they can be obtained either by doing

  from matplotlib.cm import ColormapJet

or

  from matplotlib.matlab import *

They are replaced by cm.jet and cm.grey
```

14.37 Changes for 0.54.3

```
removed the set_default_font / get_default_font scheme from the
font_manager to unify customization of font defaults with the rest of
```

```
the rc scheme.  See examples/font_properties_demo.py and help(rc) in
matplotlib.matlab.
```

14.38 Changes for 0.54

14.38.1 MATLAB interface

dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.

pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the propertes that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```
c = scatter(blah, blah)
c.set_linewidth(1.0)
c.set_facecolor('r')
c.set_alpha(0.5)
```

or:

```
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

mathtext spacing

For reasons not clear to me (and which I'll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this '' (regular space), '/' (small space) and 'hspace{frac}' where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:

```
title(r'$\rm{Histogram\ of\ IQ:}\ \mu=100,\ \sigma=15$')
```

14.38.2 Object interface - Application programmers

Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by axes.autoscale_view

Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

Artist methods

If you define your own Artists, you need to rename the _draw method to draw

Bounding boxes

matplotlib.transforms.Bound2D is replaced by matplotlib.transforms.Bbox. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use matplotlib.transforms.lbwh_to_bbox, as in

> bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

OLD:: width = fig.bbox.x.interval() height = fig.bbox.y.interval()

New:: width = fig.bbox.width() height = fig.bbox.height()

Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way or creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call axes.add_line or axes.add_patch, so they are hidden from the user.

If you want to define a custom transformation on these objects, call o.set_transform(trans) where trans is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do

l = Line2D(dpi, bbox, x, y, color = color, transx = transx, transy = transy,)

now all you need is

l = Line2D(x, y, color=color)

and the axes will set the transformation for you (unless you have set your own already, in which case it will eave it unchanged)

Transformations

The entire transformation architecture has been rewritten. Previously the x and y transformations where stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don't depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class matplotlib.transforms.Transformation and two concrete implementations, matplotlib.transforms.SeparableTransformation and matplotlib.transforms.Affine. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as ax.transData and ax.transAxes. See alignment_demo.py which uses axes coords.

Also, the transformations should be much faster now, for two reasons

- they are written entirely in extension code
- because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

```
xt = sx*func(x) + tx
yt = sy*func(y) + ty
```

> Although this was done in numerix, it still involves 6 length(x) for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.

Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

14.39 Changes for 0.50

```
* refactored Figure class so it is no longer backend dependent.
  FigureCanvasBackend takes over the backend specific duties of the
  Figure.  matplotlib.backend_bases.FigureBase moved to
  matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that
  controls the figure and handles the events if any) and
  FigureManagerBackend (wraps the canvas and the window for MATLAB
  interface).  FigureCanvasBase implements a backend switching
  mechanism

* Figure is now an Artist (like everything else in the figure) and
  is totally backend independent

* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in
  colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd
  features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:

MATLAB interface:

  The only API change for those using the MATLAB interface is in how
  you call figure redraws for dynamically updating figures.  In the
  old API, you did

    fig.draw()
  In the new API, you do

    manager = get_current_fig_manager()
    manager.canvas.draw()

  See the examples system_monitor.py, dynamic_demo.py, and anim.py

API

  There is one important API change for application developers.
  Figure instances used subclass GUI widgets that enabled them to be
  placed directly into figures.  e.g., FigureGTK subclassed
  gtk.DrawingArea.  Now the Figure class is independent of the
  backend, and FigureCanvas takes over the functionality formerly
  handled by Figure.  In order to include figures into your apps,
  you now need to do, for example

    # gtk example
    fig = Figure(figsize=(5,4), dpi=100)
    canvas = FigureCanvasGTK(fig)  # a gtk.DrawingArea
    canvas.show()
    vbox.pack_start(canvas)

  If you use the NavigationToolbar, this in now intialized with a
  FigureCanvas, not a Figure.  The examples embedding_in_gtk.py,
  embedding_in_gtk2.py, and mpl_with_glade.py all reflect the new
  API so use these as a guide.

  All prior calls to

   figure.draw()  and
   figure.print_figure(args)

  should now be

   canvas.draw()  and
   canvas.print_figure(args)

  Apologies for the inconvenience.  This refactorization brings
  significant more freedom in developing matplotlib and should bring
  better plotting capabilities, so I hope the inconvenience is worth
  it.
```

14.40 Changes for 0.42

```
* Refactoring AxisText to be backend independent.  Text drawing and
  get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module
* All the erase and reset functionality removed from AxisText - not
  needed with double buffered drawing.  Ditto with state change.
  Text instances have a get_prop_tup method that returns a hashable
  tuple of text properties which you can use to see if text props
  have changed, e.g., by caching a font or layout instance in a dict
  with the prop tup as a key -- see RendererGTK.get_pango_layout in
  backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

* Artist set_renderer and wash_brushes methods removed

* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes
  to matplotlib.axis

* moved process_text_args to matplotlib.text

* After getting Text handled in a backend independent fashion, the
  import process is much cleaner since there are no longer cyclic
  dependencies

* matplotlib.matlab._get_current_fig_manager renamed to
  matplotlib.matlab.get_current_fig_manager to allow user access to
  the GUI window attribute, e.g., figManager.window for GTK and
  figManager.frame for wx
```

14.41 Changes for 0.40

```
- Artist
    * __init__ takes a DPI instance and a Bound2D instance which is
      the bounding box of the artist in display coords
    * get_window_extent returns a Bound2D instance
    * set_size is removed; replaced by bbox and dpi
    * the clip_gc method is removed.  Artists now clip themselves with
      their box
    * added _clipOn boolean attribute.  If True, gc clip to bbox.

- AxisTextBase
    * Initialized with a transx, transy which are Transform instances
    * set_drawing_area removed
    * get_left_right and get_top_bottom are replaced by get_window_extent

- Line2D Patches now take transx, transy
    * Initialized with a transx, transy which are Transform instances

- Patches
   * Initialized with a transx, transy which are Transform instances
```

```
- FigureBase attributes dpi is a DPI intance rather than scalar and
  new attribute bbox is a Bound2D in display coords, and I got rid
  of the left, width, height, etc... attributes.  These are now
  accessible as, for example, bbox.x.min is left, bbox.x.interval()
  is width, bbox.y.max is top, etc...

- GcfBase attribute pagesize renamed to figsize

- Axes
    * removed figbg attribute
    * added fig instance to __init__
    * resizing is handled by figure call to resize.

- Subplot
    * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances.
  gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible
  way

- new module transforms supplies Bound1D, Bound2D and Transform
  instances and more

- Changes to the MATLAB helpers API

  * _matlab_helpers.GcfBase is renamed by Gcf.  Backends no longer
    need to derive from this class.  Instead, they provide a factory
    function new_figure_manager(num, figsize, dpi).  The destroy
    method of the GcfDerived from the backends is moved to the derived
    FigureManager.

  * FigureManagerBase moved to backend_bases

  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

  Make sure to self._reset = False in AxisTextWX._set_font.  This was
  something missing in my backend code.
```

CHAPTER

FIFTEEN

THE TOP LEVEL `MATPLOTLIB` MODULE

`matplotlib.`**`use`**(*arg*, *warn=True*, *force=False*)

Set the matplotlib backend to one of the known backends.

The argument is case-insensitive. *warn* specifies whether a warning should be issued if a backend has already been set up. *force* is an **experimental** flag that tells matplotlib to attempt to initialize a new backend by reloading the backend module.

Note: This function must be called *before* importing pyplot for the first time; or, if you are not using pyplot, it must be called before importing matplotlib.backends. If warn is True, a warning is issued if you try and call this after pylab or pyplot have been loaded. In certain black magic use cases, e.g. `pyplot.switch_backend()`, we are doing the reloading necessary to make the backend switch work (in some cases, e.g., pure image backends) so one can set warn=False to suppress the warnings.

To find out which backend is currently set, see `matplotlib.get_backend()`.

`matplotlib.`**`get_backend`**()

Return the name of the current backend.

`matplotlib.`**`rcParams`**

An instance of `RcParams` for handling default matplotlib values.

`matplotlib.`**`rc`**(*group*, ***kwargs*)

Set the current rc params. Group is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current rc params and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above rc command as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}

rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or `rcdefaults()` to restore the default rc params after changes.

`matplotlib.`**`matplotlib_fname`**`()`

Get the location of the config file.

The file location is determined in the following order

- `$PWD/matplotlibrc`
- `$MATPLOTLIBRC/matplotlibrc`
- `$MPLCONFIGDIR/matplotlibrc`
- On Linux,
  - `$HOME/.matplotlib/matplotlibrc`, if it exists
  - or `$XDG_CONFIG_HOME/matplotlib/matplotlibrc` (if $XDG_CONFIG_HOME is defined)
  - or `$HOME/.config/matplotlib/matplotlibrc` (if $XDG_CONFIG_HOME is not defined)
- On other platforms,
  - `$HOME/.matplotlib/matplotlibrc` if `$HOME` is defined.
- Lastly, it looks in `$MATPLOTLIBDATA/matplotlibrc` for a system-defined copy.

class `matplotlib.`**`RcParams`**`(`**args*, ***kwargs*`)`

A dictionary object including validation

validating functions are defined and associated with rc parameters in *`matplotlib.rcsetup`* `matplotlib.`**`rc_params`**`(`*fail_on_error=False*`)`

Return a *`matplotlib.RcParams`* instance from the default matplotlib rc file.

`matplotlib.`**`rc_params_from_file`**`(`*fname*, *fail_on_error=False*, *use_default_template=True*`)`

Return *`matplotlib.RcParams`* from the contents of the given file.

Parameters fname : str

Name of file parsed for matplotlib settings.

fail_on_error : bool

If True, raise an error when the parser fails to convert a parameter.

use_default_template : bool

If True, initialize with default parameters before updating with those in the given file. If False, the configuration class only contains the parameters specified in the file. (Useful for updating dicts.)

class `matplotlib.`**`rc_context`**`(`*rc=None*, *fname=None*`)`

Return a context manager for managing rc settings.

This allows one to do:

```
with mpl.rc_context(fname='screen.rc'):
    plt.plot(x, a)
    with mpl.rc_context(fname='print.rc'):
        plt.plot(x, b)
    plt.plot(x, c)
```

The ‘a’ vs ‘x’ and ‘c’ vs ‘x’ plots would have settings from ‘screen.rc’, while the ‘b’ vs ‘x’ plot would have settings from ‘print.rc’.

A dictionary can also be passed to the context manager:

```
with mpl.rc_context(rc={'text.usetex': True}, fname='screen.rc'):
    plt.plot(x, a)
```

The ‘rc’ dictionary takes precedence over the settings loaded from ‘fname’. Passing a dictionary only is also valid.

CHAPTER

SIXTEEN

AFM (ADOBE FONT METRICS INTERFACE)

16.1 `matplotlib.afm`

This is a python interface to Adobe Font Metrics Files. Although a number of other python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1. copyrighted or used a non-BSD compatible license
2. had too many dependencies and a free standing lib was needed
3. Did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and requires only built-in python libs:

```
>>> from matplotlib import rcParams
>>> import os.path
>>> afm_fname = os.path.join(rcParams['datapath'],
...                         'fonts', 'afm', 'ptmr8a.afm')
>>>
>>> from matplotlib.afm import AFM
>>> with open(afm_fname) as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

class `matplotlib.afm.`**`AFM`**(*fh*)

Bases: `object`

Parse the AFM file in file object *fh*

`family_name`

get_angle()
Return the fontangle as float

get_bbox_char(*c*, *isord=False*)

get_capheight()
Return the cap height as float

get_familyname()
Return the font family name, e.g., 'Times'

get_fontname()
Return the font name, e.g., 'Times-Roman'

get_fullname()
Return the font full name, e.g., 'Times-Roman'

get_height_char(*c*, *isord=False*)
Get the height of character *c* from the bounding box. This is the ink height (space is 0)

get_horizontal_stem_width()
Return the standard horizontal stem width as float, or *None* if not specified in AFM file.

get_kern_dist(*c1*, *c2*)
Return the kerning pair distance (possibly 0) for chars *c1* and *c2*

get_kern_dist_from_name(*name1*, *name2*)
Return the kerning pair distance (possibly 0) for chars *name1* and *name2*

get_name_char(*c*, *isord=False*)
Get the name of the character, i.e., ';' is 'semicolon'

get_str_bbox(*s*)
Return the string bounding box

get_str_bbox_and_descent(*s*)
Return the string bounding box

get_underline_thickness()
Return the underline thickness as float

get_vertical_stem_width()
Return the standard vertical stem width as float, or *None* if not specified in AFM file.

get_weight()
Return the font weight, e.g., 'Bold' or 'Roman'

get_width_char(*c*, *isord=False*)
Get the width of the character from the character metric WX field

get_width_from_char_name(*name*)
Get the width of the character from a type1 character name

get_xheight()
Return the xheight as float

string_width_height(*s*)

Return the string width (including kerning) and string height as a (*w*, *h*) tuple.

matplotlib.afm.**parse_afm**(*fh*)

Parse the Adobe Font Metics file in file handle *fh*. Return value is a (*dhead*, *dcmetrics*, *dkernpairs*, *dcomposite*) tuple where *dhead* is a `_parse_header()` dict, *dcmetrics* is a `_parse_composites()` dict, *dkernpairs* is a `_parse_kern_pairs()` dict (possibly {}), and *dcomposite* is a `_parse_composites()` dict (possibly {})

CHAPTER

SEVENTEEN

`ANIMATION` MODULE

Table of Contents

- *Animation*
- *Writer Classes*
- *Helper Classes*
- *Inheritance Diagrams*
- *Deprecated*

17.1 Animation

The easiest way to make a live animation in matplotlib is to use one of the `Animation` classes.

`FuncAnimation`	Makes an animation by repeatedly calling a function `func`.
`ArtistAnimation`	Animation using a fixed set of `Artist` objects.

17.1.1 matplotlib.animation.FuncAnimation

class `matplotlib.animation.`**`FuncAnimation`**(*fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, ***kwargs*)

Makes an animation by repeatedly calling a function `func`.

Parameters fig : matplotlib.figure.Figure

The figure object that is used to get draw, resize, and any other needed events.

func : callable

The function to call at each frame. The first argument will be the next value in `frames`. Any additional positional arguments can be supplied via the `fargs` parameter.

The required signature is

```
def func(fr: object, *fargs) -> iterable_of_artists:
```

frames : iterable, int, generator function, or None, optional

Source of data to pass `func` and each frame of the animation

If an iterable, then simply use the values provided. If the iterable has a length, it will override the `save_count` kwarg.

If an integer, equivalent to passing `range(frames)`

If a generator function, then must have the signature

```
def gen_function() -> obj:
```

In all of these cases, the values in `frames` is simply passed through to the user-supplied `func` and thus can be of any type.

If `None`, then equivalent to passing `itertools.count`.

init_func : callable, optional

A function used to draw a clear frame. If not given, the results of drawing from the first item in the frames sequence will be used. This function will be called once before the first frame.

If blit=True, `init_func` must return an iterable of artists to be re-drawn.

The required signature is

```
def init_func() -> iterable_of_artists:
```

fargs : tuple or None, optional

Additional arguments to pass to each call to `func`

save_count : int, optional

The number of values from `frames` to cache.

interval : number, optional

Delay between frames in milliseconds. Defaults to 200.

repeat_delay : number, optional

If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to `None`.

repeat : bool, optional

Controls whether the animation should repeat when the sequence of frames is completed. Defaults to `True`.

blit : bool, optional

Controls whether blitting is used to optimize drawing. Defaults to `False`.

`__init__`(*fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, ***kwargs*)

Methods

`__init__`(fig, func[, frames, init_func, ...])	
`new_frame_seq`()	
`new_saved_frame_seq`()	
`save`(filename[, writer, fps, dpi, codec, ...])	Saves a movie file by drawing every frame.
`to_html5_video`()	Returns animation as an HTML5 video tag.

17.1.2 matplotlib.animation.ArtistAnimation

class `matplotlib.animation.`**`ArtistAnimation`**(*fig*, *artists*, **args*, ***kwargs*)

Animation using a fixed set of `Artist` objects.

Before creating an instance, all plotting should have taken place and the relevant artists saved.

Parameters fig : matplotlib.figure.Figure

The figure object that is used to get draw, resize, and any other needed events.

artists : list

Each list entry a collection of artists that represent what needs to be enabled on each frame. These will be disabled for other frames.

interval : number, optional

Delay between frames in milliseconds. Defaults to 200.

repeat_delay : number, optional

If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to `None`.

repeat : bool, optional

Controls whether the animation should repeat when the sequence of frames is completed. Defaults to `True`.

blit : bool, optional

Controls whether blitting is used to optimize drawing. Defaults to `False`.

`__init__`(*fig*, *artists*, **args*, ***kwargs*)

Methods

`__init__`(fig, artists, *args, **kwargs)	
`new_frame_seq`()	Creates a new sequence of frame information.
`new_saved_frame_seq`()	Creates a new sequence of saved/cached frame information.
`save`(filename[, writer, fps, dpi, codec, ...])	Saves a movie file by drawing every frame.
`to_html5_video`()	Returns animation as an HTML5 video tag.

In both cases it is critical to keep a reference to the instance object. The animation is advanced by a timer (typically from the host GUI framework) which the *`Animation`* object holds the only reference to. If you do not hold a reference to the *`Animation`* object, it (and hence the timers), will be garbage collected which will stop the animation.

To save an animation to disk use

`Animation.save`	Saves a movie file by drawing every frame.
`Animation.to_html5_video`	Returns animation as an HTML5 video tag.

17.1.3 matplotlib.animation.Animation.save

`Animation.`**`save`**(*filename*, *writer=None*, *fps=None*, *dpi=None*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *extra_anim=None*, *savefig_kwargs=None*)

Saves a movie file by drawing every frame.

Parameters filename : str

The output filename, e.g., `mymovie.mp4`

writer : *`MovieWriter`* or str, optional

A *`MovieWriter`* instance to use or a key that identifies a class to use, such as ‘ffmpeg’ or ‘mencoder’. If `None`, defaults to `rcParams['animation.writer']`

fps : number, optional

frames per second in the movie. Defaults to None, which will use the animation’s specified interval to set the frames per second.

dpi : number, optional

Controls the dots per inch for the movie frames. This combined with the figure’s size in inches controls the size of the movie. If None, defaults to `rcparam['savefig.dpi']`

codec : str, optional

The video codec to be used. Not all codecs are supported by a given *`MovieWriter`*. If `None`, default to `rcParams['animation.codec']`

bitrate : number, optional

Specifies the number of bits used per second in the compressed movie, in kilobits per second. A higher number means a higher quality movie, but at the cost of increased file size. If `None`, defaults to `rcParam['animation.bitrate']`

extra_args : list, optional

List of extra string arguments to be passed to the underlying movie utility. If `None`, defaults to `rcParams['animation.extra_args']`

metadata : dict, optional

Dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

extra_anim : list, optional

Additional *`Animation`* objects that should be included in the saved movie file. These need to be from the same `matplotlib.Figure` instance. Also, animation frames will just be simply combined, so there should be a 1:1 correspondence between the frames from the different animations.

savefig_kwargs : dict, optional

Is a dictionary containing keyword arguments to be passed on to the 'savefig' command which is called repeatedly to save the individual frames.

Notes

fps, codec, bitrate, extra_args, metadata are used to construct a *`MovieWriter`* instance and can only be passed if `writer` is a string. If they are passed as non-`None` and `writer` is a *`MovieWriter`*, a `RuntimeError` will be raised.

17.1.4 matplotlib.animation.Animation.to_html5_video

`Animation.`**`to_html5_video`**`()`

Returns animation as an HTML5 video tag.

This saves the animation as an h264 video, encoded in base64 directly into the HTML5 video tag. This respects the rc parameters for the writer as well as the bitrate. This also makes use of the `interval` to control the speed, and uses the `repeat` parameter to decide whether to loop.

See *Helper Classes* below for details about what movie formats are supported.

17.1.5 FuncAnimation

The inner workings of *`FuncAnimation`* is more-or-less:

```
for d in frames:
   artists = func(d, *fargs)
   fig.canvas.draw_idle()
   plt.pause(interval)
```

with details to handle 'blitting' (to dramatically improve the live performance), to be non-blocking, handle repeats, multiple animated axes, and easily save the animation to a movie file.

'Blitting' is a old technique in computer graphics. The general gist is to take an existing bit map (in our case a mostly rasterized figure) and then 'blit' one more artist on top. Thus, by managing a saved 'clean' bitmap, we can only re-draw the few artists that are changing at each frame and possibly save significant amounts of time. When using blitting (by passing `blit=True`) the core loop of *FuncAnimation* gets a bit more complicated

```
ax = fig.gca()

def update_blit(artists):
    fig.canvas.restore_region(bg_cache)
    for a in artists:
        a.axes.draw_artist(a)

    ax.figure.canvas.blit(ax.bbox)

artists = init_func()

for a in artists:
   a.set_animated(True)

fig.canvas.draw()
bg_cache = fig.canvas.copy_from_bbox(ax.bbox)

for f in frames:
    artists = func(f, *fargs)
    update_blit(artists)
    plt.pause(interval)
```

This is of course leaving out many details (such as updating the background when the figure is resized or fully re-drawn). However, this hopefully minimalist example gives a sense of how `init_func` and `func` are used inside of *FuncAnimation* and the theory of how 'blitting' works.

The expected signature on `func` and `init_func` is very simple to keep *FuncAnimation* out of your book keeping and plotting logic, but this means that the callable objects you pass in must know what artists they should be working on. There are several approaches to handling this, of varying complexity and encapsulation. The simplest approach, which works quite well in the case of a script, is to define the artist at a global scope and let Python sort things out. For example

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

fig, ax = plt.subplots()
xdata, ydata = [], []
```

```
ln, = plt.plot([], [], 'ro', animated=True)

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
    return ln,

def update(frame):
    xdata.append(frame)
    ydata.append(np.sin(frame))
    ln.set_data(xdata, ydata)
    return ln,

ani = FuncAnimation(fig, update, frames=np.linspace(0, 2*np.pi, 128),
                    init_func=init, blit=True)
plt.show()
```

The second method is to us `functools.partial` to 'bind' artists to function. A third method is to use closures to build up the required artists and functions. A fourth method is to create a class.

Examples

animation example code: animate_decay.py

[source code]

```
"""
=====
Decay
=====

This example showcases a sinusoidal decay animation.
"""

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation

def data_gen(t=0):
    cnt = 0
    while cnt < 1000:
        cnt += 1
        t += 0.1
        yield t, np.sin(2*np.pi*t) * np.exp(-t/10.)

def init():
    ax.set_ylim(-1.1, 1.1)
    ax.set_xlim(0, 10)
    del xdata[:]
    del ydata[:]
    line.set_data(xdata, ydata)
    return line,

fig, ax = plt.subplots()
line, = ax.plot([], [], lw=2)
ax.grid()
xdata, ydata = [], []

def run(data):
    # update the data
    t, y = data
    xdata.append(t)
    ydata.append(y)
    xmin, xmax = ax.get_xlim()

    if t >= xmax:
        ax.set_xlim(xmin, 2*xmax)
        ax.figure.canvas.draw()
    line.set_data(xdata, ydata)

    return line,

ani = animation.FuncAnimation(fig, run, data_gen, blit=False, interval=10,
                              repeat=False, init_func=init)
plt.show()
```

Keywords: python, matplotlib, pylab, example, codex (see *Search examples*)

animation example code: bayes_update.py

[source code]

```
"""
================
The Bayes update
================

This animation displays the posterior estimate updates as it is refitted when
new data arrives.
The vertical line represents the theoretical value to which the plotted
distribution should converge.
"""

# update a distribution based on new data.
import numpy as np
import matplotlib.pyplot as plt
import scipy.stats as ss
from matplotlib.animation import FuncAnimation
```

```
class UpdateDist(object):
    def __init__(self, ax, prob=0.5):

17.2 Writer Classes

The provided writers fall into two broad categories: pipe-based and file-based. The pipe-based writers stream the captured frames over a pipe to an external process. The pipe-based variants tend to be more performant, but may not work on all systems.

FFMpegWriter	Pipe-based ffmpeg writer.
ImageMagickFileWriter	File-based animated gif writer.
AVConvWriter	Pipe-based avconv writer.

17.2.1 matplotlib.animation.FFMpegWriter

class `matplotlib.animation.`**`FFMpegWriter`**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based ffmpeg writer.

Frames are streamed directly to ffmpeg via a pipe and written in a single pass.

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

MovieWriter

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

`__init__`([fps, codec, bitrate, extra_args, ...])	MovieWriter
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	Clean-up and collect the process used to write the movie file.
`finish`()	Finish any processing for writing the movie.
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.

Continued on next page

Table 17.6 – continued from previous page

`setup`(fig, outfile, dpi)	Perform setup for writing the movie file.

Attributes

`args_key`	
`exec_key`	
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	

17.2.2 matplotlib.animation.ImageMagickFileWriter

class `matplotlib.animation.`**`ImageMagickFileWriter`**(**args*, ***kwargs*)

File-based animated gif writer.

Frames are written to temporary files on disk and then stitched together at the end.

`__init__`(**args*, ***kwargs*)

Methods

`__init__`(*args, **kwargs)	
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	
`finish`()	
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a ImageMagickWriter is actually available.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi[, frame_prefix, ...])	Perform setup for writing the movie file.

Attributes

`args_key`	
`delay`	
`exec_key`	

Continued on next page

Table 17.9 – continued from previous page

`frame_format`	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	
`supported_formats`	

17.2.3 matplotlib.animation.AVConvWriter

class `matplotlib.animation.`**`AVConvWriter`**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based avconv writer.

Frames are streamed directly to avconv via a pipe and written in a single pass.

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

MovieWriter

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

`__init__`([fps, codec, bitrate, extra_args, ...])	MovieWriter
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	Clean-up and collect the process used to write the movie file.
`finish`()	Finish any processing for writing the movie.
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi)	Perform setup for writing the movie file.

Attributes

`args_key`	
`exec_key`	
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	

Alternatively the file-based writers save temporary files for each frame which are stitched into a single file at the end. Although slower, these writers can be easier to debug.

`FFMpegFileWriter`	File-based ffmpeg writer.

Continued on next page

Table 17.12 – continued from previous page

ImageMagickWriter	Pipe-based animated gif.
AVConvFileWriter	File-based avconv writer.

17.2.4 matplotlib.animation.FFMpegFileWriter

class `matplotlib.animation.`**`FFMpegFileWriter`**(**args*, ***kwargs*)

File-based ffmpeg writer.

Frames are written to temporary files on disk and then stitched together at the end.

`__init__`(**args*, ***kwargs*)

Methods

`__init__`(*args, **kwargs)	
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	
`finish`()	
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi[, frame_prefix, ...])	Perform setup for writing the movie file.

Attributes

`args_key`	
`exec_key`	
`frame_format`	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	
`supported_formats`	

17.2.5 matplotlib.animation.ImageMagickWriter

class `matplotlib.animation.`**`ImageMagickWriter`**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based animated gif.

Frames are streamed directly to ImageMagick via a pipe and written in a single pass.

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

MovieWriter

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

`__init__`([fps, codec, bitrate, extra_args, ...])	MovieWriter
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	Clean-up and collect the process used to write the movie file.
`finish`()	Finish any processing for writing the movie.
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a ImageMagickWriter is actually available.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi)	Perform setup for writing the movie file.

Attributes

`args_key`	
`delay`	
`exec_key`	
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	

17.2.6 matplotlib.animation.AVConvFileWriter

class `matplotlib.animation.`**`AVConvFileWriter`**(**args*, ***kwargs*)

File-based avconv writer.

Frames are written to temporary files on disk and then stitched together at the end.

`__init__`(**args*, ***kwargs*)

Methods

`__init__`(*args, **kwargs)	
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	
`finish`()	
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi[, frame_prefix, ...])	Perform setup for writing the movie file.

Attributes

`args_key`	
`exec_key`	
`frame_format`	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	
`supported_formats`	

Fundamentally, a *`MovieWriter`* provides a way to grab sequential frames from the same underlying *`Figure`* object. The base class *`MovieWriter`* implements 3 methods and a context manager. The only difference between the pipe-based and file-based writers is in the arguments to their respective `setup` methods.

`MovieWriter.setup`	Perform setup for writing the movie file.
`FileMovieWriter.setup`	Perform setup for writing the movie file.
`MovieWriter.grab_frame`	Grab the image information from the figure and save as a movie frame.
`MovieWriter.finish`	Finish any processing for writing the movie.
`MovieWriter.saving`	Context manager to facilitate writing the movie file.

17.2.7 matplotlib.animation.MovieWriter.setup

`MovieWriter.`**`setup`**(*fig*, *outfile*, *dpi*)

Perform setup for writing the movie file.

Parameters fig : `matplotlib.Figure` instance

The figure object that contains the information for frames

outfile : string

The filename of the resulting movie file

dpi : int

The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

17.2.8 matplotlib.animation.FileMovieWriter.setup

`FileMovieWriter.`**`setup`**(*fig*, *outfile*, *dpi*, *frame_prefix='_tmp'*, *clear_temp=True*)

Perform setup for writing the movie file.

Parameters fig : matplotlib.figure.Figure

The figure to grab the rendered frames from.

outfile : str

The filename of the resulting movie file.

dpi : number

The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file.

frame_prefix : str, optional

The filename prefix to use for temporary files. Defaults to '_tmp'.

clear_temp : bool, optional

If the temporary files should be deleted after stitching the final result. Setting this to `False` can be useful for debugging. Defaults to `True`.

17.2.9 matplotlib.animation.MovieWriter.grab_frame

`MovieWriter.`**`grab_frame`**(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in savefig_kwargs are passed on to the 'savefig' command that saves the figure.

17.2.10 matplotlib.animation.MovieWriter.finish

`MovieWriter.`**`finish`**()

Finish any processing for writing the movie.

17.2.11 matplotlib.animation.MovieWriter.saving

`MovieWriter.`**`saving`**`(`**args*, ***kw*`)`

Context manager to facilitate writing the movie file.

`*args, **kw` are any parameters that should be passed to *`setup`*.

The `setup()` method is used to prepare the writer (possibly opening a pipe), successive calls to `grab_frame()` capture a single frame at a time and `finish()` finalizes the movie and writes the output file to disk. For example

```
moviewriter = MovieWriter(...)
moviewriter.setup(fig=fig, 'my_movie.ext', dpi=100)
for j in range(n):
    update_figure(n)
    moviewriter.grab_frame()
moviewriter.finish()
```

If using the writer classes directly (not through *`Animation.save`*), it is strongly encouraged to use the *`saving`* context manager

```
with moviewriter.saving(fig, 'myfile.mp4', dpi=100):
    for j in range(n):
        update_figure(n)
        moviewriter.grab_frame()
```

to ensures that setup and cleanup are performed as necessary.

animation example code: moviewriter.py

17.3 Helper Classes

17.3.1 Animation Base Classes

`Animation`	This class wraps the creation of an animation using matplotlib.
`TimedAnimation`	*`Animation`* subclass for time-based animation.

matplotlib.animation.Animation

class `matplotlib.animation.`**`Animation`**`(`*fig*, *event_source=None*, *blit=False*`)`

This class wraps the creation of an animation using matplotlib.

It is only a base class which should be subclassed to provide needed behavior.

This class is not typically used directly.

Parameters fig : matplotlib.figure.Figure

The figure object that is used to get draw, resize, and any other needed events.

event_source : object, optional

A class that can run a callback when desired events are generated, as well as be stopped and started.

Examples include timers (see `TimedAnimation`) and file system notifications.

blit : bool, optional

controls whether blitting is used to optimize drawing. Defaults to `False`.

See also:

`FuncAnimation`, `ArtistAnimation`

`__init__`(*fig*, *event_source=None*, *blit=False*)

Methods

`__init__`(fig[, event_source, blit])	
`new_frame_seq`()	Creates a new sequence of frame information.
`new_saved_frame_seq`()	Creates a new sequence of saved/cached frame information.
`save`(filename[, writer, fps, dpi, codec, ...])	Saves a movie file by drawing every frame.
`to_html5_video`()	Returns animation as an HTML5 video tag.

matplotlib.animation.TimedAnimation

class `matplotlib.animation.`**`TimedAnimation`**(*fig*, *interval=200*, *repeat_delay=None*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)

`Animation` subclass for time-based animation.

A new frame is drawn every *interval* milliseconds.

Parameters fig : matplotlib.figure.Figure

The figure object that is used to get draw, resize, and any other needed events.

interval : number, optional

Delay between frames in milliseconds. Defaults to 200.

repeat_delay : number, optional

If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to `None`.

repeat : bool, optional

Controls whether the animation should repeat when the sequence of frames is completed. Defaults to `True`.

blit : bool, optional

Controls whether blitting is used to optimize drawing. Defaults to `False`.

`__init__`(*fig*, *interval=200*, *repeat_delay=None*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)

Methods

`__init__`(fig[, interval, repeat_delay, ...])	
`new_frame_seq`()	Creates a new sequence of frame information.
`new_saved_frame_seq`()	Creates a new sequence of saved/cached frame information.
`save`(filename[, writer, fps, dpi, codec, ...])	Saves a movie file by drawing every frame.
`to_html5_video`()	Returns animation as an HTML5 video tag.

17.3.2 Custom Animation classes

animation example code: subplots.py

17.3.3 Writer Registry

A module-level registry is provided to map between the name of the writer and the class to allow a string to be passed to *`Animation.save`* instead of a writer instance.

`MovieWriterRegistry`	Registry of available writer classes by human readable name.

matplotlib.animation.MovieWriterRegistry

class `matplotlib.animation.`**`MovieWriterRegistry`**

Registry of available writer classes by human readable name.

`__init__`()

Methods

`__init__`()	
`ensure_not_dirty`()	If dirty, reasks the writers if they are available
`is_available`(name)	Check if given writer is available by name.
`list`()	Get a list of available MovieWriters.

Continued on next page

Table 17.24 – continued from previous page

`register(name)`	
`reset_available_writers()`	Reset the available state of all registered writers
`set_dirty()`	Sets a flag to re-setup the writers

17.3.4 Writer Base Classes

To reduce code duplication base classes

`MovieWriter`	Base class for writing movies.
`FileMovieWriter`	*`MovieWriter`* for writing to individual files and stitching at the end.

matplotlib.animation.MovieWriter

class `matplotlib.animation.`**`MovieWriter`**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Base class for writing movies.

This class is set up to provide for writing movie frame data to a pipe. See examples for how to use these classes.

Attributes

frame_format	(str) The format used in writing frame data, defaults to 'rgba'
fig	(*`Figure`*) The figure to capture data from. This must be provided by the sub-classes.

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

MovieWriter

Parameters fps: int

Framerate for movie.

codec: string or None, optional

The codec to use. If None (the default) the setting in the rcParam `animation.codec` is used.

bitrate: int or None, optional

The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the value stored in the rcParam `animation.bitrate`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args: list of strings or None

A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the 'animation.extra_args' rcParam.

metadata: dict of string:string or None

A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

`__init__`([fps, codec, bitrate, extra_args, ...])	MovieWriter
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	Clean-up and collect the process used to write the movie file.
`finish`()	Finish any processing for writing the movie.
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.

Continued on next page

Table 17.26 – continued from previous page

`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi)	Perform setup for writing the movie file.

Attributes

`frame_size`	A tuple (width,height) in pixels of a movie frame.

matplotlib.animation.FileMovieWriter

class `matplotlib.animation.`**`FileMovieWriter`**(**args*, ***kwargs*)

`MovieWriter` for writing to individual files and stitching at the end.

This must be sub-classed to be useful.

`__init__`(**args*, ***kwargs*)

Methods

`__init__`(*args, **kwargs)	
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	
`finish`()	
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi[, frame_prefix, ...])	Perform setup for writing the movie file.

Attributes

`frame_format`	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple (width,height) in pixels of a movie frame.

and mixins are provided

`AVConvBase`	Mixin class for avconv output.
`FFMpegBase`	Mixin class for FFMpeg output.
`ImageMagickBase`	Mixin class for ImageMagick output.

matplotlib.animation.AVConvBase

class `matplotlib.animation.`**`AVConvBase`**

Mixin class for avconv output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` sub-class.

`__init__`()

Initialize self. See help(type(self)) for accurate signature.

Attributes

`args_key`
`exec_key`
`output_args`

matplotlib.animation.FFMpegBase

class `matplotlib.animation.`**`FFMpegBase`**

Mixin class for FFMpeg output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` sub-class.

`__init__`()

Initialize self. See help(type(self)) for accurate signature.

Attributes

`args_key`
`exec_key`
`output_args`

matplotlib.animation.ImageMagickBase

class `matplotlib.animation.`**`ImageMagickBase`**

Mixin class for ImageMagick output.

To be useful this must be multiply-inherited from with a `MovieWriterBase` sub-class.

`__init__`()

Initialize self. See help(type(self)) for accurate signature.

Methods

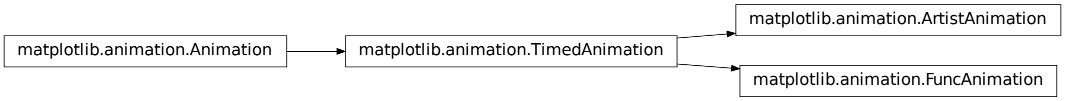
`isAvailable()`	Check to see if a ImageMagickWriter is actually available.

Attributes

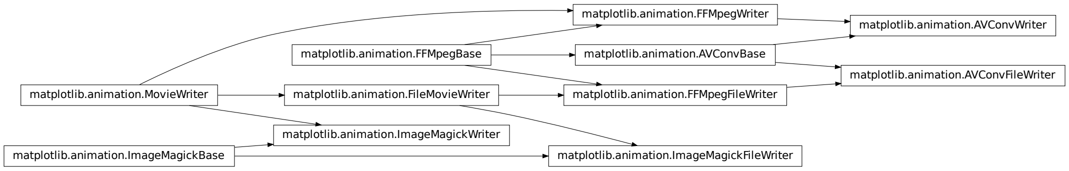
`args_key`
`delay`
`exec_key`
`output_args`

See the source code for how to easily implement new *`MovieWriter`* classes.

17.4 Inheritance Diagrams



matplotlib.animation.Animation
matplotlib.animation.TimedAnimation
matplotlib.animation.ArtistAnimation
matplotlib.animation.FuncAnimation



matplotlib.animation.FFMpegWriter
matplotlib.animation.AVConvWriter
matplotlib.animation.FFMpegBase
matplotlib.animation.AVConvBase
matplotlib.animation.AVConvFileWriter
matplotlib.animation.MovieWriter
matplotlib.animation.FileMovieWriter

17.5 Deprecated

`MencoderBase`	
`MencoderFileWriter`	Deprecated since version 2.0.

Continued on next page

Table 17.35 – continued from previous page

MencoderWriter	Deprecated since version 2.0.

17.5.1 matplotlib.animation.MencoderBase

class `matplotlib.animation.`**`MencoderBase`**

`__init__`()

Initialize self. See help(type(self)) for accurate signature.

Attributes

`allowed_metadata`
`args_key`
`exec_key`
`output_args`

17.5.2 matplotlib.animation.MencoderFileWriter

class `matplotlib.animation.`**`MencoderFileWriter`**(**args*, ***kwargs*)

Deprecated since version 2.0: Support for mencoder is only partially functional, and will be removed entirely in 2.2. Please use ffmpeg instead.

`__init__`(**args*, ***kwargs*)

Deprecated since version 2.0: Support for mencoder is only partially functional, and will be removed entirely in 2.2. Please use ffmpeg instead.

Methods

`__init__`(*args, **kwargs)	Deprecated since version 2.0.
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	
`finish`()	
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.

Continued on next page

Table 17.37 – continued from previous page

`setup`(fig, outfile, dpi[, frame_prefix, ...])	Perform setup for writing the movie file.

Attributes

`allowed_metadata`	
`args_key`	
`exec_key`	
`frame_format`	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`	
`supported_formats`	

17.5.3 matplotlib.animation.MencoderWriter

class `matplotlib.animation.`**`MencoderWriter`**(**args*, ***kwargs*)

Deprecated since version 2.0: Support for mencoder is only partially functional, and will be removed entirely in 2.2. Please use ffmpeg instead.

`__init__`(**args*, ***kwargs*)

Deprecated since version 2.0: Support for mencoder is only partially functional, and will be removed entirely in 2.2. Please use ffmpeg instead.

Methods

`__init__`(*args, **kwargs)	Deprecated since version 2.0.
`bin_path`()	Returns the binary path to the commandline tool used by a specific subclass.
`cleanup`()	Clean-up and collect the process used to write the movie file.
`finish`()	Finish any processing for writing the movie.
`grab_frame`(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
`isAvailable`()	Check to see if a MovieWriter subclass is actually available by running the commandline tool.
`saving`(*args, **kw)	Context manager to facilitate writing the movie file.
`setup`(fig, outfile, dpi)	Perform setup for writing the movie file.

Attributes

`allowed_metadata`	
`args_key`	
`exec_key`	
`frame_size`	A tuple (width,height) in pixels of a movie frame.
`output_args`

18.1 `Artist` class

class `matplotlib.artist.`**`Artist`**

Abstract base class for someone who renders into a `FigureCanvas`.

18.1.1 Interactive

`Artist.add_callback`	Adds a callback function that will be called whenever one of the *`Artist`*'s properties changes.
`Artist.format_cursor_data`	Return *cursor data* string formatted.
`Artist.get_contains`	Return the _contains test used by the artist, or *None* for default.
`Artist.get_cursor_data`	Get the cursor data for a given event.
`Artist.get_picker`	Return the picker object used by this artist
`Artist.hitlist`	List the children of the artist which contain the mouse event *event*.
`Artist.mouseover`	
`Artist.pchanged`	Fire an event when property changed, calling all of the registered callbacks.
`Artist.pick`	Process pick event
`Artist.pickable`	Return *True* if *`Artist`* is pickable.
`Artist.remove_callback`	Remove a callback based on its *id*.
`Artist.set_contains`	Replace the contains test used by this artist.
`Artist.set_picker`	Set the epsilon for picking used by this artist
`Artist.contains`	Test whether the artist contains the mouse event.

matplotlib.artist.Artist.add_callback

`Artist.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the *`Artist`*'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

matplotlib.artist.Artist.format_cursor_data

`Artist.`**`format_cursor_data`**`(`*data*`)`

Return *cursor data* string formatted.

matplotlib.artist.Artist.get_contains

`Artist.`**`get_contains`**`()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.artist.Artist.get_cursor_data

`Artist.`**`get_cursor_data`**`(`*event*`)`

Get the cursor data for a given event.

matplotlib.artist.Artist.get_picker

`Artist.`**`get_picker`**`()`

Return the picker object used by this artist

matplotlib.artist.Artist.hitlist

`Artist.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.artist.Artist.mouseover

`Artist.`**`mouseover`**

matplotlib.artist.Artist.pchanged

`Artist.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.artist.Artist.pick

`Artist.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.artist.Artist.pickable

`Artist.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.artist.Artist.remove_callback

`Artist.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

add_callback() For adding callbacks

matplotlib.artist.Artist.set_contains

`Artist.`**`set_contains`**`(`*picker*`)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.artist.Artist.set_picker

`Artist.`**`set_picker`**`(`*picker*`)`

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.artist.Artist.contains

`Artist.`**`contains`**`(`*mouseevent*`)`

Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

18.1.2 Margins and Autoscaling

Artist.sticky_edges	`x` and `y` sticky edge lists.

matplotlib.artist.Artist.sticky_edges

`Artist.`**`sticky_edges`**

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

18.1.3 Clipping

Artist.get_clip_box	Return artist clipbox
Artist.get_clip_on	Return whether artist uses clipping
Artist.get_clip_path	Return artist clip path
Artist.set_clip_box	Set the artist’s clip *Bbox*.
Artist.set_clip_on	Set whether artist uses clipping.
Artist.set_clip_path	Set the artist’s clip path, which may be:

matplotlib.artist.Artist.get_clip_box

`Artist.`**`get_clip_box`**`()`

Return artist clipbox

matplotlib.artist.Artist.get_clip_on

`Artist.`**`get_clip_on`**`()`

Return whether artist uses clipping

matplotlib.artist.Artist.get_clip_path

`Artist.`**`get_clip_path`**`()`

Return artist clip path

matplotlib.artist.Artist.set_clip_box

`Artist.`**`set_clip_box`**(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

matplotlib.artist.Artist.set_clip_on

`Artist.`**`set_clip_on`**(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.artist.Artist.set_clip_path

`Artist.`**`set_clip_path`**(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

18.1.4 Bulk Properties

`Artist.update`	Update the properties of this `Artist` from the dictionary *prop*.
`Artist.update_from`	Copy properties from *other* to *self*.
`Artist.properties`	return a dictionary mapping property name -> value for all Artist props
`Artist.set`	A property batch setter.

matplotlib.artist.Artist.update

`Artist.`**`update`**(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.artist.Artist.update_from

`Artist.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.artist.Artist.properties

`Artist.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.artist.Artist.set

`Artist.`**`set`**`(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

18.1.5 Drawing

`Artist.draw`	Derived classes drawing method
`Artist.get_animated`	Return the artist's animated state
`Artist.set_animated`	Set the artist's animation state.
`Artist.get_agg_filter`	return filter function to be used for agg filter
`Artist.get_alpha`	Return the alpha value used for blending - not supported on all
`Artist.get_snap`	Returns the snap setting which may be:
`Artist.get_visible`	Return the artist's visiblity
`Artist.get_zorder`	Return the `Artist`'s zorder.
`Artist.set_agg_filter`	set agg_filter fuction.
`Artist.set_alpha`	Set the alpha value used for blending - not supported on all backends.
`Artist.set_sketch_params`	Sets the sketch parameters.
`Artist.set_snap`	Sets the snap setting which may be:
`Artist.get_rasterized`	return True if the artist is to be rasterized
`Artist.get_sketch_params`	Returns the sketch parameters for the artist.
`Artist.set_path_effects`	set path_effects, which should be a list of instances of
`Artist.set_rasterized`	Force rasterized (bitmap) drawing in vector backend output.
`Artist.zorder`	
`Artist.set_visible`	Set the artist's visiblity.
`Artist.set_zorder`	Set the zorder for the artist.
`Artist.get_window_extent`	Get the axes bounding box in display space.
`Artist.get_path_effects`	
`Artist.get_transformed_clip_path_and_affine`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.artist.Artist.draw

Artist.**draw**(*renderer*, **args*, ***kwargs*)
Derived classes drawing method

matplotlib.artist.Artist.get_animated

Artist.**get_animated**()
Return the artist's animated state

matplotlib.artist.Artist.set_animated

Artist.**set_animated**(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.artist.Artist.get_agg_filter

Artist.**get_agg_filter**()
return filter function to be used for agg filter

matplotlib.artist.Artist.get_alpha

Artist.**get_alpha**()
Return the alpha value used for blending - not supported on all backends

matplotlib.artist.Artist.get_snap

Artist.**get_snap**()
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.artist.Artist.get_visible

Artist.**get_visible**()
Return the artist's visiblity

matplotlib.artist.Artist.get_zorder

`Artist.`**`get_zorder`**`()`

Return the *`Artist`*'s zorder.

matplotlib.artist.Artist.set_agg_filter

`Artist.`**`set_agg_filter`**`(`*filter_func*`)`

set agg_filter fuction.

matplotlib.artist.Artist.set_alpha

`Artist.`**`set_alpha`**`(`*alpha*`)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.artist.Artist.set_sketch_params

`Artist.`**`set_sketch_params`**`(`*scale=None*, *length=None*, *randomness=None*`)`

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.artist.Artist.set_snap

`Artist.`**`set_snap`**`(`*snap*`)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.artist.Artist.get_rasterized

`Artist.`**`get_rasterized`**`()`

return True if the artist is to be rasterized

matplotlib.artist.Artist.get_sketch_params

`Artist.`**`get_sketch_params`**`()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.artist.Artist.set_path_effects

`Artist.`**`set_path_effects`**`(`*path_effects*`)`

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.artist.Artist.set_rasterized

`Artist.`**`set_rasterized`**`(`*rasterized*`)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.artist.Artist.zorder

`Artist.`**`zorder`** **= 0**

matplotlib.artist.Artist.set_visible

`Artist.`**`set_visible`**`(`*b*`)`

Set the artist's visiblity.

ACCEPTS: [True | False]

matplotlib.artist.Artist.set_zorder

`Artist.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.artist.Artist.get_window_extent

`Artist.`**`get_window_extent`**`(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.artist.Artist.get_path_effects

`Artist.`**`get_path_effects`**`()`

matplotlib.artist.Artist.get_transformed_clip_path_and_affine

`Artist.`**`get_transformed_clip_path_and_affine`**`()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

18.1.6 Figure and Axes

`Artist.remove`	Remove the artist from the figure if possible.
`Artist.axes`	The *`Axes`* instance the artist resides in, or *None*.
`Artist.get_axes`	Return the *`Axes`* instance the artist resides in, or *None*.
`Artist.set_axes`	Set the *`Axes`* instance in which the artist resides, if any.
`Artist.set_figure`	Set the *`Figure`* instance the artist belongs to.
`Artist.get_figure`	Return the *`Figure`* instance the artist belongs to.
`Artist.is_figure_set`	Returns True if the artist is assigned to a *`Figure`*.

matplotlib.artist.Artist.remove

`Artist.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.artist.Artist.axes

`Artist.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.artist.Artist.get_axes

`Artist.`**`get_axes`**`()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.artist.Artist.set_axes

`Artist.`**`set_axes`**`(`*axes*`)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

matplotlib.artist.Artist.set_figure

`Artist.`**`set_figure`**`(`*fig*`)`

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.artist.Artist.get_figure

`Artist.`**`get_figure`**`()`

Return the `Figure` instance the artist belongs to.

matplotlib.artist.Artist.is_figure_set

`Artist.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

18.1.7 Children

Artist.get_children	Return a list of the child `Artist`s this `:class:`Artist` contains.
Artist.findobj	Find artist objects.

matplotlib.artist.Artist.get_children

`Artist.`**`get_children`**`()`

Return a list of the child `Artist`s this :class:`Artist` contains.

matplotlib.artist.Artist.findobj

`Artist.`**`findobj`**`(`*match=None*, *include_self=True*`)`

Find artist objects.

Recursively find all *Artist* instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

18.1.8 Transform

Artist.set_transform	Set the *Transform* instance used by this artist.
Artist.get_transform	Return the *Transform* instance used by this artist.
Artist.is_transform_set	Returns *True* if *Artist* has a transform explicitly set.

matplotlib.artist.Artist.set_transform

`Artist.`**`set_transform`**`(`*t*`)`

Set the *Transform* instance used by this artist.

ACCEPTS: *Transform* instance

matplotlib.artist.Artist.get_transform

`Artist.`**`get_transform`**`()`

Return the *Transform* instance used by this artist.

matplotlib.artist.Artist.is_transform_set

`Artist.`**`is_transform_set`**`()`

Returns *True* if *`Artist`* has a transform explicitly set.

18.1.9 Units

`Artist.convert_xunits`	For artists in an axes, if the xaxis has units support,
`Artist.convert_yunits`	For artists in an axes, if the yaxis has units support,
`Artist.have_units`	Return *True* if units are set on the *x* or *y* axes

matplotlib.artist.Artist.convert_xunits

`Artist.`**`convert_xunits`**`(`*x*`)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.artist.Artist.convert_yunits

`Artist.`**`convert_yunits`**`(`*y*`)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.artist.Artist.have_units

`Artist.`**`have_units`**`()`

Return *True* if units are set on the *x* or *y* axes

18.1.10 Metadata

`Artist.get_gid`	Returns the group id
`Artist.get_label`	Get the label used for this artist in the legend.
`Artist.set_gid`	Sets the (group) id for the artist
`Artist.set_label`	Set the label to *s* for auto legend.
`Artist.get_url`	Returns the url
`Artist.set_url`	Sets the url for the artist
`Artist.aname`	

matplotlib.artist.Artist.get_gid

`Artist.`**`get_gid`**`()`

Returns the group id

matplotlib.artist.Artist.get_label

`Artist.`**`get_label`**`()`

Get the label used for this artist in the legend.

matplotlib.artist.Artist.set_gid

`Artist.`**`set_gid`**`(`*gid*`)`

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.artist.Artist.set_label

`Artist.`**`set_label`**`(`*s*`)`

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

matplotlib.artist.Artist.get_url

`Artist.`**`get_url`**`()`

Returns the url

matplotlib.artist.Artist.set_url

`Artist.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.artist.Artist.aname

`Artist.`**`aname`** **= 'Artist'**

18.1.11 Stale

`Artist.stale`	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.artist.Artist.stale

`Artist.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

18.2 Functions

`allow_rasterization`	Decorator for Artist.draw method.
`get`	Return the value of object's property.
`getp`	Return the value of object's property.
`setp`	Set a property on an artist object.
`kwdoc`	
`ArtistInspector`	A helper class to inspect an *`Artist`* and return information about it's settable properties and their current values.

18.2.1 matplotlib.artist.allow_rasterization

`matplotlib.artist.`**`allow_rasterization`**(*draw*)

Decorator for Artist.draw method. Provides routines that run before and after the draw call. The before and after functions are useful for changing artist-dependant renderer attributes or making other setup function calls, such as starting and flushing a mixed-mode renderer.

18.2.2 matplotlib.artist.get

`matplotlib.artist.`**`get`**(*obj*, *property=None*)

Return the value of object's property. *property* is an optional string for the property you want to return

Example usage:

```
getp(obj)  # get all the object properties
getp(obj, 'linestyle')  # get the linestyle property
```

obj is a *`Artist`* instance, e.g., `Line2D` or an instance of a *`Axes`* or *`matplotlib.text.Text`*. If the *property* is 'somename', this function returns

> obj.get_somename()

`getp()` can be used to query all the gettable properties with `getp(obj)`. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

> property or alias = value

e.g.:

> linewidth or lw = 2

18.2.3 matplotlib.artist.getp

`matplotlib.artist.`**`getp`**(*obj*, *property=None*)

Return the value of object's property. *property* is an optional string for the property you want to return

Example usage:

```
getp(obj)  # get all the object properties
getp(obj, 'linestyle')  # get the linestyle property
```

obj is a *`Artist`* instance, e.g., `Line2D` or an instance of a *`Axes`* or *`matplotlib.text.Text`*. If the *property* is 'somename', this function returns

> obj.get_somename()

`getp()` can be used to query all the gettable properties with `getp(obj)`. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

> property or alias = value

e.g.:

> linewidth or lw = 2

18.2.4 matplotlib.artist.setp

`matplotlib.artist.`**`setp`**(*obj*, **args*, ***kwargs*)

Set a property on an artist object.

matplotlib supports the use of *`setp()`* ("set property") and *`getp()`* to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```
>>> line, = plot([1,2,3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```
>>> setp(line, 'linestyle')
    linestyle: [ '-' | '--' | '-.' | ':' | 'steps' | 'None' ]
```

If you want to see all the properties that can be set, and their possible values, you can do:

```
>>> setp(line)
    ... long output listing omitted
```

`setp()` operates on a single instance or a list of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the

instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```
>>> x = arange(0,1.0,0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')        # python style
```

18.2.5 matplotlib.artist.kwdoc

`matplotlib.artist.`**`kwdoc`**(*a*)

18.2.6 matplotlib.artist.ArtistInspector

class `matplotlib.artist.`**`ArtistInspector`**(*o*)

A helper class to inspect an *`Artist`* and return information about it's settable properties and their current values.

Initialize the artist inspector with an *`Artist`* or sequence of `Artists`. If a sequence is used, we assume it is a homogeneous sequence (all `Artists` are of the same type) and it is your responsibility to make sure this is so.

`__init__`(*o*)

Initialize the artist inspector with an *`Artist`* or sequence of `Artists`. If a sequence is used, we assume it is a homogeneous sequence (all `Artists` are of the same type) and it is your responsibility to make sure this is so.

Methods

`__init__`(o)	Initialize the artist inspector with an *`Artist`* or sequence of `Artists`.
`aliased_name`(s)	return 'PROPNAME or alias' if *s* has an alias, else return
`aliased_name_rest`(s, target)	return 'PROPNAME or alias' if *s* has an alias, else return
`findobj`([match])	Recursively find all *`matplotlib.artist.Artist`* instances contained in *self*.

Continued on next page

Table 18.13 – continued from previous page

`get_aliases`()	Get a dict mapping *fullname* -> *alias* for each *alias* in the `ArtistInspector`.
`get_setters`()	Get the attribute strings with setters for object.
`get_valid_values`(attr)	Get the legal arguments for the setter associated with *attr*.
`is_alias`(o)	Return *True* if method object *o* is an alias for another function.
`pprint_getters`()	Return the getters and actual values as list of strings.
`pprint_setters`([prop, leadingspace])	If *prop* is *None*, return a list of strings of all settable properies and their valid values.
`pprint_setters_rest`([prop, leadingspace])	If *prop* is *None*, return a list of strings of all settable properies and their valid values.
`properties`()	return a dictionary mapping property name -> value

CHAPTER

NINETEEN

AXES CLASS

class `matplotlib.axes.`**`Axes`**(*fig*, *rect*, *facecolor=None*, *frameon=True*, *sharex=None*, *sharey=None*, *label=''*, *xscale=None*, *yscale=None*, *axisbg=None*, ***kwargs*)

The `Axes` contains most of the figure elements: `Axis`, `Tick`, `Line2D`, `Text`, `Polygon`, etc., and sets the coordinate system.

The `Axes` instance supports callbacks through a callbacks attribute which is a `CallbackRegistry` instance. The events you can connect to are 'xlim_changed' and 'ylim_changed' and the callback will be called with func(*ax*) where *ax* is the `Axes` instance.

19.1 Plotting

19.1.1 Basic

`Axes.plot`	Plot lines and/or markers to the `Axes`.
`Axes.errorbar`	Plot an errorbar graph.
`Axes.scatter`	Make a scatter plot of `x` vs `y`
`Axes.plot_date`	A plot with data that contains dates.
`Axes.step`	Make a step plot.
`Axes.loglog`	Make a plot with log scaling on both the x and y axis.
`Axes.semilogx`	Make a plot with log scaling on the x axis.
`Axes.semilogy`	Make a plot with log scaling on the `y` axis.
`Axes.fill_between`	Make filled polygons between two curves.
`Axes.fill_betweenx`	Make filled polygons between two horizontal curves.

Continued on next page

Table 19.1 – continued from previous page

`Axes.bar`	Make a bar plot.
`Axes.barh`	Make a horizontal bar plot.
`Axes.stem`	Create a stem plot.
`Axes.eventplot`	Plot identical parallel lines at specific positions.
`Axes.pie`	Plot a pie chart.
`Axes.stackplot`	Draws a stacked area plot.
`Axes.broken_barh`	Plot horizontal bars.
`Axes.vlines`	Plot vertical lines.
`Axes.hlines`	Plot horizontal lines at each `y` from `xmin` to `xmax`.
`Axes.fill`	Plot filled polygons.

matplotlib.axes.Axes.plot

`Axes.plot`(**args*, ***kwargs*)

Plot lines and/or markers to the `Axes`. *args* is a variable length argument, allowing for multiple *x*, *y* pairs with an optional format string. For example, each of the following is legal:

```
plot(x, y)        # plot x and y using default line style and color
plot(x, y, 'bo')  # plot x and y using blue circle markers
plot(y)           # plot y using x as index array 0..N-1
plot(y, 'r+')     # ditto, but with red plusses
```

If *x* and/or *y* is 2-dimensional, then the corresponding columns will be plotted.

If used with labeled data, make sure that the color spec is not included as an element in data, as otherwise the last case `plot("v","r", data={"v":..., "r":...)` can be interpreted as the first case which would do `plot(v, r)` using the default line style and color.

If not used with labeled data (i.e., without a data argument), an arbitrary number of *x*, *y*, *fmt* groups can be specified, as in:

```
a.plot(x1, y1, 'g^', x2, y2, 'g-')
```

Return value is a list of lines that were added.

By default, each line is assigned a different style specified by a 'style cycle'. To change this behavior, you can edit the axes.prop_cycle rcParam.

The following format string characters are accepted to control the line style or marker:

character	description
`'-'`	solid line style
`'--'`	dashed line style
`'-.'`	dash-dot line style
`':'`	dotted line style
`'.'`	point marker
`','`	pixel marker
`'o'`	circle marker
`'v'`	triangle_down marker
`'^'`	triangle_up marker
`'<'`	triangle_left marker
`'>'`	triangle_right marker
`'1'`	tri_down marker
`'2'`	tri_up marker
`'3'`	tri_left marker
`'4'`	tri_right marker
`'s'`	square marker
`'p'`	pentagon marker
`'*'`	star marker
`'h'`	hexagon1 marker
`'H'`	hexagon2 marker
`'+'`	plus marker
`'x'`	x marker
`'D'`	diamond marker
`'d'`	thin_diamond marker
`'|'`	vline marker
`'_'`	hline marker

The following color abbreviations are supported:

character	color
‘b’	blue
‘g’	green
‘r’	red
‘c’	cyan
‘m’	magenta
‘y’	yellow
‘k’	black
‘w’	white

In addition, you can specify colors in many weird and wonderful ways, including full names (`'green'`), hex strings (`'#008000'`), RGB or RGBA tuples (`(0,1,0,1)`) or grayscale intensities as a string (`'0.8'`). Of these, the string specifications can be used in place of a `fmt` group, but the tuple forms can be used only as `kwargs`.

Line styles and colors are combined in a single format string, as in `'bo'` for blue circles.

The *kwargs* can be used to set line properties (any property that has a `set_*` method). You can use this to set a line label (for auto legends), linewidth, anitialising, marker face color, etc. Here is an example:

```
plot([1,2,3], [1,2,3], 'go-', label='line 1', linewidth=2)
plot([1,2,3], [1,4,9], 'rs',  label='line 2')
axis([0, 4, 0, 10])
legend()
```

If you make multiple lines with one plot command, the kwargs apply to all those lines, e.g.:

```
plot(x1, y1, x2, y2, antialiased=False)
```

Neither line will be antialiased.

You do not need to use format strings, which are just abbreviations. All of the line properties can be controlled by keyword arguments. For example, you can set the color, marker, linestyle, and markercolor with:

```
plot(x, y, color='green', linestyle='dashed', marker='o',
     markerfacecolor='blue', markersize=12).
```

See *Line2D* for details.

The kwargs are *Line2D* properties:

Property	Description
agg_filter	unknown
alpha	float (0.0 transparent through 1.0 opaque)
animated	[True | False]
antialiased or aa	[True | False]
axes	an *Axes* instance
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color or c	any matplotlib color
contains	a callable function
dash_capstyle	['butt' | 'round' | 'projecting']
dash_joinstyle	['miter' | 'round' | 'bevel']
dashes	sequence of on/off ink in points
drawstyle	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
figure	a *matplotlib.figure.Figure* instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	*A valid marker style*
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points

C

Table 19.2 – continued from previous page

Property	Description
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

kwargs *scalex* and *scaley*, if defined, are passed on to `autoscale_view()` to determine whether the *x* and *y* axes are autoscaled; the default is *True*.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x', 'y'.

---

matplotlib.axes.Axes.errorbar

`Axes.errorbar`(*x*, *y*, *yerr=None*, *xerr=None*, *fmt=''*, *ecolor=None*, *elinewidth=None*, *capsize=None*, *barsabove=False*, *lolims=False*, *uplims=False*, *xlolims=False*, *xuplims=False*, *errorevery=1*, *capthick=None*, ***kwargs*)

Plot an errorbar graph.

Plot x versus y with error deltas in yerr and xerr. Vertical errorbars are plotted if yerr is not None. Horizontal errorbars are plotted if xerr is not None.

x, y, xerr, and yerr can all be scalars, which plots a single error bar at x, y.

Parameters x : scalar or array-like

y : scalar or array-like

xerr/yerr : scalar or array-like, shape(N,) or shape(2,N), optional

If a scalar number, len(N) array-like object, or a N-element array-like object, errorbars are drawn at +/-value relative to the data. Default is None.

If a sequence of shape 2xN, errorbars are drawn at -row1 and +row2 relative to the data.

fmt : plot format string, optional, default: None

The plot format symbol. If fmt is 'none' (case-insensitive), only the errorbars are plotted. This is used for adding errorbars to a bar plot, for example. Default is '', an empty plot format string; properties are then identical to the defaults for `plot()`.

ecolor : mpl color, optional, default: None

A matplotlib color arg which gives the color the errorbar lines; if None, use the color of the line connecting the markers.

elinewidth : scalar, optional, default: None

The linewidth of the errorbar lines. If None, use the linewidth.

capsize : scalar, optional, default: None

The length of the error bar caps in points; if None, it will take the value from `errorbar.capsize` *rcParam*.

capthick : scalar, optional, default: None

An alias kwarg to markeredgewidth (a.k.a. - mew). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if mew or markeredgewidth are given, then they will over-ride capthick. This may change in future releases.

barsabove : bool, optional, default: False

if True , will plot the errorbars above the plot symbols. Default is below.

lolims / uplims / xlolims / xuplims : bool, optional, default:None

These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. lims-arguments may be of the same type as *xerr* and *yerr*. To use limits with inverted axes, `set_xlim()` or `set_ylim()` must be called before `errorbar()`.

errorevery : positive integer, optional, default:1

subsamples the errorbars. e.g., if errorevery=5, errorbars for every 5-th datapoint will be plotted. The data plot itself still shows all data points.

Returns plotline : `Line2D` instance

x, y plot markers and/or line

caplines : list of `Line2D` instances

error bar cap

barlinecols : list of `LineCollection` horizontal and vertical error ranges.

Other Parameters kwargs : All other keyword arguments are passed on to the plot

command for the markers. For example, this code makes big red squares with thick green edges:

```
x,y,yerr = rand(3,10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where mfc, mec, ms and mew are aliases for the longer property names, markerfacecolor, markeredgecolor, markersize and markeredgewidth.

valid kwargs for the marker properties are

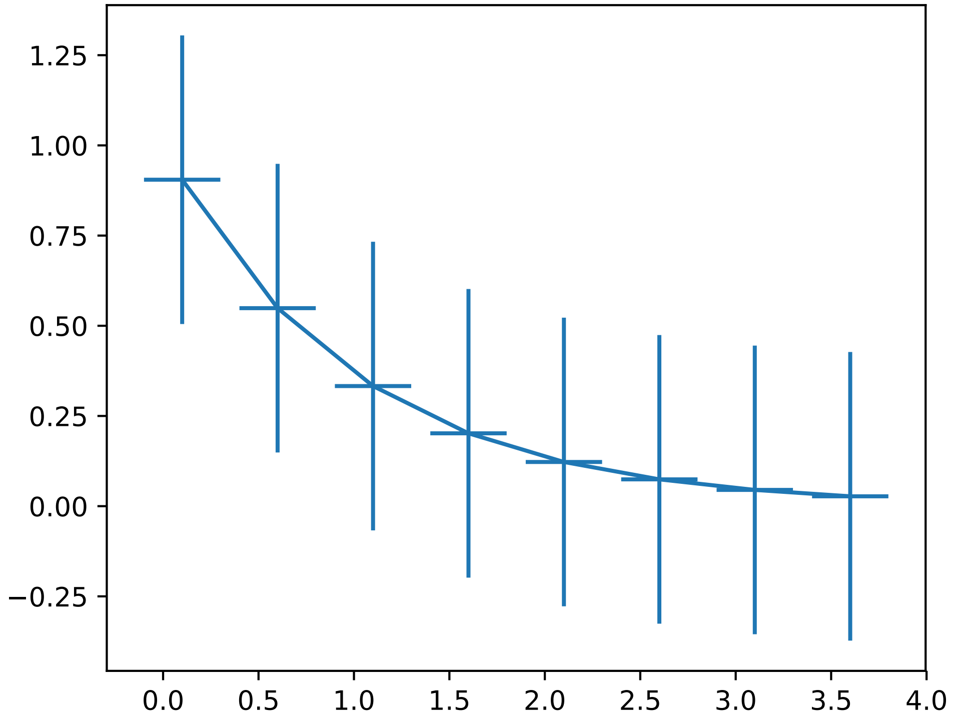
Property	Description
agg_filter	unknown
alpha	float (0.0 transparent through 1.0 opaque)
animated	[True | False]
antialiased or aa	[True | False]
axes	an *Axes* instance
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color or c	any matplotlib color
contains	a callable function
dash_capstyle	['butt' | 'round' | 'projecting']
dash_joinstyle	['miter' | 'round' | 'bevel']
dashes	sequence of on/off ink in points
drawstyle	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
figure	a *matplotlib.figure.Figure* instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	*A valid marker style*
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markerfacecoloralt or mfcalt	any matplotlib color
markersize or ms	float
markevery	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
path_effects	unknown
picker	float distance in points or callable pick function `fn(artist, event)`
pickradius	float distance in points
rasterized	[True | False | None]

C

Table 19.3 – continued from previous page

Property	Description
sketch_params	unknown
snap	unknown
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a *matplotlib.transforms.Transform* instance
url	a url string
visible	[True | False]
xdata	1D array
ydata	1D array
zorder	any number

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x', 'xerr', 'y', 'yerr'.

matplotlib.axes.Axes.scatter

`Axes.scatter`(*x*, *y*, *s=None*, *c=None*, *marker=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *verts=None*, *edgecolors=None*, ***kwargs*)

Make a scatter plot of `x` vs `y`

Marker size is scaled by `s` and marker color is mapped to `c`

Parameters x, y : array_like, shape (n,)

Input data

s : scalar or array_like, shape (n,), optional

size in points^2. Default is `rcParams['lines.markersize'] ** 2`.

c : color, sequence, or sequence of color, optional, default: 'b'

`c` can be a single color format string, or a sequence of color specifications of length `N`, or a sequence of `N` numbers to be mapped to colors using the `cmap` and `norm` specified via kwargs (see below). Note that `c` should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. `c` can be a 2-D array in which the rows are RGB or RGBA, however, including the case of a single row to specify the same color for all points.

marker : `MarkerStyle`, optional, default: 'o'

See `markers` for more information on the different styles of markers scatter supports. `marker` can be either an instance of the class or the text shorthand for a particular marker.

cmap : `Colormap`, optional, default: None

A `Colormap` instance or registered name. `cmap` is only used if `c` is an array of floats. If None, defaults to rc `image.cmap`.

norm : `Normalize`, optional, default: None

A `Normalize` instance is used to scale luminance data to 0, 1. `norm` is only used if `c` is an array of floats. If `None`, use the default `normalize()`.

vmin, vmax : scalar, optional, default: None

`vmin` and `vmax` are used in conjunction with `norm` to normalize luminance data. If either are `None`, the min and max of the color array is used. Note if you pass a `norm` instance, your settings for `vmin` and `vmax` will be ignored.

alpha : scalar, optional, default: None

The alpha blending value, between 0 (transparent) and 1 (opaque)

linewidths : scalar or array_like, optional, default: None

If None, defaults to (lines.linewidth,).

verts : sequence of (x, y), optional

If `marker` is None, these vertices will be used to construct the marker. The center of the marker is located at (0,0) in normalized units. The overall marker is rescaled by `s`.

edgecolors : color or sequence of color, optional, default: None

If None, defaults to 'face'

If 'face', the edge color will always be the same as the face color.

If it is 'none', the patch boundary will not be drawn.

For non-filled markers, the `edgecolors` kwarg is ignored and forced to 'face' internally.

Returns paths : *`PathCollection`*

Other Parameters kwargs : *`Collection`* properties

See also:

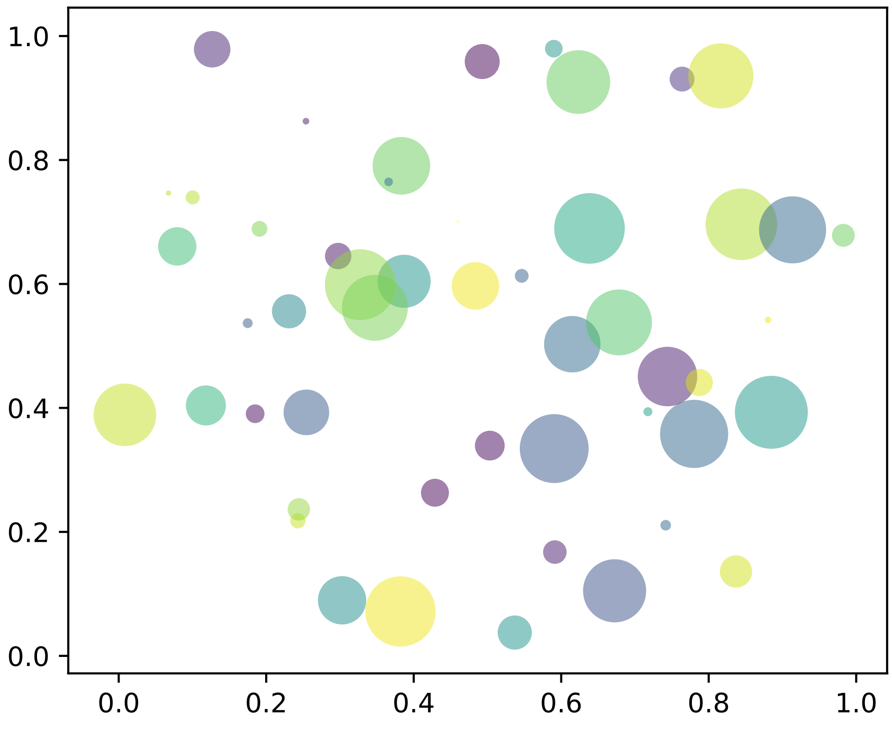
`plot` to plot scatter plots when markers are identical in size and color

Notes

- The *`plot`* function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of `x`, `y`, `s`, and `c` may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.

  Fundamentally, scatter works with 1-D arrays; `x`, `y`, `s`, and `c` may be input as 2-D arrays, but within scatter they will be flattened. The exception is `c`, which will be flattened only if its size matches the size of `x` and `y`.

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'c', 'color', 'edgecolors', 'facecolor', 'facecolors', 'linewidths', 's', 'x', 'y'.

---

matplotlib.axes.Axes.plot_date

`Axes.`**`plot_date`**(*x*, *y*, *fmt='o'*, *tz=None*, *xdate=True*, *ydate=False*, ***kwargs*)

A plot with data that contains dates.

Similar to the `plot()` command, except the *x* or *y* (or both) data is considered to be dates, and the axis is labeled accordingly.

x and/or *y* can be a sequence of dates represented as float days since 0001-01-01 UTC.

Note if you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to meth:`plot_date` since meth:`plot_date` will set the default tick locator to class:`matplotlib.dates.AutoDateLocator` (if the tick locator is not already set to a class:`matplotlib.dates.DateLocator` instance) and the default tick formatter to class:`matplotlib.dates.AutoDateFormatter` (if the tick formatter is not already set to a class:`matplotlib.dates.DateFormatter` instance).

Parameters fmt : string

The plot format string.

tz : [*None* | timezone string | `tzinfo` instance]

The time zone to use in labeling dates. If *None*, defaults to rc value.

xdate : boolean

If *True*, the *x*-axis will be labeled with dates.

ydate : boolean

If *True*, the *y*-axis will be labeled with dates.

Returns lines

Other Parameters kwargs : `matplotlib.lines.Line2D`

properties :

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
`linewidth` or lw	float value in points
`marker`	`A valid marker style`
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color

C

Table 19.4 – continued from previous page

Property	Description
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

.. note::

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x', 'y'.

See also:

`matplotlib.dates` helper functions on dates

`matplotlib.dates.date2num` how to convert dates to num

`matplotlib.dates.num2date` how to convert num to dates

`matplotlib.dates.drange` how floating point dates

matplotlib.axes.Axes.step

`Axes.step`(*x*, *y*, **args*, ***kwargs*)

Make a step plot.

Parameters x : array_like

1-D sequence, and it is assumed, but not checked, that it is uniformly increasing.

y : array_like

1-D sequence, and it is assumed, but not checked, that it is uniformly increasing.

Returns list

List of lines that were added.

Other Parameters where : [‘pre’ | ‘post’ | ‘mid’]

If ‘pre’ (the default), the interval from x[i] to x[i+1] has level y[i+1].

If ‘post’, that interval has level y[i].

If ‘mid’, the jumps in *y* occur half-way between the *x*-values.

Notes

Additional parameters are the same as those for `plot()`.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘y’.

---

matplotlib.axes.Axes.loglog

`Axes.`**`loglog`**`(`**args*, ***kwargs*`)`

Make a plot with log scaling on both the *x* and *y* axis.

`loglog()` supports all the keyword arguments of `plot()` and `matplotlib.axes.Axes.set_xscale()` / `matplotlib.axes.Axes.set_yscale()`.

Notable keyword arguments:

***basex/basey*: scalar > 1** Base of the *x*/*y* logarithm

***subsx/subsy*: [*None* | sequence]** The location of the minor *x*/*y* ticks; *None* defaults to autosubs, which depend on the number of decades in the plot; see `matplotlib.axes.Axes.set_xscale()` / `matplotlib.axes.Axes.set_yscale()` for details

***nonposx/nonposy*: [’mask’ | ‘clip’]** Non-positive values in *x* or *y* can be masked as invalid, or clipped to a very small positive number

The remaining valid kwargs are `Line2D` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]

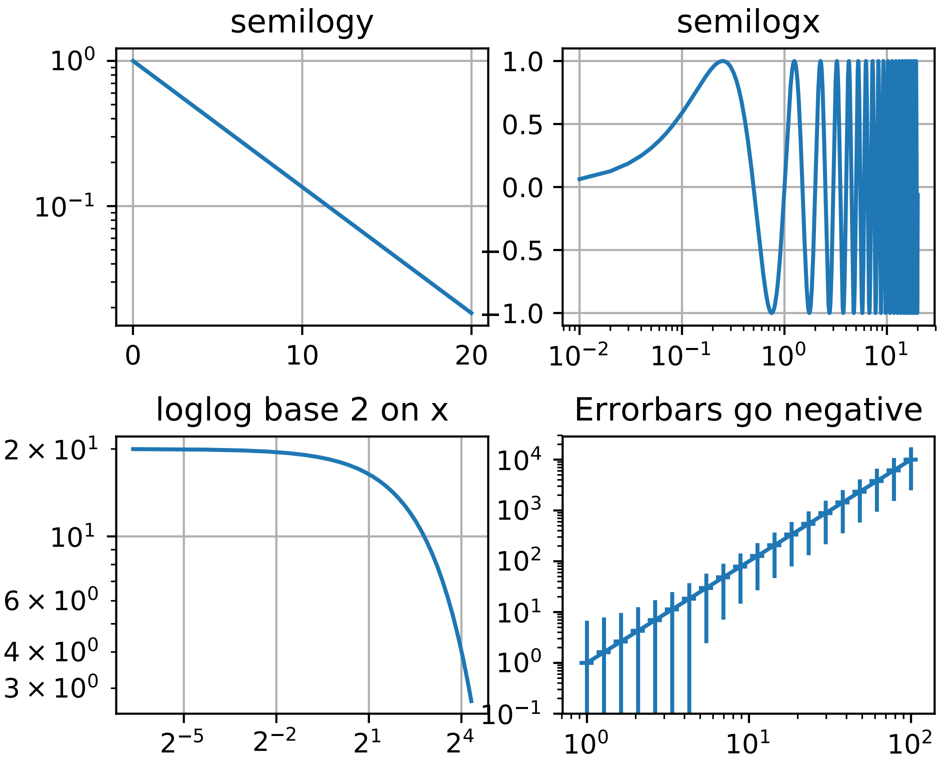
</table>

Example:



matplotlib.axes.Axes.semilogx

`Axes.`**`semilogx`**(**args*, ***kwargs*)

Make a plot with log scaling on the x axis.

Parameters basex : float, optional

Base of the x logarithm. The scalar should be larger than 1.

subsx : array_like, optional

The location of the minor xticks; *None* defaults to autosubs, which depend on the number of decades in the plot; see `set_xscale()` for details.

nonposx : string, optional, {'mask', 'clip'}

Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

Returns `plot`

Log-scaled plot on the x axis.

Other Parameters :class:'~matplotlib.lines.Line2D' properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
`linewidth` or lw	float value in points
`marker`	`A valid marker style`
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

See also:

`loglog` For example code and figure.

Notes

This function supports all the keyword arguments of *`plot()`* and *`matplotlib.axes.Axes.set_xscale()`*.

matplotlib.axes.Axes.semilogy

`Axes.`**`semilogy`**`(`**args*, ***kwargs*`)`

Make a plot with log scaling on the `y` axis.

Parameters basey : scalar > 1

Base of the `y` logarithm.

subsy [None or iterable] The location of the minor yticks. None defaults to autosubs, which depend on the number of decades in the plot. See *`set_yscale()`* for details.

nonposy [{'mask' | 'clip'} str] Non-positive values in `y` can be masked as invalid, or clipped to a very small positive number.

Returns *`Line2D`*

Line instance of the plot.

Other Parameters kwargs : *`Line2D`* properties,

`plot` and *`matplotlib.axes.Axes.set_yscale`* arguments.

`loglog()` For example code and figure.

matplotlib.axes.Axes.fill_between

`Axes.`**`fill_between`**(*x*, *y1*, *y2=0*, *where=None*, *interpolate=False*, *step=None*, ***kwargs*)

Make filled polygons between two curves.

Create a *`PolyCollection`* filling the regions between *y1* and *y2* where `where==True`

Parameters x : array

An N-length array of the x data

y1 : array

An N-length array (or scalar) of the y data

y2 : array

An N-length array (or scalar) of the y data

where : array, optional

If `None`, default to fill between everywhere. If not `None`, it is an N-length numpy boolean array and the fill will only happen over the regions where `where==True`.

interpolate : bool, optional

If `True`, interpolate between the two lines to find the precise point of intersection. Otherwise, the start and end points of the filled region will only occur on explicit values in the *x* array.

step : {'pre', 'post', 'mid'}, optional

If not None, fill with step logic.

See also:

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'where', 'x', 'y1', 'y2'.

Notes

Additional Keyword args passed on to the `PolyCollection`.

kwargs control the `Polygon` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string

matplotlib.axes.Axes.fill_betweenx

`Axes.`**`fill_betweenx`**(*y*, *x1*, *x2=0*, *where=None*, *step=None*, ***kwargs*)

Make filled polygons between two horizontal curves.

Create a *`PolyCollection`* filling the regions between *x1* and *x2* where `where==True`

Parameters y : array

An N-length array of the y data

x1 : array

An N-length array (or scalar) of the x data

x2 : array, optional

An N-length array (or scalar) of the x data

where : array, optional

If *None*, default to fill between everywhere. If not *None*, it is a N length numpy boolean array and the fill will only happen over the regions where `where==True`

step : {‘pre’, ‘post’, ‘mid’}, optional

If not None, fill with step logic.

See also:

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'where', 'x1', 'x2', 'y'.

Notes

keyword args passed on to the `PolyCollection`

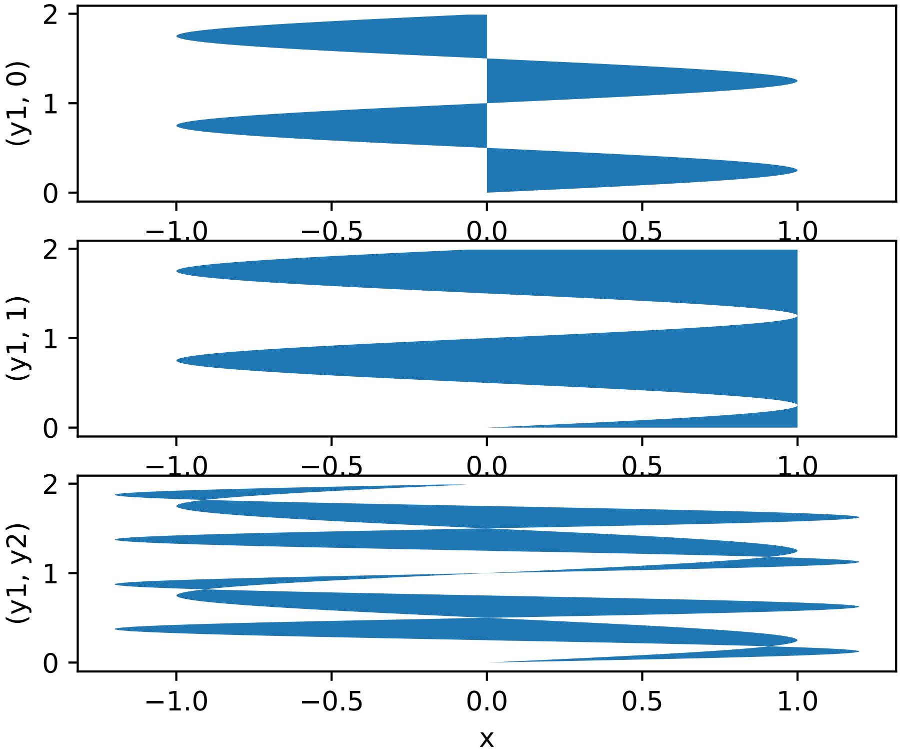
kwargs control the `Polygon` properties:

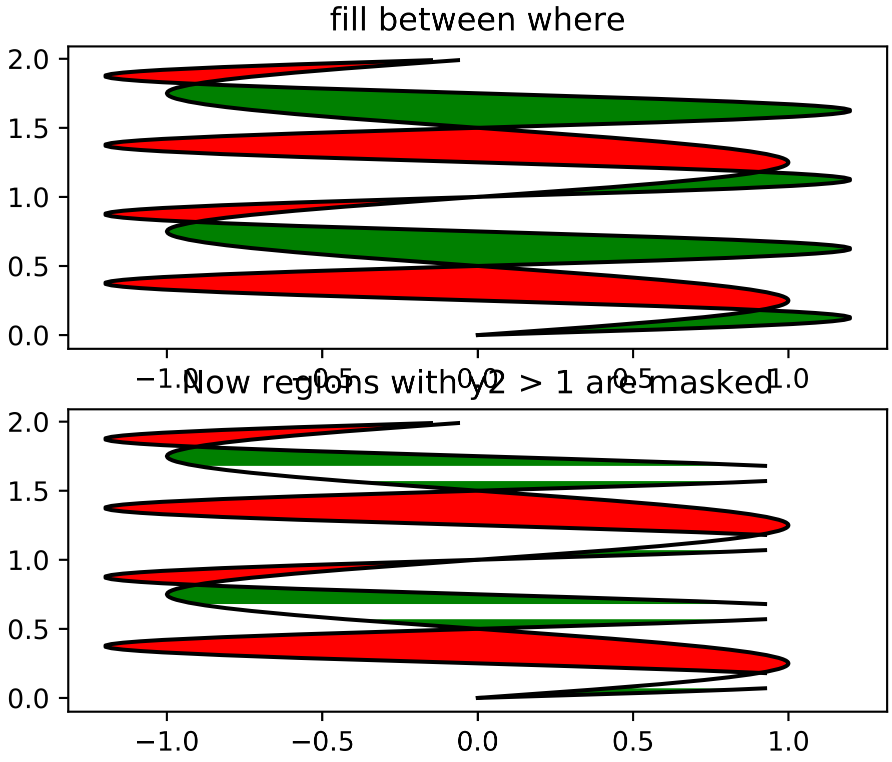
Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']
`label`	string or anything printable with '%s' conversion.
`linestyle` or dashes or linestyles	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown

Table 19.8 – continued from previous page

Property	Description
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`visible`	[True | False]
`zorder`	any number

Examples





matplotlib.axes.Axes.bar

`Axes.bar`(*left*, *height*, *width=0.8*, *bottom=None*, ***kwargs*)

Make a bar plot.

Make a bar plot with rectangles bounded by:

`left`, `left` + `width`, `bottom`, `bottom` + `height` (left, right, bottom and top edges)

Parameters left : sequence of scalars

the x coordinates of the left sides of the bars

height : sequence of scalars

the heights of the bars

width : scalar or array-like, optional

the width(s) of the bars default: 0.8

bottom : scalar or array-like, optional

the y coordinate(s) of the bars default: None

color : scalar or array-like, optional the colors of the bar faces

edgecolor : scalar or array-like, optional

the colors of the bar edges

linewidth : scalar or array-like, optional

width of bar edge(s). If None, use default linewidth; If 0, don't draw edges. default: None

tick_label : string or array-like, optional

the tick labels of the bars default: None

xerr : scalar or array-like, optional

if not None, will be used to generate errorbar(s) on the bar chart default: None

yerr : scalar or array-like, optional

if not None, will be used to generate errorbar(s) on the bar chart default: None

ecolor : scalar or array-like, optional

specifies the color of errorbar(s) default: None

capsize : scalar, optional

determines the length in points of the error bar caps default: None, which will take the value from the `errorbar.capsize` *rcParam*.

error_kw : dict, optional

dictionary of kwargs to be passed to errorbar method. *ecolor* and *capsize* may be specified here rather than as independent kwargs.

align : {'center', 'edge'}, optional

If 'edge', aligns bars by their left edges (for vertical bars) and by their bottom edges (for horizontal bars). If 'center', interpret the `left` argument as the coordinates of the centers of the bars. To align on the align bars on the right edge pass a negative `width`.

orientation : {'vertical', 'horizontal'}, optional

The orientation of the bars.

log : boolean, optional

If true, sets the axis to be log scale. default: False

Returns bars : matplotlib.container.BarContainer

Container with all of the bars + errorbars

See also:

`barh` Plot a horizontal bar plot.

Notes

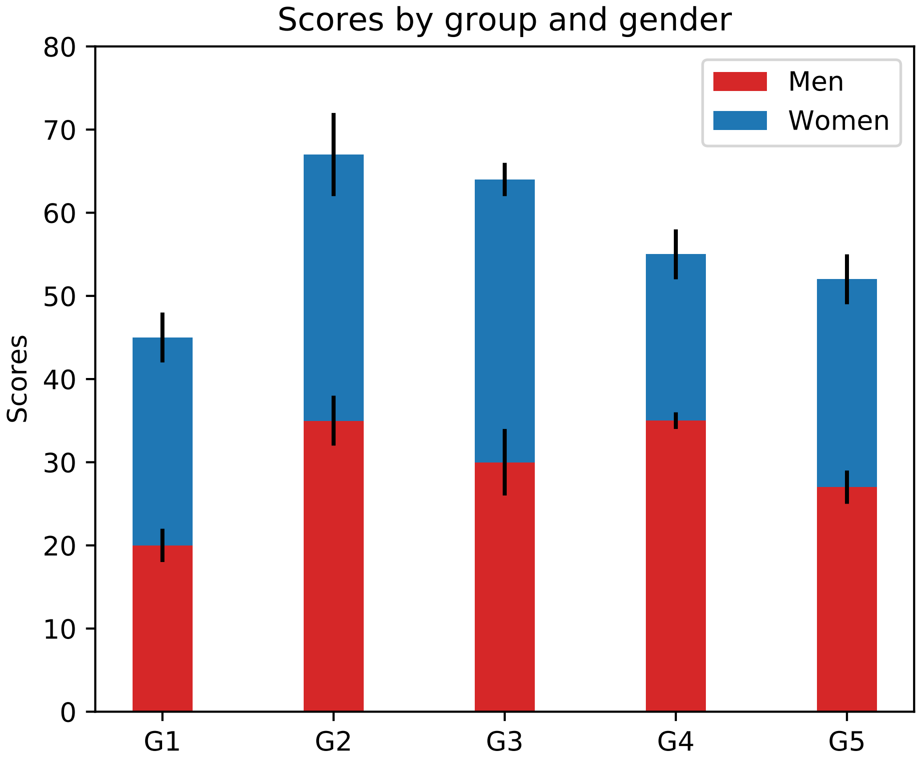
The optional arguments `color`, `edgecolor`, `linewidth`, `xerr`, and `yerr` can be either scalars or sequences of length equal to the number of bars. This enables you to use bar as the basis for stacked bar charts, or candlestick plots. Detail: `xerr` and `yerr` are passed directly to *errorbar()*, so they can also have shape 2xN for independent specification of lower and upper errors.

Other optional kwargs:

Property	Description
agg_filter	unknown
alpha	float or None
animated	[True | False]
antialiased or aa	[True | False] or None for default
axes	an *Axes* instance
capstyle	[’butt’ | ‘round’ | ‘projecting’]
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color	matplotlib color spec
contains	a callable function
edgecolor or ec	mpl color spec, None, ‘none’, or ‘auto’
facecolor or fc	mpl color spec, or None for default, or ‘none’ for no color
figure	a *matplotlib.figure.Figure* instance
fill	[True | False]
gid	an id string
hatch	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
joinstyle	[’miter’ | ‘round’ | ‘bevel’]
label	string or anything printable with ‘%s’ conversion.
linestyle or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
linewidth or lw	float or None for default
path_effects	unknown
picker	[None|float|boolean|callable]
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
zorder	any number

Examples

Example: A stacked bar chart.



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'bottom', 'color', 'ecolor', 'edgecolor', 'height', 'left', 'linewidth', 'tick_label', 'width', 'xerr', 'yerr'.

---

matplotlib.axes.Axes.barh

`Axes.`**`barh`**(*bottom*, *width*, *height=0.8*, *left=None*, ***kwargs*)

Make a horizontal bar plot.

Make a horizontal bar plot with rectangles bounded by:

`left`, `left` + `width`, `bottom`, `bottom` + `height` (left, right, bottom and top edges)

`bottom`, `width`, `height`, and `left` can be either scalars or sequences

Parameters bottom : scalar or array-like

the y coordinate(s) of the bars

width : scalar or array-like

the width(s) of the bars

height : sequence of scalars, optional, default: 0.8

the heights of the bars

left : sequence of scalars

the x coordinates of the left sides of the bars

Returns `matplotlib.patches.Rectangle` instances.

Other Parameters color : scalar or array-like, optional

the colors of the bars

edgecolor : scalar or array-like, optional

the colors of the bar edges

linewidth : scalar or array-like, optional, default: None

width of bar edge(s). If None, use default linewidth; If 0, don't draw edges.

tick_label : string or array-like, optional, default: None

the tick labels of the bars

xerr : scalar or array-like, optional, default: None

if not None, will be used to generate errorbar(s) on the bar chart

yerr : scalar or array-like, optional, default: None

if not None, will be used to generate errorbar(s) on the bar chart

ecolor : scalar or array-like, optional, default: None

specifies the color of errorbar(s)

capsize : scalar, optional

determines the length in points of the error bar caps default: None, which will take the value from the `errorbar.capsize` *rcParam*.

error_kw :

dictionary of kwargs to be passed to errorbar method. `ecolor` and `capsize` may be specified here rather than as independent kwargs.

align : {'center', 'edge'}, optional

If 'edge', aligns bars by their left edges (for vertical bars) and by their bottom edges (for horizontal bars). If 'center', interpret the `bottom` argument as the coordinates of the centers of the bars. To align on the align bars on the top edge pass a negative 'height'.

log : boolean, optional, default: False

If true, sets the axis to be log scale

See also:

`bar` Plot a vertical bar plot.

Notes

The optional arguments `color`, `edgecolor`, `linewidth`, `xerr`, and `yerr` can be either scalars or sequences of length equal to the number of bars. This enables you to use bar as the basis for stacked bar charts, or candlestick plots. Detail: `xerr` and `yerr` are passed directly to `errorbar()`, so they can also have shape 2xN for independent specification of lower and upper errors.

Other optional kwargs:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

matplotlib.axes.Axes.stem

`Axes.stem`(**args*, ***kwargs*)

Create a stem plot.

Call signatures:

```
stem(y, linefmt='b-', markerfmt='bo', basefmt='r-')
stem(x, y, linefmt='b-', markerfmt='bo', basefmt='r-')
```

A stem plot plots vertical lines (using *linefmt*) at each *x* location from the baseline to *y*, and places a marker there using *markerfmt*. A horizontal line at 0 is is plotted using *basefmt*.

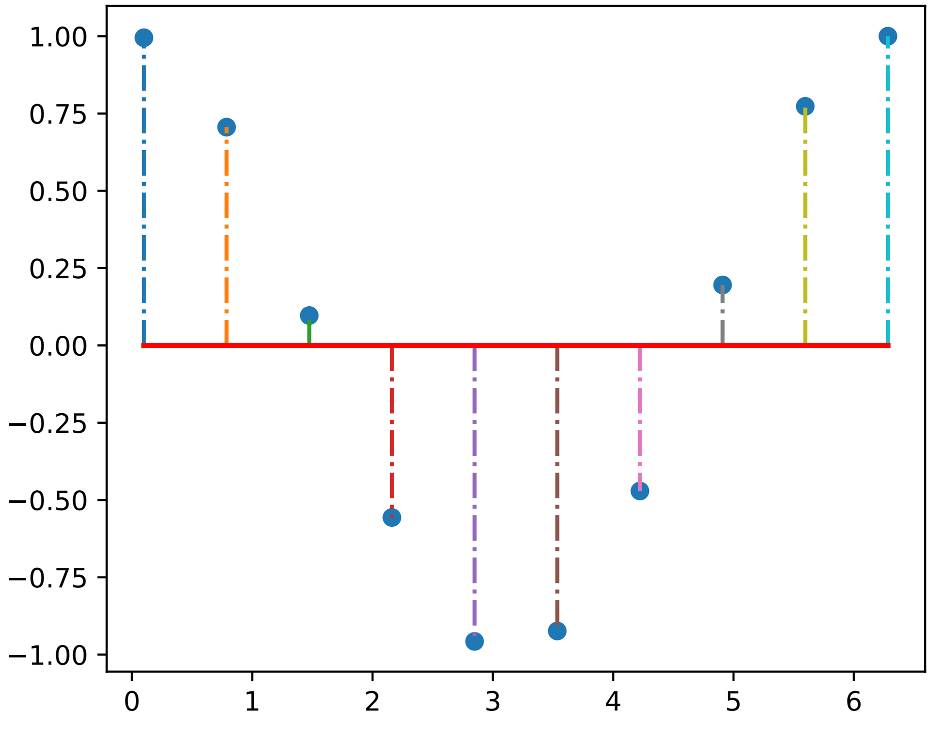
If no *x* values are provided, the default is (0, 1, ..., len(y) - 1)

Return value is a tuple (*markerline*, *stemlines*, *baseline*).

See also:

This document for details.

Example:



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.eventplot

`Axes.`**`eventplot`**(*positions*, *orientation='horizontal'*, *lineoffsets=1*, *linelengths=1*, *linewidths=None*, *colors=None*, *linestyles='solid'*, ***kwargs*)

Plot identical parallel lines at specific positions.

Plot parallel lines at the given positions. positions should be a 1D or 2D array-like object, with each row corresponding to a row or column of lines.

This type of plot is commonly used in neuroscience for representing neural events, where it is commonly called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

orientation [['horizontal' | 'vertical']] 'horizontal' : the lines will be vertical and arranged in rows
'vertical' : lines will be horizontal and arranged in columns

lineoffsets **:** A float or array-like containing floats.

linelengths **:** A float or array-like containing floats.

linewidths **:** A float or array-like containing floats.

colors must be a sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed) or a list of such sequences

linestyles **:** ['solid' | 'dashed' | 'dashdot' | 'dotted'] or an array of these values

For linelengths, linewidths, colors, and linestyles, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as positions, and each value will be applied to the corresponding row or column in positions.

Returns a list of *`matplotlib.collections.EventCollection`* objects that were added.

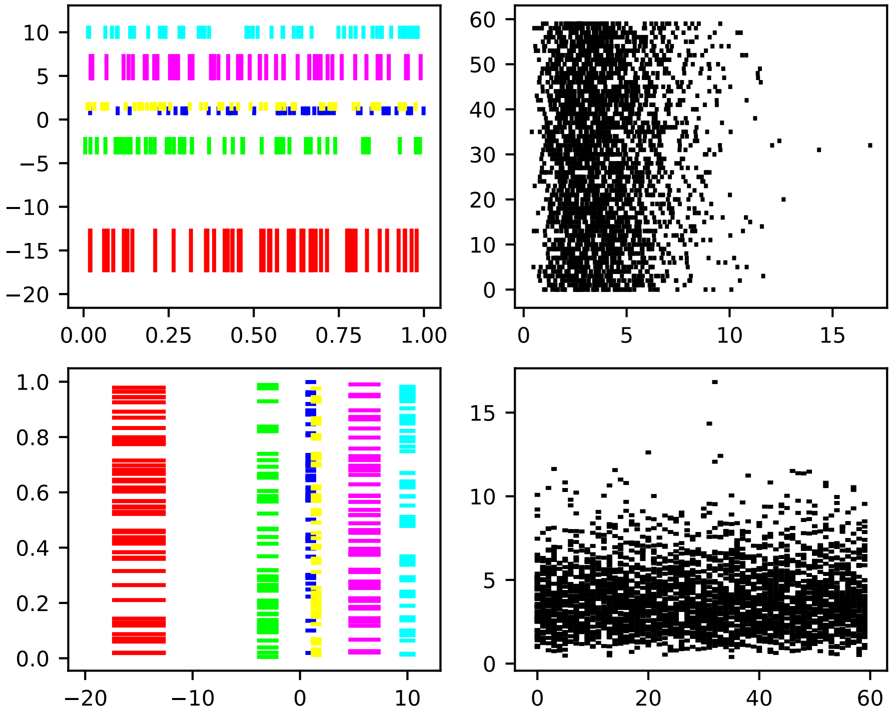
kwargs are *`LineCollection`* properties:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an *`Axes`* instance
`clim`	a length 2 sequence of floats
`clip_box`	a *`matplotlib.transforms.Bbox`* instance
`clip_on`	[True | False]
`clip_path`	[(*`Path`*, *`Transform`*) | *`Patch`* | None]

Table 19.11 – continued from previous page

Property	Description
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`paths`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`segments`	unknown
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`verts`	unknown
`visible`	[True | False]
`zorder`	any number

Example:



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'colors', 'linelengths', 'lineoffsets', 'linestyles', 'linewidths', 'positions'.

---

matplotlib.axes.Axes.pie

`Axes.pie`(*x*, *explode=None*, *labels=None*, *colors=None*, *autopct=None*, *pctdistance=0.6*, *shadow=False*, *labeldistance=1.1*, *startangle=None*, *radius=None*, *counterclock=True*, *wedgeprops=None*, *textprops=None*, *center=(0, 0)*, *frame=False*)

Plot a pie chart.

Make a pie chart of array *x*. The fractional area of each wedge is given by `x/sum(x)`. If `sum(x) <= 1`, then the values of x give the fractional area directly and the array will not be normalized. The wedges are plotted counterclockwise, by default starting from the x-axis.

Parameters x : array-like

The input array used to make the pie chart.

explode : array-like, optional, default: None

If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

labels : list, optional, default: None

A sequence of strings providing the labels for each wedge

colors : array-like, optional, default: None

A sequence of matplotlib color args through which the pie chart will cycle. If `None`, will use the colors in the currently active cycle.

autopct : None (default), string, or function, optional

If not *None*, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be `fmt%pct`. If it is a function, it will be called.

pctdistance : float, optional, default: 0.6

The ratio between the center of each pie slice and the start of the text generated by *autopct*. Ignored if *autopct* is *None*.

shadow : bool, optional, default: False

Draw a shadow beneath the pie.

labeldistance : float, optional, default: 1.1

The radial distance at which the pie labels are drawn

startangle : float, optional, default: None

If not *None*, rotates the start of the pie chart by *angle* degrees counterclockwise from the x-axis.

radius : float, optional, default: None

The radius of the pie, if *radius* is *None* it will be set to 1.

counterclock : bool, optional, default: True

Specify fractions direction, clockwise or counterclockwise.

wedgeprops : dict, optional, default: None

Dict of arguments passed to the wedge objects making the pie. For example, you can pass in``wedgeprops = {'linewidth': 3}`` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

textprops : dict, optional, default: None

Dict of arguments to pass to the text objects.

center : list of float, optional, default: (0, 0)

Center position of the chart. Takes value (0, 0) or is a sequence of 2 scalars.

frame : bool, optional, default: False

Plot axes frame with the chart if true.

Returns patches : list

A sequence of `matplotlib.patches.Wedge` instances

texts : list

A is a list of the label `matplotlib.text.Text` instances.

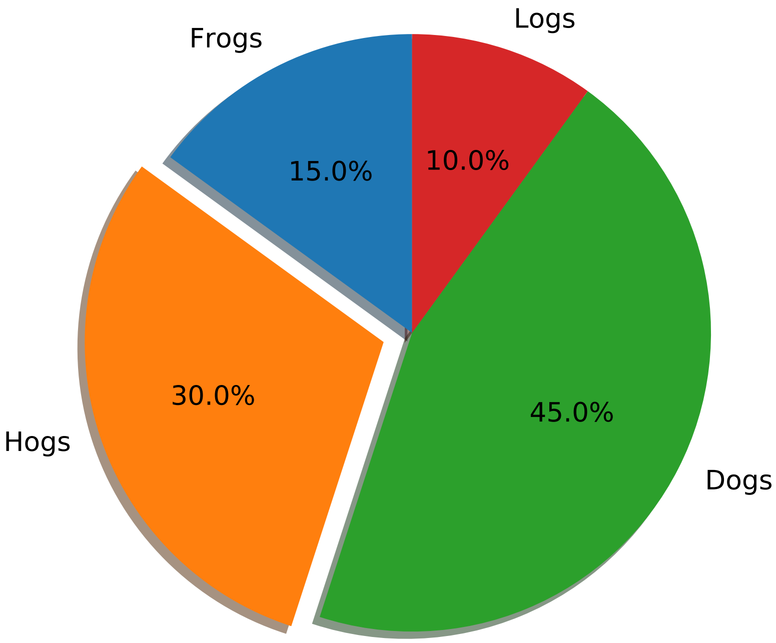
autotexts : list

A is a list of `Text` instances for the numeric labels. Is returned only if parameter *autopct* is not *None*.

Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal.

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'colors', 'explode', 'labels', 'x'.

---

matplotlib.axes.Axes.stackplot

`Axes.`**`stackplot`**`(`*x*, **args*, ***kwargs*`)`

Draws a stacked area plot.

x : 1d array of dimension N

y [2d array of dimension MxN, OR any number 1d arrays each of dimension] 1xN. The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)               # where y is MxN
stackplot(x, y1, y2, y3, y4)  # where y1, y2, y3, y4, are all 1xNm
```

Keyword arguments:

baseline [['zero', 'sym', 'wiggle', 'weighted_wiggle']] Method used to calculate the baseline. 'zero' is just a simple stacked plot. 'sym' is symmetric around zero and is sometimes called `ThemeRiver`. 'wiggle' minimizes the sum of the squared slopes. 'weighted_wiggle' does the same but weights to account for size of each layer. It is also called `Streamgraph`-layout. More details can be found at http://leebyron.com/streamgraph/.

labels : A list or tuple of labels to assign to each data series.

colors [A list or tuple of colors. These will be cycled through and] used to colour the stacked areas. All other keyword arguments are passed to `fill_between()`

Returns *r* : A list of `PolyCollection`, one for each element in the stacked area plot.

matplotlib.axes.Axes.broken_barh

`Axes.`**`broken_barh`**`(`*xranges*, *yrange*, ***kwargs*`)`

Plot horizontal bars.

A collection of horizontal bars spanning *yrange* with a sequence of *xranges*.

Required arguments:

Argument	Description
xranges	sequence of (*xmin*, *xwidth*)
yrange	sequence of (*ymin*, *ywidth*)

kwargs are `matplotlib.collections.BrokenBarHCollection` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
	(

Table 19.12 – continued from previous page

Property	Description
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`visible`	[True | False]
`zorder`	any number

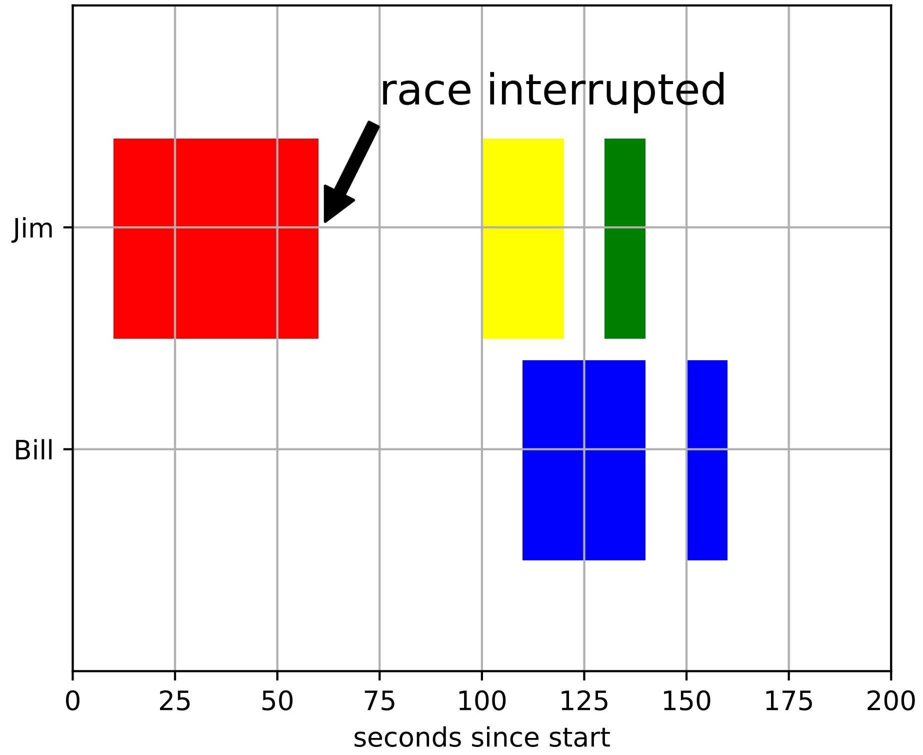
these can either be a single argument, i.e.,:

```
facecolors = 'black'
```

or a sequence of arguments for the various bars, i.e.,:

```
facecolors = ('black', 'red', 'green')
```

Example:



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.vlines

`Axes.`**`vlines`**(*x*, *ymin*, *ymax*, *colors='k'*, *linestyles='solid'*, *label=''*, ***kwargs*)

Plot vertical lines.

Plot vertical lines at each `x` from `ymin` to `ymax`.

Parameters x : scalar or 1D array_like

x-indexes where to plot the lines.

ymin, ymax : scalar or 1D array_like

Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors : array_like of colors, optional, default: 'k'

linestyles : ['solid' | 'dashed' | 'dashdot' | 'dotted'], optional

label : string, optional, default: ‘’

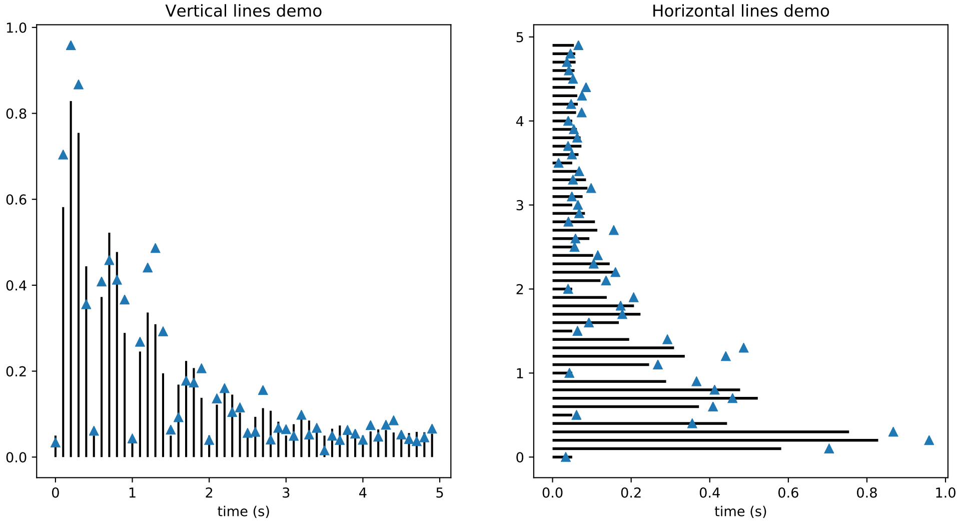
Returns lines : *LineCollection*

Other Parameters kwargs : *LineCollection* properties.

See also:

hlines horizontal lines

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘colors’, ‘x’, ‘ymax’, ‘ymin’.

---

matplotlib.axes.Axes.hlines

`Axes.`**`hlines`**(*y*, *xmin*, *xmax*, *colors='k'*, *linestyles='solid'*, *label=''*, ***kwargs*)

Plot horizontal lines at each `y` from `xmin` to `xmax`.

Parameters y : scalar or sequence of scalar

y-indexes where to plot the lines.

xmin, xmax : scalar or 1D array_like

Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors : array_like of colors, optional, default: 'k'

linestyles : ['solid' | 'dashed' | 'dashdot' | 'dotted'], optional

label : string, optional, default: ''

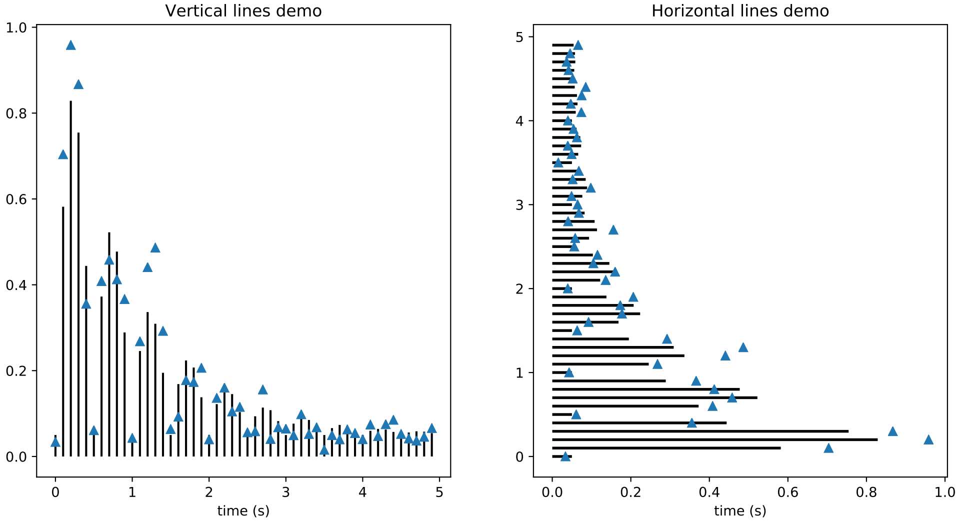
Returns lines : `LineCollection`

Other Parameters kwargs : `LineCollection` properties.

See also:

`vlines` vertical lines

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'xmax', 'xmin', 'y'.

---

matplotlib.axes.Axes.fill

`Axes.`**`fill`**`(`**args*, ***kwargs*`)`

Plot filled polygons.

Parameters args : a variable length argument

It allowing for multiple *x*, *y* pairs with an optional color format string; see `plot()` for details on the argument parsing. For example, each of the following is legal:

```
ax.fill(x, y)
ax.fill(x, y, "b")
ax.fill(x, y, "b", x, y, "r")
```

An arbitrary number of *x*, *y*, *color* groups can be specified:: ax.fill(x1, y1, 'g', x2, y2, 'r')

Returns a list of *Patch*

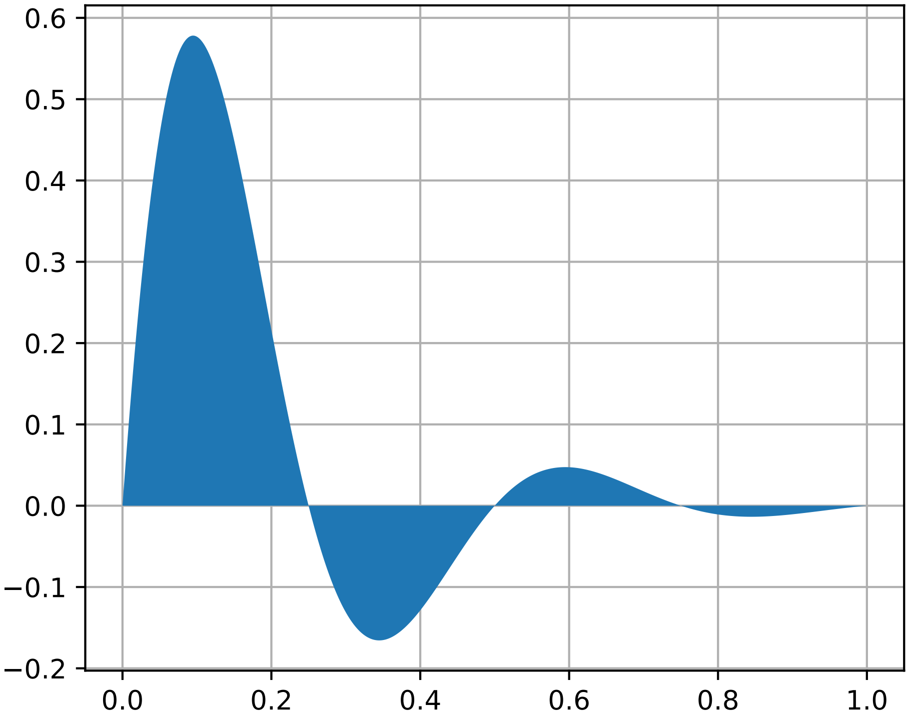
Other Parameters kwargs : *Polygon* properties

Notes

The same color strings that *plot()* supports are supported by the fill format string.

If you would like to fill below a curve, e.g., shade a region between 0 and *y* along *x*, use *fill_between()*

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument.

If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘y’.

19.1.2 Spans

`Axes.axhline`	Add a horizontal line across the axis.
`Axes.axhspan`	Add a horizontal span (rectangle) across the axis.
`Axes.axvline`	Add a vertical line across the axes.
`Axes.axvspan`	Add a vertical span (rectangle) across the axes.

matplotlib.axes.Axes.axhline

`Axes.`**`axhline`**(*y=0*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal line across the axis.

Parameters y : scalar, optional, default: 0

y position in data coordinates of the horizontal line.

xmin : scalar, optional, default: 0

Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

xmax : scalar, optional, default: 1

Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns `Line2D`

See also:

`axhspan` for example plot and source code

Notes

kwargs are passed to `Line2D` and can be used to control the line properties.

Examples

- draw a thick red hline at ‘y’ = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at ‘y’ = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

Valid kwargs are `Line2D` properties, with the exception of 'transform':

Property	Description
agg_filter	unknown
alpha	float (0.0 transparent through 1.0 opaque)
animated	[True | False]
antialiased or aa	[True | False]
axes	an Axes instance
clip_box	a matplotlib.transforms.Bbox instance
clip_on	[True | False]
clip_path	[(Path, Transform) | Patch | None]
color or c	any matplotlib color
contains	a callable function
dash_capstyle	['butt' | 'round' | 'projecting']
dash_joinstyle	['miter' | 'round' | 'bevel']
dashes	sequence of on/off ink in points
drawstyle	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
figure	a matplotlib.figure.Figure instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	A valid marker style
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markerfacecoloralt or mfcalt	any matplotlib color
markersize or ms	float
markevery	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
path_effects	unknown
picker	float distance in points or callable pick function `fn(artist, event)`
pickradius	float distance in points
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a matplotlib.transforms.Transform instance

C

Table 19.14 – continued from previous page

Property	Description
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

matplotlib.axes.Axes.axhspan

`Axes.`**`axhspan`**(*ymin*, *ymax*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal span (rectangle) across the axis.

Draw a horizontal span (rectangle) from *ymin* to *ymax*. With the default values of *xmin* = 0 and *xmax* = 1, this always spans the xrange, regardless of the xlim settings, even if you change them, e.g., with the `set_xlim()` command. That is, the horizontal extent is in axes coords: 0=left, 0.5=middle, 1.0=right but the *y* location is in data coordinates.

Parameters ymin : float

Lower limit of the horizontal span in data units.

ymax : float

Upper limit of the horizontal span in data units.

xmin : float, optional, default: 0

Lower limit of the vertical span in axes (relative 0-1) units.

xmax : float, optional, default: 1

Upper limit of the vertical span in axes (relative 0-1) units.

Returns Polygon : `Polygon`

Other Parameters kwargs : `Polygon` properties.

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]

Continued on

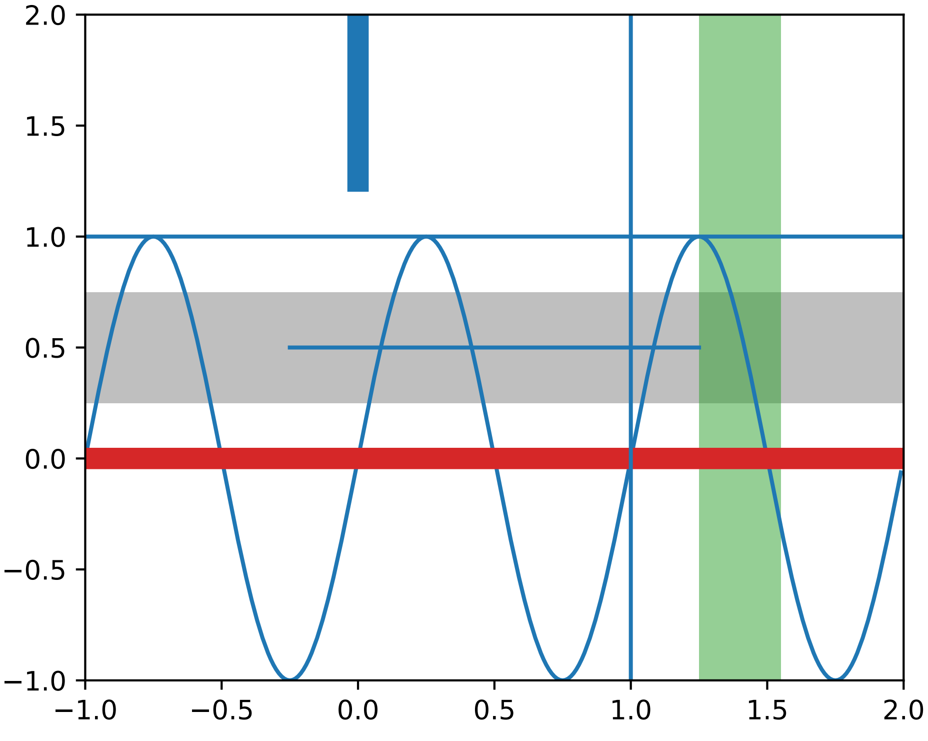
Table 19.15 – continued from previous page

Property	Description
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

See also:

`axvspan` Add a vertical span (rectangle) across the axes.

Examples



matplotlib.axes.Axes.axvline

`Axes.`**`axvline`**(*x=0*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical line across the axes.

Parameters x : scalar, optional, default: 0

x position in data coordinates of the vertical line.

ymin : scalar, optional, default: 0

Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax : scalar, optional, default: 1

Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns *`Line2D`*

See also:

axhspan for example plot and source code

Examples

- draw a thick red vline at $x = 0$ that spans the yrange:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at $x = 1$ that spans the yrange:

```
>>> axvline(x=1)
```

- draw a default vline at $x = .5$ that spans the middle half of the yrange:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

Valid kwargs are *Line2D* properties, with the exception of 'transform':

Property	Description
agg_filter	unknown

ydata	1D array
zorder	any number

matplotlib.axes.Axes.axvspan

`Axes.`**`axvspan`**(*xmin*, *xmax*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical span (rectangle) across the axes.

Draw a vertical span (rectangle) from `xmin` to `xmax`. With the default values of `ymin` = 0 and `ymax` = 1. This always spans the yrange, regardless of the ylim settings, even if you change them, e.g., with the *set_ylim()* command. That is, the vertical extent is in axes coords: 0=bottom, 0.5=middle, 1.0=top but the y location is in data coordinates.

Parameters xmin : scalar

Number indicating the first X-axis coordinate of the vertical span rectangle in data units.

xmax : scalar

Number indicating the second X-axis coordinate of the vertical span rectangle in data units.

ymin : scalar, optional

Number indicating the first Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 0.

ymax : scalar, optional

Number indicating the second Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 1.

Returns rectangle : matplotlib.patches.Polygon

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters **kwargs

Optional parameters are properties of the class matplotlib.patches.Polygon.

See also:

axhspan

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

19.1.3 Spectral

Axes.acorr	Plot the autocorrelation of `x`.
Axes.angle_spectrum	Plot the angle spectrum.
Axes.cohere	Plot the coherence between *x* and *y*.
Axes.csd	Plot the cross-spectral density.
Axes.magnitude_spectrum	Plot the magnitude spectrum.
Axes.phase_spectrum	Plot the phase spectrum.
Axes.psd	Plot the power spectral density.
Axes.specgram	Plot a spectrogram.
Axes.xcorr	Plot the cross correlation between *x* and *y*.

matplotlib.axes.Axes.acorr

`Axes.`**`acorr`**`(`*x*, ***kwargs*`)`

Plot the autocorrelation of `x`.

Parameters x : sequence of scalar

hold : boolean, optional, *deprecated*, default: True

detrend : callable, optional, default: `mlab.detrend_none`

x is detrended by the `detrend` callable. Default is no normalization.

normed : boolean, optional, default: True

if True, input vectors are normalised to unit length.

usevlines : boolean, optional, default: True

if True, Axes.vlines is used to plot the vertical lines from the origin to the acorr. Otherwise, Axes.plot is used.

maxlags : integer, optional, default: 10

number of lags to show. If None, will return all 2 * len(x) - 1 lags.

Returns (lags, c, line, b) : where:

- `lags` are a length 2‘maxlags+1 lag vector.
- `c` is the 2‘maxlags+1 auto correlation vectorI
- `line` is a *`Line2D`* instance returned by *`plot`*.
- `b` is the x-axis.

Other Parameters linestyle : *`Line2D`* prop, optional, default: None

Only used if usevlines is False.

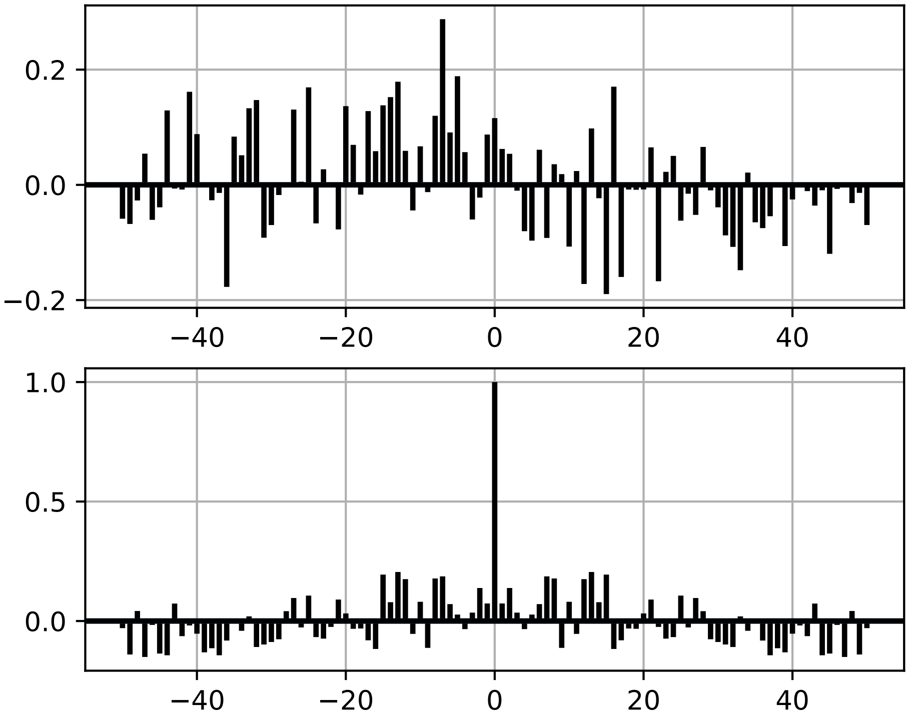
marker : string, optional, default: ‘o’

Notes

The cross correlation is performed with `numpy.correlate()` with `mode` = 2.

Examples

`xcorr` is top graph, and *`acorr`* is bottom graph.



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x'.

---

matplotlib.axes.Axes.angle_spectrum

`Axes.`**`angle_spectrum`**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, ***kwargs*)

Plot the angle spectrum.

Call signature:

```
angle_spectrum(x, Fs=2, Fc=0,  window=mlab.window_hanning,
               pad_to=None, sides='default', **kwargs)
```

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

****kwargs :**

Keyword arguments control the `Line2D` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']

C

Table 19.18 – continued from previous page

Property	Description
dashes	sequence of on/off ink in points
drawstyle	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
figure	a *matplotlib.figure.Figure* instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	*A valid marker style*
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markerfacecoloralt or mfcalt	any matplotlib color
markersize or ms	float
markevery	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
path_effects	unknown
picker	float distance in points or callable pick function `fn(artist, event)`
pickradius	float distance in points
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a *matplotlib.transforms.Transform* instance
url	a url string
visible	[True | False]
xdata	1D array
ydata	1D array
zorder	any number

Returns spectrum : 1-D array

The values for the angle spectrum in radians (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

line : a *Line2D* instance

The line created by this function

See also:

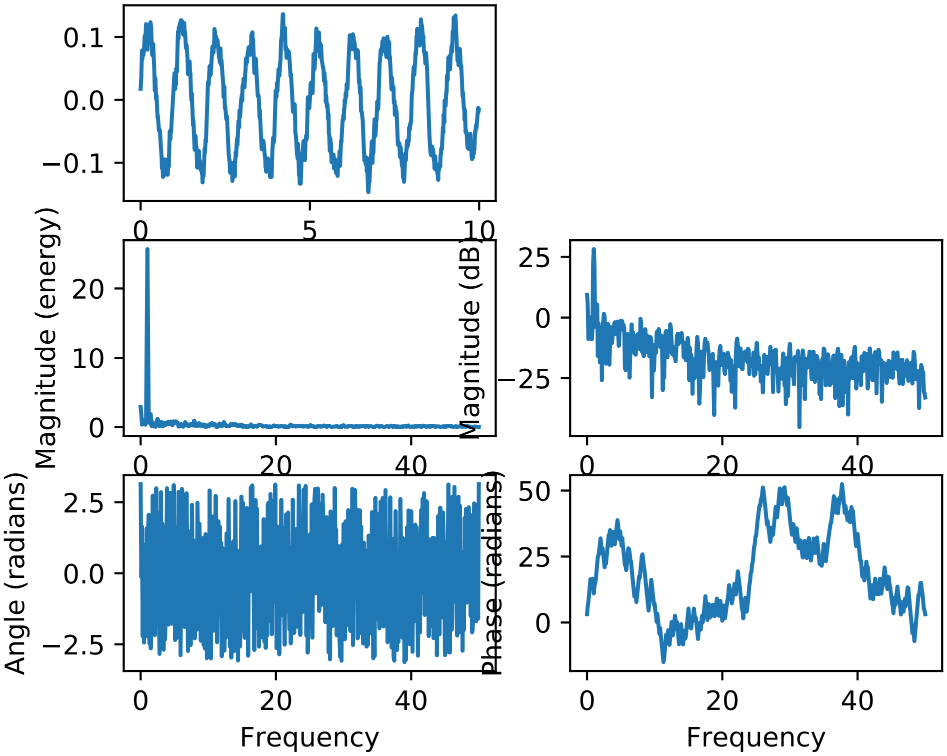
magnitude_spectrum() *angle_spectrum()* plots the magnitudes of the corresponding frequencies.

phase_spectrum() *phase_spectrum()* plots the unwrapped version of this function.

`specgram()` *specgram()* can plot the angle spectrum of segments within the signal in a colormap.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x'.

Examples



matplotlib.axes.Axes.cohere

`Axes.cohere`(*x*, *y*, *NFFT=256*, *Fs=2*, *Fc=0*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*, ***kwargs*)

Plot the coherence between *x* and *y*.

Plot the coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}} \tag{19.1}$$

Parameters Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between blocks. The default value is 0 (no overlap).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

****kwargs :**

Keyword arguments control the `Line2D` properties of the coherence plot:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
`linewidth` or lw	float value in points
`marker`	`A valid marker style`
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]

C

Table 19.19 – continued from previous page

Property	Description
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

Returns The return value is a tuple (Cxy, f), where f are the

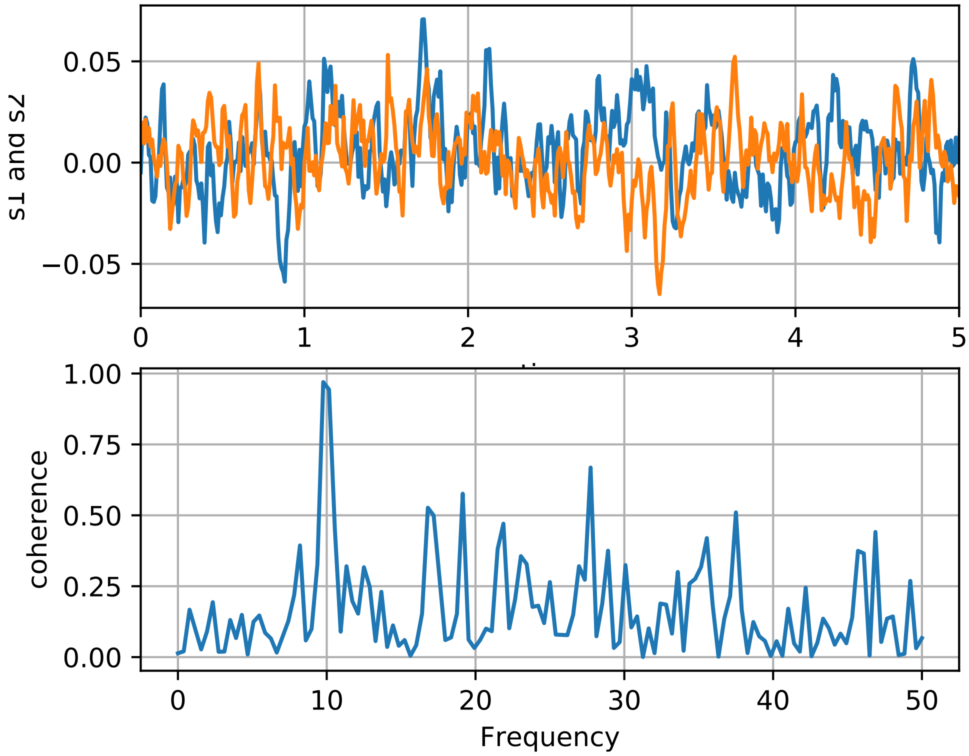
frequencies of the coherence vector.

kwargs are applied to the lines.

References

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘y’.

---

matplotlib.axes.Axes.csd

`Axes.csd`(*x*, *y*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, ***kwargs*)

Plot the cross-spectral density.

Call signature:

```
csd(x, y, NFFT=256, Fs=2, Fc=0, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None, return_line=None, **kwargs)
```

The cross spectral density P_{xy} by Welch’s average periodogram method. The vectors *x* and *y* are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of *x* and *y* are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT* or len(*y*) < *NFFT*, they will be zero padded to *NFFT*.

Parameters x, y : 1-D arrays or sequences

Arrays or sequences containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : [‘default’ | ‘onesided’ | ‘twosided’]

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between segments. The default value is 0 (no overlap).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line : bool

Whether to include the line object plotted in the returned values. Default is False.

****kwargs :**

Keyword arguments control the `Line2D` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance

C

Table 19.20 – continued from previous page

Property	Description
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or lw	float value in points
`marker`	`A valid marker style`
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

Returns Pxy : 1-D array

The values for the cross spectrum `P_{xy}` before scaling (complex valued)

freqs : 1-D array

The frequencies corresponding to the elements in *Pxy*

line : a `Line2D` instance

The line created by this function. Only returned if *return_line* is True.

See also:

`psd()` `psd()` is the equivalent to setting y=x.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x', 'y'.

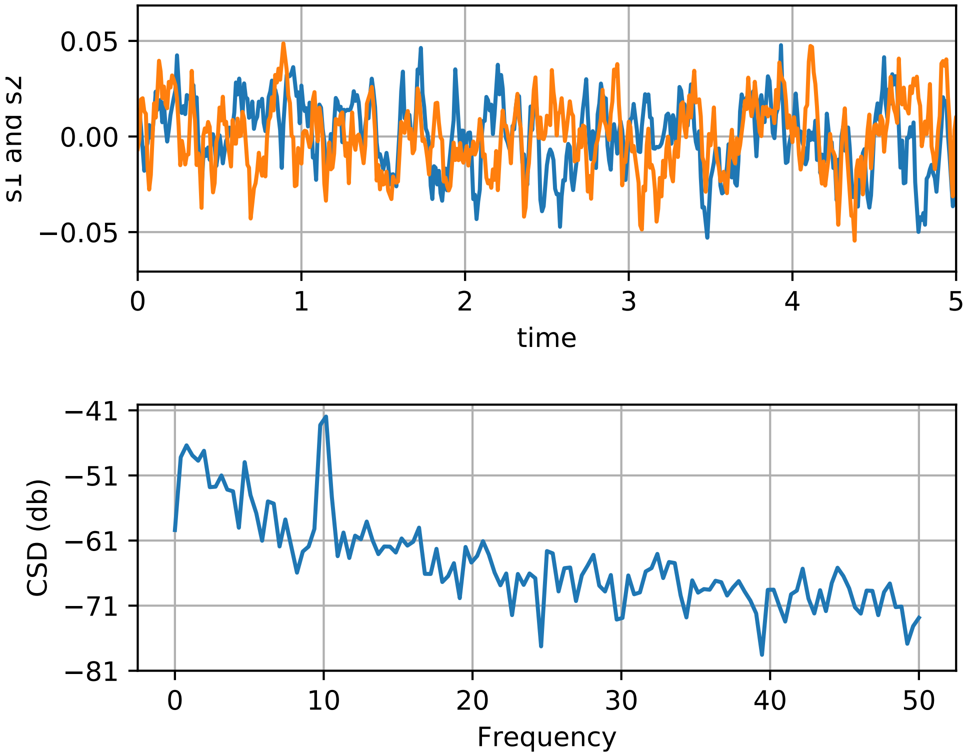
Notes

For plotting, the power is plotted as $10\log_{10}(P_{xy})$ for decibels, though `P_{xy}` itself is returned.

References

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples



matplotlib.axes.Axes.magnitude_spectrum

`Axes.magnitude_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, **kwargs)`

Plot the magnitude spectrum.

Call signature:

```
magnitude_spectrum(x, Fs=2, Fc=0,  window=mlab.window_hanning,
                   pad_to=None, sides='default', **kwargs)
```

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : [‘default’ | ‘onesided’ | ‘twosided’]

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

scale : [‘default’ | ‘linear’ | ‘dB’]

The scaling of the values in the *spec*. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale. When *mode* is ‘density’, this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). ‘default’ is ‘linear’.

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

****kwargs :**

C

Table 19.21 – continued from previous page

Property	Description
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

Returns spectrum : 1-D array

The values for the magnitude spectrum before scaling (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

line : a `Line2D` instance

The line created by this function

See also:

`psd()` `psd()` plots the power spectral density.‘.

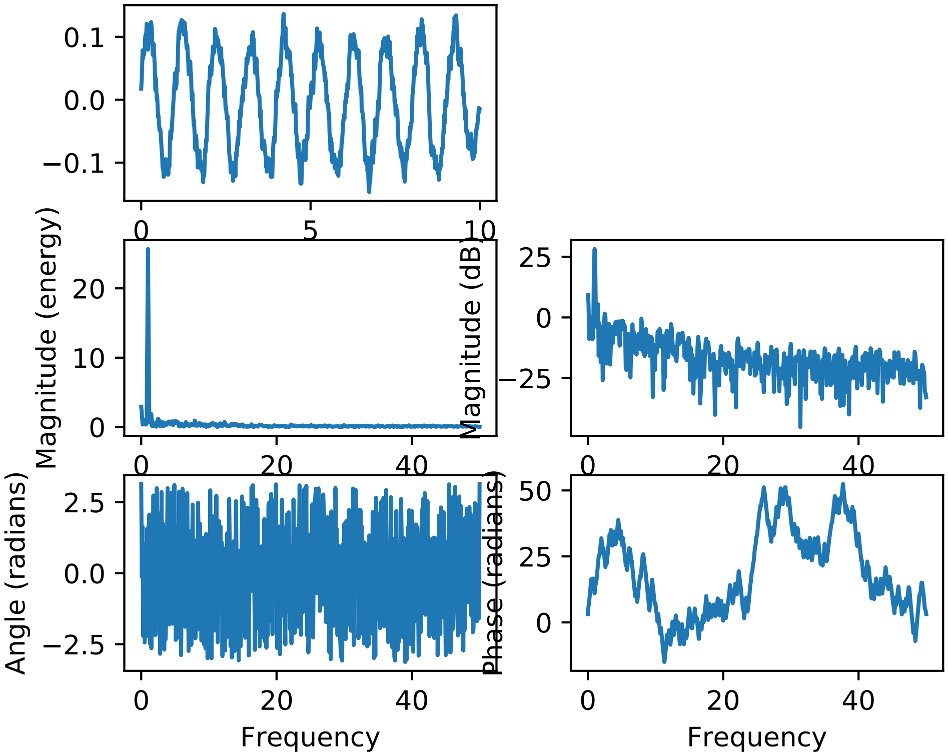
`angle_spectrum()` `angle_spectrum()` plots the angles of the corresponding frequencies.

`phase_spectrum()` `phase_spectrum()` plots the phase (unwrapped angle) of the corresponding frequencies.

`specgram()` `specgram()` can plot the magnitude spectrum of segments within the signal in a colormap.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: ‘x’.

Examples



matplotlib.axes.Axes.phase_spectrum

`Axes.`**`phase_spectrum`**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, ***kwargs*)

Plot the phase spectrum.

Call signature:

```
phase_spectrum(x, Fs=2, Fc=0,  window=mlab.window_hanning,
               pad_to=None, sides='default', **kwargs)
```

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

****kwargs :**

Keyword arguments control the *`Line2D`* properties:

Property	Description

Returns spectrum : 1-D array

The values for the phase spectrum in radians (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

line : a *Line2D* instance

The line created by this function

See also:

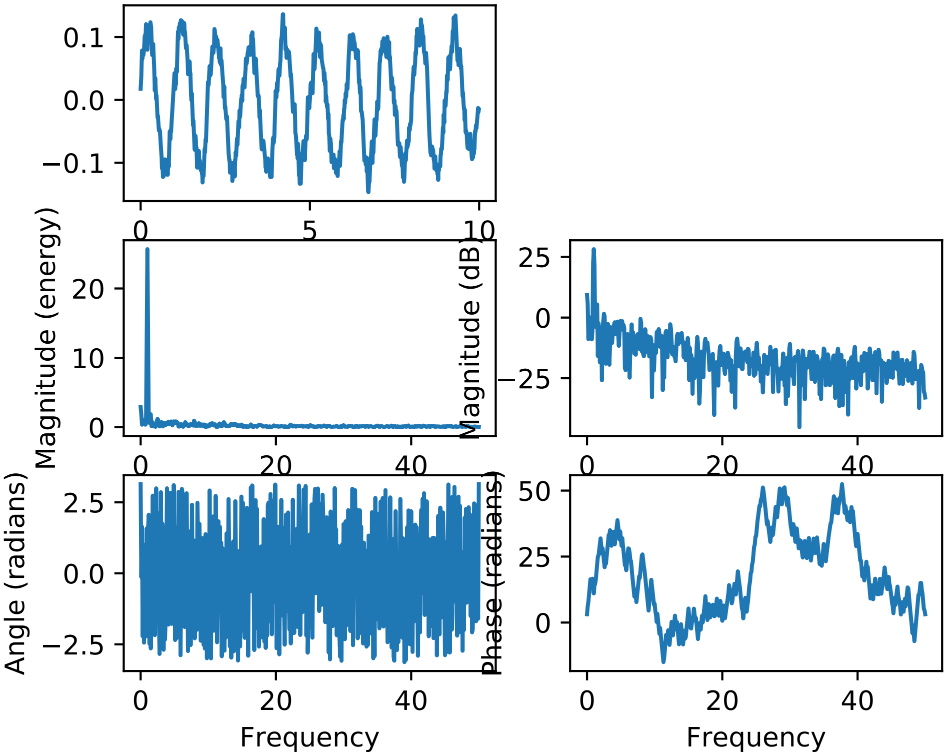
magnitude_spectrum() *magnitude_spectrum()* plots the magnitudes of the corresponding frequencies.

angle_spectrum() *angle_spectrum()* plots the wrapped version of this function.

specgram() *specgram()* can plot the phase spectrum of segments within the signal in a colormap.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x'.

Examples



matplotlib.axes.Axes.psd

`Axes.psd`(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, ***kwargs*)

Plot the power spectral density.

Call signature:

```
psd(x, NFFT=256, Fs=2, Fc=0, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None, return_line=None, **kwargs)
```

The power spectral density P_{xx} by Welch's average periodogram method. The vector x is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}, with a scaling to correct for power loss due to windowing.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between segments. The default value is 0 (no overlap).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line : bool

Whether to include the line object plotted in the returned values. Default is False.

****kwargs :**

Keyword arguments control the `Line2D` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
`linewidth` or lw	float value in points
`marker`	*`A valid marker style`*
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color

C

Table 19.23 – continued from previous page

Property	Description
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

Returns Pxx : 1-D array

The values for the power spectrum `P_{xx}` before scaling (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *Pxx*

line : a `Line2D` instance

The line created by this function. Only returned if *return_line* is True.

See also:

`specgram()` `specgram()` differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

`magnitude_spectrum()` `magnitude_spectrum()` plots the magnitude spectrum.

`csd()` `csd()` plots the spectral density between two signals.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x'.

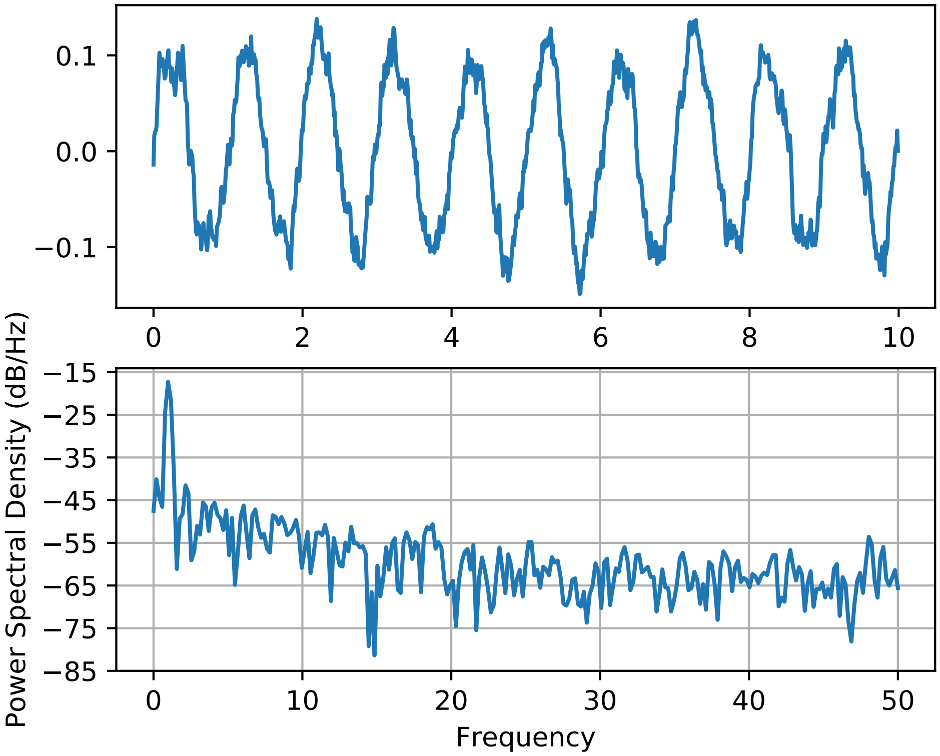
Notes

For plotting, the power is plotted as $10\log_{10}(P_{xx})$ for decibels, though *Pxx* itself is returned.

References

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples



matplotlib.axes.Axes.specgram

`Axes.`**`specgram`**(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *cmap=None*, *xextent=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*, *scale=None*, *vmin=None*, *vmax=None*, ***kwargs*)

Plot a spectrogram.

Call signature:

```
specgram(x, NFFT=256, Fs=2, Fc=0, detrend=mlab.detrend_none,
         window=mlab.window_hanning, noverlap=128,
         cmap=None, xextent=None, pad_to=None, sides='default',
         scale_by_freq=None, mode='default', scale='default',
         **kwargs)
```

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

Parameters x : 1-D array or sequence

Array or sequence containing the data.

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode : [‘default’ | ‘psd’ | ‘magnitude’ | ‘angle’ | ‘phase’]

What sort of spectrum to use. Default is ‘psd’, which takes the power spectral density. ‘complex’ returns the complex-valued frequency spectrum. ‘magnitude’ returns the magnitude spectrum. ‘angle’ returns the phase spectrum without unwrapping. ‘phase’ returns the phase spectrum with unwrapping.

noverlap : integer

The number of points of overlap between blocks. The default value is 128.

scale : [‘default’ | ‘linear’ | ‘dB’]

The scaling of the values in the *spec*. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale. When *mode* is ‘psd’, this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). ‘default’ is ‘dB’ if *mode* is ‘psd’ or ‘magnitude’ and ‘linear’ otherwise. This must be ‘linear’ if *mode* is ‘angle’ or ‘phase’.

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap :

A `matplotlib.colors.Colormap` instance; if *None*, use default determined by rc

xextent : [None | (xmin, xmax)]

The image extent along the x-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border of the last bin. Note that for *noverlap>0* the width of the bins is smaller than those of the segments.

****kwargs :**

Additional kwargs are passed on to imshow which makes the specgram image

Returns spectrum : 2-D array

Columns are the periodograms of successive segments.

freqs : 1-D array

The frequencies corresponding to the rows in *spectrum*.

t : 1-D array

The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

im : instance of class `AxesImage`

The image created by imshow containing the spectrogram

See also:

`psd()` `psd()` differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

`magnitude_spectrum()` A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

`angle_spectrum()` A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

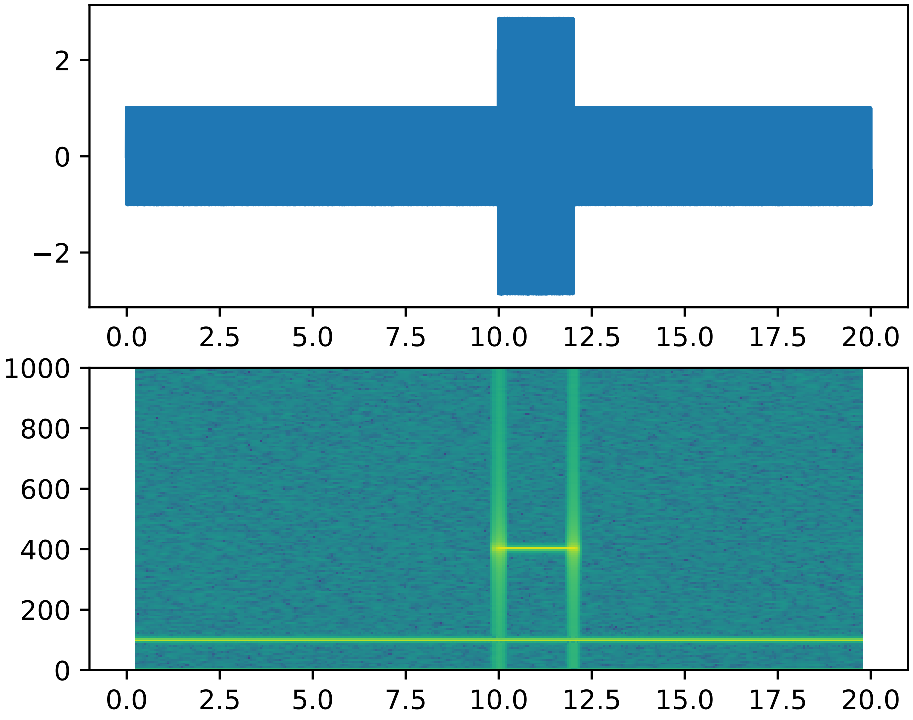
`phase_spectrum()` A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x'.

Notes

detrend and *scale_by_freq* only apply when *mode* is set to 'psd'

Examples



matplotlib.axes.Axes.xcorr

`Axes.`**`xcorr`**(*x*, *y*, *normed=True*, *detrend=<function detrend_none>*, *usevlines=True*, *maxlags=10*, **kwargs)

Plot the cross correlation between *x* and *y*.

The correlation with lag k is defined as sum_n x[n+k] * conj(y[n]).

Parameters x : sequence of scalars of length n

y : sequence of scalars of length n

hold : boolean, optional, *deprecated*, default: True

detrend : callable, optional, default: `mlab.detrend_none`

x is detrended by the `detrend` callable. Default is no normalization.

normed : boolean, optional, default: True

if True, input vectors are normalised to unit length.

usevlines : boolean, optional, default: True if True, Axes.vlines is used to plot the vertical lines from the origin to the acorr. Otherwise, Axes.plot is used.

maxlags : integer, optional, default: 10

number of lags to show. If None, will return all 2 * len(x) - 1 lags.

Returns (lags, c, line, b) : where:

- `lags` are a length 2‘maxlags+1 lag vector.
- `c` is the 2‘maxlags+1 auto correlation vectorI
- `line` is a *`Line2D`* instance returned by *`plot`*.
- `b` is the x-axis (none, if plot is used).

Other Parameters linestyle : *`Line2D`* prop, optional, default: None

Only used if usevlines is False.

marker : string, optional, default: ‘o’

Notes

The cross correlation is performed with `numpy.correlate()` with `mode` = 2.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘y’.

19.1.4 Statistics

`Axes.boxplot`	Make a box and whisker plot.
`Axes.violinplot`	Make a violin plot.
`Axes.violin`	Drawing function for violin plots.
`Axes.bxp`	Drawing function for box and whisker plots.

matplotlib.axes.Axes.boxplot

`Axes.`**`boxplot`**(*x*, *notch=None*, *sym=None*, *vert=None*, *whis=None*, *positions=None*, *widths=None*, *patch_artist=None*, *bootstrap=None*, *usermedians=None*, *conf_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage_xticks=True*, *autorange=False*, *zorder=None*)

Make a box and whisker plot.

Make a box and whisker plot for each column of `x` or each vector in sequence `x`. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters x : Array or a sequence of vectors.

The input data.

notch : bool, optional (False)

If `True`, will produce a notched box plot. Otherwise, a rectangular boxplot is produced. The notches represent the confidence interval (CI) around the median. See the entry for the `bootstrap` parameter for information regarding how the locations of the notches are computed.

Note: In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

---

sym : str, optional

The default symbol for flier points. Enter an empty string ('') if you don't want to show fliers. If `None`, then the fliers default to 'b+' If you want more control use the flierprops kwarg.

vert : bool, optional (True)

If `True` (default), makes the boxes vertical. If `False`, everything is drawn horizontally.

whis : float, sequence, or string (default = 1.5)

As a float, determines the reach of the whiskers to the beyond the first and third quartiles. In other words, where IQR is the interquartile range (`Q3-Q1`), the upper whisker will extend to last datum less than `Q3 + whis*IQR`). Similarly, the lower whisker will extend to the first datum greater than `Q1 - whis*IQR`. Beyond the whiskers, data are considered outliers and are plotted as individual points. Set this to an unreasonably high value to force the whiskers to show the min and max values. Alternatively, set this to an ascending sequence of percentile (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, `whis` can be the string `'range'` to force the whiskers to the min and max of the data.

bootstrap : int, optional

Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If `bootstrap` is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians : array-like, optional

An array or sequence whose first dimension (or length) is compatible with `x`. This overrides the medians computed by matplotlib for each element of `usermedians` that is not `None`. When an element of `usermedians` is None, the median will be computed by matplotlib as normal.

conf_intervals : array-like, optional

Array or sequence whose first dimension (or length) is compatible with `x` and whose second dimension is 2. When the an element of `conf_intervals` is not None, the notch locations computed by matplotlib are overridden (provided `notch` is `True`). When an element of `conf_intervals` is `None`, the notches are computed by the method specified by the other kwargs (e.g., `bootstrap`).

positions : array-like, optional

Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

widths : scalar or array-like

Sets the width of each box either with a scalar or a sequence. The default is 0.5, or `0.15*(distance between extreme positions)`, if that is smaller.

patch_artist : bool, optional (False)

If `False` produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

labels : sequence, optional

Labels for each dataset. Length must be compatible with dimensions of `x`.

manage_xticks : bool, optional (True)

If the function should adjust the xlim and xtick locations.

autorange : bool, optional (False)

When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to `'range'` such that the whisker ends are at the minimum and maximum of the data.

meanline : bool, optional (False)

If `True` (and `showmeans` is `True`), will try to render the mean as a line spanning the full width of the box according to `meanprops` (see below). Not recommended if `shownotches` is also True. Otherwise, means will be shown as points.

zorder : scalar, optional (None)

Sets the zorder of the boxplot.

Returns result : dict

A dictionary mapping each component of the boxplot to a list of the `matplotlib.lines.Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Other Parameters showcaps : bool, optional (True)

Show the caps on the ends of whiskers.

showbox : bool, optional (True)

Show the central box.

showfliers : bool, optional (True)

Show the outliers beyond the caps.

showmeans : bool, optional (False)

Show the arithmetic means.

capprops : dict, optional (None)

Specifies the style of the caps.

boxprops : dict, optional (None)

Specifies the style of the box.

whiskerprops : dict, optional (None)

Specifies the style of the whiskers.

flierprops : dict, optional (None)

Specifies the style of the fliers.

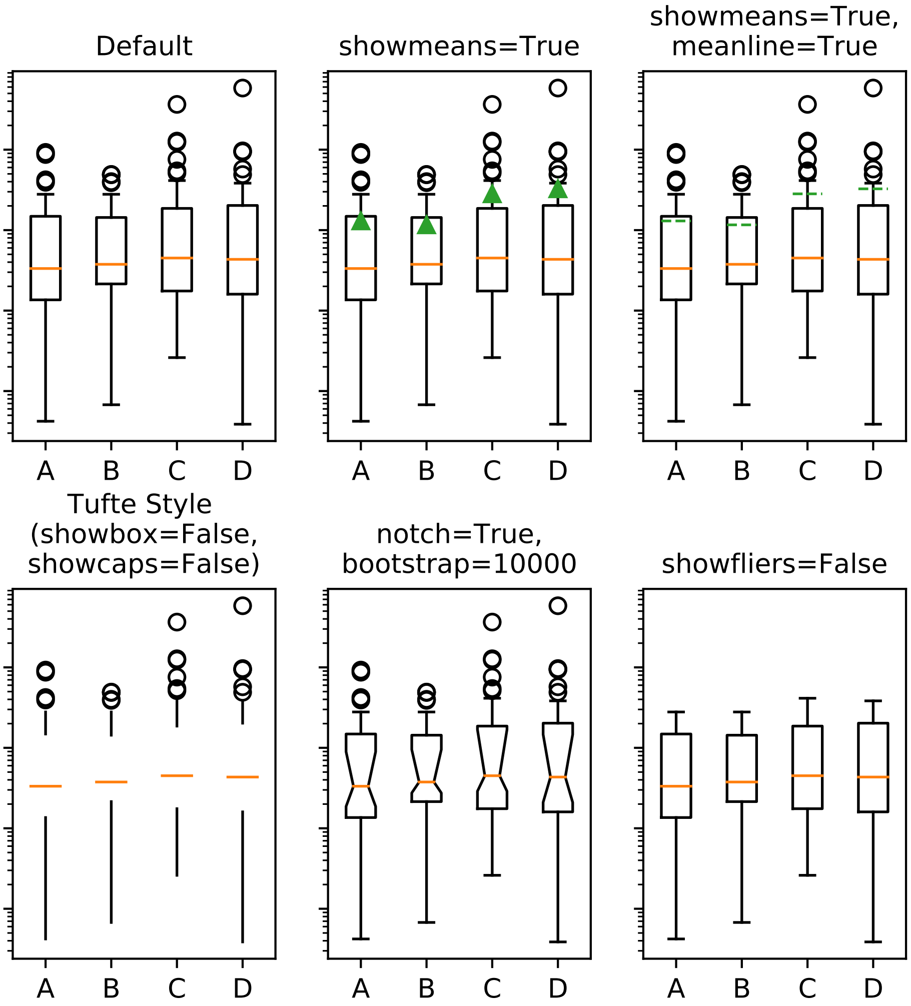
medianprops : dict, optional (None)

Specifies the style of the median.

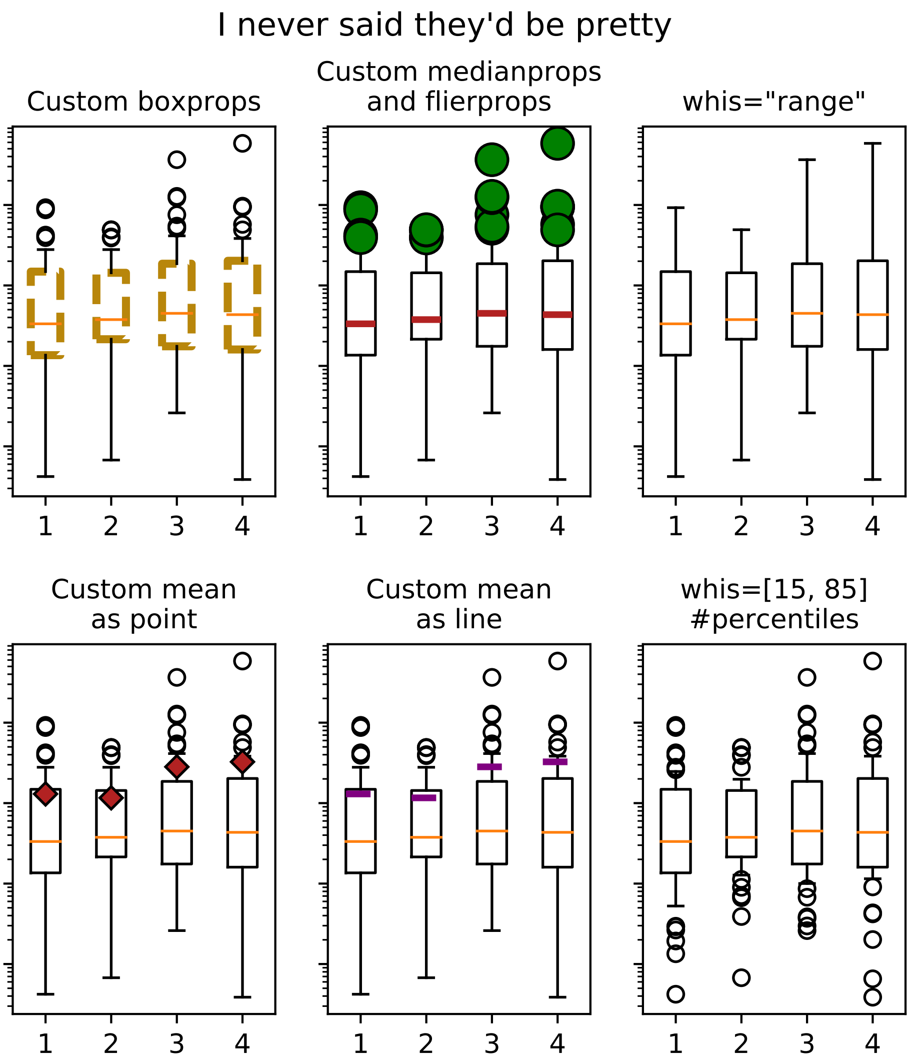
meanprops : dict, optional (None)

Specifies the style of the mean.

Examples



Default
showmeans=True
showmeans=True, meanline=True
Tufte Style (showbox=False, showcaps=False)
notch=True, bootstrap=10000
showfliers=False
A
B
C
D



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.violinplot

`Axes.`**`violinplot`**(*dataset*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*, *points=100*, *bw_method=None*)

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, and the maximum.

Parameters dataset : Array or a sequence of vectors.

The input data.

positions : array-like, default = [1, 2, ..., n]

Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert : bool, default = True.

If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

widths : array-like, default = 0.5

Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans : bool, default = False

If `True`, will toggle rendering of the means.

showextrema : bool, default = True

If `True`, will toggle rendering of the extrema.

showmedians : bool, default = False

If `True`, will toggle rendering of the medians.

points : scalar, default = 100

Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method : str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), 'scott' is used.

Returns result : dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *`matplotlib.collections.PolyCollection`* instances containing the filled area of each violin.
- `cmeans`: A *`matplotlib.collections.LineCollection`* instance created to identify the mean values of each of the violin's distribution.
- `cmins`: A *`matplotlib.collections.LineCollection`* instance created to identify the bottom of each violin's distribution.
- `cmaxes`: A *`matplotlib.collections.LineCollection`* instance created to identify the top of each violin's distribution.

- `cbars`: A *`matplotlib.collections.LineCollection`* instance created to identify the centers of each violin's distribution.
- `cmedians`: A *`matplotlib.collections.LineCollection`* instance created to identify the median values of each of the violin's distribution.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'dataset'.

---

matplotlib.axes.Axes.violin

`Axes.`**`violin`**(*vpstats*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*)

Drawing function for violin plots.

Draw a violin plot for each column of `vpstats`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, and the maximum.

Parameters vpstats : list of dicts

A list of dictionaries containing stats for each violin plot. Required keys are:

- `coords`: A list of scalars containing the coordinates that the violin's kernel density estimate were evaluated at.
- `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- `mean`: The mean value for this violin's dataset.
- `median`: The median value for this violin's dataset.
- `min`: The minimum value for this violin's dataset.
- `max`: The maximum value for this violin's dataset.

positions : array-like, default = [1, 2, ..., n]

Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert : bool, default = True.

If true, plots the violins veritcally. Otherwise, plots the violins horizontally.

widths : array-like, default = 0.5

Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans : bool, default = False

If true, will toggle rendering of the means.

showextrema : bool, default = True

If true, will toggle rendering of the extrema.

showmedians : bool, default = False

If true, will toggle rendering of the medians.

Returns result : dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *`matplotlib.collections.PolyCollection`* instances containing the filled area of each violin.
- `cmeans`: A *`matplotlib.collections.LineCollection`* instance created to identify the mean values of each of the violin's distribution.
- `cmins`: A *`matplotlib.collections.LineCollection`* instance created to identify the bottom of each violin's distribution.
- `cmaxes`: A *`matplotlib.collections.LineCollection`* instance created to identify the top of each violin's distribution.
- `cbars`: A *`matplotlib.collections.LineCollection`* instance created to identify the centers of each violin's distribution.
- `cmedians`: A *`matplotlib.collections.LineCollection`* instance created to identify the median values of each of the violin's distribution.

matplotlib.axes.Axes.bxp

`Axes.`**`bxp`**(*bxpstats*, *positions=None*, *widths=None*, *vert=True*, *patch_artist=False*, *shownotches=False*, *showmeans=False*, *showcaps=True*, *showbox=True*, *showfliers=True*, *boxprops=None*, *whiskerprops=None*, *flierprops=None*, *medianprops=None*, *capprops=None*, *meanprops=None*, *meanline=False*, *manage_xticks=True*, *zorder=None*)

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters bxpstats : list of dicts

A list of dictionaries containing stats for each boxplot. Required keys are:

- `med`: The median (scalar float).
- `q1`: The first quartile (25th percentile) (scalar float).
- `q3`: The third quartile (75th percentile) (scalar float).
- `whislo`: Lower bound of the lower whisker (scalar float).

- `whishi`: Upper bound of the upper whisker (scalar float).

Optional keys are:

- `mean`: The mean (scalar float). Needed if `showmeans=True`.
- `fliers`: Data beyond the whiskers (sequence of floats). Needed if `showfliers=True`.
- `cilo` & `cihi`: Lower and upper confidence intervals about the median. Needed if `shownotches=True`.
- `label`: Name of the dataset (string). If available, this will be used a tick label for the boxplot

positions : array-like, default = [1, 2, ..., n]

Sets the positions of the boxes. The ticks and limits are automatically set to match the positions.

widths : array-like, default = 0.5

Either a scalar or a vector and sets the width of each box. The default is 0.5, or `0.15*(distance between extreme positions)` if that is smaller.

vert : bool, default = False

If `True` (default), makes the boxes vertical. If `False`, makes horizontal boxes.

patch_artist : bool, default = False

If `False` produces boxes with the *`Line2D`* artist. If `True` produces boxes with the *`Patch`* artist.

shownotches : bool, default = False

If `False` (default), produces a rectangular box plot. If `True`, will produce a notched box plot

showmeans : bool, default = False

If `True`, will toggle on the rendering of the means

showcaps : bool, default = True

If `True`, will toggle on the rendering of the caps

showbox : bool, default = True

If `True`, will toggle on the rendering of the box

showfliers : bool, default = True

If `True`, will toggle on the rendering of the fliers

boxprops : dict or None (default)

If provided, will set the plotting style of the boxes

whiskerprops : dict or None (default)

If provided, will set the plotting style of the whiskers

capprops : dict or None (default)

If provided, will set the plotting style of the caps

flierprops : dict or None (default)

If provided will set the plotting style of the fliers

medianprops : dict or None (default)

If provided, will set the plotting style of the medians

meanprops : dict or None (default)

If provided, will set the plotting style of the means

meanline : bool, default = False

If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops*. Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

manage_xticks : bool, default = True

If the function should adjust the xlim and xtick locations.

zorder : scalar, default = None

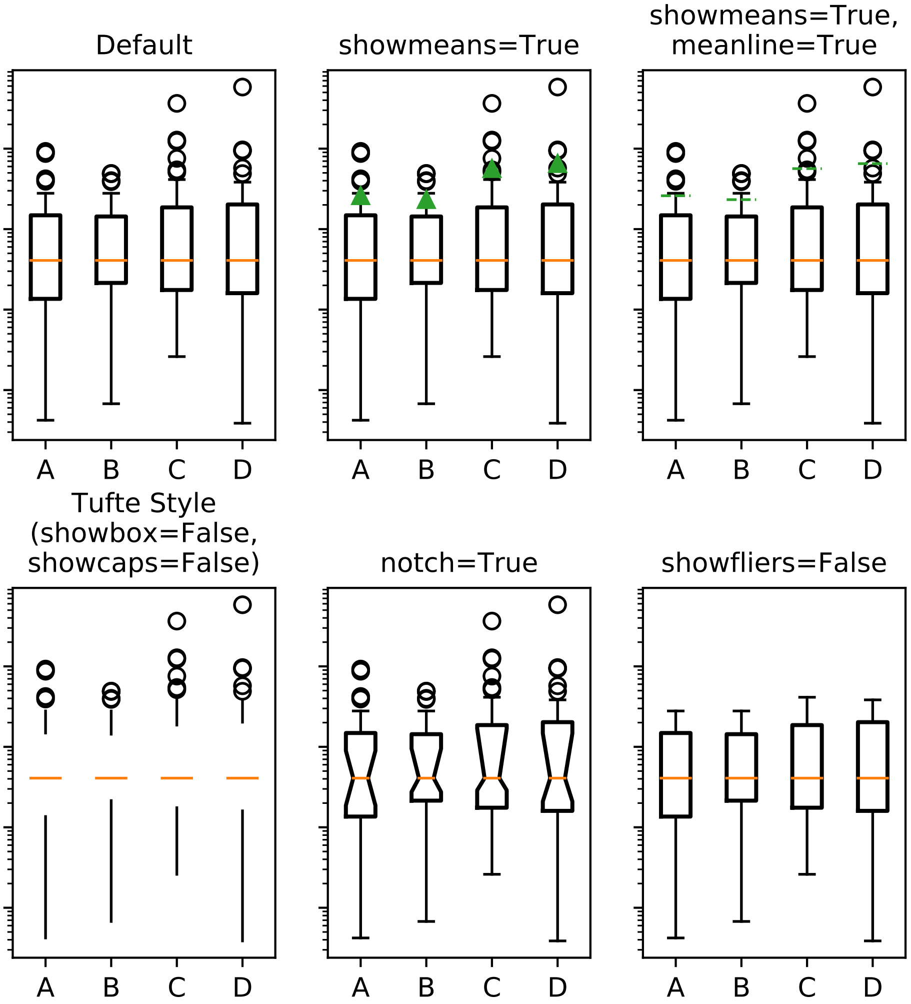
The zorder of the resulting boxplot

Returns result : dict

A dictionary mapping each component of the boxplot to a list of the `matplotlib.lines.Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Examples



Default
showmeans=True
showmeans=True,
meanline=True
Tufte Style
(showbox=False,
showcaps=False)
notch=True
showfliers=False

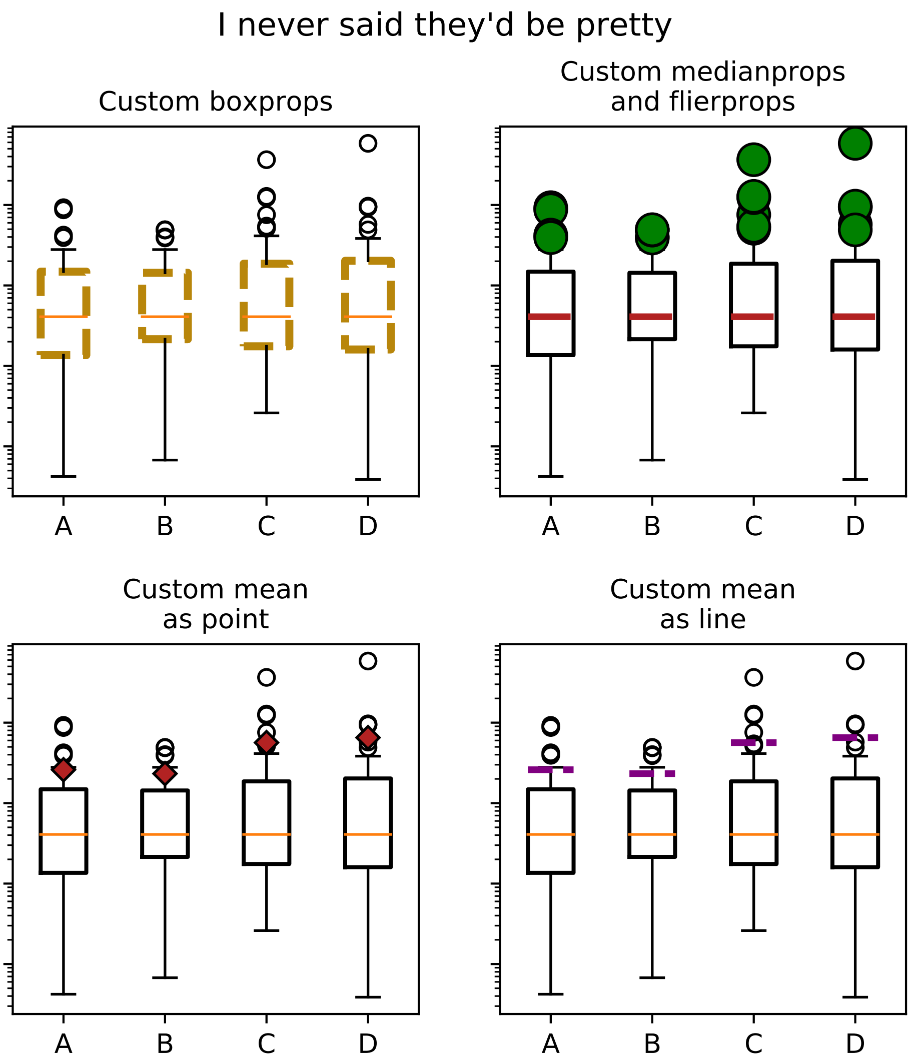
B
C
D



19.1.5 Binned

`Axes.hexbin`	Make a hexagonal binning plot.
`Axes.hist`	Plot a histogram.
`Axes.hist2d`	Make a 2D histogram plot.

matplotlib.axes.Axes.hexbin

`Axes.`**`hexbin`**(*x*, *y*, *C=None*, *gridsize=100*, *bins=None*, *xscale='linear'*, *yscale='linear'*, *extent=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors='none'*, *reduce_C_function=<function mean>*, *mincnt=None*, *marginals=False*, **kwargs)

Make a hexagonal binning plot.

Make a hexagonal binning plot of *x* versus *y*, where *x*, *y* are 1-D sequences of the same length, *N*. If *C* is *None* (the default), this is a histogram of the number of occurences of the observations at (x[i],y[i]).

If *C* is specified, it specifies values at the coordinate (x[i],y[i]). These values are accumulated for each hexagonal bin and then reduced according to *reduce_C_function*, which defaults to numpy's mean function (np.mean). (If *C* is specified, it must also be a 1-D sequence of the same length as *x* and *y*.)

Parameters x, y : array or masked array

C : array or masked array, optional, default is *None*

gridsize : int or (int, int), optional, default is 100

The number of hexagons in the *x*-direction, default is 100. The corresponding number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular. Alternatively, gridsize can be a tuple with two elements specifying the number of hexagons in the *x*-direction and the *y*-direction.

bins : {'log'} or int or sequence, optional, default is *None*

If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.

If 'log', use a logarithmic scale for the color map. Internally, $log_{10}(i + 1)$ is used to determine the hexagon color.

If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.

If a sequence of values, the values of the lower bound of the bins to be used.

xscale : {'linear', 'log'}, optional, default is 'linear'

Use a linear or log10 scale on the horizontal axis.

yscale : {'linear', 'log'}, optional, default is 'linear'

Use a linear or log10 scale on the vertical axis.

mincnt : int > 0, optional, default is *None*

If not *None*, only display cells with more than *mincnt* number of points in the cell

marginals : bool, optional, default is *False*

if marginals is *True*, plot the marginal density as colormapped rectagles along the bottom of the x-axis and left of the y-axis

extent : scalar, optional, default is *None*

The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

Returns object

a `PolyCollection` instance; use `get_array()` on this `PolyCollection` to get the counts in each hexagon.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

Other Parameters cmap : object, optional, default is *None*

a `matplotlib.colors.Colormap` instance. If *None*, defaults to rc `image.cmap`.

norm : object, optional, default is *None*

`matplotlib.colors.Normalize` instance is used to scale luminance data to 0,1.

vmin, vmax : scalar, optional, default is *None*

vmin and *vmax* are used in conjunction with *norm* to normalize luminance data. If *None*, the min and max of the color array *C* are used. Note if you pass a norm instance your settings for *vmin* and *vmax* will be ignored.

alpha : scalar between 0 and 1, optional, default is *None*

the alpha value for the patches

linewidths : scalar, optional, default is *None*

If *None*, defaults to 1.0.

edgecolors : {'none'} or mpl color, optional, default is 'none'

If 'none', draws the edges in the same color as the fill color. This is the default, as it avoids unsightly unpainted pixels between the hexagons.

If *None*, draws outlines in the default color.

If a matplotlib color arg, draws outlines in the specified color.

Notes

The standard descriptions of all the `Collection` parameters:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats

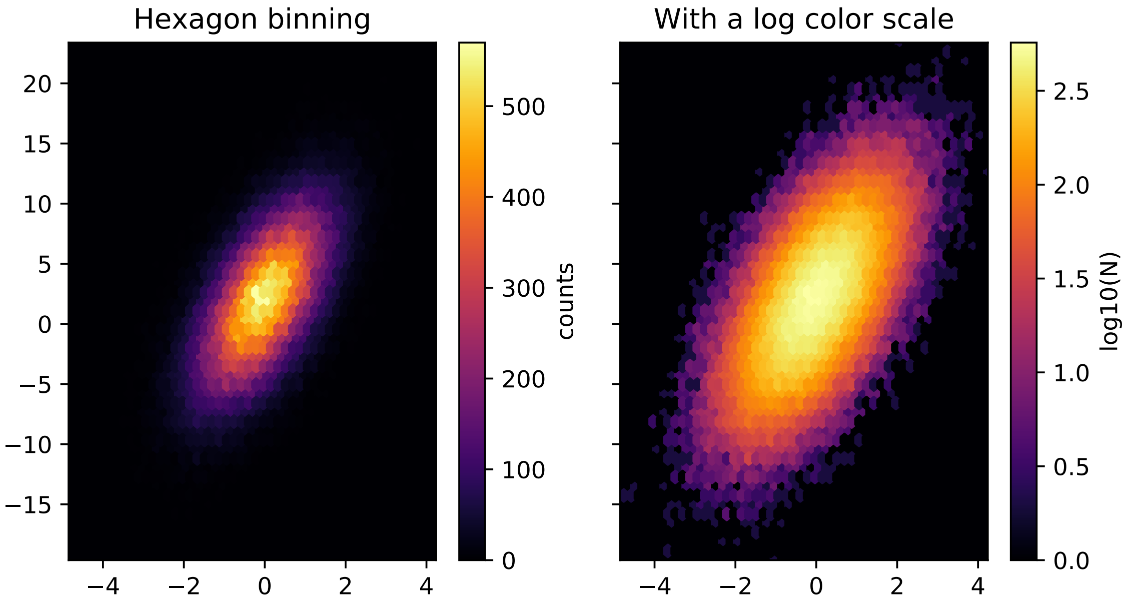
Table 19.26 – continued from previous page

Property	Description
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`visible`	[True | False]
`zorder`	any number

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘y’.

Examples



matplotlib.axes.Axes.hist

`Axes.`**`hist`**(*x*, *bins=None*, *range=None*, *normed=False*, *weights=None*, *cumulative=False*, *bottom=None*, *histtype='bar'*, *align='mid'*, *orientation='vertical'*, *rwidth=None*, *log=False*, *color=None*, *label=None*, *stacked=False*, ***kwargs*)

Plot a histogram.

Compute and draw the histogram of *x*. The return value is a tuple (*n*, *bins*, *patches*) or ([*n0*, *n1*, ...], *bins*, [*patches0*, *patches1*,...]) if the input contains multiple data.

Multiple data can be provided via *x* as a list of datasets of potentially different length ([*x0*, *x1*, ...]), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported at present.

Parameters x : (n,) array or sequence of (n,) arrays

Input values, this takes either a single array or a sequency of arrays which are not required to be of the same length

bins : integer or array_like or 'auto', optional

If an integer is given, `bins + 1` bin edges are returned, consistently with `numpy.histogram()` for numpy version >= 1.3.

Unequally spaced bins are supported if `bins` is a sequence.

If Numpy 1.11 is installed, may also be `'auto'`.

Default is taken from the rcParam `hist.bins`.

range : tuple or None, optional

The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, `range` is (x.min(), x.max()). Range has no effect if `bins` is a sequence.

If `bins` is a sequence or `range` is specified, autoscaling is based on the specified bin range instead of the range of x.

Default is `None`

normed : boolean, optional

If `True`, the first element of the return tuple will be the counts normalized to form a probability density, i.e., `` n/(len(x)`dbin) ``, i.e., the integral of the histogram will sum to 1. If *stacked* is also *True*, the sum of the histograms is normalized to 1.

Default is `False`

weights : (n,) array_like or None, optional

An array of weights, of the same shape as `x`. Each value in `x` only contributes its associated weight towards the bin count (instead of 1). If `normed` is True, the weights are normalized, so that the integral of the density over the range remains 1.

Default is `None`

cumulative : boolean, optional

If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints. If `normed` is also `True` then the histogram is normalized such that the last bin equals 1. If `cumulative` evaluates to less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if `normed` is also `True`, then the histogram is normalized such that the first bin equals 1.

Default is `False`

bottom : array_like, scalar, or None

Location of the bottom baseline of each bin. If a scalar, the base line for each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

Default is `None`

histtype : {'bar', 'barstacked', 'step', 'stepfilled'}, optional

The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are aranged side by side.

- ‘barstacked’ is a bar-type histogram where multiple data are stacked on top of each other.
- ‘step’ generates a lineplot that is by default unfilled.
- ‘stepfilled’ generates a lineplot that is by default filled.

Default is ‘bar’

align : {‘left’, ‘mid’, ‘right’}, optional

Controls how the histogram is plotted.

- ‘left’: bars are centered on the left bin edges.
- ‘mid’: bars are centered between the bin edges.
- ‘right’: bars are centered on the right bin edges.

Default is ‘mid’

orientation : {‘horizontal’, ‘vertical’}, optional

If ‘horizontal’, `barh` will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

rwidth : scalar or None, optional

The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if `histtype` is ‘step’ or ‘stepfilled’.

Default is `None`

log : boolean, optional

If `True`, the histogram axis will be set to a log scale. If `log` is `True` and `x` is a 1D array, empty bins will be filtered out and only the non-empty (`n`, `bins`, `patches`) will be returned.

Default is `False`

color : color or array_like of colors or None, optional

Color spec or sequence of color specs, one per dataset. Default (`None`) uses the standard line color sequence.

Default is `None`

label : string or None, optional

String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that the legend command will work as expected.

default is `None`

stacked : boolean, optional

If `True`, multiple data are stacked on top of each other If `False` multiple data are aranged side by side if histtype is 'bar' or on top of each other if histtype is 'step'

Default is `False`

Returns n : array or list of arrays

The values of the histogram bins. See **normed** and **weights** for a description of the possible semantics. If input **x** is an array, then this is an array of length **nbins**. If input is a sequence arrays `[data1, data2,..]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order.

bins : array

The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches : list or list of lists

Silent list of individual patches used to create the histogram or list of such list if multiple input datasets.

Other Parameters kwargs : *`Patch`* properties

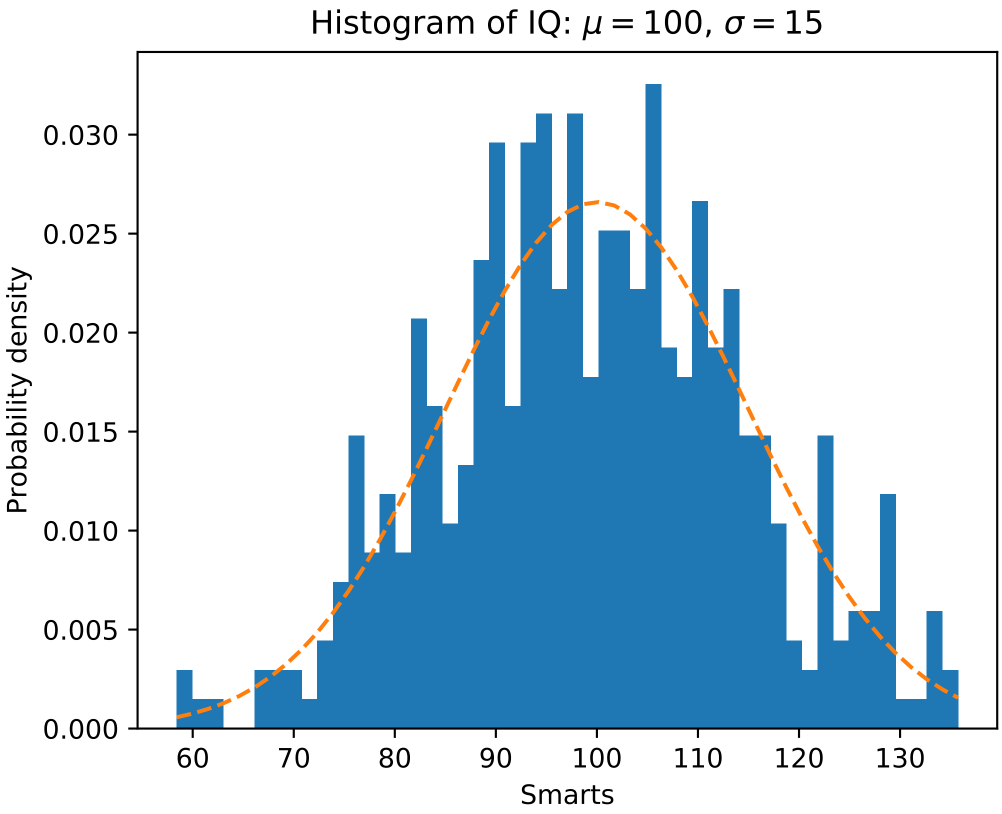
See also:

`hist2d` 2D histograms

Notes

Until numpy release 1.5, the underlying numpy histogram function was incorrect with `normed`=`True` if bin sizes were unequal. MPL inherited that error. It is now corrected within MPL when using earlier numpy versions.

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'weights', 'x'.

---

matplotlib.axes.Axes.hist2d

`Axes.`**`hist2d`**(*x*, *y*, *bins=10*, *range=None*, *normed=False*, *weights=None*, *cmin=None*, *cmax=None*, ***kwargs*)

Make a 2D histogram plot.

Parameters x, y: array_like, shape (n,)

Input values

bins: [None | int | [int, int] | array_like | [array, array]]

The bin specification:

- If int, the number of bins for the two dimensions (nx=ny=bins).
- If [int, int], the number of bins in each dimension (nx, ny = bins).

- If array_like, the bin edges for the two dimensions (x_edges=y_edges=bins).
- If [array, array], the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range : array_like shape(2, 2), optional, default: None

The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

normed : boolean, optional, default: False

Normalize histogram.

weights : array_like, shape (n,), optional, default: None

An array of values w_i weighing each sample (x_i, y_i).

cmin : scalar, optional, default: None

All bins that has count less than cmin will not be displayed and these count values in the return value count histogram will also be set to nan upon return

cmax : scalar, optional, default: None

All bins that has count more than cmax will not be displayed (set to none before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return

Returns The return value is `(counts, xedges, yedges, Image)`.

Other Parameters cmap : {Colormap, string}, optional

A *`matplotlib.colors.Colormap`* instance. If not set, use rc settings.

norm : Normalize, optional

A *`matplotlib.colors.Normalize`* instance is used to scale luminance data to `[0, 1]`. If not set, defaults to `Normalize()`.

vmin/vmax : {None, scalar}, optional

Arguments passed to the `Normalize` instance.

alpha : `0 <= scalar <= 1` or `None`, optional

The alpha blending value.

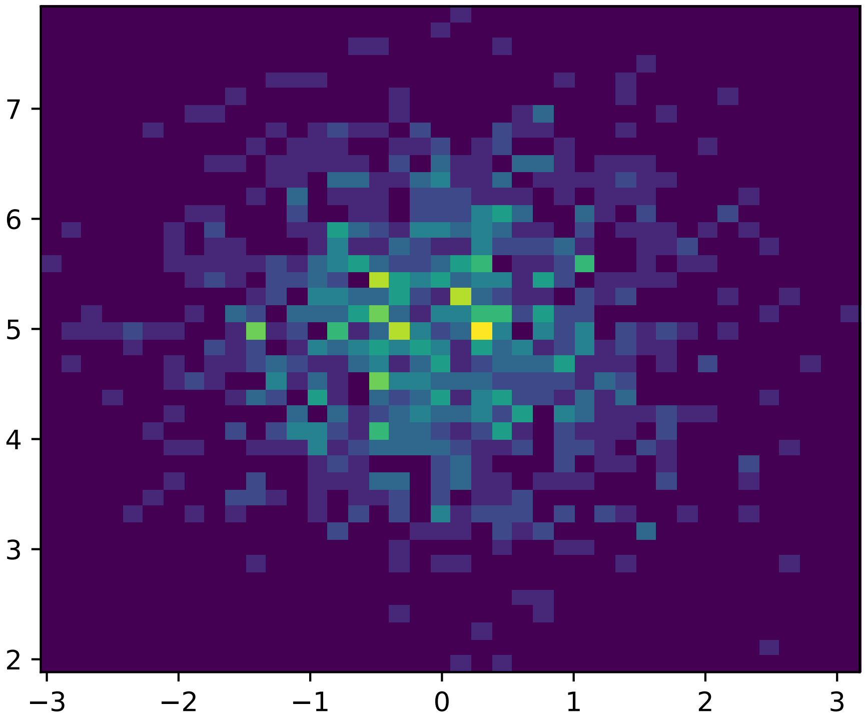
See also:

`hist` 1D histogram

Notes

Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the *norm* keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'weights', 'x', 'y'.

19.1.6 Contours

Axes.clabel	Label a contour plot.
Axes.contour	Plot contours.
Axes.contourf	Plot contours.

matplotlib.axes.Axes.clabel

`Axes.clabel`(*CS*, **args*, ***kwargs*)

Label a contour plot.

Call signature:

```
clabel(cs, **kwargs)
```

Adds labels to line contours in *cs*, where *cs* is a `ContourSet` object returned by contour.

```
clabel(cs, v, **kwargs)
```

only labels contours listed in *v*.

Optional keyword arguments:

***fontsize*:** size in points or relative size e.g., 'smaller', 'x-large'

***colors*:**

- if *None*, the color of each label matches the color of the corresponding contour
- if one string color, e.g., *colors* = 'r' or *colors* = 'red', all labels will be plotted in this color
- if a tuple of matplotlib color args (string, float, rgb, etc), different labels will be plotted in different colors in the order specified

***inline*:** controls whether the underlying contour is removed or not. Default is *True*.

***inline_spacing*:** space in pixels to leave on each side of label when placing inline. Defaults to 5. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

***fmt*:** a format string for the label. Default is '%1.3f' Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., fmt[level]=string), or it can be any callable, such as a `Formatter` instance, that returns a string when called with a numeric contour level.

***manual*:** if *True*, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

manual can be an iterable object of x,y tuples. Contour labels will be created as if mouse is clicked at each x,y positions.

***rightside_up*:** if *True* (default), label rotations will always be plus or minus 90 degrees from level.

***use_clabeltext*:** if *True* (default is False), ClabelText class (instead of matplotlib.Text) is used to create labels. ClabelText recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes.

matplotlib.axes.Axes.contour

`Axes.`**`contour`**`(`**args*, ***kwargs*`)`

Plot contours.

`contour()` and `contourf()` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

`contourf()` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour()`.

Call signatures:

```
contour(Z)
```

make a contour plot of an array *Z*. The level values are chosen automatically.

```
contour(X,Y,Z)
```

X, *Y* specify the (x, y) coordinates of the surface

```
contour(Z,N)
contour(X,Y,Z,N)
```

contour up to *N* automatically-chosen levels.

```
contour(Z,V)
contour(X,Y,Z,V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```
contourf(..., V)
```

fill the `len(V)-1` regions between the values in *V*, which must be in increasing order.

```
contour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

X and *Y* must both be 2-D with the same shape as *Z*, or they must both be 1-D such that `len(X)` is the number of columns in *Z* and `len(Y)` is the number of rows in *Z*.

`C = contour(...)` returns a `QuadContourSet` object.

Optional keyword arguments:

***corner_mask*: [*True* | *False* | 'legacy']** Enable/disable corner masking, which only has an effect if *Z* is a masked array. If *False*, any quad touching a masked point is masked out. If *True*, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual. If 'legacy', the old contouring algorithm is used, which is equivalent to *False* and is deprecated, only remaining whilst the new algorithm is tested fully.

If not specified, the default is taken from rcParams['contour.corner_mask'], which is True unless it has been modified.

***colors*: [*None* | string | (mpl_colors)]** If *None*, the colormap specified by cmap will be used.

If a string, like 'r' or 'red', all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

***alpha*: float** The alpha blending value

***cmap*: [*None* | Colormap]** A cm `Colormap` instance or *None*. If *cmap* is *None* and *colors* is *None*, a default Colormap is used.

***norm*: [*None* | Normalize]** A `matplotlib.colors.Normalize` instance for scaling data values to colors. If *norm* is *None* and *colors* is *None*, the default linear scaling is used.

***vmin*, *vmax*: [*None* | scalar]** If not *None*, either or both of these values will be supplied to the `matplotlib.colors.Normalize` instance, overriding the default color scaling based on *levels*.

***levels*: [level0, level1, ..., leveln]** A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass `levels=[0]`

***origin*: [*None* | 'upper' | 'lower' | 'image']** If *None*, the first value of *Z* will correspond to the lower left corner, location (0,0). If 'image', the rc value for `image.origin` will be used.

This keyword is not active if *X* and *Y* are specified in the call to contour.

extent: [*None* | (x0,x1,y0,y1)]

If *origin* is not *None*, then *extent* is interpreted as in `matplotlib.pyplot.imshow()`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0,0], and (*x1*, *y1*) is the position of Z[-1,-1].

This keyword is not active if *X* and *Y* are specified in the call to contour.

***locator*: [*None* | ticker.Locator subclass]** If *locator* is *None*, the default `MaxNLocator` is used. The locator is used to determine the contour levels if they are not given explicitly via the *V* argument.

***extend*: ['neither' | 'both' | 'min' | 'max']** Unless this is 'neither', contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via `matplotlib.colors.Colormap.set_under()` and `matplotlib.colors.Colormap.set_over()` methods.

***xunits*, *yunits*: [*None* | registered units]** Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

***antialiased*: [*True* | *False*]** enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from rcParams['lines.antialiased'].

***nchunk*: [0 | integer]** If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

contour-only keyword arguments:

***linewidths*: [*None* | number | tuple of numbers]** If *linewidths* is *None*, the default width in `lines.linewidth` in `matplotlibrc` is used.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified.

***linestyles*: [*None* | 'solid' | 'dashed' | 'dashdot' | 'dotted']** If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from the `matplotlibrc` `contour.negative_linestyle` setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

contourf-only keyword arguments:

***hatches*:** A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Note: contourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < z <= z2
```

There is one exception: if the lowest boundary coincides with the minimum value of the *z* array, then that minimum value will be included in the lowest interval.

matplotlib.axes.Axes.contourf

`Axes.`**`contourf`**`(`**args*, ***kwargs*`)`

Plot contours.

`contour()` and `contourf()` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

`contourf()` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour()`.

Call signatures:

```
contour(Z)
```

make a contour plot of an array *Z*. The level values are chosen automatically.

```
contour(X,Y,Z)
```

X, *Y* specify the (x, y) coordinates of the surface

```
contour(Z,N)
contour(X,Y,Z,N)
```

contour up to *N* automatically-chosen levels.

```
contour(Z,V)
contour(X,Y,Z,V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```
contourf(..., V)
```

fill the `len(V)-1` regions between the values in *V*, which must be in increasing order.

```
contour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

X and *Y* must both be 2-D with the same shape as *Z*, or they must both be 1-D such that `len(X)` is the number of columns in *Z* and `len(Y)` is the number of rows in *Z*.

`C = contour(...)` returns a `QuadContourSet` object.

Optional keyword arguments:

***corner_mask*: [*True* | *False* | 'legacy']** Enable/disable corner masking, which only has an effect if *Z* is a masked array. If *False*, any quad touching a masked point is masked out. If *True*, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual. If 'legacy', the old contouring algorithm is used, which is equivalent to *False* and is deprecated, only remaining whilst the new algorithm is tested fully.

If not specified, the default is taken from rcParams['contour.corner_mask'], which is True unless it has been modified.

***colors*: [*None* | string | (mpl_colors)]** If *None*, the colormap specified by cmap will be used.

If a string, like 'r' or 'red', all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

***alpha*: float** The alpha blending value

***cmap*: [*None* | Colormap]** A cm `Colormap` instance or *None*. If *cmap* is *None* and *colors* is *None*, a default Colormap is used.

***norm*: [*None* | Normalize]** A `matplotlib.colors.Normalize` instance for scaling data values to colors. If *norm* is *None* and *colors* is *None*, the default linear scaling is used.

***vmin*, *vmax*: [*None* | scalar]** If not *None*, either or both of these values will be supplied to the `matplotlib.colors.Normalize` instance, overriding the default color scaling based on *levels*.

***levels*: [level0, level1, ..., leveln]** A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass `levels=[0]`

***origin*: [*None* | 'upper' | 'lower' | 'image']** If *None*, the first value of *Z* will correspond to the lower left corner, location (0,0). If 'image', the rc value for `image.origin` will be used.

This keyword is not active if *X* and *Y* are specified in the call to contour.

extent: [*None* | (x0,x1,y0,y1)]

If *origin* is not *None*, then *extent* is interpreted as in `matplotlib.pyplot.imshow()`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0,0], and (*x1*, *y1*) is the position of Z[-1,-1].

This keyword is not active if *X* and *Y* are specified in the call to contour.

***locator*: [*None* | ticker.Locator subclass]** If *locator* is *None*, the default `MaxNLocator` is used. The locator is used to determine the contour levels if they are not given explicitly via the *V* argument.

***extend*: ['neither' | 'both' | 'min' | 'max']** Unless this is 'neither', contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via `matplotlib.colors.Colormap.set_under()` and `matplotlib.colors.Colormap.set_over()` methods.

***xunits*, *yunits*: [*None* | registered units]** Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

***antialiased*: [*True* | *False*]** enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from rcParams['lines.antialiased'].

***nchunk*: [0 | integer]** If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

contour-only keyword arguments:

***linewidths*: [*None* | number | tuple of numbers]** If *linewidths* is *None*, the default width in `lines.linewidth` in `matplotlibrc` is used.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified.

***linestyles*: [*None* | 'solid' | 'dashed' | 'dashdot' | 'dotted']** If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from the `matplotlibrc` `contour.negative_linestyle` setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

contourf-only keyword arguments:

***hatches*:** A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Note: contourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < z <= z2
```

There is one exception: if the lowest boundary coincides with the minimum value of the *z* array, then that minimum value will be included in the lowest interval.

19.1.7 Array

Axes.imshow	Display an image on the axes.
Axes.matshow	Plot a matrix or array as an image.
Axes.pcolor	Create a pseudocolor plot of a 2-D array.
Axes.pcolorfast	pseudocolor plot of a 2-D array
Axes.pcolormesh	Plot a quadrilateral mesh.
Axes.spy	Plot the sparsity pattern on a 2-D array.

matplotlib.axes.Axes.imshow

`Axes.`**`imshow`**(*X*, *cmap=None*, *norm=None*, *aspect=None*, *interpolation=None*, *alpha=None*, *vmin=None*, *vmax=None*, *origin=None*, *extent=None*, *shape=None*, *filternorm=1*, *filterrad=4.0*, *imlim=None*, *resample=None*, *url=None*, ***kwargs*)

Display an image on the axes.

Parameters X : array_like, shape (n, m) or (n, m, 3) or (n, m, 4)

Display the image in `X` to current axes. `X` may be an array or a PIL image. If `X` is an array, it can have the following shapes and types:

- MxN – values to be mapped (float or int)

- MxNx3 – RGB (float or uint8)
- MxNx4 – RGBA (float or uint8)

The value for each component of MxNx3 and MxNx4 float arrays should be in the range 0.0 to 1.0. MxN arrays are mapped to colors based on the `norm` (mapping scalar to scalar) and the `cmap` (mapping the normed scalar to a color).

cmap : *`Colormap`*, optional, default: None

If None, default to rc `image.cmap` value. `cmap` is ignored if `X` is 3-D, directly specifying RGB(A) values.

aspect : ['auto' | 'equal' | scalar], optional, default: None

If 'auto', changes the image aspect ratio to match that of the axes.

If 'equal', and `extent` is None, changes the axes aspect ratio to match that of the image. If `extent` is not `None`, the axes aspect ratio is changed to match that of the extent.

If None, default to rc `image.aspect` value.

interpolation : string, optional, default: None

Acceptable values are 'none', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'

If `interpolation` is None, default to rc `image.interpolation`. See also the `filternorm` and `filterrad` parameters. If `interpolation` is 'none', then no interpolation is performed on the Agg, ps and pdf backends. Other backends will fall back to 'nearest'.

norm : *`Normalize`*, optional, default: None

A *`Normalize`* instance is used to scale a 2-D float `X` input to the (0, 1) range for input to the `cmap`. If `norm` is None, use the default func:`normalize`. If `norm` is an instance of *`NoNorm`*, `X` must be an array of integers that index directly into the lookup table of the `cmap`.

vmin, vmax : scalar, optional, default: None

`vmin` and `vmax` are used in conjunction with norm to normalize luminance data. Note if you pass a `norm` instance, your settings for `vmin` and `vmax` will be ignored.

alpha : scalar, optional, default: None

The alpha blending value, between 0 (transparent) and 1 (opaque)

origin : ['upper' | 'lower'], optional, default: None

Place the [0,0] index of the array in the upper left or lower left corner of the axes. If None, default to rc `image.origin`.

extent : scalars (left, right, bottom, top), optional, default: None

The location, in data-coordinates, of the lower-left and upper-right corners. If `None`, the image is positioned such that the pixel centers fall on zero-based (row, column) indices.

shape : scalars (columns, rows), optional, default: None

For raw buffer images

filternorm : scalar, optional, default: 1

A parameter for the antigrain image resize filter. From the antigrain documentation, if `filternorm` = 1, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad : scalar, optional, default: 4.0

The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'

Returns image : `AxesImage`

Other Parameters kwargs : `Artist` properties.

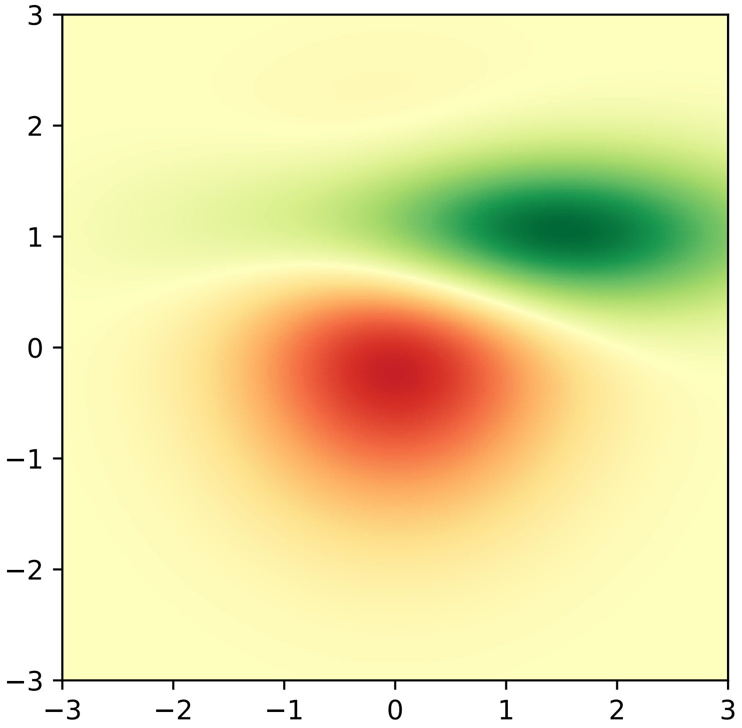
See also:

`matshow` Plot a matrix or an array as an image.

Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

Examples



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

matplotlib.axes.Axes.matshow

`Axes.`**`matshow`**(*Z*, ***kwargs*)

Plot a matrix or array as an image.

The matrix will be shown the way it would be printed, with the first row at the top. Row and column numbering is zero-based.

Parameters Z : array_like shape (n, m)

The matrix to be displayed.

Returns image : *`AxesImage`*

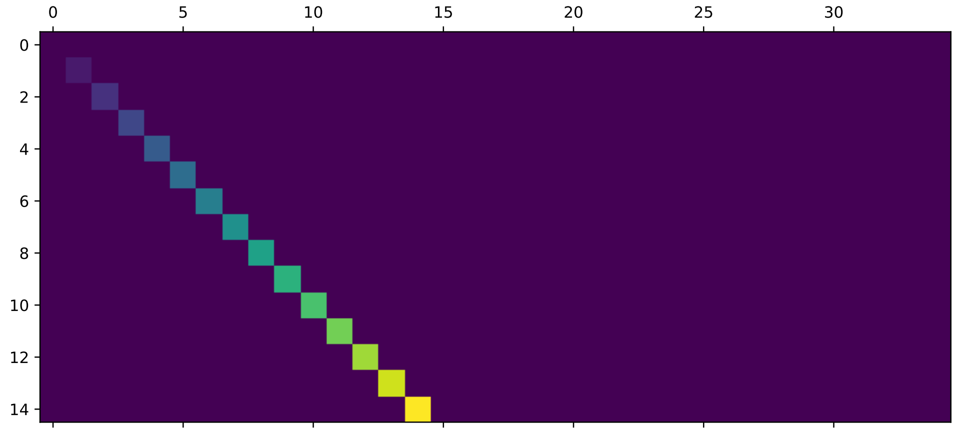
Other Parameters kwargs : *`imshow`* arguments

Sets `origin` to 'upper', 'interpolation' to 'nearest' and 'aspect' to equal.

See also:

`imshow` plot an image

Examples



matplotlib.axes.Axes.pcolor

`Axes.`**`pcolor`**`(`**args*, ***kwargs*`)`

Create a pseudocolor plot of a 2-D array.

Note: pcolor can be very slow for large arrays; consider using the similar but much faster *`pcolormesh()`* instead.

Call signatures:

```
pcolor(C, **kwargs)
pcolor(X, Y, C, **kwargs)
```

C is the array of color values.

X and *Y*, if given, specify the (x, y) coordinates of the colored quadrilaterals; the quadrilateral for C[i,j] has corners at:

```
(X[i,   j],   Y[i,   j]),
(X[i,   j+1], Y[i,   j+1]),
(X[i+1, j],   Y[i+1, j]),
(X[i+1, j+1], Y[i+1, j+1]).
```

Ideally the dimensions of *X* and *Y* should be one greater than those of *C*; if the dimensions are the same, then the last row and column of *C* will be ignored.

Note that the column index corresponds to the *x*-coordinate, and the row index corresponds to *y*; for details, see the *Grid Orientation* section below.

If either or both of *X* and *Y* are 1-D arrays or column vectors, they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

X, *Y* and *C* may be masked arrays. If either C[i, j], or one of the vertices surrounding C[i,j] (*X* or *Y* at [i, j], [i+1, j], [i, j+1],[i+1, j+1]) is masked, nothing is plotted.

Keyword arguments:

cmap: [_None_ | Colormap] A `matplotlib.colors.Colormap` instance. If *None*, use rc settings.

norm: [_None_ | Normalize] An `matplotlib.colors.Normalize` instance is used to scale luminance data to 0,1. If *None*, defaults to `normalize()`.

vmin/_vmax_: [_None_ | scalar] *vmin* and *vmax* are used in conjunction with *norm* to normalize luminance data. If either is *None*, it is autoscaled to the respective min or max of the color array *C*. If not *None*, *vmin* or *vmax* passed in here override any pre-existing values supplied in the *norm* instance.

shading: ['flat' | 'faceted'] If 'faceted', a black grid is drawn around each rectangle; if 'flat', edges are not drawn. Default is 'flat', contrary to MATLAB.

This kwarg is deprecated; please use 'edgecolors' instead:

- shading='flat' – edgecolors='none'
- shading='faceted – edgecolors='k'

edgecolors: [_None_ | `'none'` | color | color sequence] If *None*, the rc setting is used by default.

If `'none'`, edges will not be visible.

An mpl color or sequence of colors will set the edge color

alpha: `0 <= scalar <= 1` or _None_ the alpha blending value

snap: bool Whether to snap the mesh to pixel boundaries.

Return value is a `matplotlib.collections.Collection` instance. The grid orientation follows the MATLAB convention: an array *C* with shape (*nrows*, *ncolumns*) is plotted with the column number as *X* and the row number as *Y*, increasing up; hence it is plotted the way the array would be printed, except that the *Y* axis is reversed. That is, *C* is taken as C*(*y, x).

Similarly for `meshgrid()`:

```
x = np.arange(5)
y = np.arange(3)
X, Y = np.meshgrid(x, y)
```

is equivalent to:

```
X = array([[0, 1, 2, 3, 4],
           [0, 1, 2, 3, 4],
           [0, 1, 2, 3, 4]])

Y = array([[0, 0, 0, 0, 0],
           [1, 1, 1, 1, 1],
           [2, 2, 2, 2, 2]])
```

so if you have:

```
C = rand(len(x), len(y))
```

then you need to transpose C:

```
pcolor(X, Y, C.T)
```

or:

```
pcolor(C.T)
```

MATLAB `pcolor()` always discards the last row and column of *C*, but matplotlib displays the last row and column if *X* and *Y* are not specified, or if *X* and *Y* have one more row and column than *C*.

kwargs can be used to control the `PolyCollection` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown

Table 19.29 – continued from previous page

Property	Description
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`visible`	[True | False]
`zorder`	any number

Note: The default *antialiaseds* is False if the default *edgecolors*=”none” is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not “none”, then the default *antialiaseds* is taken from rcParams[’patch.antialiased’], which defaults to *True*. Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

See also:

`pcolormesh()` For an explanation of the differences between pcolor and pcolormesh.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

matplotlib.axes.Axes.pcolorfast

`Axes.`**`pcolorfast`**`(`**args*, ***kwargs*`)`

pseudocolor plot of a 2-D array

Experimental; this is a pcolor-type method that provides the fastest possible rendering with the Agg backend, and that can handle any quadrilateral grid. It supports only flat shading (no outlines), it lacks support for log scaling of the axes, and it does not have a pyplot wrapper.

Call signatures:

```
ax.pcolorfast(C, **kwargs)
ax.pcolorfast(xr, yr, C, **kwargs)
ax.pcolorfast(x, y, C, **kwargs)
ax.pcolorfast(X, Y, C, **kwargs)
```

C is the 2D array of color values corresponding to quadrilateral cells. Let (nr, nc) be its shape. C may be a masked array.

`ax.pcolorfast(C, **kwargs)` is equivalent to `ax.pcolorfast([0,nc], [0,nr], C, **kwargs)`

xr, *yr* specify the ranges of *x* and *y* corresponding to the rectangular region bounding *C*. If:

```
xr = [x0, x1]
```

and:

```
yr = [y0,y1]
```

then *x* goes from *x0* to *x1* as the second index of *C* goes from 0 to *nc*, etc. (*x0*, *y0*) is the outermost corner of cell (0,0), and (*x1*, *y1*) is the outermost corner of cell (*nr*-1, *nc*-1). All cells are rectangles of the same size. This is the fastest version.

x, *y* are monotonic 1D arrays of length *nc* +1 and *nr* +1, respectively, giving the x and y boundaries of the cells. Hence the cells are rectangular but the grid may be nonuniform. The speed is intermediate. (The grid is checked, and if found to be uniform the fast version is used.)

X and *Y* are 2D arrays with shape (*nr* +1, *nc* +1) that specify the (x,y) coordinates of the corners of the colored quadrilaterals; the quadrilateral for C[i,j] has corners at (X[i,j],Y[i,j]), (X[i,j+1],Y[i,j+1]), (X[i+1,j],Y[i+1,j]), (X[i+1,j+1],Y[i+1,j+1]). The cells need not be rectangular. This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y; for details, see *Grid Orientation*.

Optional keyword arguments:

***cmap*: [*None* | Colormap]** A `matplotlib.colors.Colormap` instance from cm. If *None*, use rc settings.

***norm*: [*None* | Normalize]** A `matplotlib.colors.Normalize` instance is used to scale luminance data to 0,1. If *None*, defaults to normalize()

***vmin/vmax*: [*None* | scalar]** *vmin* and *vmax* are used in conjunction with norm to normalize luminance data. If either are *None*, the min and max of the color array *C* is used. If you pass a norm instance, *vmin* and *vmax* will be *None*.

alpha*: `0 <= scalar <= 1` or *None the alpha blending value

Return value is an image if a regular or rectangular grid is specified, and a `QuadMesh` collection in the general quadrilateral case.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.pcolormesh

`Axes.`**`pcolormesh`**`(`**args*, ***kwargs*`)`

Plot a quadrilateral mesh.

Call signatures:

```
pcolormesh(C)
pcolormesh(X, Y, C)
pcolormesh(C, **kwargs)
```

Create a pseudocolor plot of a 2-D array.

pcolormesh is similar to *`pcolor()`*, but uses a different mechanism and returns a different object; pcolor returns a *`PolyCollection`* but pcolormesh returns a *`QuadMesh`*. It is much faster, so it is almost always preferred for large arrays.

C may be a masked array, but *X* and *Y* may not. Masked array support is implemented via *cmap* and *norm*; in contrast, *`pcolor()`* simply does not draw quadrilaterals with masked colors or vertices.

Keyword arguments:

***cmap*: [*None* | Colormap]** A *`matplotlib.colors.Colormap`* instance. If *None*, use rc settings.

***norm*: [*None* | Normalize]** A *`matplotlib.colors.Normalize`* instance is used to scale luminance data to 0,1. If *None*, defaults to `normalize()`.

***vmin*/*vmax*: [*None* | scalar]** *vmin* and *vmax* are used in conjunction with *norm* to normalize luminance data. If either is *None*, it is autoscaled to the respective min or max of the color array *C*. If not *None*, *vmin* or *vmax* passed in here override any pre-existing values supplied in the *norm* instance.

***shading*: ['flat' | 'gouraud']** 'flat' indicates a solid color for each quad. When 'gouraud', each quad will be Gouraud shaded. When gouraud shading, edgecolors is ignored.

***edgecolors*: [*None* | `'None'` | `'face'` | color |**

color sequence]

If *None*, the rc setting is used by default.

If `'None'`, edges will not be visible.

If `'face'`, edges will have the same color as the faces.

An mpl color or sequence of colors will set the edge color

alpha*: `0 <= scalar <= 1` or *None the alpha blending value

Return value is a `matplotlib.collections.QuadMesh` object.

kwargs can be used to control the `matplotlib.collections.QuadMesh` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`urls`	unknown
`visible`	[True | False]
`zorder`	any number

See also:

`pcolor()` For an explanation of the grid orientation (*Grid Orientation*) and the expansion of 1-D *X* and/or *Y* to 2-D arrays.

Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.spy

`Axes.`**`spy`**`(`*Z*, *precision=0*, *marker=None*, *markersize=None*, *aspect='equal'*, *origin='upper'*, ***kwargs*`)`

Plot the sparsity pattern on a 2-D array.

`spy(Z)` plots the sparsity pattern of the 2-D array *Z*.

Parameters Z : sparse array (n, m)

The array to be plotted.

precision : float, optional, default: 0

If *precision* is 0, any non-zero value will be plotted; else, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, there is a special case: if *precision* is 'present', any value present in the array will be plotted, even if it is identically zero.

origin : ["upper", "lower"], optional, default: "upper"

Place the [0,0] index of the array in the upper left or lower left corner of the axes.

aspect : ['auto' | 'equal' | scalar], optional, default: "equal"

If 'equal', and `extent` is None, changes the axes aspect ratio to match that of the image. If `extent` is not `None`, the axes aspect ratio is changed to match that of the extent.

If 'auto', changes the image aspect ratio to match that of the axes.

If None, default to rc `image.aspect` value.

Two plotting styles are available: image or marker. Both

are available for full arrays, but only the marker style

works for :class:‘scipy.sparse.spmatrix‘ instances.

If *marker* and *markersize* are *None*, an image will be

returned and any remaining kwargs are passed to

:func:‘~matplotlib.pyplot.imshow‘; else, a

:class:‘~matplotlib.lines.Line2D‘ object will be returned with

the value of marker determining the marker type, and any

remaining kwargs passed to the

:meth:'~matplotlib.axes.Axes.plot' method.

If *marker* and *markersize* are *None*, useful kwargs include:

*** *cmap***

*** *alpha***

See also:

imshow for image options.

plot for plotting options

19.1.8 Unstructured Triangles

Axes.tripcolor	Create a pseudocolor plot of an unstructured triangular grid.
Axes.triplot	Draw a unstructured triangular grid as lines and/or markers.
Axes.tricontour	Draw contours on an unstructured triangular grid.
Axes.tricontourf	Draw contours on an unstructured triangular grid.

matplotlib.axes.Axes.tripcolor

`Axes.`**`tripcolor`**`(`**args*, ***kwargs*`)`

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where triangulation is a *matplotlib.tri.Triangulation* object, or

```
tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)
```

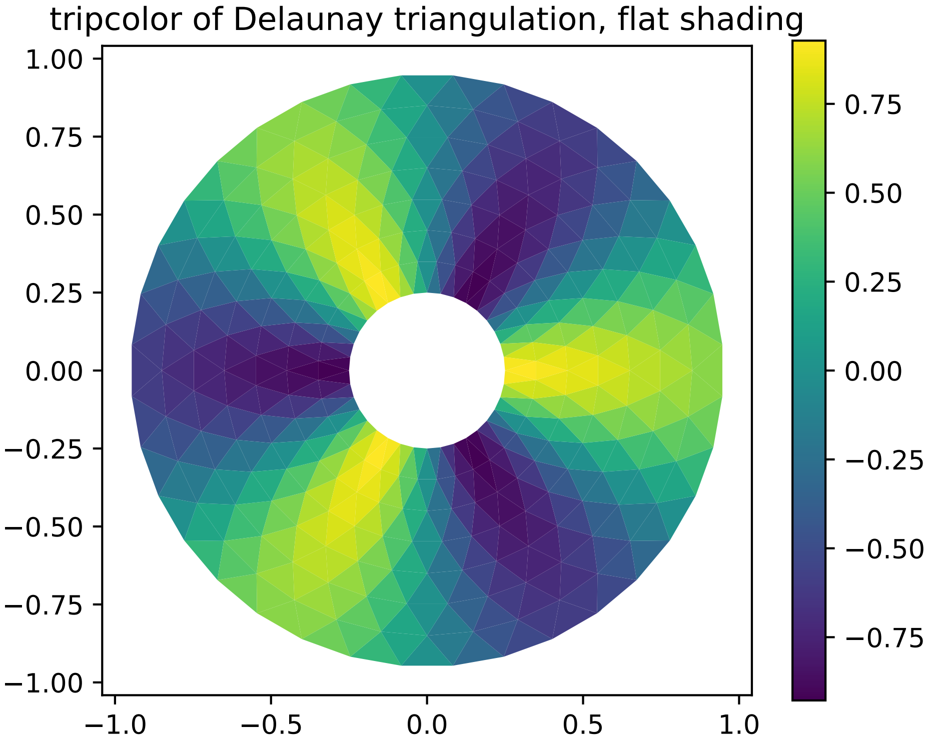
in which case a Triangulation object will be created. See *Triangulation* for a explanation of these possibilities.

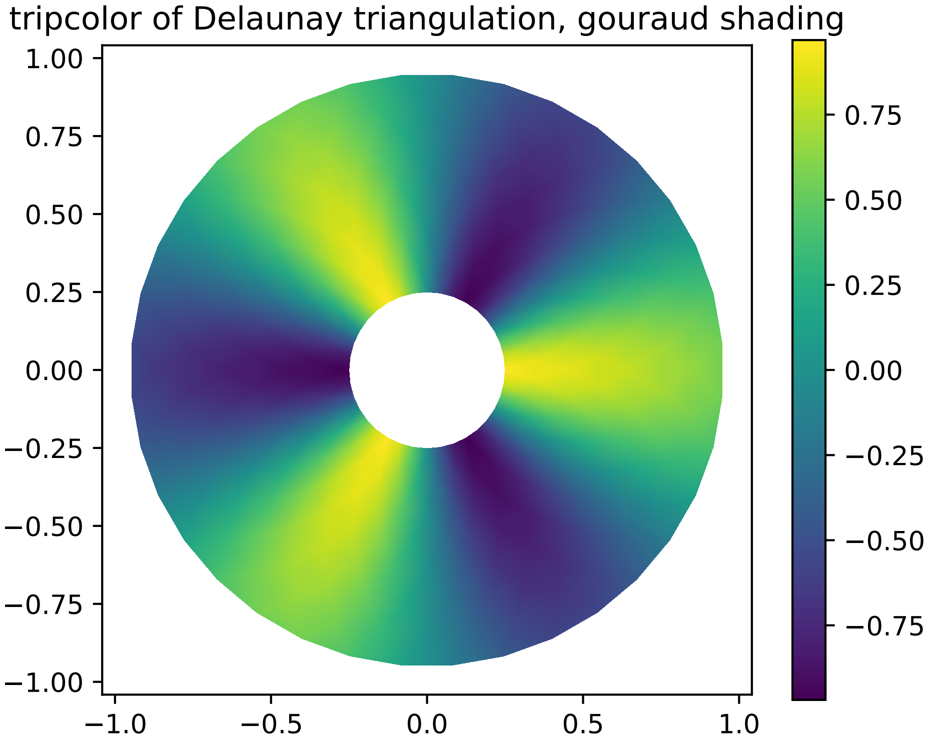
The next argument must be *C*, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg *facecolors*=C instead of just *C*.

shading may be 'flat' (the default) or 'gouraud'. If *shading* is 'flat' and C values are defined at points, the color values used for each triangle are from the mean C of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

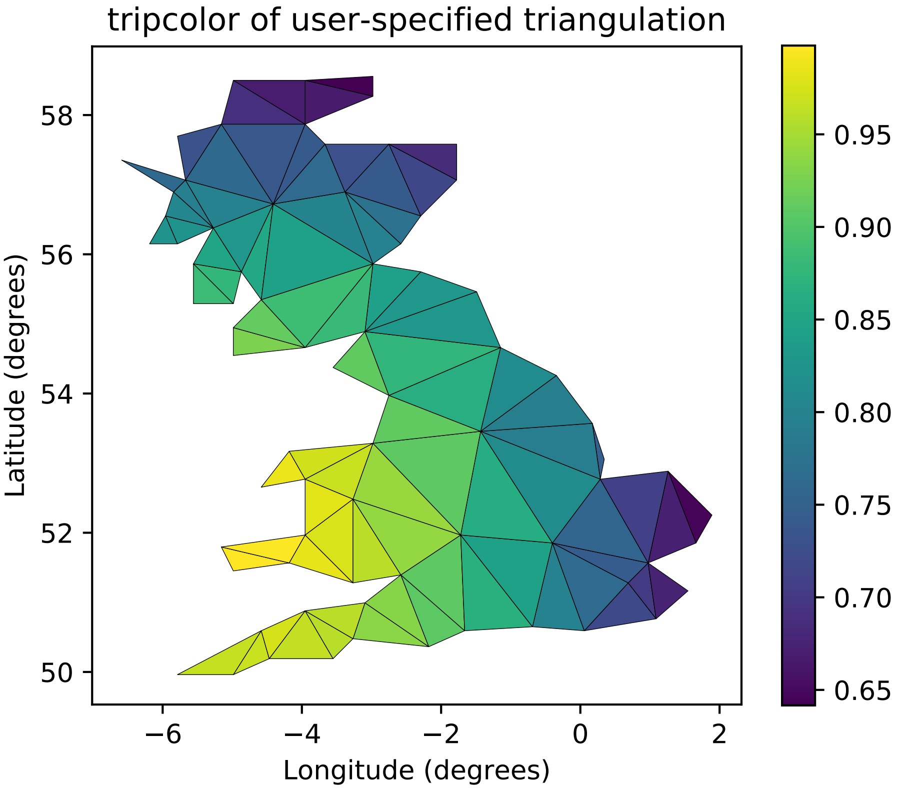
The remaining kwargs are the same as for `pcolor()`.

Example:





tripcolor of Delaunay triangulation, gouraud shading
1.00
0.75
0.50
0.25
0.00
−0.25
−0.50
−0.75
−1.00
−1.0
−0.5
0.0
0.5
1.0
0.75
0.50
0.25
0.00
−0.25
−0.50
−0.75



matplotlib.axes.Axes.triplot

`Axes.`**`triplot`**`(`**args*, ***kwargs*`)`

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```
triplot(triangulation, ...)
```

where triangulation is a *`matplotlib.tri.Triangulation`* object, or

```
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *`Triangulation`* for a explanation of these possibilities.

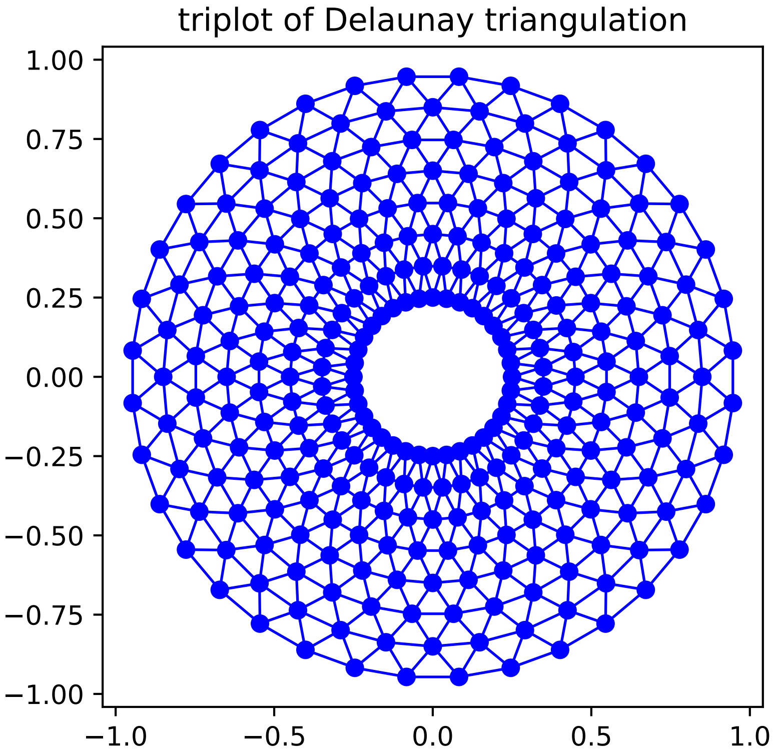
The remaining args and kwargs are the same as for *`plot()`*.

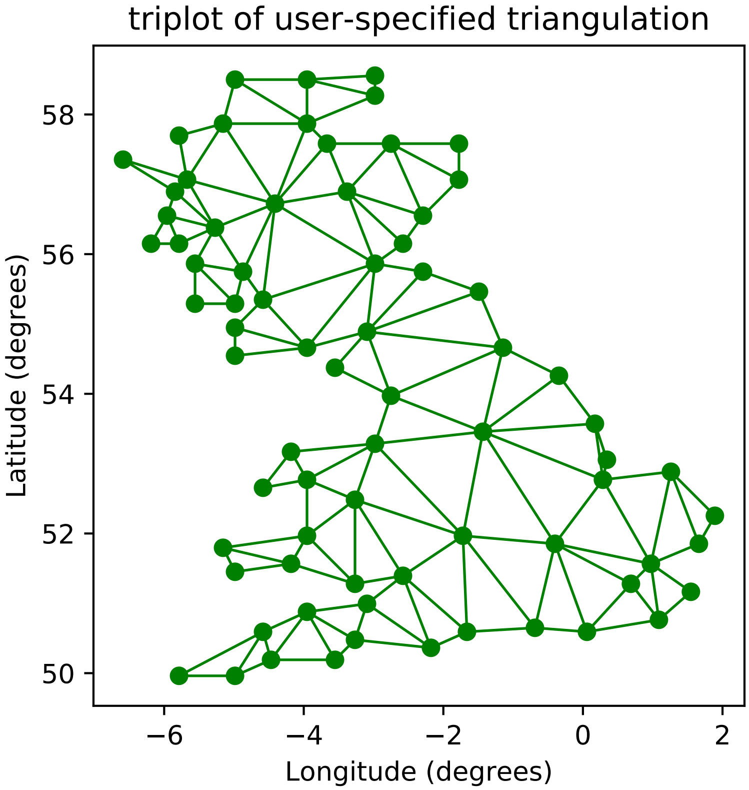
Return a list of 2 *`Line2D`* containing respectively:

- the lines plotted for triangles edges

- the markers plotted for triangles nodes

Example:





matplotlib.axes.Axes.tricontour

`Axes.`**`tricontour`**`(*args, **kwargs)`

Draw contours on an unstructured triangular grid. *`tricontour()`* and *`tricontourf()`* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either:

```
tricontour(triangulation, ...)
```

where triangulation is a *`matplotlib.tri.Triangulation`* object, or

```
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *`Triangulation`* for a explanation of these possibilities.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, N)
```

contour *N* automatically-chosen levels.

```
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```
tricontourf(..., Z, V)
```

fill the (len(*V*)-1) regions between the values in *V*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

`C = tricontour(...)` returns a `TriContourSet` object.

Optional keyword arguments:

***colors*: [*None* | string | (mpl_colors)]** If *None*, the colormap specified by cmap will be used.

If a string, like 'r' or 'red', all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

***alpha*: float** The alpha blending value

***cmap*: [*None* | Colormap]** A cm `Colormap` instance or *None*. If *cmap* is *None* and *colors* is *None*, a default Colormap is used.

***norm*: [*None* | Normalize]** A `matplotlib.colors.Normalize` instance for scaling data values to colors. If *norm* is *None* and *colors* is *None*, the default linear scaling is used.

***levels* [level0, level1, ..., leveln]** A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass `levels=[0]`

***origin*: [*None* | 'upper' | 'lower' | 'image']** If *None*, the first value of *Z* will correspond to the lower left corner, location (0,0). If 'image', the rc value for `image.origin` will be used.

This keyword is not active if *X* and *Y* are specified in the call to contour.

extent: [*None* | (x0,x1,y0,y1)]

If *origin* is not *None*, then *extent* is interpreted as in `matplotlib.pyplot.imshow()`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0,0], and (*x1*, *y1*) is the position of Z[-1,-1].

This keyword is not active if *X* and *Y* are specified in the call to contour.

***locator*: [*None* | ticker.Locator subclass]** If *locator* is None, the default `MaxNLocator` is used. The locator is used to determine the contour levels if they are not given explicitly via the *V* argument.

***extend*: ['neither' | 'both' | 'min' | 'max']** Unless this is 'neither', contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via `matplotlib.colors.Colormap.set_under()` and `matplotlib.colors.Colormap.set_over()` methods.

***xunits*, *yunits*: [*None* | registered units]** Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

tricontour-only keyword arguments:

***linewidths*: [*None* | number | tuple of numbers]** If *linewidths* is *None*, the default width in `lines.linewidth` in `matplotlibrc` is used.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified

***linestyles*: [*None* | 'solid' | 'dashed' | 'dashdot' | 'dotted']** If *linestyles* is *None*, the 'solid' is used.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

If contour is using a monochrome colormap and the contour level is less than 0, then the linestyle specified in `contour.negative_linestyle` in `matplotlibrc` will be used.

tricontourf-only keyword arguments:

***antialiased*: [*True* | *False*]** enable antialiasing

Note: tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < z <= z2
```

There is one exception: if the lowest boundary coincides with the minimum value of the *z* array, then that minimum value will be included in the lowest interval.

matplotlib.axes.Axes.tricontourf

`Axes.`**`tricontourf`**(**args*, ***kwargs*)

Draw contours on an unstructured triangular grid. *`tricontour()`* and *`tricontourf()`* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either:

```
tricontour(triangulation, ...)
```

where triangulation is a *`matplotlib.tri.Triangulation`* object, or

```
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See *`Triangulation`* for a explanation of these possibilities.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, N)
```

contour *N* automatically-chosen levels.

```
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```
tricontourf(..., Z, V)
```

fill the (len(*V*)-1) regions between the values in *V*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

`C = tricontour(...)` returns a `TriContourSet` object.

Optional keyword arguments:

***colors*: [*None* | string | (mpl_colors)]** If *None*, the colormap specified by cmap will be used.

If a string, like 'r' or 'red', all levels will be plotted in this color.

If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

***alpha*: float** The alpha blending value

***cmap*: [*None* | Colormap]** A cm `Colormap` instance or *None*. If *cmap* is *None* and *colors* is *None*, a default Colormap is used.

***norm*: [*None* | Normalize]** A `matplotlib.colors.Normalize` instance for scaling data values to colors. If *norm* is *None* and *colors* is *None*, the default linear scaling is used.

***levels* [level0, level1, ..., leveln]** A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass `levels=[0]`

***origin*: [*None* | 'upper' | 'lower' | 'image']** If *None*, the first value of *Z* will correspond to the lower left corner, location (0,0). If 'image', the rc value for `image.origin` will be used.

This keyword is not active if *X* and *Y* are specified in the call to contour.

extent: [*None* | (x0,x1,y0,y1)]

If *origin* is not *None*, then *extent* is interpreted as in `matplotlib.pyplot.imshow()`: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0,0], and (*x1*, *y1*) is the position of Z[-1,-1].

This keyword is not active if *X* and *Y* are specified in the call to contour.

***locator*: [*None* | ticker.Locator subclass]** If *locator* is None, the default `MaxNLocator` is used. The locator is used to determine the contour levels if they are not given explicitly via the *V* argument.

***extend*: ['neither' | 'both' | 'min' | 'max']** Unless this is 'neither', contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via `matplotlib.colors.Colormap.set_under()` and `matplotlib.colors.Colormap.set_over()` methods.

***xunits*, *yunits*: [*None* | registered units]** Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

tricontour-only keyword arguments:

***linewidths*: [*None* | number | tuple of numbers]** If *linewidths* is *None*, the default width in `lines.linewidth` in `matplotlibrc` is used.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified

***linestyles*: [*None* | 'solid' | 'dashed' | 'dashdot' | 'dotted']** If *linestyles* is *None*, the 'solid' is used.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

If contour is using a monochrome colormap and the contour level is less than 0, then the linestyle specified in `contour.negative_linestyle` in `matplotlibrc` will be used.

tricontourf-only keyword arguments:

***antialiased*: [*True* | *False*]** enable antialiasing

Note: tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < z <= z2
```

There is one exception: if the lowest boundary coincides with the minimum value of the *z* array, then that minimum value will be included in the lowest interval.

19.1.9 Text and Annotations

Axes.annotate	Annotate the point `xy` with text `s`.
Axes.text	Add text to the axes.
Axes.table	Add a table to the current axes.
Axes.arrow	Add an arrow to the axes.

matplotlib.axes.Axes.annotate

`Axes.`**`annotate`**(**args*, ***kwargs*)

Annotate the point `xy` with text `s`.

Additional kwargs are passed to *Text*.

Parameters s : str

The text of the annotation

xy : iterable

Length 2 sequence specifying the *(x,y)* point to annotate

xytext : iterable, optional

Length 2 sequence specifying the *(x,y)* to place the text at. If None, defaults to `xy`.

xycoords : str, Artist, Transform, callable or tuple, optional

The coordinate system that `xy` is given in.

For a `str` the allowed values are:

Property	Description
'figure points'	points from the lower left of the figure
'figure pixels'	pixels from the lower left of the figure
'figure fraction'	fraction of figure from lower left
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	fraction of axes from lower left
'data'	use the coordinate system of the object being annotated (default)
'polar'	*(theta,r)* if not native 'data' coordinates

If a *`Artist`* object is passed in the units are fraction if it's bounding box.

If a *`Transform`* object is passed in use that to transform `xy` to screen coordinates

If a callable it must take a *`RendererBase`* object as input and return a *`Transform`* or *`Bbox`* object

If a `tuple` must be length 2 tuple of str, `Artist`, `Transform` or callable objects. The first transform is used for the *x* coordinate and the second for *y*.

See *Advanced Annotation* for more details.

Defaults to `'data'`

textcoords : str, `Artist`, `Transform`, callable or tuple, optional

The coordinate system that `xytext` is given, which may be different than the coordinate system used for `xy`.

All `xycoords` values are valid as well as the following strings:

Property	Description
'offset points'	offset (in points) from the *xy* value
'offset pixels'	offset (in pixels) from the *xy* value

defaults to the input of `xycoords`

arrowprops : dict, optional

If not None, properties used to draw a *`FancyArrowPatch`* arrow between `xy` and `xytext`.

If `arrowprops` does not contain the key `'arrowstyle'` the allowed keys are:

Key	Description
width	the width of the arrow in points
headwidth	the width of the base of the arrow head in points
headlength	the length of the arrow head in points
shrink	fraction of total length to 'shrink' from both ends
?	any key to *`matplotlib.patches.FancyArrowPatch`*

If the `arrowprops` contains the key `'arrowstyle'` the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
`'-'`	None
`'->'`	head_length=0.4,head_width=0.2
`'-['`	widthB=1.0,lengthB=0.2,angleB=None
`'|-|'`	widthA=1.0,widthB=1.0
`'-|>'`	head_length=0.4,head_width=0.2
`'<-'`	head_length=0.4,head_width=0.2
`'<->'`	head_length=0.4,head_width=0.2
`'<|-'`	head_length=0.4,head_width=0.2
`'<|-|>'`	head_length=0.4,head_width=0.2
`'fancy'`	head_length=0.4,head_width=0.4,tail_width=0.4
`'simple'`	head_length=0.5,head_width=0.5,tail_width=0.2
`'wedge'`	tail_width=0.3,shrink_factor=0.5

Valid keys for *`FancyArrowPatch`* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *`matplotlib.patches.PathPatch`*

Defaults to None

annotation_clip : bool, optional

Controls the visibility of the annotation when it goes outside the axes area.

If `True`, the annotation will only be drawn when the `xy` is inside the axes. If `False`, the annotation will always be drawn regardless of its position.

The default is `None`, which behave as `True` only if *xycoords* is "data".

Returns Annotation

matplotlib.axes.Axes.text

`Axes.text`(*x*, *y*, *s*, *fontdict=None*, *withdash=False*, ***kwargs*)

Add text to the axes.

Add text in string `s` to axis at location `x`, `y`, data coordinates.

Parameters x, y : scalars

data coordinates

s : string

text

fontdict : dictionary, optional, default: None

A dictionary to override the default text properties. If fontdict is None, the defaults are determined by your rc parameters.

withdash : boolean, optional, default: False

Creates a *`TextWithDash`* instance instead of a *`Text`* instance.

Other Parameters kwargs : *`Text`* properties.

Other miscellaneous text parameters.

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords (0,0 is lower-left and 1,1 is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5,'matplotlib', horizontalalignment='center',
...      verticalalignment='center',
...      transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of *`Rectangle`* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

matplotlib.axes.Axes.table

`Axes.table`(***kwargs*)

Add a table to the current axes.

Call signature:

```
table(cellText=None, cellColours=None,
      cellLoc='right', colWidths=None,
      rowLabels=None, rowColours=None, rowLoc='left',
      colLabels=None, colColours=None, colLoc='center',
      loc='bottom', bbox=None):
```

Returns a `matplotlib.table.Table` instance. Either `cellText` or `cellColours` must be provided. For finer grained control over tables, use the `Table` class and add it to the axes with *`add_table()`*.

Thanks to John Gill for providing the class and table.

kwargs control the `Table` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`axes`	an *`Axes`* instance
`clip_box`	a *`matplotlib.transforms.Bbox`* instance
`clip_on`	[True | False]
`clip_path`	[(*`Path`*, *`Transform`*) | *`Patch`* | None]
`contains`	a callable function
`figure`	a *`matplotlib.figure.Figure`* instance
`fontsize`	a float in points
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	*`Transform`* instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

matplotlib.axes.Axes.arrow

`Axes.`**`arrow`**(*x*, *y*, *dx*, *dy*, ***kwargs*)

Add an arrow to the axes.

Draws arrow on specified axis from (`x`, `y`) to (`x` + `dx`, `y` + `dy`). Uses FancyArrow patch to construct the arrow.

Parameters x : float

X-coordinate of the arrow base

y : float

Y-coordinate of the arrow base

dx : float

Length of arrow along x-coordinate

dy : float

Length of arrow along y-coordinate

Returns a : FancyArrow

patches.FancyArrow object

Other Parameters Optional kwargs (inherited from FancyArrow patch) control the arrow

construction and properties:

Constructor arguments

***width*: float (default: 0.001)** width of full arrow tail

***length_includes_head*: [True | False] (default: False)** True if head is to be counted in calculating the length.

***head_width*: float or None (default: 3*width)** total width of the full arrow head

***head_length*: float or None (default: 1.5 * head_width)** length of arrow head

***shape*: ['full', 'left', 'right'] (default: 'full')** draw the left-half, right-half, or full arrow

***overhang*: float (default: 0)** fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

***head_starts_at_zero*: [True | False] (default: False)** if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from :class:'Patch') are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function

Continued on

Table 19.33 – continued from previous page

Property	Description
edgecolor or ec	mpl color spec, None, ‘none’, or ‘auto’
facecolor or fc	mpl color spec, or None for default, or ‘none’ for no color
figure	a *matplotlib.figure.Figure* instance
fill	[True | False]
gid	an id string
hatch	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
joinstyle	[’miter’ | ‘round’ | ‘bevel’]
label	string or anything printable with ‘%s’ conversion.
linestyle or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
linewidth or lw	float or None for default
path_effects	unknown
picker	[None|float|boolean|callable]
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
zorder	any number

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
    arrowprops=dict(arrowstyle="->"))
```

19.1.10 Fields

Axes.barbs	Plot a 2-D field of barbs.
Axes.quiver	Plot a 2-D field of arrows.
Axes.quiverkey	Add a key to a quiver plot.
Axes.streamplot	Draws streamlines of a vector flow.

matplotlib.axes.Axes.barbs

`Axes.`**`barbs`**`(`**args*, ***kw*`)`

Plot a 2-D field of barbs.

Call signatures:

```
barb(U, V, **kw)
barb(U, V, C, **kw)
barb(X, Y, U, V, **kw)
barb(X, Y, U, V, C, **kw)
```

Arguments:

> ***X*, *Y*:** The x and y coordinates of the barb locations (default is head of barb; see *pivot* kwarg)

***U*, *V*:** Give the x and y components of the barb shaft

***C*:** An optional array used to map colors to the barbs

All arguments may be 1-D or 2-D arrays or sequences. If *X* and *Y* are absent, they will be generated as a uniform grid. If *U* and *V* are 2-D arrays but *X* and *Y* are 1-D, and if `len(X)` and `len(Y)` match the column and row dimensions of *U*, then *X* and *Y* will be expanded with `numpy.meshgrid()`.

U, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Keyword arguments:

***length*:** Length of the barb in points; the other parts of the barb are scaled against this. Default is 9

***pivot*: ['tip' | 'middle']** The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*. Default is 'tip'

***barbcolor*: [color | color sequence]** Specifies the color all parts of the barb except any flags. This parameter is analagous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

***flagcolor*: [color | color sequence]** Specifies the color of any flags on the barb. This parameter is analagous to the *facecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

***sizes*:** A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

***fill_empty*:** A flag on whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, they will be drawn such that no color is applied to the center. Default is False

***rounding*:** A flag to indicate whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple. Default is True

***barb_increments*:** A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

***flip_barb*:** Either a single boolean flag or an array of booleans. Single boolean indicates whether the lines and flags should point opposite to normal for all barbs. An array (which should be the same size as the other data arrays) indicates whether to flip for each individual barb. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere.) Default is False

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:     /\    \
:    /  \    \
:   /    \    \    \
:  /      \    \    \
: ------------------------------
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

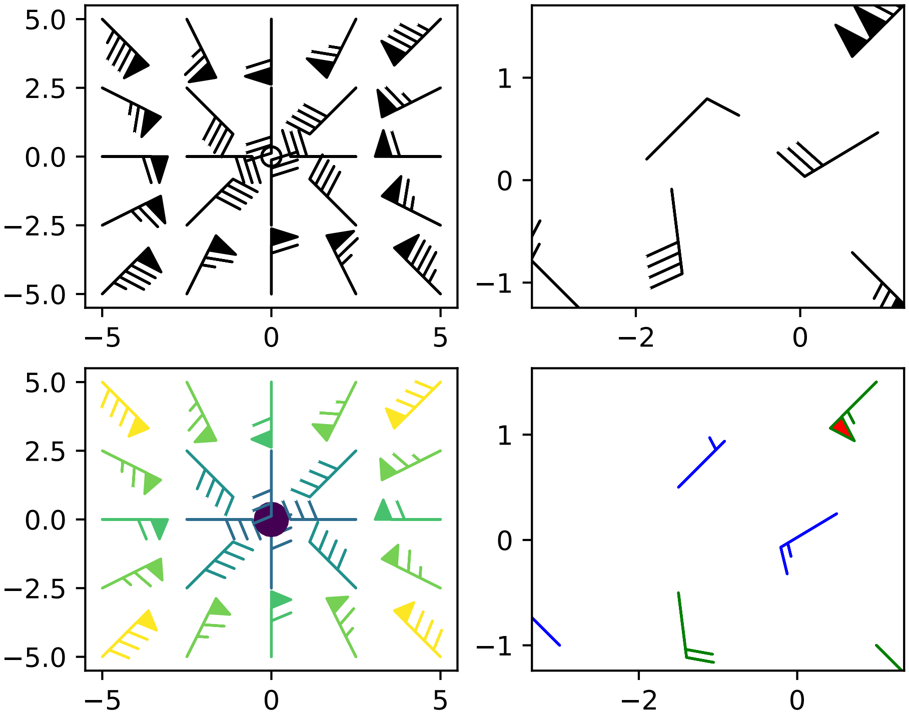
linewidths and edgecolors can be used to customize the barb. Additional `PolyCollection` keyword arguments:

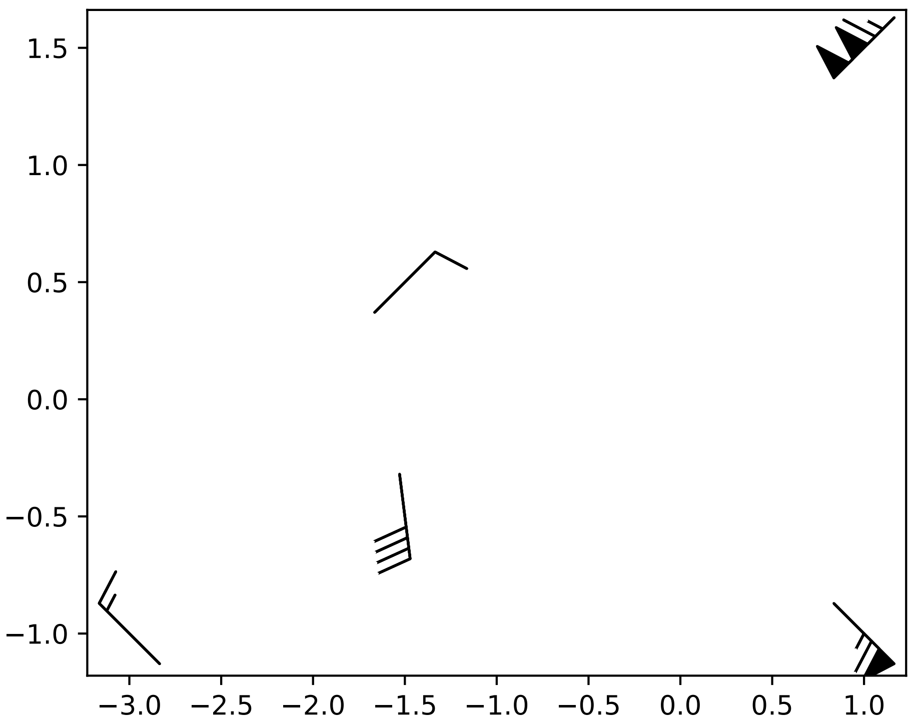
Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	['/' | '\\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']
`label`	string or anything printable with '%s' conversion.

Table 19.35 – continued from previous page

Property	Description
linestyle or dashes or linestyles	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
linewidth or linewidths or lw	float or sequence of floats
norm	unknown
offset_position	unknown
offsets	float or sequence of floats
path_effects	unknown
picker	[None|float|boolean|callable]
pickradius	unknown
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
transform	*Transform* instance
url	a url string
urls	unknown
visible	[True | False]
zorder	any number

Example:





Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

---

matplotlib.axes.Axes.quiver

`Axes.`**`quiver`**`(`**args*, ***kw*`)`

Plot a 2-D field of arrows.

Call signatures:

```
quiver(U, V, **kw)
quiver(U, V, C, **kw)
quiver(X, Y, U, V, **kw)
quiver(X, Y, U, V, C, **kw)
```

U and *V* are the arrow data, *X* and *Y* set the locaiton of the arrows, and *C* sets the color of the arrows. These arguments may be 1-D or 2-D arrays or sequences.

If *X* and *Y* are absent, they will be generated as a uniform grid. If *U* and *V* are 2-D arrays and *X* and *Y* are 1-D, and if `len(X)` and `len(Y)` match the column and row dimensions of *U*, then *X* and *Y* will be expanded with `numpy.meshgrid()`.

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* kwargs.

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

linewidths and *edgecolors* can be used to customize the arrow outlines.

Parameters X : 1D or 2D array, sequence, optional

The x coordinates of the arrow locations

Y : 1D or 2D array, sequence, optional

The y coordinates of the arrow locations

U : 1D or 2D array or masked array, sequence

The x components of the arrow vectors

V : 1D or 2D array or masked array, sequence

The y components of the arrow vectors

C : 1D or 2D array, sequence, optional

The arrow colors

units : [‘width’ | ‘height’ | ‘dots’ | ‘inches’ | ‘x’ | ‘y’ | ‘xy’]

The arrow dimensions (except for *length*) are measured in multiples of this unit.

‘width’ or ‘height’: the width or height of the axis

‘dots’ or ‘inches’: pixels or inches, based on the figure dpi

‘x’, ‘y’, or ‘xy’: respectively X, Y, or $\sqrt{X^2 + Y^2}$ in data units

The arrows scale differently depending on the units. For ‘x’ or ‘y’, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For ‘width or ‘height’, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for ‘dots’ or ‘inches’, resizing does not change the arrows.

angles : [‘uv’ | ‘xy’], array, optional

Method for determining the angle of the arrows. Default is ‘uv’.

‘uv’: the arrow axis aspect ratio is 1 so that if *U*==*V* the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

‘xy’: arrows point from (x,y) to (x+u, y+v). Use this for plotting a gradient field, for example.

Alternatively, arbitrary angles may be specified as an array of values in degrees, counter-clockwise from the horizontal axis.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

scale : None, float, optional

Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter

scale_units : ['width' | 'height' | 'dots' | 'inches' | 'x' | 'y' | 'xy'], None, optional

If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u,v) = (1,0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width'/'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

width : scalar, optional

Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth : scalar, optional

Head width as multiple of shaft width, default is 3

headlength : scalar, optional

Head length as multiple of shaft width, default is 5

headaxislength : scalar, optional

Head length at shaft intersection, default is 4.5

minshaft : scalar, optional

Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible! Default is 1

minlength : scalar, optional

Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead. Default is 1.

pivot : ['tail' | 'mid' | 'middle' | 'tip'], optional

The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

color : [color | color sequence], optional

This is a synonym for the `PolyCollection` facecolor kwarg. If *C* has been set, *color* has no effect.

See also:

`quiverkey` Add a key to a quiver plot

Notes

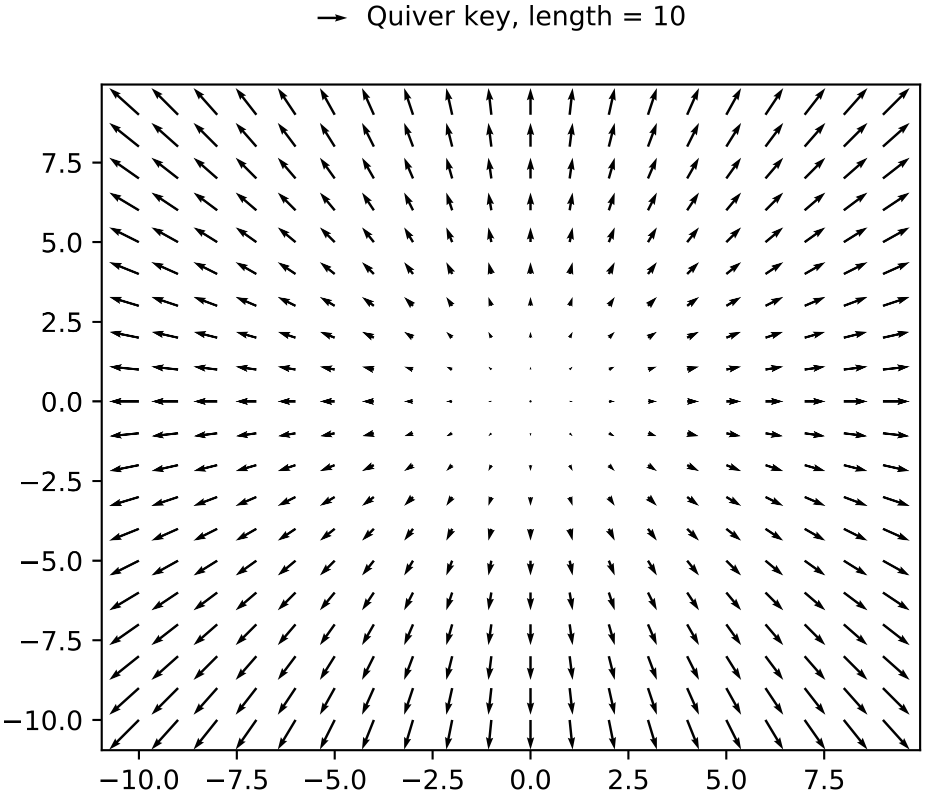
Additional `PolyCollection` keyword arguments:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or antialiaseds	Boolean or sequence of booleans
`array`	unknown
`axes`	an `Axes` instance
`clim`	a length 2 sequence of floats
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`cmap`	a colormap or registered colormap name
`color`	matplotlib color arg or sequence of rgba tuples
`contains`	a callable function
`edgecolor` or edgecolors	matplotlib color spec or sequence of specs
`facecolor` or facecolors	matplotlib color spec or sequence of specs
`figure`	a `matplotlib.figure.Figure` instance
`gid`	an id string
`hatch`	[‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or dashes or linestyles	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` |
`linewidth` or linewidths or lw	float or sequence of floats
`norm`	unknown
`offset_position`	unknown
`offsets`	float or sequence of floats
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`pickradius`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown

Table 19.36 – continued from previous page

Property	Description
snap	unknown
transform	*Transform* instance
url	a url string
urls	unknown
visible	[True | False]
zorder	any number

Examples



matplotlib.axes.Axes.quiverkey

`Axes.`**`quiverkey`**`(`**args*, ***kw*`)`

Add a key to a quiver plot.

Call signature:

```
quiverkey(Q, X, Y, U, label, **kw)
```

Arguments:

***Q*:** The Quiver instance returned by a call to quiver.

***X*, *Y*:** The location of the key; additional explanation follows.

***U*:** The length of the key

***label*:** A string with the length and units of the key

Keyword arguments:

***coordinates* = ['axes' | 'figure' | 'data' | 'inches']** Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with 0,0 in the lower left and 1,1 in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with 0,0 at the lower left corner.

***color*:** overrides face and edge colors from *Q*.

***labelpos* = ['N' | 'S' | 'E' | 'W']** Position the label above, below, to the right, to the left of the arrow, respectively.

***labelsep*:** Distance in inches between the arrow and the label. Default is 0.1

***labelcolor*:** defaults to default `Text` color.

***fontproperties*:** A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*

Any additional keyword arguments are used to override vector properties taken from *Q*.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

matplotlib.axes.Axes.streamplot

`Axes.`**`streamplot`**(*x*, *y*, *u*, *v*, *density=1*, *linewidth=None*, *color=None*, *cmap=None*, *norm=None*, *arrowsize=1*, *arrowstyle='-|>'*, *minlength=0.1*, *transform=None*, *zorder=None*, *start_points=None*)

Draws streamlines of a vector flow.

x*, *y [1d arrays] an *evenly spaced* grid.

u*, *v [2d arrays] x and y-velocities. Number of rows should match length of y, and the number of columns should match x.

density [float or 2-tuple] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid—*density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use [density_x, density_y].

linewidth [numeric or 2d array] vary linewidth when given a 2d array with the same shape as velocities.

color [matplotlib color code, or 2d array] Streamline color. When given an array with the same shape as velocities, *color* values are converted to colors using *cmap*.

cmap [`Colormap`] Colormap used to plot streamlines and arrows. Only necessary when using an array input for *color*.

norm [`Normalize`] Normalize object used to scale luminance data to 0, 1. If None, stretch (min, max) to (0, 1). Only necessary when *color* is an array.

arrowsize [float] Factor scale arrow size.

arrowstyle [str] Arrow style specification. See `FancyArrowPatch`.

minlength [float] Minimum length of streamline in axes coordinates.

***start_points*: Nx2 array** Coordinates of starting points for the streamlines. In data coordinates, the same as the `x` and `y` arrays.

zorder [int] any number

Returns:

stream_container [StreamplotSet] Container object with attributes

- lines: `matplotlib.collections.LineCollection` of streamlines
- arrows: collection of `matplotlib.patches.FancyArrowPatch` objects representing arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

19.2 Clearing

`Axes.cla`	Clear the current axes.
`Axes.clear`	clear the axes

19.2.1 matplotlib.axes.Axes.cla

`Axes.cla()`

Clear the current axes.

19.2.2 matplotlib.axes.Axes.clear

`Axes.clear()`

clear the axes

19.3 Appearance

Axes.axis	Set axis properties.
Axes.set_axis_off	turn off the axis
Axes.set_axis_on	turn on the axis
Axes.set_frame_on	Set whether the axes rectangle patch is drawn
Axes.get_frame_on	Get whether the axes rectangle patch is drawn
Axes.set_axisbelow	Set whether the axis ticks and gridlines are above or below most
Axes.get_axisbelow	Get whether axis below is true or not
Axes.grid	Turn the axes grids on or off.
Axes.get_axis_bgcolor	Deprecated since version 2.0.
Axes.get_facecolor	
Axes.get_fc	
Axes.set_facecolor	
Axes.set_fc	
Axes.set_axis_bgcolor	Deprecated since version 2.0.

19.3.1 matplotlib.axes.Axes.axis

`Axes.`**`axis`**`(`**v*, ***kwargs*`)`

Set axis properties.

Valid signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis(list_arg)
xmin, xmax, ymin, ymax = axis(string_arg)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters v : list of float or {'on', 'off', 'equal', 'tight', 'scaled', 'normal', 'auto', 'image', 'square'}

Optional positional argument

Axis data limits set from a list; or a command relating to axes:

Value	Description
'on'	Toggle axis lines and labels on
'off'	Toggle axis lines and labels off
'equal'	Equal scaling by changing limits
'scaled'	Equal scaling by changing box dimensions
'tight'	Limits set such that all data is shown
'auto'	Automatic scaling, fill rectangle with data
'normal'	Same as 'auto'; deprecated
'image'	'scaled' with axis limits equal to data limits
'square'	Square plot; similar to 'scaled', but initially forcing xmax-xmin = ymax-ymin

emit : bool, optional

Passed to set_{x,y}lim functions, if observers are notified of axis limit change

xmin, ymin, xmax, ymax : float, optional

The axis limits to be set

Returns xmin, xmax, ymin, ymax : float

The axis limits

19.3.2 matplotlib.axes.Axes.set_axis_off

`Axes.`**`set_axis_off`**`()`

turn off the axis

19.3.3 matplotlib.axes.Axes.set_axis_on

`Axes.`**`set_axis_on`**`()`

turn on the axis

19.3.4 matplotlib.axes.Axes.set_frame_on

`Axes.`**`set_frame_on`**`(`*`b`*`)`

Set whether the axes rectangle patch is drawn

ACCEPTS: [*True* | *False*]

19.3.5 matplotlib.axes.Axes.get_frame_on

`Axes.`**`get_frame_on`**`()`

Get whether the axes rectangle patch is drawn

19.3.6 matplotlib.axes.Axes.set_axisbelow

`Axes.`**`set_axisbelow`**`(`*b*`)`

Set whether the axis ticks and gridlines are above or below most artists

ACCEPTS: [*True* | *False* | ‘line’]

19.3.7 matplotlib.axes.Axes.get_axisbelow

`Axes.`**`get_axisbelow`**`()`

Get whether axis below is true or not

19.3.8 matplotlib.axes.Axes.grid

`Axes.`**`grid`**`(`*b=None*, *which=’major’*, *axis=’both’*, ***kwargs*`)`

Turn the axes grids on or off.

Set the axes grids on or off; *b* is a boolean. (For MATLAB compatibility, *b* may also be a string, ‘on’ or ‘off’.)

If *b* is *None* and `len(kwargs)==0`, toggle the grid state. If *kwargs* are supplied, it is assumed that you want a grid and *b* is thus set to *True*.

which can be ‘major’ (default), ‘minor’, or ‘both’ to control whether major tick grids, minor tick grids, or both are affected.

axis can be ‘both’ (default), ‘x’, or ‘y’ to control which set of gridlines are drawn.

kwargs are used to set the grid line properties, e.g.,:

```
ax.grid(color='r', linestyle='-', linewidth=2)
```

Valid *`Line2D`* kwargs are

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an *`Axes`* instance
`clip_box`	a *`matplotlib.transforms.Bbox`* instance
`clip_on`	[True | False]
`clip_path`	[(*`Path`*, *`Transform`*) | *`Patch`* | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`dash_joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`dashes`	sequence of on/off ink in points

C

Table 19.39 – continued from previous page

Property	Description
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
`figure`	a `matplotlib.figure.Figure` instance
`fillstyle`	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
`linewidth` or lw	float value in points
`marker`	`A valid marker style`
`markeredgecolor` or mec	any matplotlib color
`markeredgewidth` or mew	float value in points
`markerfacecolor` or mfc	any matplotlib color
`markerfacecoloralt` or mfcalt	any matplotlib color
`markersize` or ms	float
`markevery`	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
`path_effects`	unknown
`picker`	float distance in points or callable pick function `fn(artist, event)`
`pickradius`	float distance in points
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`solid_capstyle`	['butt' | 'round' | 'projecting']
`solid_joinstyle`	['miter' | 'round' | 'bevel']
`transform`	a `matplotlib.transforms.Transform` instance
`url`	a url string
`visible`	[True | False]
`xdata`	1D array
`ydata`	1D array
`zorder`	any number

19.3.9 matplotlib.axes.Axes.get_axis_bgcolor

`Axes.get_axis_bgcolor()`

Deprecated since version 2.0: The get_axis_bgcolor function was deprecated in version 2.0. Use get_facecolor instead.

Return the axis background color

19.3.10 matplotlib.axes.Axes.get_facecolor

`Axes.get_facecolor()`

19.3.11 matplotlib.axes.Axes.get_fc

Axes.**get_fc**()

19.3.12 matplotlib.axes.Axes.set_facecolor

Axes.**set_facecolor**(*color*)

19.3.13 matplotlib.axes.Axes.set_fc

Axes.**set_fc**(*color*)

19.3.14 matplotlib.axes.Axes.set_axis_bgcolor

Axes.**set_axis_bgcolor**(*color*)

Deprecated since version 2.0: The set_axis_bgcolor function was deprecated in version 2.0. Use set_facecolor instead.

set the axes background color

ACCEPTS: any matplotlib color - see `colors()`

19.4 Property cycle

Axes.set_prop_cycle	Set the property cycle for any future plot commands on this Axes.
Axes.set_color_cycle	Set the color cycle for any future plot commands on this Axes.

19.4.1 matplotlib.axes.Axes.set_prop_cycle

Axes.**set_prop_cycle**(**args*, ***kwargs*)

Set the property cycle for any future plot commands on this Axes.

set_prop_cycle(arg) set_prop_cycle(label, itr) set_prop_cycle(label1=itr1[, label2=itr2[, ...]])

Form 1 simply sets given `Cycler` object.

Form 2 creates and sets a `Cycler` from a label and an iterable.

Form 3 composes and sets a `Cycler` as an inner product of the pairs of keyword arguments. In other words, all of the iterables are cycled simultaneously, as if through zip().

Parameters arg : Cycler

Set the given Cycler. Can also be `None` to reset to the cycle defined by the current style.

label : str

The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

itr : iterable

Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

19.4.2 matplotlib.axes.Axes.set_color_cycle

`Axes.`**`set_color_cycle`**(*clist*)

Set the color cycle for any future plot commands on this Axes.

clist is a list of mpl color specifiers.

Deprecated since version 1.5.

19.5 Axis / limits

`Axes.get_yaxis`	Return the YAxis instance
`Axes.get_xaxis`	Return the XAxis instance

19.5.1 matplotlib.axes.Axes.get_yaxis

`Axes.`**`get_yaxis`**()

Return the YAxis instance

19.5.2 matplotlib.axes.Axes.get_xaxis

`Axes.`**`get_xaxis`**()

Return the XAxis instance

19.5.3 Axis Limits and direction

`Axes.invert_xaxis`	Invert the x-axis.
`Axes.invert_yaxis`	Invert the y-axis.
`Axes.xaxis_inverted`	Returns *True* if the x-axis is inverted.

Continued on next page

Table 19.42 – continued from previous page

Axes.yaxis_inverted	Returns *True* if the y-axis is inverted.
Axes.set_xlim	Set the data limits for the x-axis
Axes.set_ylim	Set the data limits for the y-axis
Axes.get_ylim	Get the y-axis range
Axes.get_xlim	Get the x-axis range
Axes.update_datalim	Update the data lim bbox with seq of xy tups or equiv.
Axes.update_datalim_bounds	Update the datalim to include the given
Axes.update_datalim_numerix	Deprecated since version 2.0.
Axes.set_ybound	Set the lower and upper numerical bounds of the y-axis.
Axes.set_xbound	Set the lower and upper numerical bounds of the x-axis.
Axes.get_ybound	Return y-axis numerical bounds in the form of
Axes.get_xbound	Returns the x-axis numerical bounds

matplotlib.axes.Axes.invert_xaxis

Axes.**invert_xaxis**()

Invert the x-axis.

matplotlib.axes.Axes.invert_yaxis

Axes.**invert_yaxis**()

Invert the y-axis.

matplotlib.axes.Axes.xaxis_inverted

Axes.**xaxis_inverted**()

Returns *True* if the x-axis is inverted.

matplotlib.axes.Axes.yaxis_inverted

Axes.**yaxis_inverted**()

Returns *True* if the y-axis is inverted.

matplotlib.axes.Axes.set_xlim

Axes.**set_xlim**(*left=None*, *right=None*, *emit=True*, *auto=False*, ***kw*)

Set the data limits for the x-axis

Parameters left : scalar, optional

The left xlim (default: None, which leaves the left limit unchanged).

right : scalar, optional

The right xlim (default: None, which leaves the right limit unchanged).

emit : bool, optional

Whether to notify observers of limit change (default: True).

auto : bool or None, optional

Whether to turn on autoscaling of the x-axis. True turns on, False turns off (default action), None leaves unchanged.

xlimits : tuple, optional

The left and right xlims may be passed as the tuple (`left`, `right`) as the first positional argument (or as the `left` keyword argument).

Returns xlimits : tuple

Returns the new x-axis limits as (`left`, `right`).

Notes

The `left` value may be greater than the `right` value, in which case the x-axis values will decrease from left to right.

Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose `x` represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```
>>> set_xlim(5000, 0)
```

matplotlib.axes.Axes.set_ylim

`Axes.`**`set_ylim`**(*bottom=None*, *top=None*, *emit=True*, *auto=False*, ***kw*)

Set the data limits for the y-axis

Parameters bottom : scalar, optional

The bottom ylim (default: None, which leaves the bottom limit unchanged).

top : scalar, optional

The top ylim (default: None, which leaves the top limit unchanged).

emit : bool, optional

Whether to notify observers of limit change (default: True).

auto : bool or None, optional

Whether to turn on autoscaling of the y-axis. True turns on, False turns off (default action), None leaves unchanged.

ylimits : tuple, optional

The bottom and top yxlims may be passed as the tuple (`bottom`, `top`) as the first positional argument (or as the `bottom` keyword argument).

Returns ylimits : tuple

Returns the new y-axis limits as (`bottom`, `top`).

Notes

The `bottom` value may be greater than the `top` value, in which case the y-axis values will decrease from bottom to top.

Examples

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose `y` represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

matplotlib.axes.Axes.get_ylim

`Axes.`**`get_ylim`**`()`

Get the y-axis range

Returns ylimits : tuple

Returns the current y-axis limits as the tuple (`bottom`, `top`).

Notes

The y-axis may be inverted, in which case the `bottom` value will be greater than the `top` value.

matplotlib.axes.Axes.get_xlim

`Axes.`**`get_xlim`**`()`

Get the x-axis range

Returns xlimits : tuple

Returns the current x-axis limits as the tuple (`left`, `right`).

Notes

The x-axis may be inverted, in which case the `left` value will be greater than the `right` value.

matplotlib.axes.Axes.update_datalim

`Axes.`**`update_datalim`**`(`*xys*, *updatex=True*, *updatey=True*`)`

Update the data lim bbox with seq of xy tups or equiv. 2-D array

matplotlib.axes.Axes.update_datalim_bounds

`Axes.`**`update_datalim_bounds`**`(`*bounds*`)`

Update the datalim to include the given `Bbox` *bounds*

matplotlib.axes.Axes.update_datalim_numerix

`Axes.`**`update_datalim_numerix`**`(`*x*, *y*`)`

Deprecated since version 2.0: The update_datalim_numerix function was deprecated in version 2.0. Use update_datalim instead.

Update the data lim bbox with seq of xy tups

matplotlib.axes.Axes.set_ybound

`Axes.`**`set_ybound`**`(`*lower=None*, *upper=None*`)`

Set the lower and upper numerical bounds of the y-axis. This method will honor axes inversion regardless of parameter order. It will not change the _autoscaleYon attribute.

matplotlib.axes.Axes.set_xbound

`Axes.`**`set_xbound`**(*lower=None*, *upper=None*)

Set the lower and upper numerical bounds of the x-axis. This method will honor axes inversion regardless of parameter order. It will not change the _autoscaleXon attribute.

matplotlib.axes.Axes.get_ybound

`Axes.`**`get_ybound`**()

Return y-axis numerical bounds in the form of `lowerBound < upperBound`

matplotlib.axes.Axes.get_xbound

`Axes.`**`get_xbound`**()

Returns the x-axis numerical bounds

This always returns:

```
lowerBound < upperBound
```

Returns lowerBound, upperBound : float

19.5.4 Axis Labels, title, and legend

`Axes.get_xlabel`	Get the xlabel text string.
`Axes.get_ylabel`	Get the ylabel text string.
`Axes.set_xlabel`	Set the label for the xaxis.
`Axes.set_ylabel`	Set the label for the yaxis
`Axes.set_title`	Set a title for the axes.
`Axes.get_title`	Get an axes title.
`Axes.legend`	Places a legend on the axes.
`Axes.get_legend`	Return the legend.Legend instance, or None if no legend is defined
`Axes.get_legend_handles_labels`	Return handles and labels for legend

matplotlib.axes.Axes.get_xlabel

`Axes.`**`get_xlabel`**()

Get the xlabel text string.

matplotlib.axes.Axes.get_ylabel

`Axes.`**`get_ylabel`**()

Get the ylabel text string.

matplotlib.axes.Axes.set_xlabel

`Axes.`**`set_xlabel`**(*xlabel*, *fontdict=None*, *labelpad=None*, ***kwargs*)

Set the label for the xaxis.

Parameters xlabel : string

x label

labelpad : scalar, optional, default: None

spacing in points between the label and the x-axis

Other Parameters kwargs : *`Text`* properties

See also:

`text` for information on how override and the optional args work

matplotlib.axes.Axes.set_ylabel

`Axes.`**`set_ylabel`**(*ylabel*, *fontdict=None*, *labelpad=None*, ***kwargs*)

Set the label for the yaxis

Parameters ylabel : string

y label

labelpad : scalar, optional, default: None

spacing in points between the label and the x-axis

Other Parameters kwargs : *`Text`* properties

See also:

`text` for information on how override and the optional args work

matplotlib.axes.Axes.set_title

`Axes.`**`set_title`**(*label*, *fontdict=None*, *loc='center'*, ***kwargs*)

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters label : str

Text to use for the title

fontdict : dict

A dictionary controlling the appearance of the title text, the default `fontdict` is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight' : rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc : {'center', 'left', 'right'}, str, optional

Which title to set, defaults to 'center'

Returns text : `Text`

The matplotlib text instance representing the title

Other Parameters kwargs : text properties

Other keyword arguments are text properties, see `Text` for a list of valid text properties.

matplotlib.axes.Axes.get_title

`Axes.`**`get_title`**(*loc='center'*)

Get an axes title.

Get one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters loc : {'center', 'left', 'right'}, str, optional

Which title to get, defaults to 'center'

Returns title: str

The title text string.

matplotlib.axes.Axes.legend

`Axes.`**`legend`**(**args*, ***kwargs*)

Places a legend on the axes.

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

However, in order to keep the "label" and the legend element instance together, it is preferable to specify the label either at artist creation, or by calling the `set_label()` method on the artist:

```
line, = ax.plot([1, 2, 3], label='Inline label')
# Overwrite the label by calling the method.
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *legend()* without any arguments and without setting the labels manually will result in no legend being drawn.

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

Parameters loc : int or string or pair of floats, default: 'upper right'

The location of the legend. Possible codes are:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

Alternatively can be a 2-tuple giving `x, y` of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

bbox_to_anchor : *matplotlib.transforms.BboxBase* instance or tuple of floats

Specify any arbitrary location for the legend in `bbox_transform` coordinates (default Axes coordinates).

For example, to put the legend's upper right hand corner in the center of the axes the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol : integer

The number of columns that the legend has. Default is 1.

prop : None or *matplotlib.font_manager.FontProperties* or dict

The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize : int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}

Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

numpoints : None or int

The number of marker points in the legend when creating a legend entry for a line/*matplotlib.lines.Line2D*. Default is `None` which will take the value from the `legend.numpoints` *rcParam*.

scatterpoints : None or int

The number of marker points in the legend when creating a legend entry for a scatter plot/ *matplotlib.collections.PathCollection*. Default is `None` which will take the value from the `legend.scatterpoints` *rcParam*.

scatteryoffsets : iterable of floats

The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`. Default `[0.375, 0.5, 0.3125]`.

markerscale : None or int or float

The relative size of legend markers compared with the originally drawn ones. Default is `None` which will take the value from the `legend.markerscale` *rcParam*.

markerfirst : bool

if *True*, legend marker is placed to the left of the legend label if *False*, legend marker is placed to the right of the legend label

frameon : None or bool

Control whether the legend should be drawn on a patch (frame). Default is `None` which will take the value from the `legend.frameon` *rcParam*.

fancybox : None or bool

Control whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background. Default is `None` which will take the value from the `legend.fancybox` *rcParam*.

shadow : None or bool

Control whether to draw a shadow behind the legend. Default is `None` which will take the value from the `legend.shadow` *rcParam*.

framealpha : None or float

Control the alpha transparency of the legend's background. Default is `None` which will take the value from the `legend.framealpha` *rcParam*.

facecolor : None or "inherit" or a color spec

Control the legend's background color. Default is `None` which will take the value from the `legend.facecolor` *rcParam*. If `"inherit"`, it will take the `axes.facecolor` *rcParam*.

edgecolor : None or "inherit" or a color spec

Control the legend's background patch edge color. Default is `None` which will take the value from the `legend.edgecolor` *rcParam*. If `"inherit"`, it will take the `axes.edgecolor` *rcParam*.

mode : {"expand", None}

If `mode` is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend's size).

bbox_transform : None or *matplotlib.transforms.Transform*

The transform for the bounding box (`bbox_to_anchor`). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title : str or None

The legend's title. Default is no title (`None`).

borderpad : float or None

The fractional whitespace inside the legend border. Measured in font-size units. Default is `None` which will take the value from the `legend.borderpad` *rcParam*.

labelspacing : float or None

The vertical space between the legend entries. Measured in font-size units. Default is `None` which will take the value from the `legend.labelspacing` *rcParam*.

handlelength : float or None

The length of the legend handles. Measured in font-size units. Default is `None` which will take the value from the `legend.handlelength` *rcParam*.

handletextpad : float or None

The pad between the legend handle and text. Measured in font-size units. Default is `None` which will take the value from the `legend.handletextpad` *rcParam*.

borderaxespad : float or None

The pad between the axes and legend border. Measured in font-size units. Default is `None` which will take the value from the `legend.borderaxespad` *rcParam*.

columnspacing : float or None

The spacing between columns. Measured in font-size units. Default is `None` which will take the value from the `legend.columnspacing` *rcParam*.

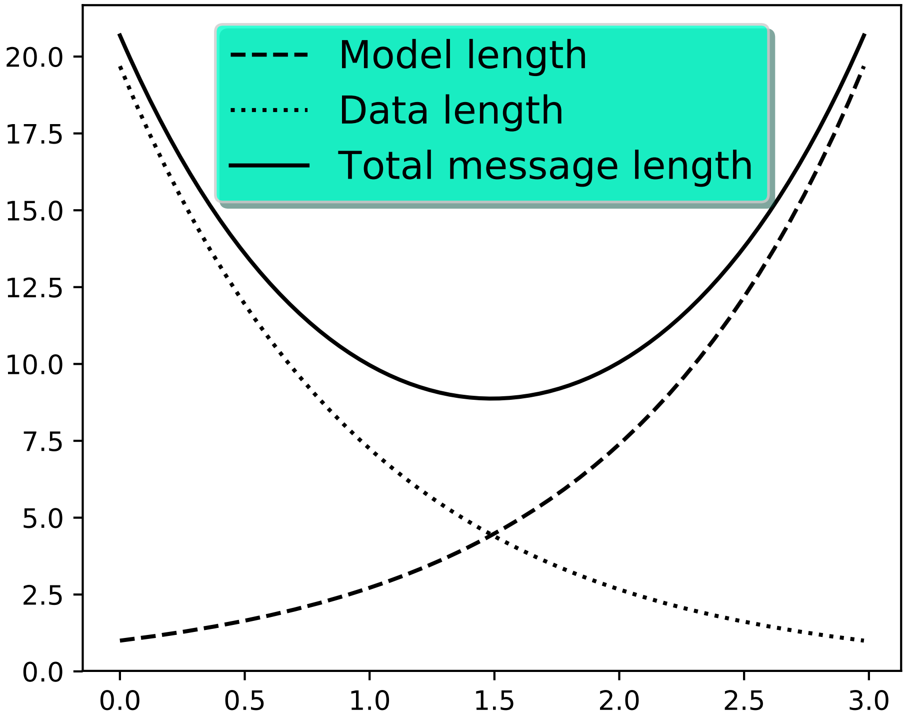
handler_map : dict or None

The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map()*.

Notes

Not all kinds of artist are supported by the legend command. See *Legend guide* for details.

Examples



matplotlib.axes.Axes.get_legend

`Axes.`**`get_legend`**`()`

Return the legend.Legend instance, or None if no legend is defined

matplotlib.axes.Axes.get_legend_handles_labels

`Axes.`**`get_legend_handles_labels`**`(`*legend_handler_map=None*`)`

Return handles and labels for legend

`ax.legend()` is equivalent to

```
h, l = ax.get_legend_handles_labels()
ax.legend(h, l)
```

19.5.5 Axis scales

`Axes.set_xscale`	Set the x-axis scale
`Axes.get_xscale`	Return the xaxis scale string: linear, log, logit, symlog
`Axes.get_yscale`	Return the yaxis scale string: linear, log, logit, symlog
`Axes.set_yscale`	Set the y-axis scale

matplotlib.axes.Axes.set_xscale

`Axes.set_xscale`(*value*, ***kwargs*)

Set the x-axis scale

Set the scaling of the x-axis: 'linear' | 'log' | 'logit' | 'symlog'

ACCEPTS: ['linear' | 'log' | 'logit' | 'symlog']

Different kwargs are accepted, depending on the scale: 'linear'

'log'

***basex/basey*: ** The base of the logarithm

***nonposx/nonposy*: ['mask' | 'clip']** non-positive values in *x* or *y* can be masked as invalid, or clipped to a very small positive number

***subsx/subsy*: ** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]`

will place 8 logarithmically spaced minor ticks between each major tick.

'logit'

***nonpos*: ['mask' | 'clip']** values beyond]0, 1[can be masked as invalid, or clipped to a number very close to 0 or 1

'symlog'

***basex/basey*: ** The base of the logarithm

***linthreshx/linthreshy*: ** The range (-*x*, *x*) within which the plot is linear (to avoid having the plot go to infinity around zero).

***subsx/subsy*: ** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]`

will place 8 logarithmically spaced minor ticks between each major tick.

***linscalex/linscaley*: ** This allows the linear range (-*linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

matplotlib.axes.Axes.get_xscale

`Axes.get_xscale()`

Return the xaxis scale string: linear, log, logit, symlog

matplotlib.axes.Axes.get_yscale

`Axes.get_yscale()`

Return the yaxis scale string: linear, log, logit, symlog

matplotlib.axes.Axes.set_yscale

`Axes.set_yscale(value, **kwargs)`

Set the y-axis scale

Set the scaling of the y-axis: ‘linear’ | ‘log’ | ‘logit’ | ‘symlog’

ACCEPTS: [’linear’ | ‘log’ | ‘logit’ | ‘symlog’]

Different kwargs are accepted, depending on the scale: ‘linear’

‘log’

***basex/basey*: ** The base of the logarithm

***nonposx/nonposy*: [’mask’ | ‘clip’]** non-positive values in *x* or *y* can be masked as invalid, or clipped to a very small positive number

***subsx/subsy*: ** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]`

will place 8 logarithmically spaced minor ticks between each major tick.

‘logit’

***nonpos*: [’mask’ | ‘clip’]** values beyond]0, 1[can be masked as invalid, or clipped to a number very close to 0 or 1

‘symlog’

***basex/basey*: ** The base of the logarithm

***linthreshx/linthreshy*: ** The range (-*x*, *x*) within which the plot is linear (to avoid having the plot go to infinity around zero).

***subsx/subsy*: ** Where to place the subticks between each major tick. Should be a sequence of integers. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]`

will place 8 logarithmically spaced minor ticks between each major tick.

***linscalex/linscaley*: ** This allows the linear range (-*linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

19.5.6 Autoscaling and margins

`Axes.use_sticky_edges`	When autoscaling, whether to obey all `Artist.sticky_edges`.
`Axes.margins`	Set or retrieve autoscaling margins.
`Axes.set_xmargin`	Set padding of X data limits prior to autoscaling.
`Axes.set_ymargin`	Set padding of Y data limits prior to autoscaling.
`Axes.relim`	Recompute the data limits based on current artists.
`Axes.autoscale`	Autoscale the axis view to the data (toggle).
`Axes.autoscale_view`	Autoscale the view limits using the data limits.
`Axes.get_autoscale_on`	Get whether autoscaling is applied for both axes on plot commands
`Axes.set_autoscale_on`	Set whether autoscaling is applied on plot commands
`Axes.get_autoscalex_on`	Get whether autoscaling for the x-axis is applied on plot commands
`Axes.set_autoscalex_on`	Set whether autoscaling for the x-axis is applied on plot commands
`Axes.get_autoscaley_on`	Get whether autoscaling for the y-axis is applied on plot commands
`Axes.set_autoscaley_on`	Set whether autoscaling for the y-axis is applied on plot commands

matplotlib.axes.Axes.use_sticky_edges

`Axes.`**`use_sticky_edges`**

When autoscaling, whether to obey all `Artist.sticky_edges`.

Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until *`autoscale`* or *`autoscale_view`* is called.

matplotlib.axes.Axes.margins

`Axes.`**`margins`**(**args*, ***kw*)

Set or retrieve autoscaling margins.

signatures:

```
margins()
```

returns xmargin, ymargin

```
margins(margin)

margins(xmargin, ymargin)

margins(x=xmargin, y=ymargin)

margins(..., tight=False)
```

All three forms above set the xmargin and ymargin parameters. All keyword parameters are optional. A single argument specifies both xmargin and ymargin. The *tight* parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting *tight* to *None* will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not None, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

matplotlib.axes.Axes.set_xmargin

`Axes.`**`set_xmargin`**`(`*m*`)`

Set padding of X data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

matplotlib.axes.Axes.set_ymargin

`Axes.`**`set_ymargin`**`(`*m*`)`

Set padding of Y data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

matplotlib.axes.Axes.relim

`Axes.`**`relim`**`(`*visible_only=False*`)`

Recompute the data limits based on current artists. If you want to exclude invisible artists from the calculation, set `visible_only=True`

At present, `Collection` instances are not supported.

matplotlib.axes.Axes.autoscale

`Axes.`**`autoscale`**`(`*enable=True*, *axis='both'*, *tight=None*`)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

***enable*: [True | False | None]** True (default) turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

***axis*: ['x' | 'y' | 'both']** which axis to operate on; default is 'both'

***tight*: [True | False | None]** If True, set view limits to data limits; if False, let the locator and margins expand the view limits; if None, use tight scaling if the only artist is an image, otherwise treat *tight* as False. The *tight* setting is retained for future autoscaling until it is explicitly changed.

Returns None.

matplotlib.axes.Axes.autoscale_view

`Axes.`**`autoscale_view`**(*tight=None*, *scalex=True*, *scaley=True*)

Autoscale the view limits using the data limits. You can selectively autoscale only a single axis, e.g., the xaxis by setting *scaley* to *False*. The autoscaling preserves any axis direction reversal that has already been done.

If *tight* is *False*, the axis major locator will be used to expand the view limits if rcParams['axes.autolimit_mode'] is 'round_numbers'. Note that any margins that are in effect will be applied first, regardless of whether *tight* is *True* or *False*. Specifying *tight* as *True* or *False* saves the setting as a private attribute of the Axes; specifying it as *None* (the default) applies the previously saved value.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use `matplotlib.axes.Axes.relim()` prior to calling autoscale_view.

matplotlib.axes.Axes.get_autoscale_on

`Axes.`**`get_autoscale_on`**()

Get whether autoscaling is applied for both axes on plot commands

matplotlib.axes.Axes.set_autoscale_on

`Axes.`**`set_autoscale_on`**(*b*)

Set whether autoscaling is applied on plot commands

accepts: [*True* | *False*]

matplotlib.axes.Axes.get_autoscalex_on

`Axes.`**`get_autoscalex_on`**()

Get whether autoscaling for the x-axis is applied on plot commands

matplotlib.axes.Axes.set_autoscalex_on

`Axes.`**`set_autoscalex_on`**`(`*b*`)`

Set whether autoscaling for the x-axis is applied on plot commands

accepts: [*True* | *False*]

matplotlib.axes.Axes.get_autoscaley_on

`Axes.`**`get_autoscaley_on`**`()`

Get whether autoscaling for the y-axis is applied on plot commands

matplotlib.axes.Axes.set_autoscaley_on

`Axes.`**`set_autoscaley_on`**`(`*b*`)`

Set whether autoscaling for the y-axis is applied on plot commands

accepts: [*True* | *False*]

19.5.7 Aspect ratio

`Axes.apply_aspect`	Use `_aspect()` and `_adjustable()` to modify the axes box or the view limits.
`Axes.get_aspect`	
`Axes.set_aspect`	*aspect*
`Axes.get_adjustable`	
`Axes.set_adjustable`	ACCEPTS: ['box' | 'datalim' | 'box-forced']

matplotlib.axes.Axes.apply_aspect

`Axes.`**`apply_aspect`**`(`*position=None*`)`

Use `_aspect()` and `_adjustable()` to modify the axes box or the view limits.

matplotlib.axes.Axes.get_aspect

`Axes.`**`get_aspect`**`()`

matplotlib.axes.Axes.set_aspect

`Axes.`**`set_aspect`**`(`*aspect*, *adjustable=None*, *anchor=None*`)`

aspect

value	description
'auto'	automatic; fill position rectangle with data
'normal'	same as 'auto'; deprecated
'equal'	same scaling from data to plot units for x and y
num	a circle will be stretched such that the height is num times the width. aspect=1 is the same as aspect='equal'.

adjustable

value	description
'box'	change physical size of axes
'datalim'	change xlim or ylim
'box-forced'	same as 'box', but axes can be shared

'box' does not allow axes sharing, as this can cause unintended side effect. For cases when sharing axes is fine, use 'box-forced'.

anchor

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

Deprecated since version 1.2: the option 'normal' for aspect is deprecated. Use 'auto' instead.

matplotlib.axes.Axes.get_adjustable

`Axes.`**`get_adjustable`**`()`

matplotlib.axes.Axes.set_adjustable

`Axes.`**`set_adjustable`**`(`*`adjustable`*`)`

ACCEPTS: ['box' | 'datalim' | 'box-forced']

19.5.8 Ticks and tick labels

`Axes.xaxis_date`	Sets up x-axis ticks and labels that treat the x data as dates.
`Axes.yaxis_date`	Sets up y-axis ticks and labels that treat the y data as dates.
`Axes.get_xmajorticklabels`	Get the xtick labels as a list of `Text` instances.

Continued on next page

Table 19.47 – continued from previous page

`Axes.get_xminorticklabels`	Get the x minor tick labels as a list of `matplotlib.text.Text` instances.
`Axes.get_xticklabels`	Get the x tick labels as a list of `Text` instances.
`Axes.get_xticklines`	Get the xtick lines as a list of Line2D instances
`Axes.get_xticks`	Return the x ticks as a list of locations
`Axes.get_ymajorticklabels`	Get the major y tick labels as a list of `Text` instances.
`Axes.get_yminorticklabels`	Get the minor y tick labels as a list of `Text` instances.
`Axes.get_yticklabels`	Get the x tick labels as a list of `Text` instances.
`Axes.get_yticklines`	Get the ytick lines as a list of Line2D instances
`Axes.get_yticks`	Return the y ticks as a list of locations
`Axes.minorticks_off`	Remove minor ticks from the axes.
`Axes.minorticks_on`	Add autoscaling minor ticks to the axes.
`Axes.set_xticklabels`	Set the xtick labels with list of strings *labels*
`Axes.set_xticks`	Set the x ticks with list of *ticks*
`Axes.set_yticklabels`	Set the y tick labels with list of strings *labels*
`Axes.set_yticks`	Set the y ticks with list of *ticks*
`Axes.get_xgridlines`	Get the x grid lines as a list of Line2D instances
`Axes.get_ygridlines`	Get the y grid lines as a list of Line2D instances
`Axes.ticklabel_format`	Change the `ScalarFormatter` used by default for linear axes.
`Axes.tick_params`	Change the appearance of ticks and tick labels.
`Axes.locator_params`	Control behavior of tick locators.

matplotlib.axes.Axes.xaxis_date

`Axes.`**`xaxis_date`**`(`*tz=None*`)`

Sets up x-axis ticks and labels that treat the x data as dates.

tz is a timezone string or `tzinfo` instance. Defaults to rc value.

matplotlib.axes.Axes.yaxis_date

`Axes.`**`yaxis_date`**`(`*tz=None*`)`

Sets up y-axis ticks and labels that treat the y data as dates.

tz is a timezone string or `tzinfo` instance. Defaults to rc value.

matplotlib.axes.Axes.get_xmajorticklabels

`Axes.`**`get_xmajorticklabels`**`()`

Get the xtick labels as a list of `Text` instances.

matplotlib.axes.Axes.get_xminorticklabels

`Axes.`**`get_xminorticklabels`**`()`

Get the x minor tick labels as a list of *`matplotlib.text.Text`* instances.

matplotlib.axes.Axes.get_xticklabels

`Axes.`**`get_xticklabels`**`(`*minor=False*, *which=None*`)`

Get the x tick labels as a list of *`Text`* instances.

Parameters minor : bool

If True return the minor ticklabels, else return the major ticklabels

which : None, ('minor', 'major', 'both')

Overrides `minor`.

Selects which ticklabels to return

Returns ret : list

List of *`Text`* instances.

matplotlib.axes.Axes.get_xticklines

`Axes.`**`get_xticklines`**`()`

Get the xtick lines as a list of Line2D instances

matplotlib.axes.Axes.get_xticks

`Axes.`**`get_xticks`**`(`*minor=False*`)`

Return the x ticks as a list of locations

matplotlib.axes.Axes.get_ymajorticklabels

`Axes.`**`get_ymajorticklabels`**`()`

Get the major y tick labels as a list of *`Text`* instances.

matplotlib.axes.Axes.get_yminorticklabels

`Axes.`**`get_yminorticklabels`**`()`

Get the minor y tick labels as a list of *`Text`* instances.

matplotlib.axes.Axes.get_yticklabels

`Axes.`**`get_yticklabels`**`(`*minor=False*, *which=None*`)`

Get the x tick labels as a list of `Text` instances.

Parameters minor : bool

If True return the minor ticklabels, else return the major ticklabels

which : None, ('minor', 'major', 'both')

Overrides `minor`.

Selects which ticklabels to return

Returns ret : list

List of `Text` instances.

matplotlib.axes.Axes.get_yticklines

`Axes.`**`get_yticklines`**`()`

Get the ytick lines as a list of Line2D instances

matplotlib.axes.Axes.get_yticks

`Axes.`**`get_yticks`**`(`*minor=False*`)`

Return the y ticks as a list of locations

matplotlib.axes.Axes.minorticks_off

`Axes.`**`minorticks_off`**`()`

Remove minor ticks from the axes.

matplotlib.axes.Axes.minorticks_on

`Axes.`**`minorticks_on`**`()`

Add autoscaling minor ticks to the axes.

matplotlib.axes.Axes.set_xticklabels

`Axes.`**`set_xticklabels`**`(`*labels*, *fontdict=None*, *minor=False*, ***kwargs*`)`

Set the xtick labels with list of strings *labels*

Return a list of axis text instances.

kwargs set the `Text` properties. Valid properties are

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`axes`	an `Axes` instance
`backgroundcolor`	any matplotlib color
`bbox`	FancyBboxPatch prop dict
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	any matplotlib color
`contains`	a callable function
`family` or fontfamily or fontname or name	[FONTNAME | ‘serif’ | ‘sans-serif’ | ‘cursive’ | ‘fantasy’ | ‘monospace’]
`figure`	a `matplotlib.figure.Figure` instance
`fontproperties` or font_properties	a `matplotlib.font_manager.FontProperties` instance
`gid`	an id string
`horizontalalignment` or ha	[‘center’ | ‘right’ | ‘left’]
`label`	string or anything printable with ‘%s’ conversion.
`linespacing`	float (multiple of font size)
`multialignment`	[’left’ | ‘right’ | ‘center’]
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	(x,y)
`rasterized`	[True | False | None]
`rotation`	[angle in degrees | ‘vertical’ | ‘horizontal’]
`rotation_mode`	unknown
`size` or fontsize	[size in points | ‘xx-small’ | ‘x-small’ | ‘small’ | ‘medium’ | ‘large’ | ‘x-large’
`sketch_params`	unknown
`snap`	unknown
`stretch` or fontstretch	[a numeric value in range 0-1000 | ‘ultra-condensed’ | ‘extra-condensed’ | ‘c
`style` or fontstyle	[‘normal’ | ‘italic’ | ‘oblique’]
`text`	string or anything printable with ‘%s’ conversion.
`transform`	`Transform` instance
`url`	a url string
`usetex`	unknown
`variant` or fontvariant	[‘normal’ | ‘small-caps’]
`verticalalignment` or ma or va	[‘center’ | ‘top’ | ‘bottom’ | ‘baseline’]
`visible`	[True | False]
`weight` or fontweight	[a numeric value in range 0-1000 | ‘ultralight’ | ‘light’ | ‘normal’ | ‘regular’ |
`wrap`	unknown
`x`	float
`y`	float
`zorder`	any number

ACCEPTS: sequence of strings

matplotlib.axes.Axes.set_xticks

`Axes.`**`set_xticks`**`(`*ticks*, *minor=False*`)`

Set the x ticks with list of *ticks*

ACCEPTS: sequence of floats

matplotlib.axes.Axes.set_yticklabels

`Axes.`**`set_yticklabels`**`(`*labels*, *fontdict=None*, *minor=False*, ***kwargs*`)`

Set the y tick labels with list of strings *labels*

Return a list of `Text` instances.

kwargs set `Text` properties for the labels. Valid properties are

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`axes`	an `Axes` instance
`backgroundcolor`	any matplotlib color
`bbox`	FancyBboxPatch prop dict
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	any matplotlib color
`contains`	a callable function
`family` or fontfamily or fontname or name	[FONTNAME | ‘serif’ | ‘sans-serif’ | ‘cursive’ | ‘fantasy’ | ‘monospace’]
`figure`	a `matplotlib.figure.Figure` instance
`fontproperties` or font_properties	a `matplotlib.font_manager.FontProperties` instance
`gid`	an id string
`horizontalalignment` or ha	[‘center’ | ‘right’ | ‘left’]
`label`	string or anything printable with ‘%s’ conversion.
`linespacing`	float (multiple of font size)
`multialignment`	[’left’ | ‘right’ | ‘center’]
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	(x,y)
`rasterized`	[True | False | None]
`rotation`	[angle in degrees | ‘vertical’ | ‘horizontal’]
`rotation_mode`	unknown
`size` or fontsize	[size in points | ‘xx-small’ | ‘x-small’ | ‘small’ | ‘medium’ | ‘large’ | ‘x-large’
`sketch_params`	unknown

Table 19.49 – continued fro

Property	Description
`snap`	unknown
`stretch` or fontstretch	[a numeric value in range 0-1000 | 'ultra-condensed' | 'extra-condensed' | 'c
`style` or fontstyle	['normal' | 'italic' | 'oblique']
`text`	string or anything printable with '%s' conversion.
`transform`	`Transform` instance
`url`	a url string
`usetex`	unknown
`variant` or fontvariant	['normal' | 'small-caps']
`verticalalignment` or ma or va	['center' | 'top' | 'bottom' | 'baseline']
`visible`	[True | False]
`weight` or fontweight	[a numeric value in range 0-1000 | 'ultralight' | 'light' | 'normal' | 'regular' |
`wrap`	unknown
`x`	float
`y`	float
`zorder`	any number

ACCEPTS: sequence of strings

matplotlib.axes.Axes.set_yticks

`Axes.`**`set_yticks`**`(`*ticks*, *minor=False*`)`

Set the y ticks with list of *ticks*

ACCEPTS: sequence of floats

Keyword arguments:

***minor*: [*False* | *True*]** Sets the minor ticks if *True*

matplotlib.axes.Axes.get_xgridlines

`Axes.`**`get_xgridlines`**`()`

Get the x grid lines as a list of Line2D instances

matplotlib.axes.Axes.get_ygridlines

`Axes.`**`get_ygridlines`**`()`

Get the y grid lines as a list of Line2D instances

matplotlib.axes.Axes.ticklabel_format

`Axes.`**`ticklabel_format`**`(`***kwargs*`)`

Change the `ScalarFormatter` used by default for linear axes.

Optional keyword arguments:

Keyword	Description
style	['sci' (or 'scientific') | 'plain'] plain turns off scientific notation
scilimits	(m, n), pair of integers; if *style* is 'sci', scientific notation will be used for numbers outside the range 10'm':sup: to 10'n':sup:. Use (0,0) to include all numbers.
useOffset	[True | False | offset]; if True, the offset will be calculated as needed; if False, no offset will be used; if a numeric offset is specified, it will be used.
axis	['x' | 'y' | 'both']
useLocale	If True, format the number according to the current locale. This affects things such as the character used for the decimal separator. If False, use C-style (English) formatting. The default setting is controlled by the axes.formatter.use_locale rcparam.

Only the major ticks are affected. If the method is called when the `ScalarFormatter` is not the `Formatter` being used, an `AttributeError` will be raised.

matplotlib.axes.Axes.tick_params

`Axes.`**`tick_params`**`(`*axis='both'*, ***kwargs*`)`

Change the appearance of ticks and tick labels.

Parameters axis : {'x', 'y', 'both'}, optional

Which axis to apply the parameters to.

Other Parameters axis : {'x', 'y', 'both'}

Axis on which to operate; default is 'both'.

reset : bool

If *True*, set all parameters to defaults before processing other keyword arguments. Default is *False*.

which : {'major', 'minor', 'both'}

Default is 'major'; apply arguments to *which* ticks.

direction : {'in', 'out', 'inout'}

Puts ticks inside the axes, outside the axes, or both.

length : float

Tick length in points.

width : float

Tick width in points.

color : color

Tick color; accepts any mpl color spec.

pad : float

Distance in points between tick and label.

labelsize : float or str

Tick label font size in points or as a string (e.g., 'large').

labelcolor : color

Tick label color; mpl color spec.

colors : color

Changes the tick color and the label color to the same value: mpl color spec.

zorder : float

Tick and label zorder.

bottom, top, left, right : bool or {'on', 'off'}

controls whether to draw the respective ticks.

labelbottom, labeltop, labelleft, labelright : bool or {'on', 'off'}

controls whether to draw the respective tick labels.

Examples

Usage

```
ax.tick_params(direction='out', length=6, width=2, colors='r')
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red.

matplotlib.axes.Axes.locator_params

`Axes.`**`locator_params`**(*axis='both'*, *tight=None*, ***kwargs*)

Control behavior of tick locators.

Keyword arguments:

axis ['x' | 'y' | 'both'] Axis on which to operate; default is 'both'.

tight [True | False | None] Parameter passed to `autoscale_view()`. Default is None, for no change.

Remaining keyword arguments are passed to directly to the `set_params()` method.

Typically one might want to reduce the maximum number of ticks and use tight bounds when plotting small subplots, for example:

```
ax.locator_params(tight=True, nbins=4)
```

Because the locator is involved in autoscaling, `autoscale_view()` is called automatically after the parameters are changed.

This presently works only for the `MaxNLocator` used by default on linear axes, but it may be generalized.

19.6 Units

`Axes.convert_xunits`	For artists in an axes, if the xaxis has units support,
`Axes.convert_yunits`	For artists in an axes, if the yaxis has units support,
`Axes.have_units`	Return *True* if units are set on the *x* or *y* axes

19.6.1 matplotlib.axes.Axes.convert_xunits

`Axes.`**`convert_xunits`**(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

19.6.2 matplotlib.axes.Axes.convert_yunits

`Axes.`**`convert_yunits`**(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

19.6.3 matplotlib.axes.Axes.have_units

`Axes.`**`have_units`**()

Return *True* if units are set on the *x* or *y* axes

19.7 Adding Artists

`Axes.add_artist`	Add any `Artist` to the axes.
`Axes.add_collection`	Add a `Collection` instance to the axes.
`Axes.add_container`	Add a `Container` instance to the axes.
`Axes.add_image`	Add a `AxesImage` to the axes.
`Axes.add_line`	Add a `Line2D` to the list of plot

Continued on next page

Table 19.51 – continued from previous page

`Axes.add_patch`	Add a `Patch` *p* to the list of axes patches; the clipbox will be set to the Axes clipping box.
`Axes.add_table`	Add a `Table` instance to the

19.7.1 matplotlib.axes.Axes.add_artist

`Axes.`**`add_artist`**`(`*a*`)`

Add any `Artist` to the axes.

Use `add_artist` only for artists for which there is no dedicated "add" method; and if necessary, use a method such as `update_datalim` or `update_datalim_numerix` to manually update the dataLim if the artist is to be included in autoscaling.

Returns the artist.

19.7.2 matplotlib.axes.Axes.add_collection

`Axes.`**`add_collection`**`(`*collection*, *autolim=True*`)`

Add a `Collection` instance to the axes.

Returns the collection.

19.7.3 matplotlib.axes.Axes.add_container

`Axes.`**`add_container`**`(`*container*`)`

Add a `Container` instance to the axes.

Returns the collection.

19.7.4 matplotlib.axes.Axes.add_image

`Axes.`**`add_image`**`(`*image*`)`

Add a `AxesImage` to the axes.

Returns the image.

19.7.5 matplotlib.axes.Axes.add_line

`Axes.`**`add_line`**`(`*line*`)`

Add a `Line2D` to the list of plot lines

Returns the line.

19.7.6 matplotlib.axes.Axes.add_patch

`Axes.`**`add_patch`**(*p*)

Add a *`Patch`* *p* to the list of axes patches; the clipbox will be set to the Axes clipping box. If the transform is not set, it will be set to `transData`.

Returns the patch.

19.7.7 matplotlib.axes.Axes.add_table

`Axes.`**`add_table`**(*tab*)

Add a `Table` instance to the list of axes tables

Returns the table.

19.8 Twinning

`Axes.twinx`	Create a twin Axes sharing the xaxis
`Axes.twiny`	Create a twin Axes sharing the yaxis
`Axes.get_shared_x_axes`	Return a copy of the shared axes Grouper object for x axes
`Axes.get_shared_y_axes`	Return a copy of the shared axes Grouper object for y axes

19.8.1 matplotlib.axes.Axes.twinx

`Axes.`**`twinx`**()

Create a twin Axes sharing the xaxis

create a twin of Axes for generating a plot with a sharex x-axis but independent y axis. The y-axis of self will have ticks on left and the returned axes will have ticks on the right. To ensure tick marks of both axis align, see *`LinearLocator`*

Note: For those who are ‘picking’ artists while using twinx, pick events are only called for the artists in the top-most axes.

19.8.2 matplotlib.axes.Axes.twiny

`Axes.`**`twiny`**()

Create a twin Axes sharing the yaxis

create a twin of Axes for generating a plot with a shared y-axis but independent x axis. The x-axis of self will have ticks on bottom and the returned axes will have ticks on the top.

Note: For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most axes.

19.8.3 matplotlib.axes.Axes.get_shared_x_axes

`Axes.`**`get_shared_x_axes`**`()`

Return a copy of the shared axes Grouper object for x axes

19.8.4 matplotlib.axes.Axes.get_shared_y_axes

`Axes.`**`get_shared_y_axes`**`()`

Return a copy of the shared axes Grouper object for y axes

19.9 Axes Position

`Axes.get_anchor`	
`Axes.set_anchor`	*anchor*
`Axes.get_axes_locator`	return axes_locator
`Axes.set_axes_locator`	set axes_locator
`Axes.reset_position`	Make the original position the active position
`Axes.get_position`	Return the a copy of the axes rectangle as a Bbox
`Axes.set_position`	Set the axes position

19.9.1 matplotlib.axes.Axes.get_anchor

`Axes.`**`get_anchor`**`()`

19.9.2 matplotlib.axes.Axes.set_anchor

`Axes.`**`set_anchor`**`(`*anchor*`)`

anchor

value	description
‘C’	Center
‘SW’	bottom left
‘S’	bottom
‘SE’	bottom right
‘E’	right
‘NE’	top right
‘N’	top
‘NW’	top left
‘W’	left

19.9.3 matplotlib.axes.Axes.get_axes_locator

`Axes.`**`get_axes_locator`**`()`

return axes_locator

19.9.4 matplotlib.axes.Axes.set_axes_locator

`Axes.`**`set_axes_locator`**`(`*locator*`)`

set axes_locator

ACCEPT: a callable object which takes an axes instance and renderer and returns a bbox.

19.9.5 matplotlib.axes.Axes.reset_position

`Axes.`**`reset_position`**`()`

Make the original position the active position

19.9.6 matplotlib.axes.Axes.get_position

`Axes.`**`get_position`**`(`*original=False*`)`

Return the a copy of the axes rectangle as a Bbox

19.9.7 matplotlib.axes.Axes.set_position

`Axes.`**`set_position`**`(`*pos*, *which='both'*`)`

Set the axes position

The expected shape of `pos` is:

```
pos = [left, bottom, width, height]
```

in relative 0,1 coords, or *pos* can be a `Bbox`

There are two position variables: one which is ultimately used, but which may be modified by `apply_aspect()`, and a second which is the starting point for `apply_aspect()`.

Optional keyword arguments: *which*

value	description
'active'	to change the first
'original'	to change the second
'both'	to change both

19.10 Async/Event based

Axes.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
Axes.pchanged	Fire an event when property changed, calling all of the registered callbacks.
Axes.add_callback	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
Axes.remove_callback	Remove a callback based on its *id*.

19.10.1 matplotlib.axes.Axes.stale

`Axes.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

19.10.2 matplotlib.axes.Axes.pchanged

`Axes.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

19.10.3 matplotlib.axes.Axes.add_callback

`Axes.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *remove_callback()* later.

19.10.4 matplotlib.axes.Axes.remove_callback

`Axes.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

add_callback() For adding callbacks

19.11 Interactive

Axes.can_pan	Return *True* if this axes supports any pan/zoom button functionality.
Axes.can_zoom	Return *True* if this axes supports the zoom box button functionality.
Axes.get_navigate	Get whether the axes responds to navigation commands
Axes.set_navigate	Set whether the axes responds to navigation toolbar commands
Axes.get_navigate_mode	Get the navigation toolbar button status: 'PAN', 'ZOOM', or None
Axes.set_navigate_mode	Set the navigation toolbar button status;
Axes.start_pan	Called when a pan operation has started.
Axes.drag_pan	Called when the mouse moves during a pan operation.
Axes.end_pan	Called when a pan operation completes (when the mouse button
Axes.format_coord	Return a format string formatting the *x*, *y* coord
Axes.format_cursor_data	Return *cursor data* string formatted.
Axes.format_xdata	Return *x* string formatted.
Axes.format_ydata	Return y string formatted.
Axes.hitlist	List the children of the artist which contain the mouse event *event*.
Axes.mouseover	
Axes.in_axes	Return *True* if the given *mouseevent* (in display coords)
Axes.pick	Trigger pick event
Axes.pickable	Return *True* if `Artist` is pickable.
Axes.get_picker	Return the picker object used by this artist
Axes.set_picker	Set the epsilon for picking used by this artist
Axes.set_contains	Replace the contains test used by this artist.
Axes.get_contains	Return the _contains test used by the artist, or *None* for default.
Axes.contains	Test whether the mouse event occured in the axes.
Axes.contains_point	Returns *True* if the point (tuple of x,y) is inside the axes (the area defined by the its patch).
Axes.get_cursor_data	Get the cursor data for a given event.
Axes.get_cursor_props	Return the cursor propertiess as a (*linewidth*, *color*)
Axes.set_cursor_props	Set the cursor property as

19.11.1 matplotlib.axes.Axes.can_pan

`Axes.can_pan()`

Return *True* if this axes supports any pan/zoom button functionality.

19.11.2 matplotlib.axes.Axes.can_zoom

`Axes.can_zoom()`

Return *True* if this axes supports the zoom box button functionality.

19.11.3 matplotlib.axes.Axes.get_navigate

`Axes.get_navigate()`

Get whether the axes responds to navigation commands

19.11.4 matplotlib.axes.Axes.set_navigate

`Axes.set_navigate(b)`

Set whether the axes responds to navigation toolbar commands

ACCEPTS: [*True* | *False*]

19.11.5 matplotlib.axes.Axes.get_navigate_mode

`Axes.get_navigate_mode()`

Get the navigation toolbar button status: 'PAN', 'ZOOM', or None

19.11.6 matplotlib.axes.Axes.set_navigate_mode

`Axes.set_navigate_mode(b)`

Set the navigation toolbar button status;

Warning: this is not a user-API function.

19.11.7 matplotlib.axes.Axes.start_pan

`Axes.start_pan(x, y, button)`

Called when a pan operation has started.

x, *y* are the mouse coordinates in display coords. button is the mouse button number:

- 1: LEFT
- 2: MIDDLE
- 3: RIGHT

Note: Intended to be overridden by new projection types.

19.11.8 matplotlib.axes.Axes.drag_pan

`Axes.`**`drag_pan`**`(`*button*, *key*, *x*, *y*`)`

Called when the mouse moves during a pan operation.

button is the mouse button number:

- 1: LEFT
- 2: MIDDLE
- 3: RIGHT

key is a "shift" key

x, *y* are the mouse coordinates in display coords.

Note: Intended to be overridden by new projection types.

19.11.9 matplotlib.axes.Axes.end_pan

`Axes.`**`end_pan`**`()`

Called when a pan operation completes (when the mouse button is up.)

Note: Intended to be overridden by new projection types.

19.11.10 matplotlib.axes.Axes.format_coord

`Axes.`**`format_coord`**`(`*x*, *y*`)`

Return a format string formatting the *x*, *y* coord

19.11.11 matplotlib.axes.Axes.format_cursor_data

`Axes.`**`format_cursor_data`**`(`*data*`)`

Return *cursor data* string formatted.

19.11.12 matplotlib.axes.Axes.format_xdata

`Axes.`**`format_xdata`**`(`*x*`)`

Return *x* string formatted. This function will use the attribute self.fmt_xdata if it is callable, else will fall back on the xaxis major formatter

19.11.13 matplotlib.axes.Axes.format_ydata

`Axes.`**`format_ydata`**`(`*y*`)`

Return y string formatted. This function will use the `fmt_ydata` attribute if it is callable, else will fall back on the yaxis major formatter

19.11.14 matplotlib.axes.Axes.hitlist

`Axes.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

19.11.15 matplotlib.axes.Axes.mouseover

`Axes.`**`mouseover`**

19.11.16 matplotlib.axes.Axes.in_axes

`Axes.`**`in_axes`**`(`*mouseevent*`)`

Return *True* if the given *mouseevent* (in display coords) is in the Axes

19.11.17 matplotlib.axes.Axes.pick

`Axes.`**`pick`**`(`**args*`)`

Trigger pick event

Call signature:

```
pick(mouseevent)
```

each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set

19.11.18 matplotlib.axes.Axes.pickable

`Axes.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

19.11.19 matplotlib.axes.Axes.get_picker

`Axes.`**`get_picker`**`()`

Return the picker object used by this artist

19.11.20 matplotlib.axes.Axes.set_picker

`Axes.`**`set_picker`**`(`*picker*`)`

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

19.11.21 matplotlib.axes.Axes.set_contains

`Axes.`**`set_contains`**`(`*picker*`)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

19.11.22 matplotlib.axes.Axes.get_contains

`Axes.`**`get_contains`**`()`

Return the _contains test used by the artist, or *None* for default.

19.11.23 matplotlib.axes.Axes.contains

`Axes.`**`contains`**`(`*mouseevent*`)`

Test whether the mouse event occured in the axes.

Returns *True* / *False*, {}

19.11.24 matplotlib.axes.Axes.contains_point

`Axes.`**`contains_point`**`(`*point*`)`

Returns *True* if the point (tuple of x,y) is inside the axes (the area defined by the its patch). A pixel coordinate is required.

19.11.25 matplotlib.axes.Axes.get_cursor_data

`Axes.`**`get_cursor_data`**`(`*event*`)`

Get the cursor data for a given event.

19.11.26 matplotlib.axes.Axes.get_cursor_props

`Axes.`**`get_cursor_props`**`()`

Return the cursor propertiess as a (*linewidth*, *color*) tuple, where *linewidth* is a float and *color* is an RGBA tuple

19.11.27 matplotlib.axes.Axes.set_cursor_props

`Axes.`**`set_cursor_props`**`(`**args*`)`

Set the cursor property as

Call signature

```
ax.set_cursor_props(linewidth, color)
```

or:

```
ax.set_cursor_props((linewidth, color))
```

ACCEPTS: a (*float*, *color*) tuple

19.12 Children

Axes.get_children	return a list of child artists
Axes.get_images	return a list of Axes images contained by the Axes
Axes.get_lines	Return a list of lines contained by the Axes
Axes.findobj	Find artist objects.

19.12.1 matplotlib.axes.Axes.get_children

`Axes.`**`get_children`**`()`

return a list of child artists

19.12.2 matplotlib.axes.Axes.get_images

`Axes.`**`get_images`**`()`

return a list of Axes images contained by the Axes

19.12.3 matplotlib.axes.Axes.get_lines

`Axes.`**`get_lines`**`()`

Return a list of lines contained by the Axes

19.12.4 matplotlib.axes.Axes.findobj

`Axes.`**`findobj`**`(`*match=None*, *include_self=True*`)`

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

19.13 Drawing

`Axes.draw`	Draw everything (plot lines, axes, labels)
`Axes.draw_artist`	This method can only be used after an initial draw which caches the renderer.
`Axes.redraw_in_frame`	This method can only be used after an initial draw which caches the renderer.
`Axes.get_renderer_cache`	
`Axes.get_rasterization_zorder`	Get zorder value below which artists will be rasterized
`Axes.set_rasterization_zorder`	Set zorder value below which artists will be rasterized.
`Axes.get_window_extent`	get the axes bounding box in display space; *args* and
`Axes.get_tightbbox`	Return the tight bounding box of the axes.

19.13.1 matplotlib.axes.Axes.draw

`Axes.`**`draw`**`(`*artist*, *renderer*, **args*, ***kwargs*`)`

Draw everything (plot lines, axes, labels)

19.13.2 matplotlib.axes.Axes.draw_artist

`Axes.`**`draw_artist`**`(`*a*`)`

This method can only be used after an initial draw which caches the renderer. It is used to efficiently update Axes data (axis ticks, labels, etc are not updated)

19.13.3 matplotlib.axes.Axes.redraw_in_frame

`Axes.`**`redraw_in_frame`**`()`

This method can only be used after an initial draw which caches the renderer. It is used to efficiently update Axes data (axis ticks, labels, etc are not updated)

19.13.4 matplotlib.axes.Axes.get_renderer_cache

`Axes.`**`get_renderer_cache`**`()`

19.13.5 matplotlib.axes.Axes.get_rasterization_zorder

`Axes.`**`get_rasterization_zorder`**`()`

Get zorder value below which artists will be rasterized

19.13.6 matplotlib.axes.Axes.set_rasterization_zorder

`Axes.`**`set_rasterization_zorder`**`(`*z*`)`

Set zorder value below which artists will be rasterized. Set to `None` to disable rasterizing of artists below a particular zorder.

19.13.7 matplotlib.axes.Axes.get_window_extent

`Axes.`**`get_window_extent`**`(`**args*, ***kwargs*`)`

get the axes bounding box in display space; *args* and *kwargs* are empty

19.13.8 matplotlib.axes.Axes.get_tightbbox

`Axes.`**`get_tightbbox`**`(`*renderer*, *call_axes_locator=True*`)`

Return the tight bounding box of the axes. The dimension of the Bbox in canvas coordinate.

If *call_axes_locator* is *False*, it does not call the _axes_locator attribute, which is necessary to get the correct bounding box. `call_axes_locator==False` can be used if the caller is only intereted in the relative size of the tightbbox compared to the axes bbox.

19.14 Bulk property manipulation

Axes.set	A property batch setter.
Axes.update	Update the properties of this `Artist` from the dictionary *prop*.
Axes.properties	return a dictionary mapping property name -> value for all Artist props
Axes.update_from	Copy properties from *other* to *self*.

19.14.1 matplotlib.axes.Axes.set

`Axes.`**`set`**`(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

19.14.2 matplotlib.axes.Axes.update

`Axes.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

19.14.3 matplotlib.axes.Axes.properties

`Axes.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

19.14.4 matplotlib.axes.Axes.update_from

`Axes.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

19.15 General Artist Properties

Axes.set_alpha	Set the alpha value used for blending - not supported on all backends.
Axes.set_animated	Set the artist's animation state.
Axes.set_clip_box	Set the artist's clip *Bbox*.
Axes.set_clip_on	Set whether artist uses clipping.

Continued on next page

Table 19.59 – continued from previous page

Axes.set_clip_path	Set the artist's clip path, which may be:
Axes.set_gid	Sets the (group) id for the artist
Axes.set_label	Set the label to *s* for auto legend.
Axes.set_url	Sets the url for the artist
Axes.set_visible	Set the artist's visiblity.
Axes.set_zorder	Set the zorder for the artist.
Axes.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
Axes.set_sketch_params	Sets the sketch parameters.
Axes.set_agg_filter	set agg_filter fuction.
Axes.set_snap	Sets the snap setting which may be:
Axes.set_transform	Set the *Transform* instance used by this artist.
Axes.set_path_effects	set path_effects, which should be a list of instances of
Axes.get_agg_filter	return filter function to be used for agg filter
Axes.get_sketch_params	Returns the sketch parameters for the artist.
Axes.get_alpha	Return the alpha value used for blending - not supported on all
Axes.get_animated	Return the artist's animated state
Axes.get_clip_box	Return artist clipbox
Axes.get_clip_on	Return whether artist uses clipping
Axes.get_clip_path	Return artist clip path
Axes.get_gid	Returns the group id
Axes.get_label	Get the label used for this artist in the legend.
Axes.get_url	Returns the url
Axes.get_visible	Return the artist's visiblity
Axes.get_zorder	Return the `Artist`'s zorder.
Axes.get_rasterized	return True if the artist is to be rasterized
Axes.get_transform	Return the *Transform* instance used by this artist.
Axes.get_snap	Returns the snap setting which may be:
Axes.get_path_effects	
Axes.axes	The *Axes* instance the artist resides in, or *None*.
Axes.get_axes	Return the *Axes* instance the artist resides in, or *None*.
Axes.set_axes	Set the *Axes* instance in which the artist resides, if any.
Axes.set_figure	Set the class:*Axes* figure
Axes.get_figure	Return the *Figure* instance the artist belongs to.

19.15.1 matplotlib.axes.Axes.set_alpha

`Axes.`**`set_alpha`**`(`*alpha*`)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

19.15.2 matplotlib.axes.Axes.set_animated

`Axes.`**`set_animated`**(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

19.15.3 matplotlib.axes.Axes.set_clip_box

`Axes.`**`set_clip_box`**(*clipbox*)

Set the artist's clip *`Bbox`*.

ACCEPTS: a *`matplotlib.transforms.Bbox`* instance

19.15.4 matplotlib.axes.Axes.set_clip_on

`Axes.`**`set_clip_on`**(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

19.15.5 matplotlib.axes.Axes.set_clip_path

`Axes.`**`set_clip_path`**(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a *`Patch`* (or subclass) instance
- **a *`Path`* instance, in which case** an optional *`Transform`* instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*`Path`*, *`Transform`*) | *`Patch`* | None]

19.15.6 matplotlib.axes.Axes.set_gid

`Axes.`**`set_gid`**(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

19.15.7 matplotlib.axes.Axes.set_label

`Axes.`**`set_label`**`(`*s*`)`

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

19.15.8 matplotlib.axes.Axes.set_url

`Axes.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

19.15.9 matplotlib.axes.Axes.set_visible

`Axes.`**`set_visible`**`(`*b*`)`

Set the artist's visiblity.

ACCEPTS: [True | False]

19.15.10 matplotlib.axes.Axes.set_zorder

`Axes.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

19.15.11 matplotlib.axes.Axes.set_rasterized

`Axes.`**`set_rasterized`**`(`*rasterized*`)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

19.15.12 matplotlib.axes.Axes.set_sketch_params

`Axes.`**`set_sketch_params`**`(`*scale=None*, *length=None*, *randomness=None*`)`

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

19.15.13 matplotlib.axes.Axes.set_agg_filter

`Axes.`**`set_agg_filter`**`(`*filter_func*`)`

set agg_filter fuction.

19.15.14 matplotlib.axes.Axes.set_snap

`Axes.`**`set_snap`**`(`*snap*`)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

19.15.15 matplotlib.axes.Axes.set_transform

`Axes.`**`set_transform`**`(`*t*`)`

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

19.15.16 matplotlib.axes.Axes.set_path_effects

`Axes.`**`set_path_effects`**`(`*path_effects*`)`

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

19.15.17 matplotlib.axes.Axes.get_agg_filter

`Axes.`**`get_agg_filter`**`()`

return filter function to be used for agg filter

19.15.18 matplotlib.axes.Axes.get_sketch_params

`Axes.`**`get_sketch_params`**`()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

19.15.19 matplotlib.axes.Axes.get_alpha

`Axes.`**`get_alpha`**`()`

Return the alpha value used for blending - not supported on all backends

19.15.20 matplotlib.axes.Axes.get_animated

`Axes.`**`get_animated`**`()`

Return the artist's animated state

19.15.21 matplotlib.axes.Axes.get_clip_box

`Axes.`**`get_clip_box`**`()`

Return artist clipbox

19.15.22 matplotlib.axes.Axes.get_clip_on

`Axes.`**`get_clip_on`**`()`

Return whether artist uses clipping

19.15.23 matplotlib.axes.Axes.get_clip_path

`Axes.`**`get_clip_path`**`()`

Return artist clip path

19.15.24 matplotlib.axes.Axes.get_gid

`Axes.`**`get_gid`**`()`

Returns the group id

19.15.25 matplotlib.axes.Axes.get_label

`Axes.`**`get_label`**`()`

Get the label used for this artist in the legend.

19.15.26 matplotlib.axes.Axes.get_url

`Axes.`**`get_url`**`()`

Returns the url

19.15.27 matplotlib.axes.Axes.get_visible

`Axes.`**`get_visible`**`()`

Return the artist's visiblity

19.15.28 matplotlib.axes.Axes.get_zorder

`Axes.`**`get_zorder`**`()`

Return the `Artist`'s zorder.

19.15.29 matplotlib.axes.Axes.get_rasterized

`Axes.`**`get_rasterized`**`()`

return True if the artist is to be rasterized

19.15.30 matplotlib.axes.Axes.get_transform

`Axes.`**`get_transform`**`()`

Return the *`Transform`* instance used by this artist.

19.15.31 matplotlib.axes.Axes.get_snap

`Axes.`**`get_snap`**`()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

19.15.32 matplotlib.axes.Axes.get_path_effects

`Axes.`**`get_path_effects`**`()`

19.15.33 matplotlib.axes.Axes.axes

`Axes.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

19.15.34 matplotlib.axes.Axes.get_axes

`Axes.`**`get_axes`**`()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

19.15.35 matplotlib.axes.Axes.set_axes

`Axes.`**`set_axes`**`(`*axes*`)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

19.15.36 matplotlib.axes.Axes.set_figure

`Axes.`**`set_figure`**`(`*fig*`)`

Set the class:`Axes` figure

accepts a class:`Figure` instance

19.15.37 matplotlib.axes.Axes.get_figure

`Axes.`**`get_figure`**`()`

Return the `Figure` instance the artist belongs to.

19.16 Artist Methods

`Axes.is_figure_set`	Returns True if the artist is assigned to a `Figure`.
`Axes.remove`	Remove the artist from the figure if possible.
`Axes.is_transform_set`	Returns *True* if `Artist` has a transform explicitly set.

19.16.1 matplotlib.axes.Axes.is_figure_set

`Axes.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

19.16.2 matplotlib.axes.Axes.remove

`Axes.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

19.16.3 matplotlib.axes.Axes.is_transform_set

`Axes.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

19.17 Projection

Methods used by *`Axis`* that must be overridden for non-rectilinear Axes.

`Axes.name`	
`Axes.get_xaxis_transform`	Get the transformation used for drawing x-axis labels, ticks and gridlines.
`Axes.get_yaxis_transform`	Get the transformation used for drawing y-axis labels, ticks and gridlines.
`Axes.get_data_ratio`	Returns the aspect ratio of the raw data.
`Axes.get_data_ratio_log`	Returns the aspect ratio of the raw data in log scale.
`Axes.get_xaxis_text1_transform`	Get the transformation used for drawing x-axis labels, which will add the given amount of padding (in points) between the axes and the label.
`Axes.get_xaxis_text2_transform`	Get the transformation used for drawing the secondary x-axis labels, which will add the given amount of padding (in points) between the axes and the label.
`Axes.get_yaxis_text1_transform`	Get the transformation used for drawing y-axis labels, which will add the given amount of padding (in points) between the axes and the label.
`Axes.get_yaxis_text2_transform`	Get the transformation used for drawing the secondary y-axis labels, which will add the given amount of padding (in points) between the axes and the label.

19.17.1 matplotlib.axes.Axes.name

`Axes.`**`name`** **= 'rectilinear'**

19.17.2 matplotlib.axes.Axes.get_xaxis_transform

`Axes.`**`get_xaxis_transform`**`(`*which='grid'*`)`

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.17.3 matplotlib.axes.Axes.get_yaxis_transform

`Axes.`**`get_yaxis_transform`**`(`*which='grid'*`)`

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.17.4 matplotlib.axes.Axes.get_data_ratio

`Axes.`**`get_data_ratio`**`()`

Returns the aspect ratio of the raw data.

This method is intended to be overridden by new projection types.

19.17.5 matplotlib.axes.Axes.get_data_ratio_log

`Axes.`**`get_data_ratio_log`**`()`

Returns the aspect ratio of the raw data in log scale. Will be used when both axis scales are in log.

19.17.6 matplotlib.axes.Axes.get_xaxis_text1_transform

`Axes.`**`get_xaxis_text1_transform`**`(`*pad_points*`)`

Get the transformation used for drawing x-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.17.7 matplotlib.axes.Axes.get_xaxis_text2_transform

`Axes.`**`get_xaxis_text2_transform`**(*pad_points*)

Get the transformation used for drawing the secondary x-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.17.8 matplotlib.axes.Axes.get_yaxis_text1_transform

`Axes.`**`get_yaxis_text1_transform`**(*pad_points*)

Get the transformation used for drawing y-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.17.9 matplotlib.axes.Axes.get_yaxis_text2_transform

`Axes.`**`get_yaxis_text2_transform`**(*pad_points*)

Get the transformation used for drawing the secondary y-axis labels, which will add the given amount of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates. Returns a 3-tuple of the form:

```
(transform, valign, halign)
```

where *valign* and *halign* are requested alignments for the text.

Note: This transformation is primarily used by the *`Axis`* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

19.18 Other

`Axes.zorder`	
`Axes.aname`	
`Axes.get_default_bbox_extra_artists`	
`Axes.get_transformed_clip_path_and_affine`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
`Axes.has_data`	Return *True* if any artists have been added to axes.
`Axes.hold`	Deprecated since version 2.0.
`Axes.ishold`	Deprecated since version 2.0.

19.18.1 matplotlib.axes.Axes.zorder

`Axes.`**`zorder`** **= 0**

19.18.2 matplotlib.axes.Axes.aname

`Axes.`**`aname`** **= 'Axes'**

19.18.3 matplotlib.axes.Axes.get_default_bbox_extra_artists

`Axes.`**`get_default_bbox_extra_artists`**`()`

19.18.4 matplotlib.axes.Axes.get_transformed_clip_path_and_affine

`Axes.`**`get_transformed_clip_path_and_affine`**`()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

19.18.5 matplotlib.axes.Axes.has_data

`Axes.`**`has_data`**`()`

Return *True* if any artists have been added to axes.

This should not be used to determine whether the *dataLim* need to be updated, and may not actually be useful for anything.

19.18.6 matplotlib.axes.Axes.hold

`Axes.`**`hold`**`(`*b=None*`)`

Deprecated since version 2.0: axes.hold is deprecated. See the API Changes document (http://matplotlib.org/api/api_changes.html) for more details.

Set the hold state

The `hold` mechanism is deprecated and will be removed in v3.0. The behavior will remain consistent with the long-time default value of True.

If *hold* is *None* (default), toggle the *hold* state. Else set the *hold* state to boolean value *b*.

Examples:

```
# toggle hold
hold()

# turn hold on
hold(True)

# turn hold off
hold(False)
```

When hold is *True*, subsequent plot commands will be added to the current axes. When hold is *False*, the current axes and figure will be cleared on the next plot command

19.18.7 matplotlib.axes.Axes.ishold

`Axes.`**`ishold`**`()`

Deprecated since version 2.0: The ishold function was deprecated in version 2.0.

return the HOLD status of the axes

> The `hold` mechanism is deprecated and will be removed in v3.0.

19.19 Inheritance

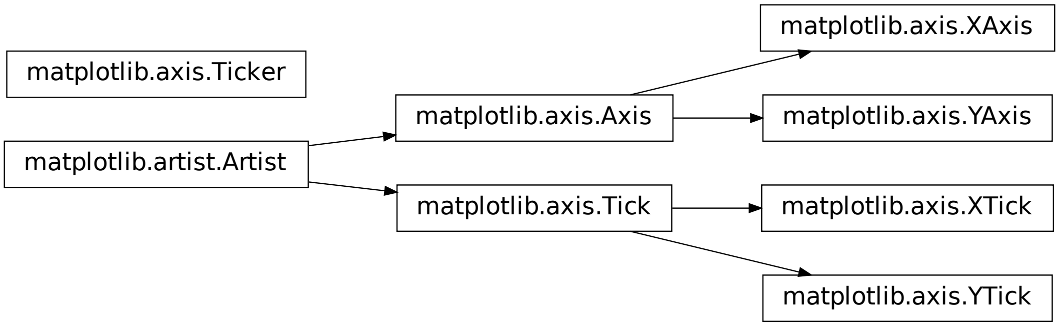
- *Axis*

Classes for the ticks and x and y axis

20.1 Inheritance



matplotlib.axis.Ticker
matplotlib.artist.Artist
matplotlib.axis.Axis
matplotlib.axis.Tick
matplotlib.axis.XAxis
matplotlib.axis.YAxis
matplotlib.axis.XTick
matplotlib.axis.YTick

20.2 `Axis` objects

class `matplotlib.axis.`**`Axis`**(*axes*, *pickradius=15*)

Public attributes

- `axes.transData` - transform data coords to display coords
- `axes.transAxes` - transform axis coords to display coords
- `labelpad` - number of points between the axis and its label

Init the axis with the parent Axes instance

class `matplotlib.axis.`**`XAxis`**(*axes*, *pickradius=15*)

Init the axis with the parent Axes instance

class `matplotlib.axis.`**`YAxis`**(*axes*, *pickradius=15*)

Init the axis with the parent Axes instance

class `matplotlib.axis.`**`Ticker`**

`Axis.cla`	clear the current axis
`Axis.get_scale`	

20.2.1 matplotlib.axis.Axis.cla

`Axis.`**`cla`**`()`

clear the current axis

20.2.2 matplotlib.axis.Axis.get_scale

`Axis.`**`get_scale`**`()`

20.2.3 Formatters and Locators

`Axis.get_major_formatter`	Get the formatter of the major ticker
`Axis.get_major_locator`	Get the locator of the major ticker
`Axis.get_minor_formatter`	Get the formatter of the minor ticker
`Axis.get_minor_locator`	Get the locator of the minor ticker
`Axis.set_major_formatter`	Set the formatter of the major ticker
`Axis.set_major_locator`	Set the locator of the major ticker
`Axis.set_minor_formatter`	Set the formatter of the minor ticker
`Axis.set_minor_locator`	Set the locator of the minor ticker

matplotlib.axis.Axis.get_major_formatter

`Axis.`**`get_major_formatter`**`()`

Get the formatter of the major ticker

matplotlib.axis.Axis.get_major_locator

`Axis.`**`get_major_locator`**`()`

Get the locator of the major ticker

matplotlib.axis.Axis.get_minor_formatter

`Axis.`**`get_minor_formatter`**`()`

Get the formatter of the minor ticker

matplotlib.axis.Axis.get_minor_locator

`Axis.`**`get_minor_locator`**`()`

Get the locator of the minor ticker

matplotlib.axis.Axis.set_major_formatter

`Axis.`**`set_major_formatter`**`(`*formatter*`)`

Set the formatter of the major ticker

ACCEPTS: A *`Formatter`* instance

matplotlib.axis.Axis.set_major_locator

`Axis.`**`set_major_locator`**`(`*locator*`)`

Set the locator of the major ticker

ACCEPTS: a *`Locator`* instance

matplotlib.axis.Axis.set_minor_formatter

`Axis.`**`set_minor_formatter`**`(`*formatter*`)`

Set the formatter of the minor ticker

ACCEPTS: A *`Formatter`* instance

matplotlib.axis.Axis.set_minor_locator

`Axis.`**`set_minor_locator`**`(`*locator*`)`

Set the locator of the minor ticker

ACCEPTS: a *`Locator`* instance

20.2.4 Axis Label

`Axis.set_label_coords`	Set the coordinates of the label.
`Axis.set_label_position`	Set the label position (top or bottom)
`Axis.set_label_text`	Sets the text value of the axis label
`Axis.get_label_position`	Return the label position (top or bottom)
`Axis.get_label_text`	Get the text of the label

matplotlib.axis.Axis.set_label_coords

`Axis.`**`set_label_coords`**`(`*x*, *y*, *transform=None*`)`

Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coodinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

matplotlib.axis.Axis.set_label_position

`Axis.`**`set_label_position`**`(`*position*`)`

Set the label position (top or bottom)

ACCEPTS: ['top' | 'bottom']

matplotlib.axis.Axis.set_label_text

`Axis.`**`set_label_text`**`(`*label*, *fontdict=None*, ***kwargs*`)`

Sets the text value of the axis label

ACCEPTS: A string value for the label

matplotlib.axis.Axis.get_label_position

`Axis.`**`get_label_position`**`()`

Return the label position (top or bottom)

matplotlib.axis.Axis.get_label_text

`Axis.`**`get_label_text`**`()`

Get the text of the label

20.2.5 Ticks, tick labels and Offset text

`Axis.get_major_ticks`	get the tick instances; grow as necessary
`Axis.get_majorticklabels`	Return a list of Text instances for the major ticklabels
`Axis.get_majorticklines`	Return the major tick lines as a list of Line2D instances
`Axis.get_majorticklocs`	Get the major tick locations in data coordinates as a numpy array
`Axis.get_minor_ticks`	get the minor tick instances; grow as necessary
`Axis.get_minorticklabels`	Return a list of Text instances for the minor ticklabels
`Axis.get_minorticklines`	Return the minor tick lines as a list of Line2D instances
`Axis.get_minorticklocs`	Get the minor tick locations in data coordinates as a numpy array
`Axis.get_offset_text`	Return the axis offsetText as a Text instance
`Axis.get_tick_padding`	
`Axis.get_ticklabels`	Get the x tick labels as a list of `Text` instances.
`Axis.get_ticklines`	Return the tick lines as a list of Line2D instances
`Axis.get_ticklocs`	Get the tick locations in data coordinates as a numpy array

Continued on next page

Table 20.4 – continued from previous page

`Axis.get_gridlines`	Return the grid lines as a list of Line2D instance
`Axis.grid`	Set the axis grid on or off; b is a boolean.
`Axis.iter_ticks`	Iterate through all of the major and minor ticks.
`Axis.set_tick_params`	Set appearance parameters for ticks and ticklabels.
`Axis.axis_date`	Sets up x-axis ticks and labels that treat the x data as dates.

matplotlib.axis.Axis.get_major_ticks

`Axis.`**`get_major_ticks`**`(`*numticks=None*`)`

get the tick instances; grow as necessary

matplotlib.axis.Axis.get_majorticklabels

`Axis.`**`get_majorticklabels`**`()`

Return a list of Text instances for the major ticklabels

matplotlib.axis.Axis.get_majorticklines

`Axis.`**`get_majorticklines`**`()`

Return the major tick lines as a list of Line2D instances

matplotlib.axis.Axis.get_majorticklocs

`Axis.`**`get_majorticklocs`**`()`

Get the major tick locations in data coordinates as a numpy array

matplotlib.axis.Axis.get_minor_ticks

`Axis.`**`get_minor_ticks`**`(`*numticks=None*`)`

get the minor tick instances; grow as necessary

matplotlib.axis.Axis.get_minorticklabels

`Axis.`**`get_minorticklabels`**`()`

Return a list of Text instances for the minor ticklabels

matplotlib.axis.Axis.get_minorticklines

`Axis.`**`get_minorticklines`**`()`

Return the minor tick lines as a list of Line2D instances

matplotlib.axis.Axis.get_minorticklocs

`Axis.`**`get_minorticklocs`**`()`

Get the minor tick locations in data coordinates as a numpy array

matplotlib.axis.Axis.get_offset_text

`Axis.`**`get_offset_text`**`()`

Return the axis offsetText as a Text instance

matplotlib.axis.Axis.get_tick_padding

`Axis.`**`get_tick_padding`**`()`

matplotlib.axis.Axis.get_ticklabels

`Axis.`**`get_ticklabels`**`(`*minor=False*, *which=None*`)`

Get the x tick labels as a list of `Text` instances.

Parameters minor : bool

If True return the minor ticklabels, else return the major ticklabels

which : None, (‘minor’, ‘major’, ‘both’)

Overrides `minor`.

Selects which ticklabels to return

Returns ret : list

List of `Text` instances.

matplotlib.axis.Axis.get_ticklines

`Axis.`**`get_ticklines`**`(`*minor=False*`)`

Return the tick lines as a list of Line2D instances

matplotlib.axis.Axis.get_ticklocs

`Axis.`**`get_ticklocs`**`(`*minor=False*`)`

Get the tick locations in data coordinates as a numpy array

matplotlib.axis.Axis.get_gridlines

`Axis.`**`get_gridlines`**`()`

Return the grid lines as a list of Line2D instance

matplotlib.axis.Axis.grid

`Axis.`**`grid`**`(`*b=None*, *which='major'*, ***kwargs*`)`

Set the axis grid on or off; b is a boolean. Use *which* = 'major' | 'minor' | 'both' to set the grid for major or minor ticks.

If *b* is *None* and len(kwargs)==0, toggle the grid state. If *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

kwargs are used to set the line properties of the grids, e.g.,

> xax.grid(color='r', linestyle='-', linewidth=2)

matplotlib.axis.Axis.iter_ticks

`Axis.`**`iter_ticks`**`()`

Iterate through all of the major and minor ticks.

matplotlib.axis.Axis.set_tick_params

`Axis.`**`set_tick_params`**`(`*which='major'*, *reset=False*, ***kw*`)`

Set appearance parameters for ticks and ticklabels.

For documentation of keyword arguments, see *`matplotlib.axes.Axes.tick_params()`*.

matplotlib.axis.Axis.axis_date

`Axis.`**`axis_date`**`(`*tz=None*`)`

Sets up x-axis ticks and labels that treat the x data as dates. *tz* is a `tzinfo` instance or a timezone string. This timezone is used to create date labels.

20.2.6 Data and view internvals

`Axis.get_data_interval`	return the Interval instance for this axis data limits
`Axis.get_view_interval`	return the Interval instance for this axis view limits
`Axis.set_data_interval`	set the axis data limits
`Axis.set_view_interval`	

matplotlib.axis.Axis.get_data_interval

`Axis.`**`get_data_interval`**`()`

return the Interval instance for this axis data limits

matplotlib.axis.Axis.get_view_interval

`Axis.`**`get_view_interval`**`()`

return the Interval instance for this axis view limits

matplotlib.axis.Axis.set_data_interval

`Axis.`**`set_data_interval`**`()`

set the axis data limits

matplotlib.axis.Axis.set_view_interval

`Axis.`**`set_view_interval`**`(`*vmin*, *vmax*, *ignore=False*`)`

20.2.7 Rendering helpers

Axis.get_minpos	
Axis.get_tick_space	Return the estimated number of ticks that can fit on the axis.
Axis.get_ticklabel_extents	Get the extents of the tick labels on either side of the axes.
Axis.get_tightbbox	Return a bounding box that encloses the axis.

matplotlib.axis.Axis.get_minpos

`Axis.`**`get_minpos`**`()`

matplotlib.axis.Axis.get_tick_space

`Axis.`**`get_tick_space`**`()`

Return the estimated number of ticks that can fit on the axis.

matplotlib.axis.Axis.get_ticklabel_extents

`Axis.`**`get_ticklabel_extents`**`(`*renderer*`)`

Get the extents of the tick labels on either side of the axes.

matplotlib.axis.Axis.get_tightbbox

`Axis.`**`get_tightbbox`**`(`*renderer*`)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

20.2.8 Interactive

`Axis.get_pickradius`	Return the depth of the axis used by the picker
`Axis.set_pickradius`	Set the depth of the axis used by the picker

matplotlib.axis.Axis.get_pickradius

`Axis.`**`get_pickradius`**`()`

Return the depth of the axis used by the picker

matplotlib.axis.Axis.set_pickradius

`Axis.`**`set_pickradius`**`(`*pickradius*`)`

Set the depth of the axis used by the picker

ACCEPTS: a distance in points

20.2.9 Units

`Axis.convert_units`	
`Axis.set_units`	set the units for axis
`Axis.get_units`	return the units for axis
`Axis.update_units`	introspect *data* for units converter and update the

matplotlib.axis.Axis.convert_units

`Axis.`**`convert_units`**`(`*x*`)`

matplotlib.axis.Axis.set_units

`Axis.`**`set_units`**`(`*u*`)`

set the units for axis

ACCEPTS: a units tag

matplotlib.axis.Axis.get_units

`Axis.`**get_units**`()`

return the units for axis

matplotlib.axis.Axis.update_units

`Axis.`**update_units**`(`*data*`)`

introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

20.2.10 Incremental navigation

Axis.pan	Pan *numsteps* (can be positive or negative)
Axis.zoom	Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

matplotlib.axis.Axis.pan

`Axis.`**pan**`(`*numsteps*`)`

Pan *numsteps* (can be positive or negative)

matplotlib.axis.Axis.zoom

`Axis.`**zoom**`(`*direction*`)`

Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

20.2.11 YAxis Specific

YAxis.axis_name	
YAxis.get_text_widths	
YAxis.get_ticks_position	Return the ticks position (left, right, both or unknown)
YAxis.set_offset_position	
YAxis.set_ticks_position	Set the ticks position (left, right, both, default or none) 'both' sets the ticks to appear on both positions, but does not change the tick labels.
YAxis.tick_left	use ticks only on left
YAxis.tick_right	use ticks only on right

matplotlib.axis.YAxis.axis_name

`YAxis.`**axis_name** = 'y'

matplotlib.axis.YAxis.get_text_widths

`YAxis.`**`get_text_widths`**`(`*renderer*`)`

matplotlib.axis.YAxis.get_ticks_position

`YAxis.`**`get_ticks_position`**`()`

Return the ticks position (left, right, both or unknown)

matplotlib.axis.YAxis.set_offset_position

`YAxis.`**`set_offset_position`**`(`*position*`)`

matplotlib.axis.YAxis.set_ticks_position

`YAxis.`**`set_ticks_position`**`(`*position*`)`

Set the ticks position (left, right, both, default or none) ‘both’ sets the ticks to appear on both positions, but does not change the tick labels. ‘default’ resets the tick positions to the default: ticks on both positions, labels at left. ‘none’ can be used if you don’t want any ticks. ‘none’ and ‘both’ affect only the ticks, not the labels.

ACCEPTS: [‘left’ | ‘right’ | ‘both’ | ‘default’ | ‘none’]

matplotlib.axis.YAxis.tick_left

`YAxis.`**`tick_left`**`()`

use ticks only on left

matplotlib.axis.YAxis.tick_right

`YAxis.`**`tick_right`**`()`

use ticks only on right

20.2.12 XAxis Specific

`XAxis.axis_name`	
`XAxis.get_text_heights`	Returns the amount of space one should reserve for text above and below the axes.
`XAxis.get_ticks_position`	Return the ticks position (top, bottom, default or unknown)

Continued on next page

Table 20.11 – continued from previous page

XAxis.set_ticks_position	Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels.
XAxis.tick_bottom	use ticks only on bottom
XAxis.tick_top	use ticks only on top

matplotlib.axis.XAxis.axis_name

`XAxis.`**`axis_name`** = 'x'

matplotlib.axis.XAxis.get_text_heights

`XAxis.`**`get_text_heights`**(*renderer*)

Returns the amount of space one should reserve for text above and below the axes. Returns a tuple (above, below)

matplotlib.axis.XAxis.get_ticks_position

`XAxis.`**`get_ticks_position`**()

Return the ticks position (top, bottom, default or unknown)

matplotlib.axis.XAxis.set_ticks_position

`XAxis.`**`set_ticks_position`**(*position*)

Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

ACCEPTS: ['top' | 'bottom' | 'both' | 'default' | 'none']

matplotlib.axis.XAxis.tick_bottom

`XAxis.`**`tick_bottom`**()

use ticks only on bottom

matplotlib.axis.XAxis.tick_top

`XAxis.`**`tick_top`**()

use ticks only on top

20.2.13 Other

Axis.OFFSETTEXTPAD	
Axis.limit_range_for_scale	
Axis.reset_ticks	
Axis.set_default_intervals	set the default limits for the axis data and view interval if they
Axis.get_smart_bounds	get whether the axis has smart bounds
Axis.set_smart_bounds	set the axis to have smart bounds

matplotlib.axis.Axis.OFFSETTEXTPAD

`Axis.`**`OFFSETTEXTPAD`** = 3

matplotlib.axis.Axis.limit_range_for_scale

`Axis.`**`limit_range_for_scale`**(*vmin*, *vmax*)

matplotlib.axis.Axis.reset_ticks

`Axis.`**`reset_ticks`**()

matplotlib.axis.Axis.set_default_intervals

`Axis.`**`set_default_intervals`**()

set the default limits for the axis data and view interval if they are not mutated

matplotlib.axis.Axis.get_smart_bounds

`Axis.`**`get_smart_bounds`**()

get whether the axis has smart bounds

matplotlib.axis.Axis.set_smart_bounds

`Axis.`**`set_smart_bounds`**(*value*)

set the axis to have smart bounds

20.2.14 Discouraged

These methods implicitly use `FixedLocator` and `FixedFormatter`. They can be convenient, but if not used together may de-couple your tick labels from your data.

`Axis.set_ticklabels`	Set the text values of the tick labels.
`Axis.set_ticks`	Set the locations of the tick marks from sequence ticks

matplotlib.axis.Axis.set_ticklabels

`Axis.`**`set_ticklabels`**(*ticklabels*, **args*, ***kwargs*)

Set the text values of the tick labels. Return a list of Text instances. Use *kwarg minor=True* to select minor ticks. All other kwargs are used to update the text object properties. As for get_ticklabels, label1 (left or bottom) is affected for a given tick only if its label1On attribute is True, and similarly for label2. The list of returned label text objects consists of all such label1 objects followed by all such label2 objects.

The input *ticklabels* is assumed to match the set of tick locations, regardless of the state of label1On and label2On.

ACCEPTS: sequence of strings or Text objects

matplotlib.axis.Axis.set_ticks

`Axis.`**`set_ticks`**(*ticks*, *minor=False*)

Set the locations of the tick marks from sequence ticks

ACCEPTS: sequence of floats

20.3 Tick objects

class `matplotlib.axis.`**`Tick`**(*axes*, *loc*, *label*, *size=None*, *width=None*, *color=None*, *tickdir=None*, *pad=None*, *labelsize=None*, *labelcolor=None*, *zorder=None*, *gridOn=None*, *tick1On=True*, *tick2On=True*, *label1On=True*, *label2On=False*, *major=True*)

Abstract base class for the axis ticks, grid lines and labels

1 refers to the bottom of the plot for xticks and the left for yticks 2 refers to the top of the plot for xticks and the right for yticks

Publicly accessible attributes:

`tick1line` a Line2D instance

`tick2line` a Line2D instance

`gridline` a Line2D instance

`label1` a Text instance

label2 a Text instance

gridOn a boolean which determines whether to draw the tickline

tick1On a boolean which determines whether to draw the 1st tickline

tick2On a boolean which determines whether to draw the 2nd tickline

label1On a boolean which determines whether to draw tick label

label2On a boolean which determines whether to draw tick label

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

class `matplotlib.axis.`**`XTick`**(*axes*, *loc*, *label*, *size=None*, *width=None*, *color=None*, *tickdir=None*, *pad=None*, *labelsize=None*, *labelcolor=None*, *zorder=None*, *gridOn=None*, *tick1On=True*, *tick2On=True*, *label1On=True*, *label2On=False*, *major=True*)

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

class `matplotlib.axis.`**`YTick`**(*axes*, *loc*, *label*, *size=None*, *width=None*, *color=None*, *tickdir=None*, *pad=None*, *labelsize=None*, *labelcolor=None*, *zorder=None*, *gridOn=None*, *tick1On=True*, *tick2On=True*, *label1On=True*, *label2On=False*, *major=True*)

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

Tick.apply_tickdir	Calculate self._pad and self._tickmarkers
Tick.get_loc	Return the tick location (data coords) as a scalar
Tick.get_pad	Get the value of the tick label pad in points
Tick.get_pad_pixels	
Tick.get_tick_padding	Get the length of the tick outside of the axes.
Tick.get_tickdir	
Tick.get_view_interval	return the view Interval instance for the axis this tick is ticking
Tick.set_label1	Set the text of ticklabel
Tick.set_label2	Set the text of ticklabel2
Tick.set_pad	Set the tick label pad in points
Tick.update_position	Set the location of tick in data coords with scalar *loc*

20.3.1 matplotlib.axis.Tick.apply_tickdir

`Tick.`**`apply_tickdir`**(*tickdir*)

Calculate self._pad and self._tickmarkers

20.3.2 matplotlib.axis.Tick.get_loc

`Tick.`**`get_loc`**`()`

Return the tick location (data coords) as a scalar

20.3.3 matplotlib.axis.Tick.get_pad

`Tick.`**`get_pad`**`()`

Get the value of the tick label pad in points

20.3.4 matplotlib.axis.Tick.get_pad_pixels

`Tick.`**`get_pad_pixels`**`()`

20.3.5 matplotlib.axis.Tick.get_tick_padding

`Tick.`**`get_tick_padding`**`()`

Get the length of the tick outside of the axes.

20.3.6 matplotlib.axis.Tick.get_tickdir

`Tick.`**`get_tickdir`**`()`

20.3.7 matplotlib.axis.Tick.get_view_interval

`Tick.`**`get_view_interval`**`()`

return the view Interval instance for the axis this tick is ticking

20.3.8 matplotlib.axis.Tick.set_label1

`Tick.`**`set_label1`**`(`*s*`)`

Set the text of ticklabel

ACCEPTS: str

20.3.9 matplotlib.axis.Tick.set_label2

`Tick.`**`set_label2`**`(`*s*`)`

Set the text of ticklabel2

ACCEPTS: str

20.3.10 matplotlib.axis.Tick.set_pad

`Tick.`**`set_pad`**`(`*val*`)`

Set the tick label pad in points

ACCEPTS: float

20.3.11 matplotlib.axis.Tick.update_position

`Tick.`**`update_position`**`(`*loc*`)`

Set the location of tick in data coords with scalar *loc*

20.4 Common and inherited methods

20.4.1 `XTick`

XTick.apply_tickdir	
XTick.get_loc	Return the tick location (data coords) as a scalar
XTick.get_pad	Get the value of the tick label pad in points
XTick.get_pad_pixels	
XTick.get_tick_padding	Get the length of the tick outside of the axes.
XTick.get_tickdir	
XTick.get_view_interval	return the Interval instance for this axis view limits
XTick.set_label1	Set the text of ticklabel
XTick.set_label2	Set the text of ticklabel2
XTick.set_pad	Set the tick label pad in points
XTick.update_position	Set the location of tick in data coords with scalar *loc*

matplotlib.axis.XTick.apply_tickdir

`XTick.`**`apply_tickdir`**`(`*tickdir*`)`

matplotlib.axis.XTick.get_loc

`XTick.`**`get_loc`**`()`

Return the tick location (data coords) as a scalar

matplotlib.axis.XTick.get_pad

`XTick.`**`get_pad`**`()`

Get the value of the tick label pad in points

matplotlib.axis.XTick.get_pad_pixels

`XTick.get_pad_pixels()`

matplotlib.axis.XTick.get_tick_padding

`XTick.get_tick_padding()`

Get the length of the tick outside of the axes.

matplotlib.axis.XTick.get_tickdir

`XTick.get_tickdir()`

matplotlib.axis.XTick.get_view_interval

`XTick.get_view_interval()`

return the Interval instance for this axis view limits

matplotlib.axis.XTick.set_label1

`XTick.set_label1(s)`

Set the text of ticklabel

ACCEPTS: str

matplotlib.axis.XTick.set_label2

`XTick.set_label2(s)`

Set the text of ticklabel2

ACCEPTS: str

matplotlib.axis.XTick.set_pad

`XTick.set_pad(val)`

Set the tick label pad in points

ACCEPTS: float

matplotlib.axis.XTick.update_position

`XTick.update_position(loc)`

Set the location of tick in data coords with scalar *loc*

20.4.2 YTick

YTick.apply_tickdir	
YTick.get_loc	Return the tick location (data coords) as a scalar
YTick.get_pad	Get the value of the tick label pad in points
YTick.get_pad_pixels	
YTick.get_tick_padding	Get the length of the tick outside of the axes.
YTick.get_tickdir	
YTick.get_view_interval	return the Interval instance for this axis view limits
YTick.set_label1	Set the text of ticklabel
YTick.set_label2	Set the text of ticklabel2
YTick.set_pad	Set the tick label pad in points
YTick.update_position	Set the location of tick in data coords with scalar loc

matplotlib.axis.YTick.apply_tickdir

YTick.**apply_tickdir**(*tickdir*)

matplotlib.axis.YTick.get_loc

YTick.**get_loc**()

Return the tick location (data coords) as a scalar

matplotlib.axis.YTick.get_pad

YTick.**get_pad**()

Get the value of the tick label pad in points

matplotlib.axis.YTick.get_pad_pixels

YTick.**get_pad_pixels**()

matplotlib.axis.YTick.get_tick_padding

YTick.**get_tick_padding**()

Get the length of the tick outside of the axes.

matplotlib.axis.YTick.get_tickdir

YTick.**get_tickdir**()

matplotlib.axis.YTick.get_view_interval

`YTick.get_view_interval()`

return the Interval instance for this axis view limits

matplotlib.axis.YTick.set_label1

`YTick.set_label1(s)`

Set the text of ticklabel

ACCEPTS: str

matplotlib.axis.YTick.set_label2

`YTick.set_label2(s)`

Set the text of ticklabel2

ACCEPTS: str

matplotlib.axis.YTick.set_pad

`YTick.set_pad(val)`

Set the tick label pad in points

ACCEPTS: float

matplotlib.axis.YTick.update_position

`YTick.update_position(loc)`

Set the location of tick in data coords with scalar loc

20.4.3 YAxis

YAxis.OFFSETTEXTPAD	
YAxis.axis_date	Sets up x-axis ticks and labels that treat the x data as dates.
YAxis.cla	clear the current axis
YAxis.convert_units	
YAxis.get_data_interval	return the Interval instance for this axis data limits
YAxis.get_gridlines	Return the grid lines as a list of Line2D instance
YAxis.get_label_position	Return the label position (top or bottom)
YAxis.get_label_text	Get the text of the label
YAxis.get_major_formatter	Get the formatter of the major ticker
YAxis.get_major_locator	Get the locator of the major ticker

Continued on next page

Table 20.17 – continued from previous page

`YAxis.get_major_ticks`	get the tick instances; grow as necessary
`YAxis.get_majorticklabels`	Return a list of Text instances for the major ticklabels
`YAxis.get_majorticklines`	Return the major tick lines as a list of Line2D instances
`YAxis.get_majorticklocs`	Get the major tick locations in data coordinates as a numpy array
`YAxis.get_minor_formatter`	Get the formatter of the minor ticker
`YAxis.get_minor_locator`	Get the locator of the minor ticker
`YAxis.get_minor_ticks`	get the minor tick instances; grow as necessary
`YAxis.get_minorticklabels`	Return a list of Text instances for the minor ticklabels
`YAxis.get_minorticklines`	Return the minor tick lines as a list of Line2D instances
`YAxis.get_minorticklocs`	Get the minor tick locations in data coordinates as a numpy array
`YAxis.get_minpos`	
`YAxis.get_offset_text`	Return the axis offsetText as a Text instance
`YAxis.get_pickradius`	Return the depth of the axis used by the picker
`YAxis.get_scale`	
`YAxis.get_smart_bounds`	get whether the axis has smart bounds
`YAxis.get_tick_padding`	
`YAxis.get_tick_space`	
`YAxis.get_ticklabel_extents`	Get the extents of the tick labels on either side of the axes.
`YAxis.get_ticklabels`	Get the x tick labels as a list of `Text` instances.
`YAxis.get_ticklines`	Return the tick lines as a list of Line2D instances
`YAxis.get_ticklocs`	Get the tick locations in data coordinates as a numpy array
`YAxis.get_tightbbox`	Return a bounding box that encloses the axis.
`YAxis.get_units`	return the units for axis
`YAxis.get_view_interval`	return the Interval instance for this axis view limits
`YAxis.grid`	Set the axis grid on or off; b is a boolean.
`YAxis.iter_ticks`	Iterate through all of the major and minor ticks.
`YAxis.limit_range_for_scale`	
`YAxis.pan`	Pan *numsteps* (can be positive or negative)
`YAxis.reset_ticks`	
`YAxis.set_data_interval`	set the axis data limits
`YAxis.set_default_intervals`	set the default limits for the axis interval if they are not mutated
`YAxis.set_label_coords`	Set the coordinates of the label.
`YAxis.set_label_position`	Set the label position (left or right)
`YAxis.set_label_text`	Sets the text value of the axis label
`YAxis.set_major_formatter`	Set the formatter of the major ticker
`YAxis.set_major_locator`	Set the locator of the major ticker
`YAxis.set_minor_formatter`	Set the formatter of the minor ticker

Continued on next page

Table 20.17 – continued from previous page

YAxis.set_minor_locator	Set the locator of the minor ticker
YAxis.set_pickradius	Set the depth of the axis used by the picker
YAxis.set_smart_bounds	set the axis to have smart bounds
YAxis.set_tick_params	Set appearance parameters for ticks and ticklabels.
YAxis.set_ticklabels	Set the text values of the tick labels.
YAxis.set_ticks	Set the locations of the tick marks from sequence ticks
YAxis.set_units	set the units for axis
YAxis.set_view_interval	If *ignore* is *False*, the order of vmin, vmax does not matter; the original axis orientation will be preserved.
YAxis.update_units	introspect *data* for units converter and update the
YAxis.zoom	Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

matplotlib.axis.YAxis.OFFSETTEXTPAD

YAxis.**OFFSETTEXTPAD = 3**

matplotlib.axis.YAxis.axis_date

YAxis.**axis_date**(*tz=None*)

Sets up x-axis ticks and labels that treat the x data as dates. *tz* is a `tzinfo` instance or a timezone string. This timezone is used to create date labels.

matplotlib.axis.YAxis.cla

YAxis.**cla**()

clear the current axis

matplotlib.axis.YAxis.convert_units

YAxis.**convert_units**(*x*)

matplotlib.axis.YAxis.get_data_interval

YAxis.**get_data_interval**()

return the Interval instance for this axis data limits

matplotlib.axis.YAxis.get_gridlines

YAxis.**get_gridlines**()

Return the grid lines as a list of Line2D instance

matplotlib.axis.YAxis.get_label_position

YAxis.**get_label_position**()

Return the label position (top or bottom)

matplotlib.axis.YAxis.get_label_text

YAxis.**get_label_text**()

Get the text of the label

matplotlib.axis.YAxis.get_major_formatter

YAxis.**get_major_formatter**()

Get the formatter of the major ticker

matplotlib.axis.YAxis.get_major_locator

YAxis.**get_major_locator**()

Get the locator of the major ticker

matplotlib.axis.YAxis.get_major_ticks

YAxis.**get_major_ticks**(*numticks=None*)

get the tick instances; grow as necessary

matplotlib.axis.YAxis.get_majorticklabels

YAxis.**get_majorticklabels**()

Return a list of Text instances for the major ticklabels

matplotlib.axis.YAxis.get_majorticklines

YAxis.**get_majorticklines**()

Return the major tick lines as a list of Line2D instances

matplotlib.axis.YAxis.get_majorticklocs

YAxis.**get_majorticklocs**()

Get the major tick locations in data coordinates as a numpy array

matplotlib.axis.YAxis.get_minor_formatter

YAxis.**get_minor_formatter**()

Get the formatter of the minor ticker

matplotlib.axis.YAxis.get_minor_locator

YAxis.**get_minor_locator**()

Get the locator of the minor ticker

matplotlib.axis.YAxis.get_minor_ticks

YAxis.**get_minor_ticks**(*numticks=None*)

get the minor tick instances; grow as necessary

matplotlib.axis.YAxis.get_minorticklabels

YAxis.**get_minorticklabels**()

Return a list of Text instances for the minor ticklabels

matplotlib.axis.YAxis.get_minorticklines

YAxis.**get_minorticklines**()

Return the minor tick lines as a list of Line2D instances

matplotlib.axis.YAxis.get_minorticklocs

YAxis.**get_minorticklocs**()

Get the minor tick locations in data coordinates as a numpy array

matplotlib.axis.YAxis.get_minpos

YAxis.**get_minpos**()

matplotlib.axis.YAxis.get_offset_text

YAxis.**get_offset_text**()

Return the axis offsetText as a Text instance

matplotlib.axis.YAxis.get_pickradius

`YAxis.`**`get_pickradius`**`()`

Return the depth of the axis used by the picker

matplotlib.axis.YAxis.get_scale

`YAxis.`**`get_scale`**`()`

matplotlib.axis.YAxis.get_smart_bounds

`YAxis.`**`get_smart_bounds`**`()`

get whether the axis has smart bounds

matplotlib.axis.YAxis.get_tick_padding

`YAxis.`**`get_tick_padding`**`()`

matplotlib.axis.YAxis.get_tick_space

`YAxis.`**`get_tick_space`**`()`

matplotlib.axis.YAxis.get_ticklabel_extents

`YAxis.`**`get_ticklabel_extents`**`(`*renderer*`)`

Get the extents of the tick labels on either side of the axes.

matplotlib.axis.YAxis.get_ticklabels

`YAxis.`**`get_ticklabels`**`(`*minor=False*, *which=None*`)`

Get the x tick labels as a list of `Text` instances.

Parameters minor : bool

If True return the minor ticklabels, else return the major ticklabels

which : None, (‘minor’, ‘major’, ‘both’)

Overrides `minor`.

Selects which ticklabels to return

Returns ret : list

List of `Text` instances.

matplotlib.axis.YAxis.get_ticklines

`YAxis.`**`get_ticklines`**(*minor=False*)

Return the tick lines as a list of Line2D instances

matplotlib.axis.YAxis.get_ticklocs

`YAxis.`**`get_ticklocs`**(*minor=False*)

Get the tick locations in data coordinates as a numpy array

matplotlib.axis.YAxis.get_tightbbox

`YAxis.`**`get_tightbbox`**(*renderer*)

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

matplotlib.axis.YAxis.get_units

`YAxis.`**`get_units`**()

return the units for axis

matplotlib.axis.YAxis.get_view_interval

`YAxis.`**`get_view_interval`**()

return the Interval instance for this axis view limits

matplotlib.axis.YAxis.grid

`YAxis.`**`grid`**(*b=None*, *which='major'*, ***kwargs*)

Set the axis grid on or off; b is a boolean. Use *which* = 'major' | 'minor' | 'both' to set the grid for major or minor ticks.

If *b* is *None* and len(kwargs)==0, toggle the grid state. If *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

kwargs are used to set the line properties of the grids, e.g.,

> xax.grid(color='r', linestyle='-', linewidth=2)

matplotlib.axis.YAxis.iter_ticks

`YAxis.`**`iter_ticks`**()

Iterate through all of the major and minor ticks.

matplotlib.axis.YAxis.limit_range_for_scale

YAxis.**limit_range_for_scale**(*vmin*, *vmax*)

matplotlib.axis.YAxis.pan

YAxis.**pan**(*numsteps*)

Pan *numsteps* (can be positive or negative)

matplotlib.axis.YAxis.reset_ticks

YAxis.**reset_ticks**()

matplotlib.axis.YAxis.set_data_interval

YAxis.**set_data_interval**(*vmin*, *vmax*, *ignore=False*)

set the axis data limits

matplotlib.axis.YAxis.set_default_intervals

YAxis.**set_default_intervals**()

set the default limits for the axis interval if they are not mutated

matplotlib.axis.YAxis.set_label_coords

YAxis.**set_label_coords**(*x*, *y*, *transform=None*)

Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coodinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

matplotlib.axis.YAxis.set_label_position

YAxis.**set_label_position**(*position*)

Set the label position (left or right)

ACCEPTS: [‘left’ | ‘right’]

matplotlib.axis.YAxis.set_label_text

`YAxis.`**`set_label_text`**`(`*label*, *fontdict=None*, ***kwargs*`)`

Sets the text value of the axis label

ACCEPTS: A string value for the label

matplotlib.axis.YAxis.set_major_formatter

`YAxis.`**`set_major_formatter`**`(`*formatter*`)`

Set the formatter of the major ticker

ACCEPTS: A `Formatter` instance

matplotlib.axis.YAxis.set_major_locator

`YAxis.`**`set_major_locator`**`(`*locator*`)`

Set the locator of the major ticker

ACCEPTS: a `Locator` instance

matplotlib.axis.YAxis.set_minor_formatter

`YAxis.`**`set_minor_formatter`**`(`*formatter*`)`

Set the formatter of the minor ticker

ACCEPTS: A `Formatter` instance

matplotlib.axis.YAxis.set_minor_locator

`YAxis.`**`set_minor_locator`**`(`*locator*`)`

Set the locator of the minor ticker

ACCEPTS: a `Locator` instance

matplotlib.axis.YAxis.set_pickradius

`YAxis.`**`set_pickradius`**`(`*pickradius*`)`

Set the depth of the axis used by the picker

ACCEPTS: a distance in points

matplotlib.axis.YAxis.set_smart_bounds

`YAxis.`**`set_smart_bounds`**`(`*value*`)`

set the axis to have smart bounds

matplotlib.axis.YAxis.set_tick_params

`YAxis.`**`set_tick_params`**`(`*which='major'*, *reset=False*, ***kw*`)`

Set appearance parameters for ticks and ticklabels.

For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

matplotlib.axis.YAxis.set_ticklabels

`YAxis.`**`set_ticklabels`**`(`*ticklabels*, **args*, ***kwargs*`)`

Set the text values of the tick labels. Return a list of Text instances. Use *kwarg minor=True* to select minor ticks. All other kwargs are used to update the text object properties. As for get_ticklabels, label1 (left or bottom) is affected for a given tick only if its label1On attribute is True, and similarly for label2. The list of returned label text objects consists of all such label1 objects followed by all such label2 objects.

The input *ticklabels* is assumed to match the set of tick locations, regardless of the state of label1On and label2On.

ACCEPTS: sequence of strings or Text objects

matplotlib.axis.YAxis.set_ticks

`YAxis.`**`set_ticks`**`(`*ticks*, *minor=False*`)`

Set the locations of the tick marks from sequence ticks

ACCEPTS: sequence of floats

matplotlib.axis.YAxis.set_units

`YAxis.`**`set_units`**`(`*u*`)`

set the units for axis

ACCEPTS: a units tag

matplotlib.axis.YAxis.set_view_interval

`YAxis.`**`set_view_interval`**`(`*vmin*, *vmax*, *ignore=False*`)`

If *ignore* is *False*, the order of vmin, vmax does not matter; the original axis orientation will be preserved. In addition, the view limits can be expanded, but will not be reduced. This method is for mpl internal use; for normal use, see `set_ylim()`.

matplotlib.axis.YAxis.update_units

`YAxis.`**`update_units`**`(`*data*`)`

introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

matplotlib.axis.YAxis.zoom

`YAxis.zoom`(*direction*)

Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

20.4.4 YAxis

XAxis.OFFSETTEXTPAD	
XAxis.axis_date	Sets up x-axis ticks and labels that treat the x data as dates.
XAxis.cla	clear the current axis
XAxis.convert_units	
XAxis.get_data_interval	return the Interval instance for this axis data limits
XAxis.get_gridlines	Return the grid lines as a list of Line2D instance
XAxis.get_label_position	Return the label position (top or bottom)
XAxis.get_label_text	Get the text of the label
XAxis.get_major_formatter	Get the formatter of the major ticker
XAxis.get_major_locator	Get the locator of the major ticker
XAxis.get_major_ticks	get the tick instances; grow as necessary
XAxis.get_majorticklabels	Return a list of Text instances for the major ticklabels
XAxis.get_majorticklines	Return the major tick lines as a list of Line2D instances
XAxis.get_majorticklocs	Get the major tick locations in data coordinates as a numpy array
XAxis.get_minor_formatter	Get the formatter of the minor ticker
XAxis.get_minor_locator	Get the locator of the minor ticker
XAxis.get_minor_ticks	get the minor tick instances; grow as necessary
XAxis.get_minorticklabels	Return a list of Text instances for the minor ticklabels
XAxis.get_minorticklines	Return the minor tick lines as a list of Line2D instances
XAxis.get_minorticklocs	Get the minor tick locations in data coordinates as a numpy array
XAxis.get_minpos	
XAxis.get_offset_text	Return the axis offsetText as a Text instance
XAxis.get_pickradius	Return the depth of the axis used by the picker
XAxis.get_scale	
XAxis.get_smart_bounds	get whether the axis has smart bounds
XAxis.get_tick_padding	
XAxis.get_tick_space	
XAxis.get_ticklabel_extents	Get the extents of the tick labels on either side of the axes.
XAxis.get_ticklabels	Get the x tick labels as a list of `Text` instances.
XAxis.get_ticklines	Return the tick lines as a list of Line2D instances

Continued on next page

Table 20.18 – continued from previous page

XAxis.get_ticklocs	Get the tick locations in data coordinates as a numpy array
XAxis.get_tightbbox	Return a bounding box that encloses the axis.
XAxis.get_units	return the units for axis
XAxis.get_view_interval	return the Interval instance for this axis view limits
XAxis.grid	Set the axis grid on or off; b is a boolean.
XAxis.iter_ticks	Iterate through all of the major and minor ticks.
XAxis.limit_range_for_scale	
XAxis.pan	Pan *numsteps* (can be positive or negative)
XAxis.reset_ticks	
XAxis.set_data_interval	set the axis data limits
XAxis.set_default_intervals	set the default limits for the axis interval if they are not mutated
XAxis.set_label_coords	Set the coordinates of the label.
XAxis.set_label_position	Set the label position (top or bottom)
XAxis.set_label_text	Sets the text value of the axis label
XAxis.set_major_formatter	Set the formatter of the major ticker
XAxis.set_major_locator	Set the locator of the major ticker
XAxis.set_minor_formatter	Set the formatter of the minor ticker
XAxis.set_minor_locator	Set the locator of the minor ticker
XAxis.set_pickradius	Set the depth of the axis used by the picker
XAxis.set_smart_bounds	set the axis to have smart bounds
XAxis.set_tick_params	Set appearance parameters for ticks and ticklabels.
XAxis.set_ticklabels	Set the text values of the tick labels.
XAxis.set_ticks	Set the locations of the tick marks from sequence ticks
XAxis.set_units	set the units for axis
XAxis.set_view_interval	If *ignore* is *False*, the order of vmin, vmax does not matter; the original axis orientation will be preserved.
XAxis.update_units	introspect *data* for units converter and update the
XAxis.zoom	Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

matplotlib.axis.XAxis.OFFSETTEXTPAD

`XAxis.`**`OFFSETTEXTPAD`** **= 3**

matplotlib.axis.XAxis.axis_date

`XAxis.`**`axis_date`**(*tz=None*)

Sets up x-axis ticks and labels that treat the x data as dates. *tz* is a `tzinfo` instance or a timezone string. This timezone is used to create date labels.

matplotlib.axis.XAxis.cla

XAxis.**cla**()

clear the current axis

matplotlib.axis.XAxis.convert_units

XAxis.**convert_units**(*x*)

matplotlib.axis.XAxis.get_data_interval

XAxis.**get_data_interval**()

return the Interval instance for this axis data limits

matplotlib.axis.XAxis.get_gridlines

XAxis.**get_gridlines**()

Return the grid lines as a list of Line2D instance

matplotlib.axis.XAxis.get_label_position

XAxis.**get_label_position**()

Return the label position (top or bottom)

matplotlib.axis.XAxis.get_label_text

XAxis.**get_label_text**()

Get the text of the label

matplotlib.axis.XAxis.get_major_formatter

XAxis.**get_major_formatter**()

Get the formatter of the major ticker

matplotlib.axis.XAxis.get_major_locator

XAxis.**get_major_locator**()

Get the locator of the major ticker

matplotlib.axis.XAxis.get_major_ticks

XAxis.**get_major_ticks**(*numticks=None*)
get the tick instances; grow as necessary

matplotlib.axis.XAxis.get_majorticklabels

XAxis.**get_majorticklabels**()
Return a list of Text instances for the major ticklabels

matplotlib.axis.XAxis.get_majorticklines

XAxis.**get_majorticklines**()
Return the major tick lines as a list of Line2D instances

matplotlib.axis.XAxis.get_majorticklocs

XAxis.**get_majorticklocs**()
Get the major tick locations in data coordinates as a numpy array

matplotlib.axis.XAxis.get_minor_formatter

XAxis.**get_minor_formatter**()
Get the formatter of the minor ticker

matplotlib.axis.XAxis.get_minor_locator

XAxis.**get_minor_locator**()
Get the locator of the minor ticker

matplotlib.axis.XAxis.get_minor_ticks

XAxis.**get_minor_ticks**(*numticks=None*)
get the minor tick instances; grow as necessary

matplotlib.axis.XAxis.get_minorticklabels

XAxis.**get_minorticklabels**()
Return a list of Text instances for the minor ticklabels

matplotlib.axis.XAxis.get_minorticklines

XAxis.**get_minorticklines**()

Return the minor tick lines as a list of Line2D instances

matplotlib.axis.XAxis.get_minorticklocs

XAxis.**get_minorticklocs**()

Get the minor tick locations in data coordinates as a numpy array

matplotlib.axis.XAxis.get_minpos

XAxis.**get_minpos**()

matplotlib.axis.XAxis.get_offset_text

XAxis.**get_offset_text**()

Return the axis offsetText as a Text instance

matplotlib.axis.XAxis.get_pickradius

XAxis.**get_pickradius**()

Return the depth of the axis used by the picker

matplotlib.axis.XAxis.get_scale

XAxis.**get_scale**()

matplotlib.axis.XAxis.get_smart_bounds

XAxis.**get_smart_bounds**()

get whether the axis has smart bounds

matplotlib.axis.XAxis.get_tick_padding

XAxis.**get_tick_padding**()

matplotlib.axis.XAxis.get_tick_space

`XAxis.`**`get_tick_space`**`()`

matplotlib.axis.XAxis.get_ticklabel_extents

`XAxis.`**`get_ticklabel_extents`**`(`*renderer*`)`

Get the extents of the tick labels on either side of the axes.

matplotlib.axis.XAxis.get_ticklabels

`XAxis.`**`get_ticklabels`**`(`*minor=False*, *which=None*`)`

Get the x tick labels as a list of `Text` instances.

Parameters minor : bool

If True return the minor ticklabels, else return the major ticklabels

which : None, ('minor', 'major', 'both')

Overrides `minor`.

Selects which ticklabels to return

Returns ret : list

List of `Text` instances.

matplotlib.axis.XAxis.get_ticklines

`XAxis.`**`get_ticklines`**`(`*minor=False*`)`

Return the tick lines as a list of Line2D instances

matplotlib.axis.XAxis.get_ticklocs

`XAxis.`**`get_ticklocs`**`(`*minor=False*`)`

Get the tick locations in data coordinates as a numpy array

matplotlib.axis.XAxis.get_tightbbox

`XAxis.`**`get_tightbbox`**`(`*renderer*`)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

matplotlib.axis.XAxis.get_units

`XAxis.`**`get_units`**`()`

return the units for axis

matplotlib.axis.XAxis.get_view_interval

`XAxis.`**`get_view_interval`**`()`

return the Interval instance for this axis view limits

matplotlib.axis.XAxis.grid

`XAxis.`**`grid`**`(`*b=None*, *which='major'*, ***kwargs*`)`

Set the axis grid on or off; b is a boolean. Use *which* = 'major' | 'minor' | 'both' to set the grid for major or minor ticks.

If *b* is *None* and len(kwargs)==0, toggle the grid state. If *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

kwargs are used to set the line properties of the grids, e.g.,

> xax.grid(color='r', linestyle='-', linewidth=2)

matplotlib.axis.XAxis.iter_ticks

`XAxis.`**`iter_ticks`**`()`

Iterate through all of the major and minor ticks.

matplotlib.axis.XAxis.limit_range_for_scale

`XAxis.`**`limit_range_for_scale`**`(`*vmin*, *vmax*`)`

matplotlib.axis.XAxis.pan

`XAxis.`**`pan`**`(`*numsteps*`)`

Pan *numsteps* (can be positive or negative)

matplotlib.axis.XAxis.reset_ticks

`XAxis.`**`reset_ticks`**`()`

matplotlib.axis.XAxis.set_data_interval

`XAxis.`**`set_data_interval`**`(`*vmin*, *vmax*, *ignore=False*`)`

set the axis data limits

matplotlib.axis.XAxis.set_default_intervals

`XAxis.`**`set_default_intervals`**`()`

set the default limits for the axis interval if they are not mutated

matplotlib.axis.XAxis.set_label_coords

`XAxis.`**`set_label_coords`**`(`*x*, *y*, *transform=None*`)`

Set the coordinates of the label. By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coodinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

matplotlib.axis.XAxis.set_label_position

`XAxis.`**`set_label_position`**`(`*position*`)`

Set the label position (top or bottom)

ACCEPTS: ['top' | 'bottom']

matplotlib.axis.XAxis.set_label_text

`XAxis.`**`set_label_text`**`(`*label*, *fontdict=None*, ***kwargs*`)`

Sets the text value of the axis label

ACCEPTS: A string value for the label

matplotlib.axis.XAxis.set_major_formatter

`XAxis.`**`set_major_formatter`**`(`*formatter*`)`

Set the formatter of the major ticker

ACCEPTS: A *`Formatter`* instance

matplotlib.axis.XAxis.set_major_locator

`XAxis.`**`set_major_locator`**`(`*locator*`)`

Set the locator of the major ticker

ACCEPTS: a *`Locator`* instance

matplotlib.axis.XAxis.set_minor_formatter

`XAxis.`**`set_minor_formatter`**`(`*formatter*`)`

Set the formatter of the minor ticker

ACCEPTS: A `Formatter` instance

matplotlib.axis.XAxis.set_minor_locator

`XAxis.`**`set_minor_locator`**`(`*locator*`)`

Set the locator of the minor ticker

ACCEPTS: a `Locator` instance

matplotlib.axis.XAxis.set_pickradius

`XAxis.`**`set_pickradius`**`(`*pickradius*`)`

Set the depth of the axis used by the picker

ACCEPTS: a distance in points

matplotlib.axis.XAxis.set_smart_bounds

`XAxis.`**`set_smart_bounds`**`(`*value*`)`

set the axis to have smart bounds

matplotlib.axis.XAxis.set_tick_params

`XAxis.`**`set_tick_params`**`(`*which='major'*, *reset=False*, ***kw*`)`

Set appearance parameters for ticks and ticklabels.

For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

matplotlib.axis.XAxis.set_ticklabels

`XAxis.`**`set_ticklabels`**`(`*ticklabels*, **args*, ***kwargs*`)`

Set the text values of the tick labels. Return a list of Text instances. Use *kwarg minor=True* to select minor ticks. All other kwargs are used to update the text object properties. As for get_ticklabels, label1 (left or bottom) is affected for a given tick only if its label1On attribute is True, and similarly for label2. The list of returned label text objects consists of all such label1 objects followed by all such label2 objects.

The input *ticklabels* is assumed to match the set of tick locations, regardless of the state of label1On and label2On.

ACCEPTS: sequence of strings or Text objects

matplotlib.axis.XAxis.set_ticks

`XAxis.`**`set_ticks`**(*ticks*, *minor=False*)

Set the locations of the tick marks from sequence ticks

ACCEPTS: sequence of floats

matplotlib.axis.XAxis.set_units

`XAxis.`**`set_units`**(*u*)

set the units for axis

ACCEPTS: a units tag

matplotlib.axis.XAxis.set_view_interval

`XAxis.`**`set_view_interval`**(*vmin*, *vmax*, *ignore=False*)

If *ignore* is *False*, the order of vmin, vmax does not matter; the original axis orientation will be preserved. In addition, the view limits can be expanded, but will not be reduced. This method is for mpl internal use; for normal use, see `set_xlim()`.

matplotlib.axis.XAxis.update_units

`XAxis.`**`update_units`**(*data*)

introspect *data* for units converter and update the axis.converter instance if necessary. Return *True* if *data* is registered for unit conversion.

matplotlib.axis.XAxis.zoom

`XAxis.`**`zoom`**(*direction*)

Zoom in/out on axis; if *direction* is >0 zoom in, else zoom out

20.4.5 Inherited from artist

Ticks

`Tick.add_callback`	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
`Tick.aname`	
`Tick.axes`	The `Axes` instance the artist resides in, or *None*.
`Tick.contains`	Test whether the mouse event occurred in the Tick marks.
`Tick.convert_xunits`	For artists in an axes, if the xaxis has units support,

Continued on next page

Table 20.19 – continued from previous page

Tick.convert_yunits	For artists in an axes, if the yaxis has units support,
Tick.draw	
Tick.findobj	Find artist objects.
Tick.format_cursor_data	Return *cursor data* string formatted.
Tick.get_agg_filter	return filter function to be used for agg filter
Tick.get_alpha	Return the alpha value used for blending - not supported on all
Tick.get_animated	Return the artist's animated state
Tick.get_axes	Return the *Axes* instance the artist resides in, or *None*.
Tick.get_children	
Tick.get_clip_box	Return artist clipbox
Tick.get_clip_on	Return whether artist uses clipping
Tick.get_clip_path	Return artist clip path
Tick.get_contains	Return the _contains test used by the artist, or *None* for default.
Tick.get_cursor_data	Get the cursor data for a given event.
Tick.get_figure	Return the *Figure* instance the artist belongs to.
Tick.get_gid	Returns the group id
Tick.get_label	Get the label used for this artist in the legend.
Tick.get_path_effects	
Tick.get_picker	Return the picker object used by this artist
Tick.get_rasterized	return True if the artist is to be rasterized
Tick.get_sketch_params	Returns the sketch parameters for the artist.
Tick.get_snap	Returns the snap setting which may be:
Tick.get_transform	Return the *Transform* instance used by this artist.
Tick.get_transformed_clip_path_and_affine	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
Tick.get_url	Returns the url
Tick.get_visible	Return the artist's visiblity
Tick.get_window_extent	Get the axes bounding box in display space.
Tick.get_zorder	Return the `Artist`'s zorder.
Tick.have_units	Return *True* if units are set on the *x* or *y* axes
Tick.hitlist	List the children of the artist which contain the mouse event *event*.
Tick.is_figure_set	Returns True if the artist is assigned to a *Figure*.
Tick.is_transform_set	Returns *True* if `Artist` has a transform explicitly set.
Tick.mouseover	
Tick.pchanged	Fire an event when property changed, calling all of the registered callbacks.
Tick.pick	Process pick event
Tick.pickable	Return *True* if `Artist` is pickable.
Tick.properties	return a dictionary mapping property name -> value for all Artist props

Continued on next page

Table 20.19 – continued from previous page

Tick.remove	Remove the artist from the figure if possible.
Tick.remove_callback	Remove a callback based on its *id*.
Tick.set	A property batch setter.
Tick.set_agg_filter	set agg_filter fuction.
Tick.set_alpha	Set the alpha value used for blending - not supported on all backends.
Tick.set_animated	Set the artist's animation state.
Tick.set_axes	Set the *Axes* instance in which the artist resides, if any.
Tick.set_clip_box	Set the artist's clip *Bbox*.
Tick.set_clip_on	Set whether artist uses clipping.
Tick.set_clip_path	Set the artist's clip path, which may be:
Tick.set_contains	Replace the contains test used by this artist.
Tick.set_figure	Set the *Figure* instance the artist belongs to.
Tick.set_gid	Sets the (group) id for the artist
Tick.set_label	Set the text of ticklabel
Tick.set_path_effects	set path_effects, which should be a list of instances of
Tick.set_picker	Set the epsilon for picking used by this artist
Tick.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
Tick.set_sketch_params	Sets the sketch parameters.
Tick.set_snap	Sets the snap setting which may be:
Tick.set_transform	Set the *Transform* instance used by this artist.
Tick.set_url	Sets the url for the artist
Tick.set_visible	Set the artist's visiblity.
Tick.set_zorder	Set the zorder for the artist.
Tick.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
Tick.update	Update the properties of this `Artist` from the dictionary *prop*.
Tick.update_from	Copy properties from *other* to *self*.
Tick.zorder	
XTick.add_callback	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
XTick.aname	
XTick.axes	The *Axes* instance the artist resides in, or *None*.
XTick.contains	Test whether the mouse event occurred in the Tick marks.
XTick.convert_xunits	For artists in an axes, if the xaxis has units support,
XTick.convert_yunits	For artists in an axes, if the yaxis has units support,
XTick.draw	
XTick.findobj	Find artist objects.
XTick.format_cursor_data	Return *cursor data* string formatted.
XTick.get_agg_filter	return filter function to be used for agg filter

Continued on next page

Table 20.19 – continued from previous page

XTick.get_alpha	Return the alpha value used for blending - not supported on all
XTick.get_animated	Return the artist's animated state
XTick.get_axes	Return the `Axes` instance the artist resides in, or *None*.
XTick.get_children	
XTick.get_clip_box	Return artist clipbox
XTick.get_clip_on	Return whether artist uses clipping
XTick.get_clip_path	Return artist clip path
XTick.get_contains	Return the _contains test used by the artist, or *None* for default.
XTick.get_cursor_data	Get the cursor data for a given event.
XTick.get_figure	Return the `Figure` instance the artist belongs to.
XTick.get_gid	Returns the group id
XTick.get_label	Get the label used for this artist in the legend.
XTick.get_path_effects	
XTick.get_picker	Return the picker object used by this artist
XTick.get_rasterized	return True if the artist is to be rasterized
XTick.get_sketch_params	Returns the sketch parameters for the artist.
XTick.get_snap	Returns the snap setting which may be:
XTick.get_transform	Return the `Transform` instance used by this artist.
XTick.get_transformed_clip_path_and_affine	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
XTick.get_url	Returns the url
XTick.get_visible	Return the artist's visiblity
XTick.get_window_extent	Get the axes bounding box in display space.
XTick.get_zorder	Return the `Artist`'s zorder.
XTick.have_units	Return *True* if units are set on the *x* or *y* axes
XTick.hitlist	List the children of the artist which contain the mouse event *event*.
XTick.is_figure_set	Returns True if the artist is assigned to a `Figure`.
XTick.is_transform_set	Returns *True* if `Artist` has a transform explicitly set.
XTick.mouseover	
XTick.pchanged	Fire an event when property changed, calling all of the registered callbacks.
XTick.pick	Process pick event
XTick.pickable	Return *True* if `Artist` is pickable.
XTick.properties	return a dictionary mapping property name -> value for all Artist props
XTick.remove	Remove the artist from the figure if possible.
XTick.remove_callback	Remove a callback based on its *id*.
XTick.set	A property batch setter.
XTick.set_agg_filter	set agg_filter fuction.

Continued on next page

Table 20.19 – continued from previous page

XTick.set_alpha	Set the alpha value used for blending - not supported on all backends.
XTick.set_animated	Set the artist's animation state.
XTick.set_axes	Set the `Axes` instance in which the artist resides, if any.
XTick.set_clip_box	Set the artist's clip *Bbox*.
XTick.set_clip_on	Set whether artist uses clipping.
XTick.set_clip_path	Set the artist's clip path, which may be:
XTick.set_contains	Replace the contains test used by this artist.
XTick.set_figure	Set the `Figure` instance the artist belongs to.
XTick.set_gid	Sets the (group) id for the artist
XTick.set_label	Set the text of ticklabel
XTick.set_path_effects	set path_effects, which should be a list of instances of
XTick.set_picker	Set the epsilon for picking used by this artist
XTick.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
XTick.set_sketch_params	Sets the sketch parameters.
XTick.set_snap	Sets the snap setting which may be:
XTick.set_transform	Set the *Transform* instance used by this artist.
XTick.set_url	Sets the url for the artist
XTick.set_visible	Set the artist's visiblity.
XTick.set_zorder	Set the zorder for the artist.
XTick.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
XTick.update	Update the properties of this `Artist` from the dictionary *prop*.
XTick.update_from	Copy properties from *other* to *self*.
XTick.zorder	
YTick.add_callback	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
YTick.aname	
YTick.axes	The `Axes` instance the artist resides in, or *None*.
YTick.contains	Test whether the mouse event occurred in the Tick marks.
YTick.convert_xunits	For artists in an axes, if the xaxis has units support,
YTick.convert_yunits	For artists in an axes, if the yaxis has units support,
YTick.draw	
YTick.findobj	Find artist objects.
YTick.format_cursor_data	Return *cursor data* string formatted.
YTick.get_agg_filter	return filter function to be used for agg filter
YTick.get_alpha	Return the alpha value used for blending - not supported on all
YTick.get_animated	Return the artist's animated state
YTick.get_axes	Return the `Axes` instance the artist resides in, or *None*.

Continued on next page

Table 20.19 – continued from previous page

`YTick.get_children`	
`YTick.get_clip_box`	Return artist clipbox
`YTick.get_clip_on`	Return whether artist uses clipping
`YTick.get_clip_path`	Return artist clip path
`YTick.get_contains`	Return the _contains test used by the artist, or *None* for default.
`YTick.get_cursor_data`	Get the cursor data for a given event.
`YTick.get_figure`	Return the `Figure` instance the artist belongs to.
`YTick.get_gid`	Returns the group id
`YTick.get_label`	Get the label used for this artist in the legend.
`YTick.get_path_effects`	
`YTick.get_picker`	Return the picker object used by this artist
`YTick.get_rasterized`	return True if the artist is to be rasterized
`YTick.get_sketch_params`	Returns the sketch parameters for the artist.
`YTick.get_snap`	Returns the snap setting which may be:
`YTick.get_transform`	Return the `Transform` instance used by this artist.
`YTick.get_transformed_clip_path_and_affine`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
`YTick.get_url`	Returns the url
`YTick.get_visible`	Return the artist's visiblity
`YTick.get_window_extent`	Get the axes bounding box in display space.
`YTick.get_zorder`	Return the `Artist`'s zorder.
`YTick.have_units`	Return *True* if units are set on the *x* or *y* axes
`YTick.hitlist`	List the children of the artist which contain the mouse event *event*.
`YTick.is_figure_set`	Returns True if the artist is assigned to a `Figure`.
`YTick.is_transform_set`	Returns *True* if `Artist` has a transform explicitly set.
`YTick.mouseover`	
`YTick.pchanged`	Fire an event when property changed, calling all of the registered callbacks.
`YTick.pick`	Process pick event
`YTick.pickable`	Return *True* if `Artist` is pickable.
`YTick.properties`	return a dictionary mapping property name -> value for all Artist props
`YTick.remove`	Remove the artist from the figure if possible.
`YTick.remove_callback`	Remove a callback based on its *id*.
`YTick.set`	A property batch setter.
`YTick.set_agg_filter`	set agg_filter fuction.
`YTick.set_alpha`	Set the alpha value used for blending - not supported on all backends.
`YTick.set_animated`	Set the artist's animation state.
`YTick.set_axes`	Set the `Axes` instance in which the artist resides, if any.

Continued on next page

Table 20.19 – continued from previous page

YTick.set_clip_box	Set the artist's clip *Bbox*.
YTick.set_clip_on	Set whether artist uses clipping.
YTick.set_clip_path	Set the artist's clip path, which may be:
YTick.set_contains	Replace the contains test used by this artist.
YTick.set_figure	Set the *Figure* instance the artist belongs to.
YTick.set_gid	Sets the (group) id for the artist
YTick.set_label	Set the text of ticklabel
YTick.set_path_effects	set path_effects, which should be a list of instances of
YTick.set_picker	Set the epsilon for picking used by this artist
YTick.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
YTick.set_sketch_params	Sets the sketch parameters.
YTick.set_snap	Sets the snap setting which may be:
YTick.set_transform	Set the *Transform* instance used by this artist.
YTick.set_url	Sets the url for the artist
YTick.set_visible	Set the artist's visiblity.
YTick.set_zorder	Set the zorder for the artist.
YTick.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
YTick.update	Update the properties of this `Artist` from the dictionary *prop*.
YTick.update_from	Copy properties from *other* to *self*.
YTick.zorder	

matplotlib.axis.Tick.add_callback

`Tick.`**add_callback**(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *remove_callback()* later.

matplotlib.axis.Tick.aname

`Tick.`**aname = 'Artist'**

matplotlib.axis.Tick.axes

`Tick.`**axes**

The *Axes* instance the artist resides in, or *None*.

matplotlib.axis.Tick.contains

`Tick.`**`contains`**(*mouseevent*)

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

matplotlib.axis.Tick.convert_xunits

`Tick.`**`convert_xunits`**(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.Tick.convert_yunits

`Tick.`**`convert_yunits`**(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.Tick.draw

`Tick.`**`draw`**(*artist*, *renderer*, **args*, ***kwargs*)

matplotlib.axis.Tick.findobj

`Tick.`**`findobj`**(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.Tick.format_cursor_data

`Tick.`**`format_cursor_data`**(*data*)

Return *cursor data* string formatted.

matplotlib.axis.Tick.get_agg_filter

`Tick.`**`get_agg_filter`**`()`
return filter function to be used for agg filter

matplotlib.axis.Tick.get_alpha

`Tick.`**`get_alpha`**`()`
Return the alpha value used for blending - not supported on all backends

matplotlib.axis.Tick.get_animated

`Tick.`**`get_animated`**`()`
Return the artist's animated state

matplotlib.axis.Tick.get_axes

`Tick.`**`get_axes`**`()`
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.Tick.get_children

`Tick.`**`get_children`**`()`

matplotlib.axis.Tick.get_clip_box

`Tick.`**`get_clip_box`**`()`
Return artist clipbox

matplotlib.axis.Tick.get_clip_on

`Tick.`**`get_clip_on`**`()`
Return whether artist uses clipping

matplotlib.axis.Tick.get_clip_path

`Tick.`**`get_clip_path`**`()`
Return artist clip path

matplotlib.axis.Tick.get_contains

`Tick.`**`get_contains`**`()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.Tick.get_cursor_data

`Tick.`**`get_cursor_data`**`(`*event*`)`

Get the cursor data for a given event.

matplotlib.axis.Tick.get_figure

`Tick.`**`get_figure`**`()`

Return the `Figure` instance the artist belongs to.

matplotlib.axis.Tick.get_gid

`Tick.`**`get_gid`**`()`

Returns the group id

matplotlib.axis.Tick.get_label

`Tick.`**`get_label`**`()`

Get the label used for this artist in the legend.

matplotlib.axis.Tick.get_path_effects

`Tick.`**`get_path_effects`**`()`

matplotlib.axis.Tick.get_picker

`Tick.`**`get_picker`**`()`

Return the picker object used by this artist

matplotlib.axis.Tick.get_rasterized

`Tick.`**`get_rasterized`**`()`

return True if the artist is to be rasterized

matplotlib.axis.Tick.get_sketch_params

`Tick.get_sketch_params()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.Tick.get_snap

`Tick.get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.Tick.get_transform

`Tick.get_transform()`

Return the *`Transform`* instance used by this artist.

matplotlib.axis.Tick.get_transformed_clip_path_and_affine

`Tick.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.Tick.get_url

`Tick.get_url()`

Returns the url

matplotlib.axis.Tick.get_visible

`Tick.`**`get_visible`**`()`

Return the artist's visiblity

matplotlib.axis.Tick.get_window_extent

`Tick.`**`get_window_extent`**`(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.Tick.get_zorder

`Tick.`**`get_zorder`**`()`

Return the `Artist`'s zorder.

matplotlib.axis.Tick.have_units

`Tick.`**`have_units`**`()`

Return *True* if units are set on the *x* or *y* axes

matplotlib.axis.Tick.hitlist

`Tick.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.Tick.is_figure_set

`Tick.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a *`Figure`*.

matplotlib.axis.Tick.is_transform_set

`Tick.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.Tick.mouseover

`Tick.`**`mouseover`**

matplotlib.axis.Tick.pchanged

`Tick.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.Tick.pick

`Tick.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.Tick.pickable

`Tick.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.Tick.properties

`Tick.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.Tick.remove

`Tick.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.Tick.remove_callback

`Tick.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.Tick.set

`Tick.set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.Tick.set_agg_filter

`Tick.set_agg_filter(filter_func)`

set agg_filter fuction.

matplotlib.axis.Tick.set_alpha

`Tick.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.Tick.set_animated

`Tick.set_animated(b)`

Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.Tick.set_axes

`Tick.set_axes(axes)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

matplotlib.axis.Tick.set_clip_box

`Tick.set_clip_box(clipbox)`

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

matplotlib.axis.Tick.set_clip_on

`Tick.`**`set_clip_on`**`(`*b*`)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.Tick.set_clip_path

`Tick.`**`set_clip_path`**`(`*clippath*, *transform=None*`)`

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

matplotlib.axis.Tick.set_contains

`Tick.`**`set_contains`**`(`*picker*`)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.Tick.set_figure

`Tick.`**`set_figure`**`(`*fig*`)`

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.axis.Tick.set_gid

`Tick.`**`set_gid`**`(`*gid*`)`

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.Tick.set_label

`Tick.`**`set_label`**`(`*s*`)`

Set the text of ticklabel

ACCEPTS: str

matplotlib.axis.Tick.set_path_effects

`Tick.`**`set_path_effects`**`(`*path_effects*`)`

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.Tick.set_picker

`Tick.`**`set_picker`**`(`*picker*`)`

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.Tick.set_rasterized

`Tick.`**`set_rasterized`**(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.Tick.set_sketch_params

`Tick.`**`set_sketch_params`**(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.Tick.set_snap

`Tick.`**`set_snap`**(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.Tick.set_transform

`Tick.`**`set_transform`**(*t*)

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

matplotlib.axis.Tick.set_url

`Tick.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.Tick.set_visible

`Tick.`**`set_visible`**`(`*b*`)`

Set the artist's visiblity.

ACCEPTS: [True | False]

matplotlib.axis.Tick.set_zorder

`Tick.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.Tick.stale

`Tick.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.Tick.update

`Tick.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.Tick.update_from

`Tick.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.axis.Tick.zorder

`Tick.`**`zorder`** **= 0**

matplotlib.axis.XTick.add_callback

`XTick.`**`add_callback`**(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

matplotlib.axis.XTick.aname

`XTick.`**`aname`** **= 'Artist'**

matplotlib.axis.XTick.axes

`XTick.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.axis.XTick.contains

`XTick.`**`contains`**(*mouseevent*)

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

matplotlib.axis.XTick.convert_xunits

`XTick.`**`convert_xunits`**(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.XTick.convert_yunits

`XTick.`**`convert_yunits`**(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.XTick.draw

`XTick.`**`draw`**(*artist*, *renderer*, **args*, ***kwargs*)

matplotlib.axis.XTick.findobj

`XTick.findobj(match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.XTick.format_cursor_data

`XTick.format_cursor_data(data)`

Return *cursor data* string formatted.

matplotlib.axis.XTick.get_agg_filter

`XTick.get_agg_filter()`

return filter function to be used for agg filter

matplotlib.axis.XTick.get_alpha

`XTick.get_alpha()`

Return the alpha value used for blending - not supported on all backends

matplotlib.axis.XTick.get_animated

`XTick.get_animated()`

Return the artist’s animated state

matplotlib.axis.XTick.get_axes

`XTick.get_axes()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.XTick.get_children

`XTick.get_children()`

matplotlib.axis.XTick.get_clip_box

`XTick.get_clip_box()`

Return artist clipbox

matplotlib.axis.XTick.get_clip_on

`XTick.get_clip_on()`

Return whether artist uses clipping

matplotlib.axis.XTick.get_clip_path

`XTick.get_clip_path()`

Return artist clip path

matplotlib.axis.XTick.get_contains

`XTick.get_contains()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.XTick.get_cursor_data

`XTick.get_cursor_data(event)`

Get the cursor data for a given event.

matplotlib.axis.XTick.get_figure

`XTick.get_figure()`

Return the `Figure` instance the artist belongs to.

matplotlib.axis.XTick.get_gid

`XTick.get_gid()`

Returns the group id

matplotlib.axis.XTick.get_label

`XTick.get_label()`

Get the label used for this artist in the legend.

matplotlib.axis.XTick.get_path_effects

`XTick.get_path_effects()`

matplotlib.axis.XTick.get_picker

`XTick.get_picker()`

Return the picker object used by this artist

matplotlib.axis.XTick.get_rasterized

`XTick.get_rasterized()`

return True if the artist is to be rasterized

matplotlib.axis.XTick.get_sketch_params

`XTick.get_sketch_params()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.XTick.get_snap

`XTick.get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.XTick.get_transform

`XTick.`**`get_transform`**`()`

Return the *`Transform`* instance used by this artist.

matplotlib.axis.XTick.get_transformed_clip_path_and_affine

`XTick.`**`get_transformed_clip_path_and_affine`**`()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.XTick.get_url

`XTick.`**`get_url`**`()`

Returns the url

matplotlib.axis.XTick.get_visible

`XTick.`**`get_visible`**`()`

Return the artist's visiblity

matplotlib.axis.XTick.get_window_extent

`XTick.`**`get_window_extent`**`(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.XTick.get_zorder

`XTick.`**`get_zorder`**`()`

Return the `Artist`'s zorder.

matplotlib.axis.XTick.have_units

`XTick.`**`have_units`**`()`

Return *True* if units are set on the x or y axes

matplotlib.axis.XTick.hitlist

`XTick.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.XTick.is_figure_set

`XTick.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

matplotlib.axis.XTick.is_transform_set

`XTick.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.XTick.mouseover

`XTick.`**`mouseover`**

matplotlib.axis.XTick.pchanged

`XTick.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.XTick.pick

`XTick.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.XTick.pickable

`XTick.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.XTick.properties

`XTick.properties()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.XTick.remove

`XTick.remove()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.XTick.remove_callback

`XTick.remove_callback(oid)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.XTick.set

`XTick.set(**kwargs)`

A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.XTick.set_agg_filter

`XTick.set_agg_filter(filter_func)`

set agg_filter fuction.

matplotlib.axis.XTick.set_alpha

`XTick.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.XTick.set_animated

`XTick.`**`set_animated`**`(`*b*`)`

Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.XTick.set_axes

`XTick.`**`set_axes`**`(`*axes*`)`

Set the *`Axes`* instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an *`Axes`* instance

matplotlib.axis.XTick.set_clip_box

`XTick.`**`set_clip_box`**`(`*clipbox*`)`

Set the artist's clip *`Bbox`*.

ACCEPTS: a *`matplotlib.transforms.Bbox`* instance

matplotlib.axis.XTick.set_clip_on

`XTick.`**`set_clip_on`**`(`*b*`)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.XTick.set_clip_path

`XTick.`**`set_clip_path`**`(`*clippath*, *transform=None*`)`

Set the artist's clip path, which may be:

- a *`Patch`* (or subclass) instance
- **a *`Path`* instance, in which case** an optional *`Transform`* instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(*`Path`*, *`Transform`*) | *`Patch`* | None]

matplotlib.axis.XTick.set_contains

`XTick.set_contains(picker)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.XTick.set_figure

`XTick.set_figure(fig)`

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.axis.XTick.set_gid

`XTick.set_gid(gid)`

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.XTick.set_label

`XTick.set_label(s)`

Set the text of ticklabel

ACCEPTS: str

matplotlib.axis.XTick.set_path_effects

`XTick.set_path_effects(path_effects)`

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.XTick.set_picker

`XTick.set_picker(picker)`

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.XTick.set_rasterized

`XTick.`**`set_rasterized`**`(`*rasterized*`)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.XTick.set_sketch_params

`XTick.`**`set_sketch_params`**`(`*scale=None*, *length=None*, *randomness=None*`)`

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.XTick.set_snap

`XTick.`**`set_snap`**`(`*snap*`)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.XTick.set_transform

`XTick.`**`set_transform`**`(`*t*`)`

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

matplotlib.axis.XTick.set_url

`XTick.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.XTick.set_visible

`XTick.`**`set_visible`**`(`*b*`)`

Set the artist's visiblity.

ACCEPTS: [True | False]

matplotlib.axis.XTick.set_zorder

`XTick.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.XTick.stale

`XTick.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.XTick.update

`XTick.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.XTick.update_from

`XTick.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.axis.XTick.zorder

`XTick.`**`zorder`** **= 0**

matplotlib.axis.YTick.add_callback

`YTick.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

matplotlib.axis.YTick.aname

`YTick.`**`aname`** **= 'Artist'**

matplotlib.axis.YTick.axes

`YTick.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.axis.YTick.contains

`YTick.`**`contains`**`(`*mouseevent*`)`

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

matplotlib.axis.YTick.convert_xunits

`YTick.`**`convert_xunits`**`(`*x*`)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.YTick.convert_yunits

`YTick.`**`convert_yunits`**`(`*y*`)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.YTick.draw

`YTick.`**`draw`**`(`*artist*, *renderer*, **args*, ***kwargs*`)`

matplotlib.axis.YTick.findobj

`YTick.`**`findobj`**`(`*match=None*, *include_self=True*`)`

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.YTick.format_cursor_data

`YTick.`**`format_cursor_data`**`(`*data*`)`

Return *cursor data* string formatted.

matplotlib.axis.YTick.get_agg_filter

`YTick.`**`get_agg_filter`**`()`

return filter function to be used for agg filter

matplotlib.axis.YTick.get_alpha

`YTick.`**`get_alpha`**`()`

Return the alpha value used for blending - not supported on all backends

matplotlib.axis.YTick.get_animated

`YTick.get_animated()`

Return the artist's animated state

matplotlib.axis.YTick.get_axes

`YTick.get_axes()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.YTick.get_children

`YTick.get_children()`

matplotlib.axis.YTick.get_clip_box

`YTick.get_clip_box()`

Return artist clipbox

matplotlib.axis.YTick.get_clip_on

`YTick.get_clip_on()`

Return whether artist uses clipping

matplotlib.axis.YTick.get_clip_path

`YTick.get_clip_path()`

Return artist clip path

matplotlib.axis.YTick.get_contains

`YTick.get_contains()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.YTick.get_cursor_data

`YTick.get_cursor_data(event)`

Get the cursor data for a given event.

matplotlib.axis.YTick.get_figure

`YTick.`**`get_figure`**`()`

Return the *`Figure`* instance the artist belongs to.

matplotlib.axis.YTick.get_gid

`YTick.`**`get_gid`**`()`

Returns the group id

matplotlib.axis.YTick.get_label

`YTick.`**`get_label`**`()`

Get the label used for this artist in the legend.

matplotlib.axis.YTick.get_path_effects

`YTick.`**`get_path_effects`**`()`

matplotlib.axis.YTick.get_picker

`YTick.`**`get_picker`**`()`

Return the picker object used by this artist

matplotlib.axis.YTick.get_rasterized

`YTick.`**`get_rasterized`**`()`

return True if the artist is to be rasterized

matplotlib.axis.YTick.get_sketch_params

`YTick.`**`get_sketch_params`**`()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.YTick.get_snap

`YTick.`**`get_snap`**`()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.YTick.get_transform

`YTick.`**`get_transform`**`()`

Return the *`Transform`* instance used by this artist.

matplotlib.axis.YTick.get_transformed_clip_path_and_affine

`YTick.`**`get_transformed_clip_path_and_affine`**`()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.YTick.get_url

`YTick.`**`get_url`**`()`

Returns the url

matplotlib.axis.YTick.get_visible

`YTick.`**`get_visible`**`()`

Return the artist's visiblity

matplotlib.axis.YTick.get_window_extent

`YTick.`**`get_window_extent`**`(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.YTick.get_zorder

`YTick.`**`get_zorder`**`()`

Return the `Artist`'s zorder.

matplotlib.axis.YTick.have_units

`YTick.`**`have_units`**`()`

Return *True* if units are set on the *x* or *y* axes

matplotlib.axis.YTick.hitlist

`YTick.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.YTick.is_figure_set

`YTick.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

matplotlib.axis.YTick.is_transform_set

`YTick.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.YTick.mouseover

`YTick.`**`mouseover`**

matplotlib.axis.YTick.pchanged

`YTick.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.YTick.pick

`YTick.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.YTick.pickable

`YTick.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.YTick.properties

`YTick.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.YTick.remove

`YTick.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.YTick.remove_callback

`YTick.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.YTick.set

`YTick.`**`set`**`(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.YTick.set_agg_filter

`YTick.set_agg_filter(filter_func)`

set agg_filter fuction.

matplotlib.axis.YTick.set_alpha

`YTick.set_alpha(alpha)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.YTick.set_animated

`YTick.set_animated(b)`

Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.YTick.set_axes

`YTick.set_axes(axes)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

matplotlib.axis.YTick.set_clip_box

`YTick.set_clip_box(clipbox)`

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

matplotlib.axis.YTick.set_clip_on

`YTick.set_clip_on(b)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.YTick.set_clip_path

`YTick.`**`set_clip_path`**(*clippath*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

matplotlib.axis.YTick.set_contains

`YTick.`**`set_contains`**(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.YTick.set_figure

`YTick.`**`set_figure`**(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.axis.YTick.set_gid

`YTick.`**`set_gid`**(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.YTick.set_label

`YTick.`**`set_label`**(*s*)

Set the text of ticklabel

ACCEPTS: str

matplotlib.axis.YTick.set_path_effects

`YTick.`**`set_path_effects`**(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.YTick.set_picker

`YTick.`**`set_picker`**(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.YTick.set_rasterized

`YTick.`**`set_rasterized`**(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.YTick.set_sketch_params

`YTick.`**`set_sketch_params`**(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.YTick.set_snap

`YTick.`**`set_snap`**`(`*snap*`)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.YTick.set_transform

`YTick.`**`set_transform`**`(`*t*`)`

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

matplotlib.axis.YTick.set_url

`YTick.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.YTick.set_visible

`YTick.`**`set_visible`**`(`*b*`)`

Set the artist’s visiblity.

ACCEPTS: [True | False]

matplotlib.axis.YTick.set_zorder

`YTick.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.YTick.stale

`YTick.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.YTick.update

`YTick.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.YTick.update_from

`YTick.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.axis.YTick.zorder

`YTick.`**`zorder`** **= 0**

Axis

`Axis.add_callback`	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
`Axis.aname`	
`Axis.axes`	The `Axes` instance the artist resides in, or *None*.
`Axis.contains`	Test whether the artist contains the mouse event.
`Axis.convert_xunits`	For artists in an axes, if the xaxis has units support,
`Axis.convert_yunits`	For artists in an axes, if the yaxis has units support,
`Axis.draw`	Draw the axis lines, grid lines, tick lines and labels
`Axis.findobj`	Find artist objects.
`Axis.format_cursor_data`	Return *cursor data* string formatted.
`Axis.get_agg_filter`	return filter function to be used for agg filter
`Axis.get_alpha`	Return the alpha value used for blending - not supported on all

Continued on next page

Table 20.20 – continued from previous page

`Axis.get_animated`	Return the artist's animated state
`Axis.get_axes`	Return the `Axes` instance the artist resides in, or *None*.
`Axis.get_children`	
`Axis.get_clip_box`	Return artist clipbox
`Axis.get_clip_on`	Return whether artist uses clipping
`Axis.get_clip_path`	Return artist clip path
`Axis.get_contains`	Return the _contains test used by the artist, or *None* for default.
`Axis.get_cursor_data`	Get the cursor data for a given event.
`Axis.get_figure`	Return the `Figure` instance the artist belongs to.
`Axis.get_gid`	Returns the group id
`Axis.get_label`	Return the axis label as a Text instance
`Axis.get_path_effects`	
`Axis.get_picker`	Return the picker object used by this artist
`Axis.get_rasterized`	return True if the artist is to be rasterized
`Axis.get_sketch_params`	Returns the sketch parameters for the artist.
`Axis.get_snap`	Returns the snap setting which may be:
`Axis.get_transform`	
`Axis.get_transformed_clip_path_and_affine`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
`Axis.get_url`	Returns the url
`Axis.get_visible`	Return the artist's visiblity
`Axis.get_window_extent`	Get the axes bounding box in display space.
`Axis.get_zorder`	Return the `Artist`'s zorder.
`Axis.have_units`	
`Axis.hitlist`	List the children of the artist which contain the mouse event *event*.
`Axis.is_figure_set`	Returns True if the artist is assigned to a `Figure`.
`Axis.is_transform_set`	Returns *True* if `Artist` has a transform explicitly set.
`Axis.mouseover`	
`Axis.pchanged`	Fire an event when property changed, calling all of the registered callbacks.
`Axis.pick`	Process pick event
`Axis.pickable`	Return *True* if `Artist` is pickable.
`Axis.properties`	return a dictionary mapping property name -> value for all Artist props
`Axis.remove`	Remove the artist from the figure if possible.
`Axis.remove_callback`	Remove a callback based on its *id*.
`Axis.set`	A property batch setter.
`Axis.set_agg_filter`	set agg_filter fuction.
`Axis.set_alpha`	Set the alpha value used for blending - not supported on all backends.
`Axis.set_animated`	Set the artist's animation state.

Continued on next page

Table 20.20 – continued from previous page

Axis.set_axes	Set the *Axes* instance in which the artist resides, if any.
Axis.set_clip_box	Set the artist's clip *Bbox*.
Axis.set_clip_on	Set whether artist uses clipping.
Axis.set_clip_path	
Axis.set_contains	Replace the contains test used by this artist.
Axis.set_figure	Set the *Figure* instance the artist belongs to.
Axis.set_gid	Sets the (group) id for the artist
Axis.set_label	Set the label to *s* for auto legend.
Axis.set_path_effects	set path_effects, which should be a list of instances of
Axis.set_picker	Set the epsilon for picking used by this artist
Axis.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
Axis.set_sketch_params	Sets the sketch parameters.
Axis.set_snap	Sets the snap setting which may be:
Axis.set_transform	Set the *Transform* instance used by this artist.
Axis.set_url	Sets the url for the artist
Axis.set_visible	Set the artist's visiblity.
Axis.set_zorder	Set the zorder for the artist.
Axis.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
Axis.update	Update the properties of this `Artist` from the dictionary *prop*.
Axis.update_from	Copy properties from *other* to *self*.
Axis.zorder	
XAxis.add_callback	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
XAxis.aname	
XAxis.axes	The *Axes* instance the artist resides in, or *None*.
XAxis.contains	Test whether the mouse event occured in the x axis.
XAxis.convert_xunits	For artists in an axes, if the xaxis has units support,
XAxis.convert_yunits	For artists in an axes, if the yaxis has units support,
XAxis.draw	Draw the axis lines, grid lines, tick lines and labels
XAxis.findobj	Find artist objects.
XAxis.format_cursor_data	Return *cursor data* string formatted.
XAxis.get_agg_filter	return filter function to be used for agg filter
XAxis.get_alpha	Return the alpha value used for blending - not supported on all
XAxis.get_animated	Return the artist's animated state
XAxis.get_axes	Return the *Axes* instance the artist resides in, or *None*.
XAxis.get_children	
XAxis.get_clip_box	Return artist clipbox
XAxis.get_clip_on	Return whether artist uses clipping
XAxis.get_clip_path	Return artist clip path

Continued on next page

Table 20.20 – continued from previous page

XAxis.get_contains	Return the _contains test used by the artist, or *None* for default.
XAxis.get_cursor_data	Get the cursor data for a given event.
XAxis.get_figure	Return the *Figure* instance the artist belongs to.
XAxis.get_gid	Returns the group id
XAxis.get_label	Return the axis label as a Text instance
XAxis.get_path_effects	
XAxis.get_picker	Return the picker object used by this artist
XAxis.get_rasterized	return True if the artist is to be rasterized
XAxis.get_sketch_params	Returns the sketch parameters for the artist.
XAxis.get_snap	Returns the snap setting which may be:
XAxis.get_transform	
XAxis.get_transformed_clip_path_and_affine	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
XAxis.get_url	Returns the url
XAxis.get_visible	Return the artist's visiblity
XAxis.get_window_extent	Get the axes bounding box in display space.
XAxis.get_zorder	Return the `Artist`'s zorder.
XAxis.have_units	
XAxis.hitlist	List the children of the artist which contain the mouse event *event*.
XAxis.is_figure_set	Returns True if the artist is assigned to a *Figure*.
XAxis.is_transform_set	Returns *True* if `Artist` has a transform explicitly set.
XAxis.mouseover	
XAxis.pchanged	Fire an event when property changed, calling all of the registered callbacks.
XAxis.pick	Process pick event
XAxis.pickable	Return *True* if `Artist` is pickable.
XAxis.properties	return a dictionary mapping property name -> value for all Artist props
XAxis.remove	Remove the artist from the figure if possible.
XAxis.remove_callback	Remove a callback based on its *id*.
XAxis.set	A property batch setter.
XAxis.set_agg_filter	set agg_filter fuction.
XAxis.set_alpha	Set the alpha value used for blending - not supported on all backends.
XAxis.set_animated	Set the artist's animation state.
XAxis.set_axes	Set the *Axes* instance in which the artist resides, if any.
XAxis.set_clip_box	Set the artist's clip *Bbox*.
XAxis.set_clip_on	Set whether artist uses clipping.
XAxis.set_clip_path	
XAxis.set_contains	Replace the contains test used by this artist.

Continued on next page

Table 20.20 – continued from previous page

XAxis.set_figure	Set the *Figure* instance the artist belongs to.
XAxis.set_gid	Sets the (group) id for the artist
XAxis.set_label	Set the label to *s* for auto legend.
XAxis.set_path_effects	set path_effects, which should be a list of instances of
XAxis.set_picker	Set the epsilon for picking used by this artist
XAxis.set_rasterized	Force rasterized (bitmap) drawing in vector backend output.
XAxis.set_sketch_params	Sets the sketch parameters.
XAxis.set_snap	Sets the snap setting which may be:
XAxis.set_transform	Set the *Transform* instance used by this artist.
XAxis.set_url	Sets the url for the artist
XAxis.set_visible	Set the artist's visiblity.
XAxis.set_zorder	Set the zorder for the artist.
XAxis.stale	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
XAxis.update	Update the properties of this `Artist` from the dictionary *prop*.
XAxis.update_from	Copy properties from *other* to *self*.
XAxis.zorder	
YAxis.add_callback	Adds a callback function that will be called whenever one of the `Artist`'s properties changes.
YAxis.aname	
YAxis.axes	The *Axes* instance the artist resides in, or *None*.
YAxis.contains	Test whether the mouse event occurred in the y axis.
YAxis.convert_xunits	For artists in an axes, if the xaxis has units support,
YAxis.convert_yunits	For artists in an axes, if the yaxis has units support,
YAxis.draw	Draw the axis lines, grid lines, tick lines and labels
YAxis.findobj	Find artist objects.
YAxis.format_cursor_data	Return *cursor data* string formatted.
YAxis.get_agg_filter	return filter function to be used for agg filter
YAxis.get_alpha	Return the alpha value used for blending - not supported on all
YAxis.get_animated	Return the artist's animated state
YAxis.get_axes	Return the *Axes* instance the artist resides in, or *None*.
YAxis.get_children	
YAxis.get_clip_box	Return artist clipbox
YAxis.get_clip_on	Return whether artist uses clipping
YAxis.get_clip_path	Return artist clip path
YAxis.get_contains	Return the _contains test used by the artist, or *None* for default.
YAxis.get_cursor_data	Get the cursor data for a given event.
YAxis.get_figure	Return the *Figure* instance the artist belongs to.
YAxis.get_gid	Returns the group id
YAxis.get_label	Return the axis label as a Text instance

Continued on next page

Table 20.20 – continued from previous page

`YAxis.get_path_effects`	
`YAxis.get_picker`	Return the picker object used by this artist
`YAxis.get_rasterized`	return True if the artist is to be rasterized
`YAxis.get_sketch_params`	Returns the sketch parameters for the artist.
`YAxis.get_snap`	Returns the snap setting which may be:
`YAxis.get_transform`	
`YAxis.get_transformed_clip_path_and_affine`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
`YAxis.get_url`	Returns the url
`YAxis.get_visible`	Return the artist's visiblity
`YAxis.get_window_extent`	Get the axes bounding box in display space.
`YAxis.get_zorder`	Return the `Artist`'s zorder.
`YAxis.have_units`	
`YAxis.hitlist`	List the children of the artist which contain the mouse event *event*.
`YAxis.is_figure_set`	Returns True if the artist is assigned to a `Figure`.
`YAxis.is_transform_set`	Returns *True* if `Artist` has a transform explicitly set.
`YAxis.mouseover`	
`YAxis.pchanged`	Fire an event when property changed, calling all of the registered callbacks.
`YAxis.pick`	Process pick event
`YAxis.pickable`	Return *True* if `Artist` is pickable.
`YAxis.properties`	return a dictionary mapping property name -> value for all Artist props
`YAxis.remove`	Remove the artist from the figure if possible.
`YAxis.remove_callback`	Remove a callback based on its *id*.
`YAxis.set`	A property batch setter.
`YAxis.set_agg_filter`	set agg_filter fuction.
`YAxis.set_alpha`	Set the alpha value used for blending - not supported on all backends.
`YAxis.set_animated`	Set the artist's animation state.
`YAxis.set_axes`	Set the `Axes` instance in which the artist resides, if any.
`YAxis.set_clip_box`	Set the artist's clip `Bbox`.
`YAxis.set_clip_on`	Set whether artist uses clipping.
`YAxis.set_clip_path`	
`YAxis.set_contains`	Replace the contains test used by this artist.
`YAxis.set_figure`	Set the `Figure` instance the artist belongs to.
`YAxis.set_gid`	Sets the (group) id for the artist
`YAxis.set_label`	Set the label to *s* for auto legend.
`YAxis.set_path_effects`	set path_effects, which should be a list of instances of
`YAxis.set_picker`	Set the epsilon for picking used by this artist

Continued on next page

Table 20.20 – continued from previous page

`YAxis.set_rasterized`	Force rasterized (bitmap) drawing in vector backend output.
`YAxis.set_sketch_params`	Sets the sketch parameters.
`YAxis.set_snap`	Sets the snap setting which may be:
`YAxis.set_transform`	Set the `Transform` instance used by this artist.
`YAxis.set_url`	Sets the url for the artist
`YAxis.set_visible`	Set the artist's visiblity.
`YAxis.set_zorder`	Set the zorder for the artist.
`YAxis.stale`	If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
`YAxis.update`	Update the properties of this `Artist` from the dictionary *prop*.
`YAxis.update_from`	Copy properties from *other* to *self*.
`YAxis.zorder`	

matplotlib.axis.Axis.add_callback

`Axis.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

matplotlib.axis.Axis.aname

`Axis.`**`aname`** **= 'Artist'**

matplotlib.axis.Axis.axes

`Axis.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.axis.Axis.contains

`Axis.`**`contains`**`(`*mouseevent*`)`

Test whether the artist contains the mouse event.

Returns the truth value and a dictionary of artist specific details of selection, such as which points are contained in the pick radius. See individual artists for details.

matplotlib.axis.Axis.convert_xunits

`Axis.`**`convert_xunits`**(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.Axis.convert_yunits

`Axis.`**`convert_yunits`**(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.Axis.draw

`Axis.`**`draw`**(*artist*, *renderer*, **args*, ***kwargs*)

Draw the axis lines, grid lines, tick lines and labels

matplotlib.axis.Axis.findobj

`Axis.`**`findobj`**(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.Axis.format_cursor_data

`Axis.`**`format_cursor_data`**(*data*)

Return *cursor data* string formatted.

matplotlib.axis.Axis.get_agg_filter

`Axis.`**`get_agg_filter`**()

return filter function to be used for agg filter

matplotlib.axis.Axis.get_alpha

`Axis.get_alpha()`

Return the alpha value used for blending - not supported on all backends

matplotlib.axis.Axis.get_animated

`Axis.get_animated()`

Return the artist's animated state

matplotlib.axis.Axis.get_axes

`Axis.get_axes()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.Axis.get_children

`Axis.get_children()`

matplotlib.axis.Axis.get_clip_box

`Axis.get_clip_box()`

Return artist clipbox

matplotlib.axis.Axis.get_clip_on

`Axis.get_clip_on()`

Return whether artist uses clipping

matplotlib.axis.Axis.get_clip_path

`Axis.get_clip_path()`

Return artist clip path

matplotlib.axis.Axis.get_contains

`Axis.get_contains()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.Axis.get_cursor_data

`Axis.`**`get_cursor_data`**`(`*`event`*`)`

Get the cursor data for a given event.

matplotlib.axis.Axis.get_figure

`Axis.`**`get_figure`**`()`

Return the *`Figure`* instance the artist belongs to.

matplotlib.axis.Axis.get_gid

`Axis.`**`get_gid`**`()`

Returns the group id

matplotlib.axis.Axis.get_label

`Axis.`**`get_label`**`()`

Return the axis label as a Text instance

matplotlib.axis.Axis.get_path_effects

`Axis.`**`get_path_effects`**`()`

matplotlib.axis.Axis.get_picker

`Axis.`**`get_picker`**`()`

Return the picker object used by this artist

matplotlib.axis.Axis.get_rasterized

`Axis.`**`get_rasterized`**`()`

return True if the artist is to be rasterized

matplotlib.axis.Axis.get_sketch_params

`Axis.`**`get_sketch_params`**`()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.Axis.get_snap

`Axis.`**`get_snap`**`()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.Axis.get_transform

`Axis.`**`get_transform`**`()`

matplotlib.axis.Axis.get_transformed_clip_path_and_affine

`Axis.`**`get_transformed_clip_path_and_affine`**`()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.Axis.get_url

`Axis.`**`get_url`**`()`

Returns the url

matplotlib.axis.Axis.get_visible

`Axis.`**`get_visible`**`()`

Return the artist’s visiblity

matplotlib.axis.Axis.get_window_extent

`Axis.`**`get_window_extent`**`(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.Axis.get_zorder

`Axis.`**`get_zorder`**`()`

Return the `Artist`'s zorder.

matplotlib.axis.Axis.have_units

`Axis.`**`have_units`**`()`

matplotlib.axis.Axis.hitlist

`Axis.`**`hitlist`**`(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.Axis.is_figure_set

`Axis.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

matplotlib.axis.Axis.is_transform_set

`Axis.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.Axis.mouseover

`Axis.`**`mouseover`**

matplotlib.axis.Axis.pchanged

`Axis.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.Axis.pick

`Axis.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.Axis.pickable

`Axis.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.Axis.properties

`Axis.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.Axis.remove

`Axis.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.Axis.remove_callback

`Axis.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.Axis.set

`Axis.set(**kwargs)`
A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.Axis.set_agg_filter

`Axis.set_agg_filter(filter_func)`
set agg_filter fuction.

matplotlib.axis.Axis.set_alpha

`Axis.set_alpha(alpha)`
Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.Axis.set_animated

`Axis.set_animated(b)`
Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.Axis.set_axes

`Axis.set_axes(axes)`
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

matplotlib.axis.Axis.set_clip_box

`Axis.set_clip_box(clipbox)`
Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

matplotlib.axis.Axis.set_clip_on

`Axis.set_clip_on(b)`
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.Axis.set_clip_path

`Axis.`**`set_clip_path`**`(`*clippath*, *transform=None*`)`

matplotlib.axis.Axis.set_contains

`Axis.`**`set_contains`**`(`*picker*`)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.Axis.set_figure

`Axis.`**`set_figure`**`(`*fig*`)`

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.axis.Axis.set_gid

`Axis.`**`set_gid`**`(`*gid*`)`

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.Axis.set_label

`Axis.`**`set_label`**`(`*s*`)`

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

matplotlib.axis.Axis.set_path_effects

`Axis.`**`set_path_effects`**(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.Axis.set_picker

`Axis.`**`set_picker`**(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.Axis.set_rasterized

`Axis.`**`set_rasterized`**(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.Axis.set_sketch_params

`Axis.`**`set_sketch_params`**(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.Axis.set_snap

`Axis.`**`set_snap`**`(`*snap*`)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.Axis.set_transform

`Axis.`**`set_transform`**`(`*t*`)`

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

matplotlib.axis.Axis.set_url

`Axis.`**`set_url`**`(`*url*`)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.Axis.set_visible

`Axis.`**`set_visible`**`(`*b*`)`

Set the artist’s visiblity.

ACCEPTS: [True | False]

matplotlib.axis.Axis.set_zorder

`Axis.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.Axis.stale

`Axis.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.Axis.update

`Axis.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.Axis.update_from

`Axis.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.axis.Axis.zorder

`Axis.`**`zorder`** **= 0**

matplotlib.axis.XAxis.add_callback

`XAxis.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

matplotlib.axis.XAxis.aname

`XAxis.`**`aname`** **= 'Artist'**

matplotlib.axis.XAxis.axes

`XAxis.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.axis.XAxis.contains

`XAxis.`**`contains`**(*mouseevent*)

Test whether the mouse event occured in the x axis.

matplotlib.axis.XAxis.convert_xunits

`XAxis.`**`convert_xunits`**(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.XAxis.convert_yunits

`XAxis.`**`convert_yunits`**(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.XAxis.draw

`XAxis.`**`draw`**(*artist*, *renderer*, **args*, ***kwargs*)

Draw the axis lines, grid lines, tick lines and labels

matplotlib.axis.XAxis.findobj

`XAxis.`**`findobj`**(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.XAxis.format_cursor_data

`XAxis.`**`format_cursor_data`**`(`*`data`*`)`

Return *cursor data* string formatted.

matplotlib.axis.XAxis.get_agg_filter

`XAxis.`**`get_agg_filter`**`()`

return filter function to be used for agg filter

matplotlib.axis.XAxis.get_alpha

`XAxis.`**`get_alpha`**`()`

Return the alpha value used for blending - not supported on all backends

matplotlib.axis.XAxis.get_animated

`XAxis.`**`get_animated`**`()`

Return the artist's animated state

matplotlib.axis.XAxis.get_axes

`XAxis.`**`get_axes`**`()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.XAxis.get_children

`XAxis.`**`get_children`**`()`

matplotlib.axis.XAxis.get_clip_box

`XAxis.`**`get_clip_box`**`()`

Return artist clipbox

matplotlib.axis.XAxis.get_clip_on

`XAxis.`**`get_clip_on`**`()`

Return whether artist uses clipping

matplotlib.axis.XAxis.get_clip_path

`XAxis.get_clip_path()`

Return artist clip path

matplotlib.axis.XAxis.get_contains

`XAxis.get_contains()`

Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.XAxis.get_cursor_data

`XAxis.get_cursor_data(event)`

Get the cursor data for a given event.

matplotlib.axis.XAxis.get_figure

`XAxis.get_figure()`

Return the `Figure` instance the artist belongs to.

matplotlib.axis.XAxis.get_gid

`XAxis.get_gid()`

Returns the group id

matplotlib.axis.XAxis.get_label

`XAxis.get_label()`

Return the axis label as a Text instance

matplotlib.axis.XAxis.get_path_effects

`XAxis.get_path_effects()`

matplotlib.axis.XAxis.get_picker

`XAxis.get_picker()`

Return the picker object used by this artist

matplotlib.axis.XAxis.get_rasterized

`XAxis.get_rasterized()`

return True if the artist is to be rasterized

matplotlib.axis.XAxis.get_sketch_params

`XAxis.get_sketch_params()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.XAxis.get_snap

`XAxis.get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.XAxis.get_transform

`XAxis.get_transform()`

matplotlib.axis.XAxis.get_transformed_clip_path_and_affine

`XAxis.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.XAxis.get_url

`XAxis.get_url()`

Returns the url

matplotlib.axis.XAxis.get_visible

`XAxis.get_visible()`

Return the artist's visiblity

matplotlib.axis.XAxis.get_window_extent

`XAxis.get_window_extent(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.XAxis.get_zorder

`XAxis.get_zorder()`

Return the `Artist`'s zorder.

matplotlib.axis.XAxis.have_units

`XAxis.have_units()`

matplotlib.axis.XAxis.hitlist

`XAxis.hitlist(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.XAxis.is_figure_set

`XAxis.is_figure_set()`

Returns True if the artist is assigned to a `Figure`.

matplotlib.axis.XAxis.is_transform_set

`XAxis.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.XAxis.mouseover

`XAxis.`**`mouseover`**

matplotlib.axis.XAxis.pchanged

`XAxis.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.XAxis.pick

`XAxis.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.XAxis.pickable

`XAxis.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.XAxis.properties

`XAxis.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.XAxis.remove

`XAxis.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.XAxis.remove_callback

`XAxis.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.XAxis.set

`XAxis.`**`set`**`(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.XAxis.set_agg_filter

`XAxis.`**`set_agg_filter`**`(`*filter_func*`)`

set agg_filter fuction.

matplotlib.axis.XAxis.set_alpha

`XAxis.`**`set_alpha`**`(`*alpha*`)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.XAxis.set_animated

`XAxis.`**`set_animated`**`(`*b*`)`

Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.XAxis.set_axes

`XAxis.`**`set_axes`**`(`*axes*`)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

matplotlib.axis.XAxis.set_clip_box

`XAxis.`**`set_clip_box`**`(`*clipbox*`)`

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

matplotlib.axis.XAxis.set_clip_on

`XAxis.`**`set_clip_on`**`(`*b*`)`

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.XAxis.set_clip_path

`XAxis.`**`set_clip_path`**`(`*clippath*, *transform=None*`)`

matplotlib.axis.XAxis.set_contains

`XAxis.`**`set_contains`**`(`*picker*`)`

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.XAxis.set_figure

`XAxis.`**`set_figure`**`(`*fig*`)`

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

matplotlib.axis.XAxis.set_gid

`XAxis.`**`set_gid`**`(`*gid*`)`

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.XAxis.set_label

`XAxis.set_label(s)`

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

matplotlib.axis.XAxis.set_path_effects

`XAxis.set_path_effects(path_effects)`

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.XAxis.set_picker

`XAxis.set_picker(picker)`

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.XAxis.set_rasterized

`XAxis.set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.XAxis.set_sketch_params

`XAxis.set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.XAxis.set_snap

`XAxis.set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.XAxis.set_transform

`XAxis.set_transform(t)`

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

matplotlib.axis.XAxis.set_url

`XAxis.set_url(url)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.XAxis.set_visible

`XAxis.`**`set_visible`**`(`*b*`)`

Set the artist's visiblity.

ACCEPTS: [True | False]

matplotlib.axis.XAxis.set_zorder

`XAxis.`**`set_zorder`**`(`*level*`)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.XAxis.stale

`XAxis.`**`stale`**

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.XAxis.update

`XAxis.`**`update`**`(`*props*`)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.XAxis.update_from

`XAxis.`**`update_from`**`(`*other*`)`

Copy properties from *other* to *self*.

matplotlib.axis.XAxis.zorder

`XAxis.`**`zorder`** **= 0**

matplotlib.axis.YAxis.add_callback

`YAxis.`**`add_callback`**`(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

matplotlib.axis.YAxis.aname

`YAxis.`**`aname`** = **'Artist'**

matplotlib.axis.YAxis.axes

`YAxis.`**`axes`**

The `Axes` instance the artist resides in, or *None*.

matplotlib.axis.YAxis.contains

`YAxis.`**`contains`**`(`*mouseevent*`)`

Test whether the mouse event occurred in the y axis.

Returns *True* | *False*

matplotlib.axis.YAxis.convert_xunits

`YAxis.`**`convert_xunits`**`(`*x*`)`

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

matplotlib.axis.YAxis.convert_yunits

`YAxis.`**`convert_yunits`**`(`*y*`)`

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

matplotlib.axis.YAxis.draw

`YAxis.`**`draw`**`(`*artist*, *renderer*, **args*, ***kwargs*`)`

Draw the axis lines, grid lines, tick lines and labels

matplotlib.axis.YAxis.findobj

`YAxis.`**`findobj`**`(`*match=None*, *include_self=True*`)`

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches

- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

matplotlib.axis.YAxis.format_cursor_data

`YAxis.`**`format_cursor_data`**`(`*`data`*`)`

Return *cursor data* string formatted.

matplotlib.axis.YAxis.get_agg_filter

`YAxis.`**`get_agg_filter`**`()`

return filter function to be used for agg filter

matplotlib.axis.YAxis.get_alpha

`YAxis.`**`get_alpha`**`()`

Return the alpha value used for blending - not supported on all backends

matplotlib.axis.YAxis.get_animated

`YAxis.`**`get_animated`**`()`

Return the artist's animated state

matplotlib.axis.YAxis.get_axes

`YAxis.`**`get_axes`**`()`

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

matplotlib.axis.YAxis.get_children

`YAxis.`**`get_children`**`()`

matplotlib.axis.YAxis.get_clip_box

`YAxis.`**`get_clip_box`**`()`

Return artist clipbox

matplotlib.axis.YAxis.get_clip_on

`YAxis.`**`get_clip_on`**`()`
Return whether artist uses clipping

matplotlib.axis.YAxis.get_clip_path

`YAxis.`**`get_clip_path`**`()`
Return artist clip path

matplotlib.axis.YAxis.get_contains

`YAxis.`**`get_contains`**`()`
Return the _contains test used by the artist, or *None* for default.

matplotlib.axis.YAxis.get_cursor_data

`YAxis.`**`get_cursor_data`**`(`*`event`*`)`
Get the cursor data for a given event.

matplotlib.axis.YAxis.get_figure

`YAxis.`**`get_figure`**`()`
Return the `Figure` instance the artist belongs to.

matplotlib.axis.YAxis.get_gid

`YAxis.`**`get_gid`**`()`
Returns the group id

matplotlib.axis.YAxis.get_label

`YAxis.`**`get_label`**`()`
Return the axis label as a Text instance

matplotlib.axis.YAxis.get_path_effects

`YAxis.`**`get_path_effects`**`()`

matplotlib.axis.YAxis.get_picker

`YAxis.get_picker()`

Return the picker object used by this artist

matplotlib.axis.YAxis.get_rasterized

`YAxis.get_rasterized()`

return True if the artist is to be rasterized

matplotlib.axis.YAxis.get_sketch_params

`YAxis.get_sketch_params()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

matplotlib.axis.YAxis.get_snap

`YAxis.get_snap()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.YAxis.get_transform

`YAxis.get_transform()`

matplotlib.axis.YAxis.get_transformed_clip_path_and_affine

`YAxis.get_transformed_clip_path_and_affine()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.YAxis.get_url

`YAxis.get_url()`

Returns the url

matplotlib.axis.YAxis.get_visible

`YAxis.get_visible()`

Return the artist's visiblity

matplotlib.axis.YAxis.get_window_extent

`YAxis.get_window_extent(`*renderer*`)`

Get the axes bounding box in display space. Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.YAxis.get_zorder

`YAxis.get_zorder()`

Return the `Artist`'s zorder.

matplotlib.axis.YAxis.have_units

`YAxis.have_units()`

matplotlib.axis.YAxis.hitlist

`YAxis.hitlist(`*event*`)`

List the children of the artist which contain the mouse event *event*.

matplotlib.axis.YAxis.is_figure_set

`YAxis.`**`is_figure_set`**`()`

Returns True if the artist is assigned to a `Figure`.

matplotlib.axis.YAxis.is_transform_set

`YAxis.`**`is_transform_set`**`()`

Returns *True* if `Artist` has a transform explicitly set.

matplotlib.axis.YAxis.mouseover

`YAxis.`**`mouseover`**

matplotlib.axis.YAxis.pchanged

`YAxis.`**`pchanged`**`()`

Fire an event when property changed, calling all of the registered callbacks.

matplotlib.axis.YAxis.pick

`YAxis.`**`pick`**`(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

matplotlib.axis.YAxis.pickable

`YAxis.`**`pickable`**`()`

Return *True* if `Artist` is pickable.

matplotlib.axis.YAxis.properties

`YAxis.`**`properties`**`()`

return a dictionary mapping property name -> value for all Artist props

matplotlib.axis.YAxis.remove

`YAxis.`**`remove`**`()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.axis.YAxis.remove_callback

`YAxis.`**`remove_callback`**`(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

matplotlib.axis.YAxis.set

`YAxis.`**`set`**`(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

matplotlib.axis.YAxis.set_agg_filter

`YAxis.`**`set_agg_filter`**`(`*filter_func*`)`

set agg_filter fuction.

matplotlib.axis.YAxis.set_alpha

`YAxis.`**`set_alpha`**`(`*alpha*`)`

Set the alpha value used for blending - not supported on all backends.

ACCEPTS: float (0.0 transparent through 1.0 opaque)

matplotlib.axis.YAxis.set_animated

`YAxis.`**`set_animated`**`(`*b*`)`

Set the artist's animation state.

ACCEPTS: [True | False]

matplotlib.axis.YAxis.set_axes

`YAxis.`**`set_axes`**`(`*axes*`)`

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an *`Axes`* instance

matplotlib.axis.YAxis.set_clip_box

`YAxis.`**`set_clip_box`**(*clipbox*)

Set the artist's clip *`Bbox`*.

ACCEPTS: a *`matplotlib.transforms.Bbox`* instance

matplotlib.axis.YAxis.set_clip_on

`YAxis.`**`set_clip_on`**(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

matplotlib.axis.YAxis.set_clip_path

`YAxis.`**`set_clip_path`**(*clippath*, *transform=None*)

matplotlib.axis.YAxis.set_contains

`YAxis.`**`set_contains`**(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

matplotlib.axis.YAxis.set_figure

`YAxis.`**`set_figure`**(*fig*)

Set the *`Figure`* instance the artist belongs to.

ACCEPTS: a *`matplotlib.figure.Figure`* instance

matplotlib.axis.YAxis.set_gid

`YAxis.`**`set_gid`**(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

matplotlib.axis.YAxis.set_label

`YAxis.`**`set_label`**(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

matplotlib.axis.YAxis.set_path_effects

`YAxis.`**`set_path_effects`**(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

matplotlib.axis.YAxis.set_picker

`YAxis.`**`set_picker`**(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

matplotlib.axis.YAxis.set_rasterized

`YAxis.set_rasterized(rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

matplotlib.axis.YAxis.set_sketch_params

`YAxis.set_sketch_params(scale=None, length=None, randomness=None)`

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.YAxis.set_snap

`YAxis.set_snap(snap)`

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

matplotlib.axis.YAxis.set_transform

`YAxis.set_transform(t)`

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

matplotlib.axis.YAxis.set_url

`YAxis.set_url(url)`

Sets the url for the artist

ACCEPTS: a url string

matplotlib.axis.YAxis.set_visible

`YAxis.set_visible(b)`

Set the artist's visiblity.

ACCEPTS: [True | False]

matplotlib.axis.YAxis.set_zorder

`YAxis.set_zorder(level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

matplotlib.axis.YAxis.stale

`YAxis.stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.YAxis.update

`YAxis.update(props)`

Update the properties of this `Artist` from the dictionary *prop*.

matplotlib.axis.YAxis.update_from

`YAxis.update_from(other)`

Copy properties from *other* to *self*.

matplotlib.axis.YAxis.zorder

`YAxis.zorder = 0`

CHAPTER

TWENTYONE

BACKENDS

21.1 matplotlib.backend_bases

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a matplotlib backend

RendererBase An abstract base class to handle drawing/rendering operations.

FigureCanvasBase The abstraction layer that separates the *matplotlib.figure.Figure* from the backend specific details like a user interface drawing area

GraphicsContextBase An abstract base class that provides color, line styles, etc...

Event The base class for all of the matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

ShowBase The base class for the Show class of each interactive backend; the 'show' callable is then set to Show.__call__, inherited from ShowBase.

ToolContainerBase The base class for the Toolbar class of each interactive backend.

StatusbarBase The base class for the messaging area.

class `matplotlib.backend_bases.`**`CloseEvent`**(*name*, *canvas*, *guiEvent=None*)

Bases: *matplotlib.backend_bases.Event*

An event triggered by a figure being closed

In addition to the *Event* attributes, the following event attributes are defined:

class `matplotlib.backend_bases.`**`DrawEvent`**(*name*, *canvas*, *renderer*)

Bases: *matplotlib.backend_bases.Event*

An event triggered by a draw operation on the canvas

In addition to the *Event* attributes, the following event attributes are defined:

renderer the *RendererBase* instance for the draw event

class `matplotlib.backend_bases.`**`Event`**(*name*, *canvas*, *guiEvent=None*)

Bases: `object`

A matplotlib event. Attach additional attributes as defined in `FigureCanvasBase.mpl_connect()`. The following attributes are defined and shown with their default values

name the event name

canvas the FigureCanvas instance generating the event

guiEvent the GUI event that triggered the matplotlib event

class `matplotlib.backend_bases.`**`FigureCanvasBase`**(*figure*)
Bases: `object`

The canvas the figure renders into.

Public attributes

figure A `matplotlib.figure.Figure` instance

`blit`(*bbox=None*)
blit the canvas in bbox (default entire canvas)

`button_press_event`(*x*, *y*, *button*, *dblclick=False*, *guiEvent=None*)
Backend derived classes should call this function on any mouse button press. x,y are the canvas coords: 0,0 is lower, left. button and key are as defined in `MouseEvent`.

This method will be call all functions connected to the 'button_press_event' with a `MouseEvent` instance.

`button_release_event`(*x*, *y*, *button*, *guiEvent=None*)
Backend derived classes should call this function on any mouse button release.

x the canvas coordinates where 0=left

y the canvas coordinates where 0=bottom

guiEvent the native UI event that generated the mpl event

This method will be call all functions connected to the 'button_release_event' with a `MouseEvent` instance.

`close_event`(*guiEvent=None*)
This method will be called by all functions connected to the 'close_event' with a `CloseEvent`

`draw`(**args*, ***kwargs*)
Render the `Figure`

`draw_cursor`(*event*)
Draw a cursor in the event.axes if inaxes is not None. Use native GUI drawing for efficiency if possible

`draw_event`(*renderer*)
This method will be call all functions connected to the 'draw_event' with a `DrawEvent`

`draw_idle`(**args*, ***kwargs*)
`draw()` only if idle; defaults to draw but backends can overrride

`enter_notify_event`(*guiEvent=None*, *xy=None*)
Backend derived classes should call this function when entering canvas

guiEvent the native UI event that generated the mpl event

xy the coordinate location of the pointer when the canvas is entered

`events` **= [’resize_event’, ‘draw_event’, ‘key_press_event’, ‘key_release_event’, ‘button_press_event’, ‘button_**

`filetypes` **= {‘ps’: ‘Postscript’, ‘eps’: ‘Encapsulated Postscript’, ‘pdf’: ‘Portable Document Format’, ‘pgf’: ‘**

`fixed_dpi` **= None**

`flush_events`()
Flush the GUI events for the figure. Implemented only for backends with GUIs.

`get_default_filename`()
Return a string, which includes extension, suitable for use as a default filename.

classmethod **`get_default_filetype`**()
Get the default savefig file format as specified in rcParam `savefig.format`. Returned string excludes period. Overridden in backends that only support a single file type.

classmethod **`get_supported_filetypes`**()
Return dict of savefig file formats supported by this backend

classmethod **`get_supported_filetypes_grouped`**()
Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as ‘Joint Photographic Experts Group’, and the values are a list of filename extensions used for that filetype, such as [’jpg’, ‘jpeg’].

`get_width_height`()
Return the figure width and height in points or pixels (depending on the backend), truncated to integers

`get_window_title`()
Get the title text of the window containing the figure. Return None if there is no window (e.g., a PS backend).

`grab_mouse`(*ax*)
Set the child axes which are currently grabbing the mouse events. Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.

`idle_event`(*guiEvent=None*)
Called when GUI is idle.

`is_saving`()
Returns `True` when the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

`key_press_event`(*key*, *guiEvent=None*)
This method will be call all functions connected to the ‘key_press_event’ with a `KeyEvent`

`key_release_event`(*key*, *guiEvent=None*)
This method will be call all functions connected to the ‘key_release_event’ with a `KeyEvent`

leave_notify_event(*guiEvent=None*)

Backend derived classes should call this function when leaving canvas

guiEvent the native UI event that generated the mpl event

motion_notify_event(*x*, *y*, *guiEvent=None*)

Backend derived classes should call this function on any motion-notify-event.

x the canvas coordinates where 0=left

y the canvas coordinates where 0=bottom

guiEvent the native UI event that generated the mpl event

This method will be call all functions connected to the 'motion_notify_event' with a `MouseEvent` instance.

mpl_connect(*s*, *func*)

Connect event with string *s* to *func*. The signature of *func* is:

```
def func(event)
```

where event is a `matplotlib.backend_bases.Event`. The following events are recognized

- 'button_press_event'
- 'button_release_event'
- 'draw_event'
- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event',
- 'figure_leave_event',
- 'axes_enter_event',
- 'axes_leave_event'
- 'close_event'

For the location events (button and key press/release), if the mouse is over the axes, the variable `event.inaxes` will be set to the `Axes` the event occurs is over, and additionally, the variables `event.xdata` and `event.ydata` will be defined. This is the mouse location in data coords. See `KeyEvent` and `MouseEvent` for more info.

Return value is a connection id that can be used with `mpl_disconnect()`.

Example usage:

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

mpl_disconnect(*cid*)

Disconnect callback id cid

Example usage:

```
cid = canvas.mpl_connect('button_press_event', on_press)
#...later
canvas.mpl_disconnect(cid)
```

new_timer(**args*, ***kwargs*)

Creates a new backend-specific subclass of `backend_bases.Timer`. This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

optional arguments:

interval Timer interval in milliseconds

callbacks Sequence of (func, args, kwargs) where func(*args, **kwargs) will be executed by the timer every *interval.*

onHilite(*ev*)

Mouse event processor which highlights the artists under the cursor. Connect this to the 'motion_notify_event' using:

```
canvas.mpl_connect('motion_notify_event',canvas.onHilite)
```

onRemove(*ev*)

Mouse event processor which removes the top artist under the cursor. Connect this to the 'mouse_press_event' using:

```
canvas.mpl_connect('mouse_press_event',canvas.onRemove)
```

pick(*mouseevent*)

pick_event(*mouseevent*, *artist*, ***kwargs*)

This method will be called by artists who are picked and will fire off *PickEvent* callbacks registered listeners

print_figure(*filename*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *orientation='portrait'*, *format=None*, ***kwargs*)

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

Arguments are:

filename can also be a file object on image backends

orientation only currently applies to PostScript printing.

dpi the dots per inch to save the figure in; if None, use savefig.dpi

facecolor the facecolor of the figure; if None, defaults to savefig.facecolor

edgecolor the edgecolor of the figure; if None, defaults to savefig.edgecolor

orientation landscape' | 'portrait' (not supported on all backends)

format when set, forcibly set the file format to save to

bbox_inches Bbox in inches. Only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure. If None, use savefig.bbox

pad_inches Amount of padding around the figure when bbox_inches is 'tight'. If None, use savefig.pad_inches

bbox_extra_artists A list of extra artists that will be considered when the tight bbox is calculated.

release_mouse(*ax*)

Release the mouse grab held by the axes, ax. Usually called by the widgets. It is ok to call this even if you ax doesn't have the mouse grab currently.

resize(*w*, *h*)

set the canvas size in pixels

resize_event()

This method will be call all functions connected to the 'resize_event' with a `ResizeEvent`

scroll_event(*x*, *y*, *step*, *guiEvent=None*)

Backend derived classes should call this function on any scroll wheel event. x,y are the canvas coords: 0,0 is lower, left. button and key are as defined in MouseEvent.

This method will be call all functions connected to the 'scroll_event' with a `MouseEvent` instance.

set_window_title(*title*)

Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

start_event_loop(*timeout*)

Start an event loop. This is used to start a blocking event loop so that interactive functions, such as ginput and waitforbuttonpress, can wait for events. This should not be confused with the main GUI event loop, which is always running and has nothing to do with this.

This is implemented only for backends with GUIs.

start_event_loop_default(*timeout=0*)

Start an event loop. This is used to start a blocking event loop so that interactive functions, such as ginput and waitforbuttonpress, can wait for events. This should not be confused with the main GUI event loop, which is always running and has nothing to do with this.

This function provides default event loop functionality based on time.sleep that is meant to be used until event loop functions for each of the GUI backends can be written. As such, it throws a deprecated warning.

This call blocks until a callback function triggers stop_event_loop() or *timeout* is reached. If *timeout* is <=0, never timeout.

`stop_event_loop``()`
Stop an event loop. This is used to stop a blocking event loop so that interactive functions, such as ginput and waitforbuttonpress, can wait for events.

This is implemented only for backends with GUIs.

`stop_event_loop_default``()`
Stop an event loop. This is used to stop a blocking event loop so that interactive functions, such as ginput and waitforbuttonpress, can wait for events.

`supports_blit` **= True**

`switch_backends``(`*FigureCanvasClass*`)`
Instantiate an instance of FigureCanvasClass

This is used for backend switching, e.g., to instantiate a FigureCanvasPS from a FigureCanvasGTK. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

class `matplotlib.backend_bases.`**`FigureManagerBase`**`(`*canvas*, *num*`)`
Bases: `object`

Helper class for pyplot mode, wraps everything up into a neat bundle

Public attibutes:

canvas A `FigureCanvasBase` instance

num The figure number

`destroy``()`

`full_screen_toggle``()`

`get_window_title``()`
Get the title text of the window containing the figure. Return None for non-GUI backends (e.g., a PS backend).

`key_press``(`*event*`)`
Implement the default mpl key bindings defined at *Navigation Keyboard Shortcuts*

`resize``(`*w*, *h*`)`
“For gui backends, resize the window (in pixels).

`set_window_title``(`*title*`)`
Set the title text of the window containing the figure. Note that this has no effect for non-GUI backends (e.g., a PS backend).

`show``()`
For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception to be caught by *`show()`*, for an optional warning.

show_popup(*msg*)
Display message in a popup – GUI only

class `matplotlib.backend_bases.`**GraphicsContextBase**
Bases: `object`

An abstract base class that provides color, line styles, etc...

copy_properties(*gc*)
Copy properties from gc to self

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_antialiased()
Return true if the object should try to do antialiased rendering

get_capstyle()
Return the capstyle as a string in ('butt', 'round', 'projecting')

get_clip_path()
Return the clip path in the form (path, transform), where path is a *Path* instance, and transform is an affine transform to apply to the path before clipping.

get_clip_rectangle()
Return the clip rectangle as a *Bbox* instance

get_dashes()
Return the dash information as an offset dashlist tuple.

The dash list is a even size list that gives the ink on, ink off in pixels.

See p107 of to PostScript BLUEBOOK for more info.

Default value is None

get_forced_alpha()
Return whether the value given by get_alpha() should be used to override any other alpha-channel values.

get_gid()
Return the object identifier if one is set, None otherwise.

get_hatch()
Gets the current hatch style

get_hatch_color()
Gets the color to use for hatching.

get_hatch_linewidth()
Gets the linewidth to use for hatching.

get_hatch_path(*density=6.0*)
Returns a Path for the current hatch.

get_joinstyle()
Return the line join style as one of ('miter', 'round', 'bevel')

get_linestyle(*style*)
Return the linestyle: one of ('solid', 'dashed', 'dashdot', 'dotted').

get_linewidth()
Return the line width in points as a scalar

get_rgb()
returns a tuple of three or four floats from 0-1.

get_sketch_params()
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()
returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

get_url()
returns a url if one is set, None otherwise

restore()
Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack

set_alpha(*alpha*)
Set the alpha value used for blending - not supported on all backends. If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

set_antialiased(*b*)
True if object should be drawn with antialiased rendering

set_capstyle(*cs*)
Set the capstyle as a string in ('butt', 'round', 'projecting')

set_clip_path(*path*)
Set the clip path and transformation. Path should be a *`TransformedPath`* instance.

set_clip_rectangle(*rectangle*)
Set the clip rectangle with sequence (left, bottom, width, height)

`set_dashes`(*dash_offset*, *dash_list*)
Set the dash style for the gc.

dash_offset is the offset (usually 0).

dash_list specifies the on-off sequence as points. `(None, None)` specifies a solid line

`set_foreground`(*fg*, *isRGBA=False*)
Set the foreground color. fg can be a MATLAB format string, a html hex color string, an rgb or rgba unit tuple, or a float between 0 and 1. In the latter case, grayscale is used.

If you know fg is rgba, set `isRGBA=True` for efficiency.

`set_gid`(*id*)
Sets the id.

`set_graylevel`(*frac*)
Set the foreground color to be a gray level with *frac*

`set_hatch`(*hatch*)
Sets the hatch style for filling

`set_hatch_color`(*hatch_color*)
sets the color to use for hatching.

`set_joinstyle`(*js*)
Set the join style to be one of ('miter', 'round', 'bevel')

`set_linestyle`(*style*)
Set the linestyle to be one of ('solid', 'dashed', 'dashdot', 'dotted'). These are defined in the rcParams `lines.dashed_pattern`, `lines.dashdot_pattern` and `lines.dotted_pattern`. One may also specify customized dash styles by providing a tuple of (offset, dash pairs).

`set_linewidth`(*w*)
Set the linewidth in points

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`set_url`(*url*)

Sets the url for links in compatible backends

class `matplotlib.backend_bases.`**`IdleEvent`**(*name*, *canvas*, *guiEvent=None*)

Bases: *`matplotlib.backend_bases.Event`*

An event triggered by the GUI backend when it is idle – useful for passive animation

class `matplotlib.backend_bases.`**`KeyEvent`**(*name*, *canvas*, *key*, *x=0*, *y=0*, *guiEvent=None*)

Bases: *`matplotlib.backend_bases.LocationEvent`*

A key event (key press, key release).

Attach additional attributes as defined in *`FigureCanvasBase.mpl_connect()`*.

In addition to the `Event` and `LocationEvent` attributes, the following attributes are defined:

key the key(s) pressed. Could be **None**, a single case sensitive ascii character (“g”, “G”, “#”, etc.), a special key (“control”, “shift”, “f1”, “up”, etc.) or a combination of the above (e.g., “ctrl+alt+g”, “ctrl+alt+G”).

Note: Modifier keys will be prefixed to the pressed key and will be in the order “ctrl”, “alt”, “super”. The exception to this rule is when the pressed key is itself a modifier key, therefore “ctrl+alt” and “alt+control” can both be valid key values.

Example usage:

```python
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

class `matplotlib.backend_bases.`**`LocationEvent`**(*name*, *canvas*, *x*, *y*, *guiEvent=None*)

Bases: *`matplotlib.backend_bases.Event`*

An event that has a screen location

The following additional attributes are defined and shown with their default values.

In addition to the `Event` attributes, the following event attributes are defined:

x x position - pixels from left of canvas

y y position - pixels from bottom of canvas

inaxes the `Axes` instance if mouse is over axes

xdata x coord of mouse in data coords

ydata y coord of mouse in data coords

x, *y* in figure coords, 0,0 = bottom, left

inaxes = None

lastevent = None

x = None

xdata = None

y = None

ydata = None

class `matplotlib.backend_bases.`**`MouseEvent`**(*name*, *canvas*, *x*, *y*, *button=None*, *key=None*, *step=0*, *dblclick=False*, *guiEvent=None*)

Bases: `matplotlib.backend_bases.LocationEvent`

A mouse event ('button_press_event', 'button_release_event', 'scroll_event', 'motion_notify_event').

In addition to the `Event` and `LocationEvent` attributes, the following attributes are defined:

button button pressed None, 1, 2, 3, 'up', 'down' (up and down are used for scroll events). Note that in the nbagg backend, both the middle and right clicks return 3 since right clicking will bring up the context menu in some browsers.

key the key depressed when the mouse event triggered (see `KeyEvent`)

step number of scroll steps (positive for 'up', negative for 'down')

Example usage:

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

x, y in figure coords, 0,0 = bottom, left button pressed None, 1, 2, 3, 'up', 'down'

button = None

dblclick = None

inaxes = None

step = None

x = None

xdata = None

y = None

ydata = None

class `matplotlib.backend_bases.`**`NavigationToolbar2`**(*canvas*)

Bases: `object`

Base class for the navigation cursor, version 2

backends must implement a canvas that handles connections for 'button_press_event' and 'button_release_event'. See `FigureCanvasBase.mpl_connect()` for more information

They must also define

`save_figure()` save the current figure

`set_cursor()` if you want the pointer icon to change

`_init_toolbar()` create your toolbar widget

`draw_rubberband()` **(optional)** draw the zoom to rect "rubberband" rectangle

`press()` **(optional)** whenever a mouse button is pressed, you'll be notified with the event

`release()` **(optional)** whenever a mouse button is released, you'll be notified with the event

`dynamic_update()` **(optional)** dynamically update the window while navigating

`set_message()` **(optional)** display message

`set_history_buttons()` **(optional)** you can change the history back / forward buttons to indicate disabled / enabled state.

That's it, we'll do the rest!

`back`(**args*)

move back up the view lim stack

`drag_pan`(*event*)

the drag callback in pan/zoom mode

`drag_zoom`(*event*)

the drag callback in zoom mode

`draw`()

Redraw the canvases, update the locators

`draw_rubberband`(*event, x0, y0, x1, y1*)

Draw a rectangle rubberband to indicate zoom limits

dynamic_update()

forward(**args*)
Move forward in the view lim stack

home(**args*)
Restore the original view

mouse_move(*event*)

pan(**args*)
Activate the pan/zoom tool. pan with left button, zoom with right

press(*event*)
Called whenver a mouse button is pressed.

press_pan(*event*)
the press mouse button in pan/zoom mode callback

press_zoom(*event*)
the press mouse button in zoom to rect mode callback

push_current()
push the current view limits and position onto the stack

release(*event*)
this will be called whenever mouse button is released

release_pan(*event*)
the release mouse button callback in pan/zoom mode

release_zoom(*event*)
the release mouse button callback in zoom to rect mode

remove_rubberband()
Remove the rubberband

save_figure(**args*)
Save the current figure

set_cursor(*cursor*)
Set the current cursor to one of the `Cursors` enums values

set_history_buttons()
Enable or disable back/forward button

set_message(*s*)
Display a message on toolbar or in status bar

toolitems = ((‘Home’, ‘Reset original view’, ‘home’, ‘home’), (‘Back’, ‘Back to previous view’, ‘back’, ‘back’

update()
Reset the axes stack

zoom(**args*)

Activate zoom to rect mode

exception `matplotlib.backend_bases.`**`NonGuiException`**

Bases: `Exception`

class `matplotlib.backend_bases.`**`PickEvent`**(*name*, *canvas*, *mouseevent*, *artist*, *guiEvent=None*, ***kwargs*)

Bases: *`matplotlib.backend_bases.Event`*

a pick event, fired when the user picks a location on the canvas sufficiently close to an artist.

Attrs: all the *`Event`* attributes plus

mouseevent the *`MouseEvent`* that generated the pick

artist the *`Artist`* picked

other extra class dependent attrs – e.g., a *`Line2D`* pick may define different extra attributes than a *`PatchCollection`* pick event

Example usage:

```
ax.plot(np.rand(100), 'o', picker=5)  # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

class `matplotlib.backend_bases.`**`RendererBase`**

Bases: `object`

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing *`draw_path()`* alone would give a highly capable backend):

- *`draw_path()`*
- *`draw_image()`*
- *`draw_gouraud_triangle()`*

The following methods *should* be implemented in the backend for optimization reasons:

- *`draw_text()`*
- *`draw_markers()`*
- *`draw_path_collection()`*
- *`draw_quad_mesh()`*

close_group(*s*)

Close a grouping element with label *s* Is only currently used by *`backend_svg`*

draw_gouraud_triangle(*gc*, *points*, *colors*, *transform*)

Draw a Gouraud-shaded triangle.

points is a 3x2 array of (x, y) points for the triangle.

colors is a 3x4 array of RGBA colors for each point of the triangle.

transform is an affine transform to apply to the points.

draw_gouraud_triangles(*gc*, *triangles_array*, *colors_array*, *transform*)

Draws a series of Gouraud triangles.

points is a Nx3x2 array of (x, y) points for the trianglex.

colors is a Nx3x4 array of RGBA colors for each point of the triangles.

transform is an affine transform to apply to the points.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

gc a `GraphicsContextBase` instance with clipping information.

x the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im An NxMx4 array of RGBA pixels (of dtype uint8).

transform If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation *may* be passed to `draw_image()`. It takes the form of a `Affine2DBase` instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override `x` and `y`, and has to be applied *before* translating the result by `x` and `y` (this can be accomplished by adding `x` and `y` to the translation vector defined by `transform`).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

gc the `GraphicsContextBase` instance

marker_trans is an affine transform applied to the marker.

trans is an affine transform applied to the path.

This provides a fallback implementation of draw_markers that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draws a `Path` instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offsetTrans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draws a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied. *offset_position* may be either "screen" or "data" depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_quad_mesh`(*gc*, *master_transform*, *meshWidth*, *meshHeight*, *coordinates*, *offsets*, *offsetTrans*, *facecolors*, *antialiased*, *edgecolors*)

This provides a fallback implementation of `draw_quad_mesh()` that generates paths and then calls `draw_path_collection()`.

`draw_tex`(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath='TeX!'*, *mtext=None*)

`draw_text`(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw the text instance

gc the `GraphicsContextBase` instance

x the x location of the text in display coords

y the y location of the text baseline in display coords

s the text string

prop a `matplotlib.font_manager.FontProperties` instance

angle the rotation angle in degrees

mtext a `matplotlib.text.Text` instance

backend implementers note

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy`()

Return true if y small numbers are top for renderer Is used for drawing text (`matplotlib.text`) and images (`matplotlib.image`) only

`get_canvas_width_height`()

return the canvas width and height in display coords

`get_image_magnification`()

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

get_texmanager()

return the `matplotlib.texmanager.TexManager` instance

get_text_width_height_descent(*s*, *prop*, *ismath*)

get the width and height, and the offset from the bottom to the baseline (descent), in display coords of the string s with `FontProperties` prop

new_gc()

Return an instance of a `GraphicsContextBase`

open_group(*s*, *gid=None*)

Open a grouping element with label *s*. If *gid* is given, use *gid* as the id of the group. Is only currently used by `backend_svg`.

option_image_nocomposite()

override this method for renderers that do not necessarily always want to rescale and composite raster images. (like SVG, PDF, or PS)

option_scale_image()

override this method for renderers that support arbitrary affine transformations in `draw_image()` (most vector backends).

points_to_pixels(*points*)

Convert points to display units

points a float or a numpy array of float

return points converted to pixels

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

start_filter()

Used in AggRenderer. Switch to a temporary renderer for image filtering effects.

start_rasterizing()

Used in MixedModeRenderer. Switch to the raster renderer.

stop_filter(*filter_func*)

Used in AggRenderer. Switch back to the original renderer. The contents of the temporary renderer is processed with the *filter_func* and is drawn on the original renderer as an image.

stop_rasterizing()

Used in MixedModeRenderer. Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

strip_math(*s*)

class `matplotlib.backend_bases.`**ResizeEvent**(*name*, *canvas*)

Bases: `matplotlib.backend_bases.Event`

An event triggered by a canvas resize

In addition to the `Event` attributes, the following event attributes are defined:

width width of the canvas in pixels

height height of the canvas in pixels

class `matplotlib.backend_bases.`**`ShowBase`**

Bases: `object`

Simple base class to generate a show() callable in backends.

Subclass must override mainloop() method.

`mainloop``()`

class `matplotlib.backend_bases.`**`StatusbarBase`**`(`*toolmanager*`)`

Bases: `object`

Base class for the statusbar

`set_message``(`*s*`)`

Display a message on toolbar or in status bar

Parameters s : str

Message text

class `matplotlib.backend_bases.`**`TimerBase`**`(`*interval=None*, *callbacks=None*`)`

Bases: `object`

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Mandatory functions that must be implemented:

- `_timer_start`: Contains backend-specific code for starting the timer
- `_timer_stop`: Contains backend-specific code for stopping the timer

Optional overrides:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the `Timer` class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
- `_on_timer`: This is the internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

Attributes:

- `interval`: The time between timer events in milliseconds. Default is 1000 ms.
- `single_shot`: Boolean flag indicating whether this timer should operate as single shot (run once and then stop). Defaults to `False`.

- `callbacks`: Stores list of (func, args) tuples that will be called upon timer events. This list can be manipulated directly, or the functions *`add_callback`* and *`remove_callback`* can be used.

`add_callback`(*func*, **args*, ***kwargs*)
Register `func` to be called by timer when the event fires. Any additional arguments provided will be passed to `func`.

`interval`

`remove_callback`(*func*, **args*, ***kwargs*)
Remove `func` from list of callbacks. `args` and `kwargs` are optional and used to distinguish between copies of the same function registered to be called with different arguments.

`single_shot`

`start`(*interval=None*)
Start the timer object. *`interval`* is optional and will be used to reset the timer interval first if provided.

`stop`()
Stop the timer.

class `matplotlib.backend_bases.`**`ToolContainerBase`**(*toolmanager*)
Bases: `object`

Base class for all tool containers, e.g. toolbars.

Attributes

toolmanager	(`ToolManager` object that holds the tools that) this `ToolContainer` wants to communicate with.

`add_tool`(*tool*, *group*, *position=-1*)
Adds a tool to this container

Parameters tool : tool_like

The tool to add, see `ToolManager.get_tool`.

group : str

The name of the group to add this tool to.

position : int (optional)

The position within the group to place this tool. Defaults to end.

`add_toolitem`(*name*, *group*, *position*, *image*, *description*, *toggle*)
Add a toolitem to the container

This method must get implemented per backend

The callback associated with the button click event, must be **EXACTLY** `self.trigger_tool(name)`

Parameters name : string

Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons

group : String

Name of the group that this tool belongs to

position : Int

Position of the tool within its group, if -1 it goes at the End

image_file : String

Filename of the image for the button or `None`

description : String

Description of the tool, used for the tooltips

toggle : Bool

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks)
- `False` : The button is a normal button (returns to unpressed state after release)

`remove_toolitem`(*name*)

Remove a toolitem from the `ToolContainer`

This method must get implemented per backend

Called when `ToolManager` emits a `tool_removed_event`

Parameters name : string

Name of the tool to remove

`toggle_toolitem`(*name*, *toggled*)

Toggle the toolitem without firing event

Parameters name : String

Id of the tool to toggle

toggled : bool

Whether to set this tool as toggled or not.

`trigger_tool`(*name*)

Trigger the tool

Parameters name : String

Name(id) of the tool triggered from within the container

`matplotlib.backend_bases.`**`get_registered_canvas_class`**(*format*)

Return the registered default canvas for given file format. Handles deferred import of required backend.

`matplotlib.backend_bases.`**`key_press_handler`**`(`*event*, *canvas*, *toolbar=None*`)`

Implement the default mpl key bindings for the canvas and toolbar described at *Navigation Keyboard Shortcuts*

event a `KeyEvent` instance

canvas a `FigureCanvasBase` instance

toolbar a `NavigationToolbar2` instance

`matplotlib.backend_bases.`**`register_backend`**`(`*format*, *backend*, *description=None*`)`

Register a backend for saving to a given file format.

format [str] File extention

backend [module string or canvas class] Backend for handling file output

description [str, optional] Description of the file type. Defaults to an empty string

21.2 `matplotlib.backend_managers`

`ToolManager` Class that makes the bridge between user interaction (key press, toolbar clicks, ..) and the actions in response to the user inputs.

class `matplotlib.backend_managers.`**`ToolEvent`**`(`*name*, *sender*, *tool*, *data=None*`)`

Bases: `object`

Event for tool manipulation (add/remove)

class `matplotlib.backend_managers.`**`ToolManager`**`(`*canvas*`)`

Bases: `object`

Helper class that groups all the user interactions for a FigureManager

Attributes

manager: `FigureManager`	
keypresslock: `widgets.LockDraw`	`LockDraw` object to know if the `canvas` key_press_event is locked
messagelock: `widgets.LockDraw`	`LockDraw` object to know if the message is available to write

`active_toggle`

Currently toggled tools

`add_tool``(`*name*, *tool*, **args*, ***kwargs*`)`

Add *tool* to `ToolManager`

If successful adds a new event `tool_trigger_name` where **name** is the **name** of the tool, this event is fired everytime the tool is triggered.

Parameters name : str

Name of the tool, treated as the ID, has to be unique

tool : class_like, i.e. str or type

Reference to find the class of the Tool to added.

See also:

`matplotlib.backend_tools.ToolBase` The base class for tools.

Notes

args and kwargs get passed directly to the tools constructor.

`get_tool`(*name*, *warn=True*)

Return the tool object, also accepts the actual tool for convenience

Parameters name : str, ToolBase

Name of the tool, or the tool itself

warn : bool, optional

If this method should give warnings.

`get_tool_keymap`(*name*)

Get the keymap associated with the specified tool

Parameters name : string

Name of the Tool

Returns list : list of keys associated with the Tool

`message_event`(*message*, *sender=None*)

Emit a *`ToolManagerMessageEvent`*

`remove_tool`(*name*)

Remove tool from *`ToolManager`*

Parameters name : string

Name of the Tool

`toolmanager_connect`(*s*, *func*)

Connect event with string *s* to *func*.

Parameters s : String

Name of the event

The following events are recognized

- 'tool_message_event'
- 'tool_removed_event'
- 'tool_added_event'

For every tool added a new event is created

- ‘tool_trigger_TOOLNAME‘ Where TOOLNAME is the id of the tool.

func : function

Function to be called with signature def func(event)

`toolmanager_disconnect`(*cid*)

Disconnect callback id *cid*

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom',
                                      on_press)
#...later
toolmanager.toolmanager_disconnect(cid)
```

`tools`

Return the tools controlled by *`ToolManager`*

`trigger_tool`(*name*, *sender=None*, *canvasevent=None*, *data=None*)

Trigger a tool and emit the tool_trigger_[name] event

Parameters name : string

Name of the tool

sender: object

Object that wishes to trigger the tool

canvasevent : Event

Original Canvas event or None

data : Object

Extra data to pass to the tool when triggering

`update_keymap`(*name*, **keys*)

Set the keymap to associate with the specified tool

Parameters name : string

Name of the Tool

keys : keys to associate with the Tool

class `matplotlib.backend_managers.`**`ToolManagerMessageEvent`**(*name*, *sender*, *message*)

Bases: `object`

Event carrying messages from toolmanager

Messages usually get displayed to the user by the toolbar

class `matplotlib.backend_managers.`**`ToolTriggerEvent`**(*name*, *sender*, *tool*, *canvasevent=None*, *data=None*)

Bases: *`matplotlib.backend_managers.ToolEvent`*

Event to inform that a tool has been triggered

21.3 `matplotlib.backend_tools`

Abstract base classes define the primitives for Tools. These tools are used by *`matplotlib.backend_managers.ToolManager`*

`ToolBase` Simple stateless tool

`ToolToggleBase` Tool that has two states, only one Toggle tool can be active at any given time for the same *`matplotlib.backend_managers.ToolManager`*

class `matplotlib.backend_tools.`**`AxisScaleBase`**(**args*, ***kwargs*)

Bases: *`matplotlib.backend_tools.ToolToggleBase`*

Base Tool to toggle between linear and logarithmic

`disable`(*event*)

`enable`(*event*)

`trigger`(*sender*, *event*, *data=None*)

class `matplotlib.backend_tools.`**`ConfigureSubplotsBase`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Base tool for the configuration of subplots

`description` **= 'Configure subplots'**

`image` **= 'subplots.png'**

class `matplotlib.backend_tools.`**`Cursors`**

Bases: `object`

Simple namespace for cursor reference

`HAND` **= 0**

`MOVE` **= 3**

`POINTER` **= 1**

`SELECT_REGION` **= 2**

class `matplotlib.backend_tools.`**`RubberbandBase`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Draw and remove rubberband

`draw_rubberband`(**data*)

Draw rubberband

This method must get implemented per backend

`remove_rubberband`()

Remove rubberband

This method should get implemented per backend

`trigger`(*sender*, *event*, *data*)

Call *`draw_rubberband`* or *`remove_rubberband`* based on data

class `matplotlib.backend_tools.`**`SaveFigureBase`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Base tool for figure saving

`default_keymap` **= ['s', 'ctrl+s']**

`description` **= 'Save the figure'**

`image` **= 'filesave.png'**

class `matplotlib.backend_tools.`**`SetCursorBase`**(**args*, ***kwargs*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Change to the current cursor while inaxes

This tool, keeps track of all *`ToolToggleBase`* derived tools, and calls set_cursor when a tool gets triggered

`set_cursor`(*cursor*)

Set the cursor

This method has to be implemented per backend

class `matplotlib.backend_tools.`**`ToolBack`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ViewsPositionsBase`*

Move back up the view lim stack

`default_keymap` **= ['left', 'c', 'backspace']**

`description` **= 'Back to previous view'**

`image` **= 'back.png'**

class `matplotlib.backend_tools.`**`ToolBase`**(*toolmanager*, *name*)

Bases: `object`

Base tool class

A base tool, only implements *`trigger`* method or not method at all. The tool is instantiated by *`matplotlib.backend_managers.ToolManager`*

Attributes

toolmanager: *`matplotlib.backend_managers.ToolManager`*	ToolManager that controls this Tool
figure: `FigureCanvas`	Figure instance that is affected by this Tool
name: String	Used as **Id** of the tool, has to be unique among tools of the same ToolManager

`default_keymap` **= None**

Keymap to associate with this tool

String: List of comma separated keys that will be used to call this tool when the keypress event of *self.figure.canvas* is emited

`description` **= None**

Description of the Tool

String: If the Tool is included in the Toolbar this text is used as a Tooltip

`destroy`()

Destroy the tool

This method is called when the tool is removed by *`matplotlib.backend_managers.ToolManager.remove_tool`*

`figure`

`image` **= None**

Filename of the image

String: Filename of the image to use in the toolbar. If None, the *`name`* is used as a label in the toolbar button

`name`

Tool Id

`trigger`(*sender*, *event*, *data=None*)

Called when this tool gets used

This method is called by *`matplotlib.backend_managers.ToolManager.trigger_tool`*

Parameters event: 'Event'

The Canvas event that caused this tool to be called

sender: object

Object that requested the tool to be triggered

data: object

Extra data

class `matplotlib.backend_tools.`**`ToolCursorPosition`**`(`**args*, ***kwargs*`)`

Bases: *`matplotlib.backend_tools.ToolBase`*

Send message with the current pointer position

This tool runs in the background reporting the position of the cursor

`send_message``(`*event*`)`

Call *`matplotlib.backend_managers.ToolManager.message_event`*

class `matplotlib.backend_tools.`**`ToolEnableAllNavigation`**`(`*toolmanager*, *name*`)`

Bases: *`matplotlib.backend_tools.ToolBase`*

Tool to enable all axes for toolmanager interaction

`default_keymap` **= ['a']**

`description` **= 'Enables all axes toolmanager'**

`trigger``(`*sender*, *event*, *data=None*`)`

class `matplotlib.backend_tools.`**`ToolEnableNavigation`**`(`*toolmanager*, *name*`)`

Bases: *`matplotlib.backend_tools.ToolBase`*

Tool to enable a specific axes for toolmanager interaction

`default_keymap` **= (1, 2, 3, 4, 5, 6, 7, 8, 9)**

`description` **= 'Enables one axes toolmanager'**

`trigger``(`*sender*, *event*, *data=None*`)`

class `matplotlib.backend_tools.`**`ToolForward`**`(`*toolmanager*, *name*`)`

Bases: *`matplotlib.backend_tools.ViewsPositionsBase`*

Move forward in the view lim stack

`default_keymap` **= ['right', 'v']**

`description` **= 'Forward to next view'**

`image` **= 'forward.png'**

class `matplotlib.backend_tools.`**`ToolFullScreen`**(**args*, ***kwargs*)

Bases: *`matplotlib.backend_tools.ToolToggleBase`*

Tool to toggle full screen

`default_keymap` **= ['f', 'ctrl+f']**

`description` **= 'Toogle Fullscreen mode'**

`disable`(*event*)

`enable`(*event*)

class `matplotlib.backend_tools.`**`ToolGrid`**(**args*, ***kwargs*)

Bases: *`matplotlib.backend_tools.ToolToggleBase`*

Tool to toggle the grid of the figure

`default_keymap` **= ['g']**

`description` **= 'Toogle Grid'**

`disable`(*event*)

`enable`(*event*)

`trigger`(*sender*, *event*, *data=None*)

class `matplotlib.backend_tools.`**`ToolHome`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ViewsPositionsBase`*

Restore the original view lim

`default_keymap` **= ['h', 'r', 'home']**

`description` **= 'Reset original view'**

`image` **= 'home.png'**

class `matplotlib.backend_tools.`**`ToolPan`**(**args*)

Bases: *`matplotlib.backend_tools.ZoomPanBase`*

Pan axes with left mouse, zoom with right

`cursor` **= 3**

`default_keymap` **= ['p']**

`description` **= 'Pan axes with left mouse, zoom with right'**

`image` **= 'move.png'**

`radio_group` **= 'default'**

class `matplotlib.backend_tools.`**`ToolQuit`**(*toolmanager*, *name*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Tool to call the figure manager destroy method

`default_keymap` **= ['ctrl+w', 'cmd+w']**

`description` **= 'Quit the figure'**

`trigger`(*sender*, *event*, *data=None*)

class `matplotlib.backend_tools.`**`ToolToggleBase`**(**args*, ***kwargs*)

Bases: *`matplotlib.backend_tools.ToolBase`*

Toggleable tool

Every time it is triggered, it switches between enable and disable

`cursor` **= None**

Cursor to use when the tool is active

`disable`(*event=None*)

Disable the toggle tool

`trigger` call this method when *`toggled`* is True.

This can happen in different circumstances

- Click on the toolbar tool button
- Call to *`matplotlib.backend_managers.ToolManager.trigger_tool`*
- Another *`ToolToggleBase`* derived tool is triggered (from the same `ToolManager`)

`enable`(*event=None*)

Enable the toggle tool

`trigger` calls this method when *`toggled`* is False

`radio_group` **= None**

Attribute to group 'radio' like tools (mutually exclusive)

String that identifies the group or **None** if not belonging to a group

toggled
State of the toggled tool

trigger(*sender*, *event*, *data=None*)
Calls *enable* or *disable* based on *toggled* value

class `matplotlib.backend_tools.`**ToolViewsPositions**(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.ToolBase*

Auxiliary Tool to handle changes in views and positions

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- *ToolZoom*
- *ToolPan*
- *ToolHome*
- *ToolBack*
- *ToolForward*

add_figure()
Add the current figure to the stack of views and positions

back()
Back one step in the stack of views and positions

clear(*figure*)
Reset the axes stack

forward()
Forward one step in the stack of views and positions

home()
Recall the first view and position from the stack

push_current()
push the current view limits and position onto the stack

refresh_locators()
Redraw the canvases, update the locators

update_view()
Update the viewlim and position from the view and position stack for each axes

class `matplotlib.backend_tools.`**ToolXScale**(**args*, ***kwargs*)
Bases: *matplotlib.backend_tools.AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the X axis

default_keymap = ['k', 'L']

description = 'Toogle Scale X axis'

set_scale(*ax*, *scale*)

class matplotlib.backend_tools.**ToolYScale**(**args*, ***kwargs*)

Bases: `matplotlib.backend_tools.AxisScaleBase`

Tool to toggle between linear and logarithmic scales on the Y axis

default_keymap = ['l']

description = 'Toogle Scale Y axis'

set_scale(*ax*, *scale*)

class matplotlib.backend_tools.**ToolZoom**(**args*)

Bases: `matplotlib.backend_tools.ZoomPanBase`

Zoom to rectangle

cursor = 2

default_keymap = ['o']

description = 'Zoom to rectangle'

image = 'zoom_to_rect.png'

radio_group = 'default'

class matplotlib.backend_tools.**ViewsPositionsBase**(*toolmanager*, *name*)

Bases: `matplotlib.backend_tools.ToolBase`

Base class for `ToolHome`, `ToolBack` and `ToolForward`

trigger(*sender*, *event*, *data=None*)

class matplotlib.backend_tools.**ZoomPanBase**(**args*)

Bases: `matplotlib.backend_tools.ToolToggleBase`

Base class for `ToolZoom` and `ToolPan`

disable(*event*)

Release the canvas and disconnect press/release events

enable(*event*)

Connect press/release events and lock the canvas

scroll_zoom(*event*)

`trigger`(*sender*, *event*, *data=None*)

`matplotlib.backend_tools.`**`add_tools_to_container`**(*container*, *tools=[['navigation', ['home', 'back', 'forward']], ['zoompan', ['pan', 'zoom', 'subplots']], ['io', ['save']]]*)

Add multiple tools to the container.

Parameters container: Container

`backend_bases.ToolContainerBase` object that will get the tools added

tools : list, optional

List in the form [[group1, [tool1, tool2 ...]], [group2, [...]]] Where the tools given by tool1, and tool2 will display in group1. See `add_tool` for details.

`matplotlib.backend_tools.`**`add_tools_to_manager`**(*toolmanager*, *tools={'home': <class 'matplotlib.backend_tools.ToolHome'>, 'back': <class 'matplotlib.backend_tools.ToolBack'>, 'forward': <class 'matplotlib.backend_tools.ToolForward'>, 'zoom': <class 'matplotlib.backend_tools.ToolZoom'>, 'pan': <class 'matplotlib.backend_tools.ToolPan'>, 'subplots': 'ToolConfigureSubplots', 'save': 'ToolSaveFigure', 'grid': <class 'matplotlib.backend_tools.ToolGrid'>, 'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>, 'quit': <class 'matplotlib.backend_tools.ToolQuit'>, 'allnav': <class 'matplotlib.backend_tools.ToolEnableAllNavigation'>, 'nav': <class 'matplotlib.backend_tools.ToolEnableNavigation'>, 'xscale': <class 'matplotlib.backend_tools.ToolXScale'>, 'yscale': <class 'matplotlib.backend_tools.ToolYScale'>, 'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>, 'viewpos': <class 'matplotlib.backend_tools.ToolViewsPositions'>, 'cursor': 'ToolSetCursor', 'rubberband': 'ToolRubberband'}*)

Add multiple tools to `ToolManager`

Parameters toolmanager: ToolManager

`backend_managers.ToolManager` object that will get the tools added

tools : {str: class_like}, optional

The tools to add in a {name: tool} dict, see `add_tool` for more info.

`matplotlib.backend_tools.`**`default_toolbar_tools`** **= [['navigation', ['home', 'back', 'forward']], ['zoompan',**

Default tools in the toolbar

`matplotlib.backend_tools.`**`default_tools`** **= {'home': <class 'matplotlib.backend_tools.ToolHome'>, 'back': <**

Default tools

21.4 matplotlib.backends.backend_gtkagg

TODO We'll add this later, importing the gtk backends requires an active X-session, which is not compatible with cron jobs.

21.5 matplotlib.backends.backend_qt4agg

Render to qt from agg

`matplotlib.backends.backend_qt4agg.`**`FigureCanvas`**

alias of *`FigureCanvasQTAgg`*

class `matplotlib.backends.backend_qt4agg.`**`FigureCanvasQTAgg`**(*figure*)

Bases: *`matplotlib.backends.backend_qt4agg.FigureCanvasQTAggBase`*, `matplotlib.backends.backend_qt4.FigureCanvasQT`, `matplotlib.backends.backend_agg.FigureCanvasAgg`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

Public attribute

figure - A Figure instance

class `matplotlib.backends.backend_qt4agg.`**`FigureCanvasQTAggBase`**(*figure*)

Bases: *`matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase`*

`matplotlib.backends.backend_qt4agg.`**`new_figure_manager`**(*num*, **args*, ***kwargs*)

Create a new figure manager instance

`matplotlib.backends.backend_qt4agg.`**`new_figure_manager_given_figure`**(*num*, *figure*)

Create a new figure manager instance for the given figure.

21.6 matplotlib.backends.backend_qt5agg

Render to qt from agg

`matplotlib.backends.backend_qt5agg.`**`FigureCanvas`**

alias of *`FigureCanvasQTAgg`*

class `matplotlib.backends.backend_qt5agg.`**`FigureCanvasQTAgg`**(*figure*)

Bases: *`matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase`*, `matplotlib.backends.backend_qt5.FigureCanvasQT`, `matplotlib.backends.backend_agg.FigureCanvasAgg`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Modified to import from Qt5 backend for new-style mouse events.

Public attribute

> figure - A Figure instance

class `matplotlib.backends.backend_qt5agg.`**`FigureCanvasQTAggBase`**(*figure*)

Bases: `object`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

Public attribute

> figure - A Figure instance

`blit`(*bbox=None*)

Blit the region in bbox

`draw`()

Draw the figure with Agg, and queue a request for a Qt draw.

`drawRectangle`(*rect*)

`draw_idle`()

Queue redraw of the Agg buffer and request Qt paintEvent.

`paintEvent`(*e*)

Copy the image from the Agg canvas to the qt.drawable. In Qt, all drawing should be done inside of here when a widget is shown onscreen.

`print_figure`(**args*, ***kwargs*)

`matplotlib.backends.backend_qt5agg.`**`new_figure_manager`**(*num*, **args*, ***kwargs*)

Create a new figure manager instance

`matplotlib.backends.backend_qt5agg.`**`new_figure_manager_given_figure`**(*num*, *figure*)

Create a new figure manager instance for the given figure.

21.7 `matplotlib.backends.backend_wxagg`

`matplotlib.backends.backend_wxagg.`**`FigureCanvas`**

alias of *`FigureCanvasWxAgg`*

class `matplotlib.backends.backend_wxagg.`**`FigureCanvasWxAgg`**(*parent*, *id*, *figure*)

Bases: `matplotlib.backends.backend_agg.FigureCanvasAgg`, `matplotlib.backends.backend_wx.FigureCanvasWx`

The FigureCanvas contains the figure and does event handling.

In the wxPython backend, it is derived from wxPanel, and (usually) lives inside a frame instantiated by a FigureManagerWx. The parent window probably implements a wxSizer to control the displayed control size - but we give a hint as to our preferred minimum size.

Initialise a FigureWx instance.

- Initialise the FigureCanvasBase and wxPanel parents.
- Set event handlers for: EVT_SIZE (Resize event) EVT_PAINT (Paint event)

blit(*bbox=None*)
Transfer the region of the agg buffer defined by bbox to the display. If bbox is None, the entire buffer is transferred.

draw(*drawDC=None*)
Render the figure using agg.

filetypes = {'ps': 'Postscript', 'eps': 'Encapsulated Postscript', 'pdf': 'Portable Document Format', 'pgf':

print_figure(*filename*, **args*, ***kwargs*)

class `matplotlib.backends.backend_wxagg.`**FigureFrameWxAgg**(*num*, *fig*)
Bases: `matplotlib.backends.backend_wx.FigureFrameWx`

get_canvas(*fig*)

class `matplotlib.backends.backend_wxagg.`**NavigationToolbar2WxAgg**(*canvas*)
Bases: `matplotlib.backends.backend_wx.NavigationToolbar2Wx`

get_canvas(*frame*, *fig*)

`matplotlib.backends.backend_wxagg.`**new_figure_manager**(*num*, **args*, ***kwargs*)
Create a new figure manager instance

`matplotlib.backends.backend_wxagg.`**new_figure_manager_given_figure**(*num*, *figure*)
Create a new figure manager instance for the given figure.

21.8 matplotlib.backends.backend_pdf

A PDF matplotlib backend Author: Jouni K Seppänen <jks@iki.fi>

`matplotlib.backends.backend_pdf.`**FigureCanvas**
alias of *FigureCanvasPdf*

class `matplotlib.backends.backend_pdf.`**FigureCanvasPdf**(*figure*)
Bases: *matplotlib.backend_bases.FigureCanvasBase*

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

Public attribute

figure - A Figure instance

class `matplotlib.backends.backend_pdf.`**`Name`**`(`*name*`)`

Bases: `object`

PDF name object.

class `matplotlib.backends.backend_pdf.`**`Operator`**`(`*op*`)`

Bases: `object`

PDF operator object.

class `matplotlib.backends.backend_pdf.`**`PdfFile`**`(`*filename*`)`

Bases: `object`

PDF file object.

`alphaState``(`*alpha*`)`

Return name of an ExtGState that sets alpha to the given value

`embedTTF``(`*filename*, *characters*`)`

Embed the TTF font from the named file into the document.

`fontName``(`*fontprop*`)`

Select a font based on fontprop and return a name suitable for Op.selectfont. If fontprop is a string, it will be interpreted as the filename (or dvi name) of the font.

`imageObject``(`*image*`)`

Return name of an image XObject representing the given image.

`markerObject``(`*path*, *trans*, *fill*, *stroke*, *lw*, *joinstyle*, *capstyle*`)`

Return name of a marker XObject representing the given path.

`reserveObject``(`*name='‘*`)`

Reserve an ID for an indirect object. The name is used for debugging in case we forget to print out the object with writeObject.

`writeInfoDict``()`

Write out the info dictionary, checking it for good form

`writeTrailer``()`

Write out the PDF trailer.

`writeXref``()`

Write out the xref table.

class `matplotlib.backends.backend_pdf.`**`PdfPages`**`(`*filename*, *keep_empty=True*`)`

Bases: `object`

A multi-page PDF file.

Notes

In reality *PdfPages* is a thin wrapper around *PdfFile*, in order to avoid confusion when using *savefig()* and forgetting the format argument.

Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

Parameters filename: str

Plots using *PdfPages.savefig()* will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

keep_empty: bool, optional

If set to False, then empty pdf files will be deleted automatically when closed.

attach_note(*text, positionRect=[-100, -100, 0, 0]*)

Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

close()

Finalize this object, making the underlying file a complete PDF file.

get_pagecount()

Returns the current number of pages in the multipage pdf file.

infodict()

Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

savefig(*figure=None*, ***kwargs*)

Saves a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig()*.

Parameters figure: :class:'~matplotlib.figure.Figure' or int, optional

Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

class `matplotlib.backends.backend_pdf.`**`Reference`**`(`*id*`)`

Bases: `object`

PDF reference object. Use PdfFile.reserveObject() to create References.

class `matplotlib.backends.backend_pdf.`**`Stream`**`(`*id*, *len*, *file*, *extra=None*, *png=None*`)`

Bases: `object`

PDF stream object.

This has no pdfRepr method. Instead, call begin(), then output the contents of the stream by calling write(), and finally call end().

id: object id of stream; len: an unused Reference object for the length of the stream, or None (to use a memory buffer); file: a PdfFile; extra: a dictionary of extra key-value pairs to include in the stream header; png: if the data is already png compressed, the decode parameters

`end``()`

Finalize stream.

`write``(`*data*`)`

Write some data on the stream.

class `matplotlib.backends.backend_pdf.`**`Verbatim`**`(`*x*`)`

Bases: `object`

Store verbatim PDF command content for later inclusion in the stream.

`matplotlib.backends.backend_pdf.`**`fill`**`(`*strings*, *linelen=75*`)`

Make one string from sequence of strings, with whitespace in between. The whitespace is chosen to form lines of at most linelen characters, if possible.

`matplotlib.backends.backend_pdf.`**`new_figure_manager`**`(`*num*, **args*, ***kwargs*`)`

Create a new figure manager instance

`matplotlib.backends.backend_pdf.`**`new_figure_manager_given_figure`**`(`*num*, *figure*`)`

Create a new figure manager instance for the given figure.

`matplotlib.backends.backend_pdf.`**`pdfRepr`**`(`*obj*`)`

Map Python objects to PDF syntax.

21.9 `matplotlib.backends.backend_svg`

`matplotlib.backends.backend_svg.`**`new_figure_manager_given_figure`**`(`*num*, *figure*`)`

Create a new figure manager instance for the given figure.

`matplotlib.backends.backend_svg.`**`short_float_fmt`**`(`*x*`)`

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

CHAPTER

TWENTYTWO

CBOOK

22.1 `matplotlib.cbook`

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook – hence the name cbook.

This module is safe to import from anywhere within matplotlib; it imports matplotlib only at runtime.

class `matplotlib.cbook.`**`Bunch`**(***kwds*)

Bases: `object`

Often we want to just collect a bunch of stuff together, naming each item of the bunch; a dictionary's OK for that, but a small do- nothing class is even handier, and prettier to use. Whenever you want to group a few variables:

```
>>> point = Bunch(datum=2, squared=4, coord=12)
>>> point.datum

By: Alex Martelli
From: https://code.activestate.com/recipes/121294/
```

class `matplotlib.cbook.`**`CallbackRegistry`**

Bases: `object`

Handle registering and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...    print('eat', x)
>>> def ondrink(x):
...    print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
```

```
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456) # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)      # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive. The Python stdlib weakref module can not create weak references to bound methods directly, so we need to create a proxy object to handle weak references to bound methods (or regular free functions). This technique was shared by Peter Parente on his "Mindtrove" blog.

connect(*s*, *func*)
register *func* to be called when a signal *s* is generated func will be called

disconnect(*cid*)
disconnect the callback registered with callback id *cid*

process(*s*, **args*, ***kwargs*)
process signal *s*. All of the functions registered to receive callbacks on *s* will be called with **args* and ***kwargs*

class `matplotlib.cbook.`**GetRealpathAndStat**
Bases: `object`

class `matplotlib.cbook.`**Grouper**(*init=()*)
Bases: `object`

This class provides a lightweight way to group arbitrary objects together into disjoint sets when a full-blown graph data structure would be overkill.

Objects can be joined using `join()`, tested for connectedness using `joined()`, and all disjoint sets can be retreived by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

For example:

```
>>> from matplotlib.cbook import Grouper
>>> class Foo(object):
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
```

```
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

clean()
Clean dead weak references from the dictionary

get_siblings(*a*)
Returns all of the items joined with *a*, including itself.

join(*a*, **args*)
Join given arguments into the same set. Accepts one or more arguments.

joined(*a*, *b*)
Returns True if *a* and *b* are members of the same set.

remove(*a*)

exception `matplotlib.cbook.`**IgnoredKeywordWarning**
Bases: `UserWarning`

A class for issuing warnings about keyword arguments that will be ignored by matplotlib

class `matplotlib.cbook.`**Locked**(*path*)
Bases: `object`

Context manager to handle locks.

Based on code from conda.

(c) 2012-2013 Continuum Analytics, Inc. / https://www.continuum.io/ All Rights Reserved

conda is distributed under the terms of the BSD 3-clause license. Consult LICENSE_CONDA or https://opensource.org/licenses/BSD-3-Clause.

LOCKFN = '.matplotlib_lock'

exception TimeoutError
Bases: `RuntimeError`

exception `matplotlib.cbook.`**MatplotlibDeprecationWarning**
Bases: `UserWarning`

A class for issuing deprecation warnings for Matplotlib users.

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7 (see link below), this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default.

https://docs.python.org/dev/whatsnew/2.7.html#the-future-for-python-2-x

class `matplotlib.cbook.`**`MemoryMonitor`**(*nmax=20000*)

Bases: `object`

`clear`()

`plot`(*i0=0*, *isub=1*, *fig=None*)

`report`(*segments=4*)

`xy`(*i0=0*, *isub=1*)

class `matplotlib.cbook.`**`Null`**(**args*, ***kwargs*)

Bases: `object`

Null objects always and reliably "do nothing."

class `matplotlib.cbook.`**`RingBuffer`**(*size_max*)

Bases: `object`

class that implements a not-yet-full buffer

`append`(*x*)

append an element at the end of the buffer

`get`()

Return a list of elements from the oldest to the newest.

class `matplotlib.cbook.`**`Sorter`**

Bases: `object`

Sort by attribute or item

Example usage:

```
sort = Sorter()

list = [(1, 2), (4, 8), (0, 3)]
dict = [{'a': 3, 'b': 4}, {'a': 5, 'b': 2}, {'a': 0, 'b': 0},
        {'a': 9, 'b': 9}]

sort(list)       # default sort
sort(list, 1)    # sort by index 1
sort(dict, 'a')  # sort a list of dicts by key 'a'
```

`byAttribute`(*data*, *attributename*, *inplace=1*)

`byItem`(*data*, *itemindex=None*, *inplace=1*)

`sort`(*data*, *itemindex=None*, *inplace=1*)

class `matplotlib.cbook.`**`Stack`**(*default=None*)

Bases: `object`

Implement a stack where elements can be pushed on and you can move back and forth. But no pop. Should mimic home / back / forward in a browser

`back`()

move the position back and return the current element

`bubble`(*o*)

raise *o* to the top of the stack and return *o*. *o* must be in the stack

`clear`()

empty the stack

`empty`()

`forward`()

move the position forward and return the current element

`home`()

push the first element onto the top of the stack

`push`(*o*)

push object onto stack at current position - all elements occurring later than the current position are discarded

`remove`(*o*)

remove element *o* from the stack

class `matplotlib.cbook.`**`Xlator`**

Bases: `dict`

All-in-one multiple-string-substitution class

Example usage:

```
text = "Larry Wall is the creator of Perl"
adict = {
"Larry Wall" : "Guido van Rossum",
"creator" : "Benevolent Dictator for Life",
"Perl" : "Python",
}

print(multiple_replace(adict, text))

xlat = Xlator(adict)
print(xlat.xlat(text))
```

`xlat`(*text*)

Translate *text*, returns the modified text.

`matplotlib.cbook.`**`align_iterators`**(*func*, **iterables*)

This generator takes a bunch of iterables that are ordered by func It sends out ordered tuples:

```
(func(row), [rows from all iterators matching func(row)])
```

It is used by `matplotlib.mlab.recs_join()` to join record arrays

`matplotlib.cbook.`**`allequal`**(*seq*)

Return *True* if all elements of *seq* compare equal. If *seq* is 0 or 1 length, return *True*

`matplotlib.cbook.`**`allpairs`**(*x*)

return all possible pairs in sequence *x*

Condensed by Alex Martelli from this thread on c.l.python

`matplotlib.cbook.`**`alltrue`**(*seq*)

Return *True* if all elements of *seq* evaluate to *True*. If *seq* is empty, return *False*.

`matplotlib.cbook.`**`boxplot_stats`**(*X*, *whis=1.5*, *bootstrap=None*, *labels=None*, *autorange=False*)

Returns list of dictionaries of statistics used to draw a series of box and whisker plots. The `Returns` section enumerates the required keys of the dictionary. Users can skip this function and pass a user-defined set of dictionaries to the new `axes.bxp` method instead of relying on MPL to do the calculations.

Parameters X : array-like

Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

whis : float, string, or sequence (default = 1.5)

As a float, determines the reach of the whiskers to the beyond the first and third quartiles. In other words, where IQR is the interquartile range (`Q3-Q1`), the upper whisker will extend to last datum less than `Q3 + whis*IQR`). Similarly, the lower whisker will extend to the first datum greater than `Q1 - whis*IQR`. Beyond the whiskers, data are considered outliers and are plotted as individual points. This can be set this to an ascending sequence of percentile (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, `whis` can be the string `'range'` to force the whiskers to the minimum and maximum of the data. In the edge case that the 25th and 75th percentiles are equivalent, `whis` can be automatically set to `'range'` via the `autorange` option.

bootstrap : int, optional

Number of times the confidence intervals around the median should be bootstrapped (percentile method).

labels : array-like, optional

Labels for each dataset. Length must be compatible with dimensions of `X`.

autorange : bool, optional (False)

When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to `'range'` such that the whisker ends are at the minimum and maximum of the data.

Returns bxpstats : list of dict

A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithemetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

Notes

Non-bootstrapping approach to confidence interval uses Gaussian- based asymptotic approximation:

$$\mathrm{med} \pm 1.57 \times \frac{\mathrm{iqr}}{\sqrt{N}} \tag{22.1}$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) “Variations of Boxplots”, The American Statistician, 32:12-16.

class `matplotlib.cbook.`**`converter`**(*missing='Null'*, *missingval=None*)

Bases: `object`

Base class for handling string -> python type with support for missing values

`is_missing`(*s*)

`matplotlib.cbook.`**`dedent`**(*s*)

Remove excess indentation from docstring *s*.

Discards any leading blank lines, then removes up to n whitespace characters from each line, where n is the number of leading whitespace characters in the first line. It differs from textwrap.dedent in its deletion of leading blank lines and its use of the first non-blank line to determine the indentation.

It is also faster in most cases.

`matplotlib.cbook.`**`delete_masked_points`**(**args*)

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

1. 1-D masked arrays
2. 1-D ndarrays

3.ndarrays with more than one dimension

4.other non-string iterables

5.anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `np.isfinite()` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for Axes.scatter().

`matplotlib.cbook.`**`deprecated`**(*since*, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type='function'*)

Decorator to mark a function as deprecated.

Parameters since : str

The release at which this API became deprecated. This is required.

message : str, optional

Override the default deprecation message. The format specifier `%(func)s` may be used for the name of the function, and `%(alternative)s` may be used in the deprecation message to insert the name of an alternative to the deprecated function. `%(obj_type)` may be used to insert a friendly name for the type of object being deprecated.

name : str, optional

The name of the deprecated function; if not provided the name is automatically determined from the passed in function, though this is useful in the case of renamed functions, where the new function is just assigned to the name of the deprecated function. For example:

```
def new_function():
    ...
oldFunction = new_function
```

alternative : str, optional

An alternative function that the user may use in place of the deprecated function. The deprecation warning will tell the user about this alternative if provided.

pending : bool, optional

If True, uses a PendingDeprecationWarning instead of a DeprecationWarning.

Examples

Basic example:

```
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

`matplotlib.cbook.`**`dict_delall`**(*d*, *keys*)

delete all of the *keys* from the `dict` *d*

`matplotlib.cbook.`**`exception_to_str`**(*s=None*)

`matplotlib.cbook.`**`file_requires_unicode`**(*x*)

Returns `True` if the given writable file-like object requires Unicode to be written to it.

`matplotlib.cbook.`**`finddir`**(*o*, *match*, *case=False*)

return all attributes of *o* which match string in match. if case is True require an exact case match.

`matplotlib.cbook.`**`flatten`**(*seq*, *scalarp=<function is_scalar_or_string>*)

Returns a generator of flattened nested containers

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[([42, (5, 23)], )]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: https://code.activestate.com/recipes/121294/ and Recipe 1.12 in cookbook

`matplotlib.cbook.`**`get_label`**(*y*, *default_name*)

`matplotlib.cbook.`**`get_recursive_filelist`**(*args*)

Recurse all the files and dirs in *args* ignoring symbolic links and return the files as a list of strings

`matplotlib.cbook.`**`get_sample_data`**(*fname*, *asfileobj=True*)

Return a sample data file. *fname* is a path relative to the `mpl-data/sample_data` directory. If *asfileobj* is `True` return a file object, otherwise just a file path.

Set the rc parameter examples.directory to the directory where we should look, if sample_data files are stored in a location different than default (which is ‘mpl-data/sample_data‘ at the same level of ‘matplotlib‘ Python module files).

If the filename ends in .gz, the file is implicitly ungzipped.

`matplotlib.cbook.`**`get_split_ind`**(*seq*, *N*)

seq is a list of words. Return the index into seq such that:

```
len(' '.join(seq[:ind])<=N
```

.

`matplotlib.cbook.`**`index_of`**`(`*y*`)`

A helper function to get the index of an input to plot against if x values are not explicitly given.

Tries to get `y.index` (works if this is a pd.Series), if that fails, return np.arange(y.shape[0]).

This will be extended in the future to deal with more types of labeled data.

Parameters y : scalar or array-like

The proposed y-value

Returns x, y : ndarray

The x and y values to plot.

`matplotlib.cbook.`**`is_hashable`**`(`*obj*`)`

Returns true if *obj* can be hashed

`matplotlib.cbook.`**`is_math_text`**`(`*s*`)`

`matplotlib.cbook.`**`is_numlike`**`(`*obj*`)`

return true if *obj* looks like a number

`matplotlib.cbook.`**`is_scalar`**`(`*obj*`)`

return true if *obj* is not string like and is not iterable

`matplotlib.cbook.`**`is_scalar_or_string`**`(`*val*`)`

Return whether the given object is a scalar or string like.

`matplotlib.cbook.`**`is_sequence_of_strings`**`(`*obj*`)`

Returns true if *obj* is iterable and contains strings

`matplotlib.cbook.`**`is_string_like`**`(`*obj*`)`

Return True if *obj* looks like a string

`matplotlib.cbook.`**`is_writable_file_like`**`(`*obj*`)`

return true if *obj* looks like a file object with a *write* method

`matplotlib.cbook.`**`issubclass_safe`**`(`*x*, *klass*`)`

return issubclass(x, klass) and return False on a TypeError

`matplotlib.cbook.`**`iterable`**`(`*obj*`)`

return true if *obj* is iterable

`matplotlib.cbook.`**`listFiles`**`(`*root*, *patterns='*'*, *recurse=1*, *return_folders=0*`)`

Recursively list files

from Parmar and Martelli in the Python Cookbook

`matplotlib.cbook.`**`local_over_kwdict`**`(`*local_var*, *kwargs*, **keys*`)`

Enforces the priority of a local variable over potentially conflicting argument(s) from a kwargs dict. The following possible output values are considered in order of priority:

> local_var > kwargs[keys[0]] > ... > kwargs[keys[-1]]

The first of these whose value is not None will be returned. If all are None then None will be returned. Each key in keys will be removed from the kwargs dict in place.

Parameters local_var: any object

The local variable (highest priority)

kwargs: dict Dictionary of keyword arguments; modified in place

keys: str(s) Name(s) of keyword arguments to process, in descending order of priority

Returns out: any object

Either local_var or one of kwargs[key] for key in keys

Raises IgnoredKeywordWarning

For each key in keys that is removed from kwargs but not used as the output value

class `matplotlib.cbook.`**`maxdict`**(*maxsize*)

Bases: `dict`

A dictionary with a maximum size; this doesn't override all the relevant methods to constrain the size, just setitem, so use with caution

`matplotlib.cbook.`**`mkdirs`**(*newdir*, *mode=511*)

make directory *newdir* recursively, and set *mode*. Equivalent to

```
> mkdir -p NEWDIR
> chmod MODE NEWDIR
```

`matplotlib.cbook.`**`mplDeprecation`**

alias of `MatplotlibDeprecationWarning`

`matplotlib.cbook.`**`normalize_kwargs`**(*kw*, *alias_mapping=None*, *required=()*, *forbidden=()*, *allowed=None*)

Helper function to normalize kwarg inputs

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in `allowed`, `forbidden`, `required`

Parameters alias_mapping, dict, optional

A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

required : iterable, optional

A tuple of fields that must be in kwargs.

forbidden : iterable, optional

A list of keys which may not be in kwargs

allowed : tuple, optional

A tuple of allowed fields. If this not None, then raise if `kw` contains any keys not in the union of `required` and `allowed`. To allow only the required fields pass in `()` for `allowed`

Raises TypeError

To match what python raises if invalid args/kwargs are passed to a callable.

`matplotlib.cbook.`**`onetrue`**`(`*seq*`)`

Return *True* if one element of *seq* is *True*. It *seq* is empty, return *False*.

`matplotlib.cbook.`**`pieces`**`(`*seq*, *num=2*`)`

Break up the *seq* into *num* tuples

`matplotlib.cbook.`**`popall`**`(`*seq*`)`

empty a list

`matplotlib.cbook.`**`print_cycles`**`(`*objects*, *outstream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='UTF-8'>*, *show_progress=False*`)`

objects A list of objects to find cycles in. It is often useful to pass in gc.garbage to find the cycles that are preventing some objects from being garbage collected.

outstream The stream for output.

show_progress If True, print the number of objects reached as they are found.

`matplotlib.cbook.`**`pts_to_midstep`**`(`*x*, **args*`)`

Covert continuous line to pre-steps

Given a set of N points convert to 2 N -1 points which when connected linearly give a step function which changes values at the begining the intervals.

Parameters x : array

The x location of the steps

y1, y2, ... : array

Any number of y arrays to be turned into steps. All must be the same length as `x`

Returns x, y1, y2, .. : array

The x and y values converted to steps in the same order as the input. If the input is length `N`, each of these arrays will be length `2N + 1`

Examples

>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)

`matplotlib.cbook.`**`pts_to_poststep`**(*x*, **args*)

Covert continuous line to pre-steps

Given a set of N points convert to 2 N -1 points which when connected linearly give a step function which changes values at the begining the intervals.

Parameters x : array

The x location of the steps

y1, y2, ... : array

Any number of y arrays to be turned into steps. All must be the same length as `x`

Returns x, y1, y2, .. : array

The x and y values converted to steps in the same order as the input. If the input is length `N`, each of these arrays will be length `2N + 1`

Examples

>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)

`matplotlib.cbook.`**`pts_to_prestep`**(*x*, **args*)

Covert continuous line to pre-steps

Given a set of N points convert to 2 N -1 points which when connected linearly give a step function which changes values at the begining the intervals.

Parameters x : array

The x location of the steps

y1, y2, ... : array

Any number of y arrays to be turned into steps. All must be the same length as `x`

Returns x, y1, y2, .. : array

The x and y values converted to steps in the same order as the input. If the input is length `N`, each of these arrays will be length `2N + 1`

Examples

>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)

`matplotlib.cbook.`**`recursive_remove`**(*path*)

`matplotlib.cbook.`**`report_memory`**`(`*i=0*`)`
return the memory consumed by process

`matplotlib.cbook.`**`restrict_dict`**`(`*d*, *keys*`)`
Return a dictionary that contains those keys that appear in both d and keys, with values from d.

`matplotlib.cbook.`**`reverse_dict`**`(`*d*`)`
reverse the dictionary – may lose data if values are not unique!

`matplotlib.cbook.`**`safe_first_element`**`(`*obj*`)`

`matplotlib.cbook.`**`safe_masked_invalid`**`(`*x*, *copy=False*`)`

`matplotlib.cbook.`**`safezip`**`(`**args*`)`
make sure *args* are equal len before zipping

class `matplotlib.cbook.`**`silent_list`**`(`*type*, *seq=None*`)`
Bases: `list`

override repr when returning a list of matplotlib artists to prevent long, meaningless output. This is meant to be used for a homogeneous list of a given type

`matplotlib.cbook.`**`simple_linear_interpolation`**`(`*a*, *steps*`)`

`matplotlib.cbook.`**`soundex`**`(`*name*, *len=4*`)`
soundex module conforming to Odell-Russell algorithm

`matplotlib.cbook.`**`strip_math`**`(`*s*`)`
remove latex formatting from mathtext

`matplotlib.cbook.`**`to_filehandle`**`(`*fname*, *flag='rU'*, *return_opened=False*`)`
fname can be a filename or a file handle. Support for gzipped files is automatic, if the filename ends in .gz. *flag* is a read/write flag for `file()`

class `matplotlib.cbook.`**`todate`**`(`*fmt='%Y-%m-%d'*, *missing='Null'*, *missingval=None*`)`
Bases: `matplotlib.cbook.converter`

convert to a date or None

use a `time.strptime()` format string for conversion

class `matplotlib.cbook.`**`todatetime`**`(`*fmt='%Y-%m-%d'*, *missing='Null'*, *missingval=None*`)`
Bases: `matplotlib.cbook.converter`

convert to a datetime or None

use a `time.strptime()` format string for conversion

class `matplotlib.cbook.`**`tofloat`**`(`*missing='Null'*, *missingval=None*`)`
Bases: `matplotlib.cbook.converter`

convert to a float or None

class `matplotlib.cbook.`**`toint`**`(`*missing='Null'*, *missingval=None*`)`
Bases: `matplotlib.cbook.converter`

convert to an int or None

class `matplotlib.cbook.`**`tostr`**(*missing=’Null’*, *missingval=’‘*)

Bases: *`matplotlib.cbook.converter`*

convert to string or None

`matplotlib.cbook.`**`unicode_safe`**(*s*)

`matplotlib.cbook.`**`unique`**(*x*)

Return a list of unique elements of *x*

`matplotlib.cbook.`**`unmasked_index_ranges`**(*mask*, *compressed=True*)

Find index ranges where *mask* is *False*.

mask will be flattened if it is not already 1-D.

Returns Nx2 `numpy.ndarray` with each row the start and stop indices for slices of the compressed `numpy.ndarray` corresponding to each of *N* uninterrupted runs of unmasked values. If optional argument *compressed* is *False*, it returns the start and stop indices into the original `numpy.ndarray`, not the compressed `numpy.ndarray`. Returns *None* if there are no unmasked values.

Example:

```
y = ma.array(np.arange(5), mask = [0,0,1,0,0])
ii = unmasked_index_ranges(ma.getmaskarray(y))
# returns array [[0,2,] [2,4,]]

y.compressed()[ii[1,0]:ii[1,1]]
# returns array [3,4,]

ii = unmasked_index_ranges(ma.getmaskarray(y), compressed=False)
# returns array [[0, 2], [3, 5]]

y.filled()[ii[1,0]:ii[1,1]]
# returns array [3,4,]
```

Prior to the transforms refactoring, this was used to support masked arrays in Line2D.

`matplotlib.cbook.`**`violin_stats`**(*X*, *method*, *points=100*)

Returns a list of dictionaries of data which can be used to draw a series of violin plots. See the `Returns` section below to view the required keys of the dictionary. Users can skip this function and pass a user-defined set of dictionaries to the `axes.vplot` method instead of using MPL to do the calculations.

Parameters X : array-like

Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

method : callable

The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in coords.

points : scalar, default = 100

Defines the number of points to evaluate each of the gaussian kernel density estimates at.

Returns A list of dictionaries containing the results for each column of data.

The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in `coords`.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
- min: The minimum value for this column of data.
- max: The maximum value for this column of data.

`matplotlib.cbook.`**`warn_deprecated`**(*since*, *message=''*, *name=''*, *alternative=''*, *pending=False*, *obj_type='attribute'*)

Used to display deprecation warning in a standard way.

Parameters since : str

The release at which this API became deprecated.

message : str, optional

Override the default deprecation message. The format specifier `%(func)s` may be used for the name of the function, and `%(alternative)s` may be used in the deprecation message to insert the name of an alternative to the deprecated function. `%(obj_type)` may be used to insert a friendly name for the type of object being deprecated.

name : str, optional

The name of the deprecated function; if not provided the name is automatically determined from the passed in function, though this is useful in the case of renamed functions, where the new function is just assigned to the name of the deprecated function. For example:

```
def new_function():
    ...
oldFunction = new_function
```

alternative : str, optional

An alternative function that the user may use in place of the deprecated function. The deprecation warning will tell the user about this alternative if provided.

pending : bool, optional

If True, uses a PendingDeprecationWarning instead of a DeprecationWarning.

obj_type : str, optional

The object type being deprecated.

Examples

Basic example:

```
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                obj_type='module')
```

`matplotlib.cbook.`**`wrap`**(*prefix*, *text*, *cols*)

wrap *text* with *prefix* at length *cols*

CHAPTER

TWENTYTHREE

CM (COLORMAP)

23.1 `matplotlib.cm`

This module provides a large set of colormaps, functions for registering new colormaps and for getting a colormap by name, and a mixin class for adding color mapping functionality.

class `matplotlib.cm.`**`ScalarMappable`**(*norm=None*, *cmap=None*)

Bases: `object`

This is a mixin class to support scalar data to RGBA mapping. The ScalarMappable makes use of data normalization before returning RGBA colors from the given colormap.

Parameters norm : *`matplotlib.colors.Normalize`* instance

The normalizing object which scales data, typically into the interval `[0, 1]`. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap : str or *`Colormap`* instance

The colormap used to map normalized data values to RGBA colors.

`add_checker`(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`autoscale`()

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`changed`()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)

If mappable has changed since the last check, return True; else return False

`cmap` = None

The Colormap instance of this ScalarMappable.

`colorbar` **= None**
The last colorbar associated with this ScalarMappable. May be None.

`get_array`()
Return the array

`get_clim`()
return the min, max of the color limits for image scaling

`get_cmap`()
return the colormap

`norm` **= None**
The Normalization instance of this ScalarMappable.

`set_array`(*A*)
Set the image array from numpy array *A*

`set_clim`(*vmin=None*, *vmax=None*)
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_cmap`(*cmap*)
set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_norm`(*norm*)
set the normalization instance

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`matplotlib.cm.`**`get_cmap`**(*name=None*, *lut=None*)

Get a colormap instance, defaulting to rc values if *name* is None.

Colormaps added with *`register_cmap()`* take precedence over built-in colormaps.

If *name* is a *`matplotlib.colors.Colormap`* instance, it will be returned.

If *lut* is not None it must be an integer giving the number of entries desired in the lookup table, and *name* must be a standard mpl colormap name.

`matplotlib.cm.`**`register_cmap`**(*name=None*, *cmap=None*, *data=None*, *lut=None*)

Add a colormap to the set recognized by *`get_cmap()`*.

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)

register_cmap(name='choppy', data=choppydata, lut=128)
```

In the first case, *cmap* must be a *`matplotlib.colors.Colormap`* instance. The *name* is optional; if absent, the name will be the `name` attribute of the *cmap*.

In the second case, the three arguments are passed to the *`LinearSegmentedColormap`* initializer, and the resulting colormap is registered.

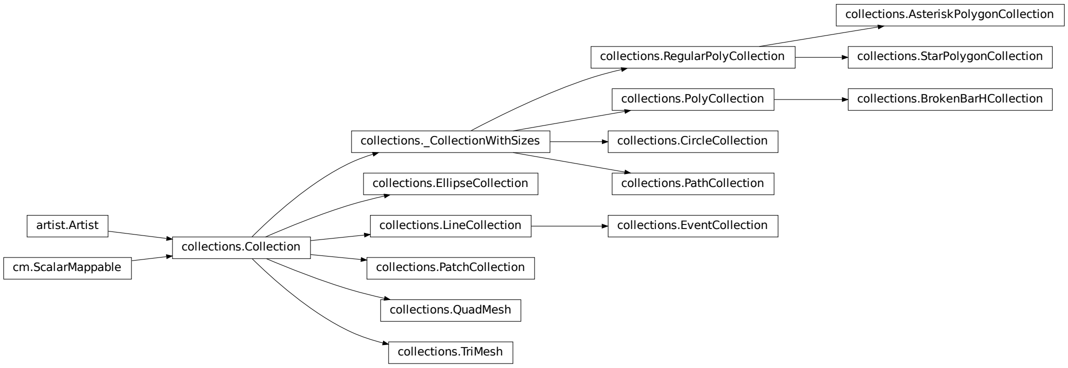
`matplotlib.cm.`**`revcmap`**(*data*)

Can only handle specification *data* in dictionary format.

CHAPTER

TWENTYFOUR

COLLECTIONS



collections.AsteriskPolygonCollection
collections.RegularPolyCollection
collections.StarPolygonCollection
collections.PolyCollection
collections.BrokenBarHCollection
collections._CollectionWithSizes
collections.CircleCollection
collections.EllipseCollection
collections.PathCollection
artist.Artist
collections.LineCollection
collections.EventCollection
collections.Collection
cm.ScalarMappable
collections.PatchCollection
collections.QuadMesh
collections.TriMesh

24.1 `matplotlib.collections`

Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segemnts)

class `matplotlib.collections.`**`AsteriskPolygonCollection`**(*numsides*, *rotation=0*, *sizes=(1,)*, ***kwargs*)

Bases: `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular asterisks with *numsides* points.

numsides the number of sides of the polygon

rotation the rotation of the polygon in radians

sizes gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `examples/dynamic_collection.py` for complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors = facecolors,
    edgecolors = (black,),
    linewidths = (1,),
    offsets = offsets,
    transOffset = ax.transData,
    )
```

add_callback(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

add_checker(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname = 'Artist'

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()

Return the alpha value used for blending - not supported on all backends

get_animated()

Return the artist's animated state

get_array()

Return the array

get_axes()

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()

Return a list of the child `` Artist`s this :class:`Artist `` contains.

`get_clim()`
return the min, max of the color limits for image scaling

`get_clip_box()`
Return artist clipbox

`get_clip_on()`
Return whether artist uses clipping

`get_clip_path()`
Return artist clip path

`get_cmap()`
return the colormap

`get_contains()`
Return the _contains test used by the artist, or *None* for default.

`get_cursor_data`(*event*)
Get the cursor data for a given event.

`get_dashes()`

`get_datalim`(*transData*)

`get_edgecolor()`

`get_edgecolors()`

`get_facecolor()`

`get_facecolors()`

`get_figure()`
Return the `Figure` instance the artist belongs to.

`get_fill()`
return whether fill is set

`get_gid()`
Returns the group id

`get_hatch()`
Return the current hatching pattern

`get_label()`
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles()`

`get_linewidth()`

`get_linewidths()`

`get_numsides()`

`get_offset_position()`
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`
Return the picker object used by this artist

`get_pickradius()`

`get_rasterized()`
return True if the artist is to be rasterized

`get_rotation()`

`get_sizes()`
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

`get_sketch_params()`
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.

- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()

Return the *`Transform`* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Returns the url

get_urls()

get_visible()

Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()

Return the `Artist`'s zorder.

have_units()

Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)

List the children of the artist which contain the mouse event *event*.

is_figure_set()

Returns True if the artist is assigned to a *`Figure`*.

is_transform_set()

Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)
alias for set_linestyle

set_edgecolor(*c*)
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)
alias for set_edgecolor

set_facecolor(*c*)
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)
alias for set_facecolor

set_figure(*fig*)
Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)
Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

set_label(*s*)
Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

set_linestyle(*ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':'} and more see description

The line style.

set_linestyles(*ls*)
alias for set_linestyle

set_linewidth(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

set_linewidths(*lw*)
alias for set_linewidth

set_lw(*lw*)
alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`()

`set_picker`(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)
Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)
Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)
Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)
Update the properties of this `Artist` from the dictionary *prop*.

update_from(*other*)
copy properties from other to self

`update_scalarmappable()`
If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

class `matplotlib.collections.`**`BrokenBarHCollection`**(*xranges*, *yrange*, ***kwargs*)
Bases: *`matplotlib.collections.PolyCollection`*

A collection of horizontal bars spanning *yrange* with a sequence of *xranges*.

xranges sequence of (*xmin*, *xwidth*)

yrange *ymin*, *ywidth*

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for *`matplotlib.cm.ScalarMappable`*)
- *cmap*: None (optional for *`matplotlib.cm.ScalarMappable`*)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *`matplotlib.rcParams`* patch setting, in sequence form.

`add_callback`(*func*)
Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname = 'Artist'`

`autoscale()`
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None()`
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The *`Axes`* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()

Return the alpha value used for blending - not supported on all backends

get_animated()

Return the artist's animated state

get_array()

Return the array

get_axes()

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()

Return a list of the child ``Artist`s this :class:`Artist`` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()

Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picker object used by this artist

get_pickradius()

get_rasterized()

return True if the artist is to be rasterized

get_sizes()

Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

get_sketch_params()

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()
Returns the url

get_urls()

get_visible()
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a *Figure*.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

set_axes(*axes*)
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)
Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)
alias for set_linestyle

`set_linewidth`(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)
alias for set_linewidth

`set_lw`(*lw*)
alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If

offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`(*verts*, *closed=True*)

This allows one to delay initialization of the vertices.

`set_picker`(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

set_transform(*t*)

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

set_url(*url*)

Sets the url for the artist

ACCEPTS: a url string

set_urls(*urls*)

set_verts(*verts*, *closed=True*)

This allows one to delay initialization of the vertices.

set_verts_and_codes(*verts*, *codes*)

This allows one to initialize vertices with path codes.

set_visible(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

static span_where(*x*, *ymin*, *ymax*, *where*, ***kwargs*)

Create a BrokenBarHCollection to plot horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

A *BrokenBarHCollection* is returned. *kwargs* are passed on to the collection.

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)
copy properties from other to self

`update_scalarmappable`()
If the scalar mappable array is not none, update colors from scalar data

`zorder` **= 0**

class `matplotlib.collections.`**`CircleCollection`**(*sizes*, ***kwargs*)
Bases: `matplotlib.collections._CollectionWithSizes`

A collection of circles, drawn using splines.

sizes Gives the area of the circle in points^2

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback`(*func*)
Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` **= 'Artist'**

`autoscale`()
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The `Axes` instance the artist resides in, or *None*.

changed()
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)
If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)
Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child ``Artist`s this :class:`Artist`` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()

Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picker object used by this artist

get_pickradius()

get_rasterized()

return True if the artist is to be rasterized

get_sizes()

Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

get_sketch_params()

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()
Returns the url

get_urls()

get_visible()
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a *Figure*.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

set_axes(*axes*)
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)
Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)
alias for set_linestyle

`set_linewidth`(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)
alias for set_linewidth

`set_lw`(*lw*)
alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If

offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

set_offsets(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths()

set_picker(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

update_from(*other*)

copy properties from other to self

update_scalarmappable()

If the scalar mappable array is not none, update colors from scalar data

zorder = 0

class `matplotlib.collections.`**`Collection`**(*edgecolors=None*, *facecolors=None*, *linewidths=None*, *linestyles='solid'*, *antialiaseds=None*, *offsets=None*, *transOffset=None*, *norm=None*, *cmap=None*, *pickradius=5.0*, *hatch=None*, *urls=None*, *offset_position='screen'*, *zorder=1*, ***kwargs*)

Bases: `matplotlib.artist.Artist`, `matplotlib.cm.ScalarMappable`

Base class for Collections. Must be subclassed to be usable.

All properties in a collection must be sequences or scalars; if scalars, they will be converted to sequences. The property of the ith element of the collection is:

```
prop[i % len(props)]
```

Keyword arguments and default values:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *offset_position*: ‘screen’ (default) or ‘data’
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)
- *hatch*: None
- *zorder*: 1

offsets and *transOffset* are used to translate the patch after rendering (default no offsets). If offset_position is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

The use of `ScalarMappable` is optional. If the `ScalarMappable` matrix _A is not None (i.e., a call to set_array has been made), at draw time a call to scalar mappable will be made to set the face colors.

Create a Collection

%(Collection)s

`add_callback`(*func*)

Adds a callback function that will be called whenever one of the `Artist`‘s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

add_checker(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname = 'Artist'

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picker object used by this artist

get_pickradius()

get_rasterized()
return True if the artist is to be rasterized

get_sketch_params()
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap``()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_transform``()`

Return the *`Transform`* instance used by this artist.

`get_transformed_clip_path_and_affine``()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms``()`

`get_url``()`

Returns the url

`get_urls``()`

`get_visible``()`

Return the artist's visiblity

`get_window_extent``(`*renderer*`)`

`get_zorder``()`

Return the `Artist`'s zorder.

`have_units``()`

Return *True* if units are set on the *x* or *y* axes

`hitlist``(`*event*`)`

List the children of the artist which contain the mouse event *event*.

`is_figure_set``()`

Returns True if the artist is assigned to a *`Figure`*.

`is_transform_set``()`

Returns *True* if `Artist` has a transform explicitly set.

`mouseover`

`pchanged``()`

Fire an event when property changed, calling all of the registered callbacks.

`pick``(`*mouseevent*`)`

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable``()`

Return *True* if `Artist` is pickable.

`properties``()`

return a dictionary mapping property name -> value for all Artist props

`remove``()`

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback``(`*oid*`)`

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

`set``(`***kwargs*`)`

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter``(`*filter_func*`)`

set agg_filter fuction.

`set_alpha``(`*alpha*`)`

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated``(`*b*`)`

Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased``(`*aa*`)`

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)

alias for set_antialiased

set_array(*A*)

Set the image array from numpy array *A*

set_axes(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

set_clim(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

set_clip_box(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

set_clip_on(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
```

```
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)
Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)
alias for set_linestyle

`set_linewidth`(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)
alias for set_linewidth

set_lw(*lw*)
alias for set_linewidth

set_norm(*norm*)
set the normalization instance

set_offset_position(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

set_offsets(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths()

set_picker(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_rasterized(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

set_transform(*t*)

Set the *Transform* instance used by this artist.

ACCEPTS: *Transform* instance

set_url(*url*)

Sets the url for the artist

ACCEPTS: a url string

set_urls(*urls*)

set_visible(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit “sticks” to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)
Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)
copy properties from other to self

`update_scalarmappable`()
If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

class `matplotlib.collections.`**`EllipseCollection`**(*widths*, *heights*, *angles*, *units='points'*, ***kwargs*)

Bases: `matplotlib.collections.Collection`

A collection of ellipses, drawn using splines.

***widths*: sequence** lengths of first axes (e.g., major axis lengths)

***heights*: sequence** lengths of second axes

***angles*: sequence** angles of first axes, degrees CCW from the X-axis

units: ['points' | 'inches' | 'dots' | 'width' | 'height' | 'x' | 'y' | 'xy']

units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the *offsets* data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the `Ellipse` with axes.transData as its transform.

Additional kwargs inherited from the base `Collection`:

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

add_callback(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

add_checker(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname = 'Artist'

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)
If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)
Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()

Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picker object used by this artist

get_pickradius()

get_rasterized()

return True if the artist is to be rasterized

get_sketch_params()

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()
Returns the url

get_urls()

get_visible()
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a *Figure*.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

`properties`()
return a dictionary mapping property name -> value for all Artist props

`remove`()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

`set`(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter`(*filter_func*)
set agg_filter fuction.

`set_alpha`(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated`(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased`(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

`set_antialiaseds`(*aa*)
alias for set_antialiased

`set_array`(*A*)
Set the image array from numpy array *A*

`set_axes`(*axes*)
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

set_clip_box(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

set_clip_on(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

`set_norm`(*norm*)

set the normalization instance

`set_offset_position`(*offset_position*)

Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths()

set_picker(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_rasterized(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

update_from(*other*)

copy properties from other to self

update_scalarmappable()

If the scalar mappable array is not none, update colors from scalar data

zorder = 0

class `matplotlib.collections.`**EventCollection**(*positions*, *orientation=None*, *lineoffset=0*, *linelength=1*, *linewidth=None*, *color=None*, *linestyle='solid'*, *antialiased=None*, ***kwargs*)

Bases: *matplotlib.collections.LineCollection*

A collection of discrete events.

An event is a 1-dimensional value, usually the position of something along an axis, such as time or length. Events do not have an amplitude. They are displayed as v

positions a sequence of numerical values or a 1D numpy array. Can be None

orientation **['horizontal' | 'vertical' | None]** defaults to 'horizontal' if not specified or None

lineoffset a single numerical value, corresponding to the offset of the center of the markers from the origin

linelength a single numerical value, corresponding to the total height of the marker (i.e. the marker stretches from lineoffset+linelength/2 to lineoffset-linelength/2). Defaults to 1

linewidth a single numerical value

color must be a sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

linestyle ['solid' | 'dashed' | 'dashdot' | 'dotted']

antialiased 1 or 2

If *linewidth*, *color*, or *antialiased* is None, they default to their rcParams setting, in sequence form.

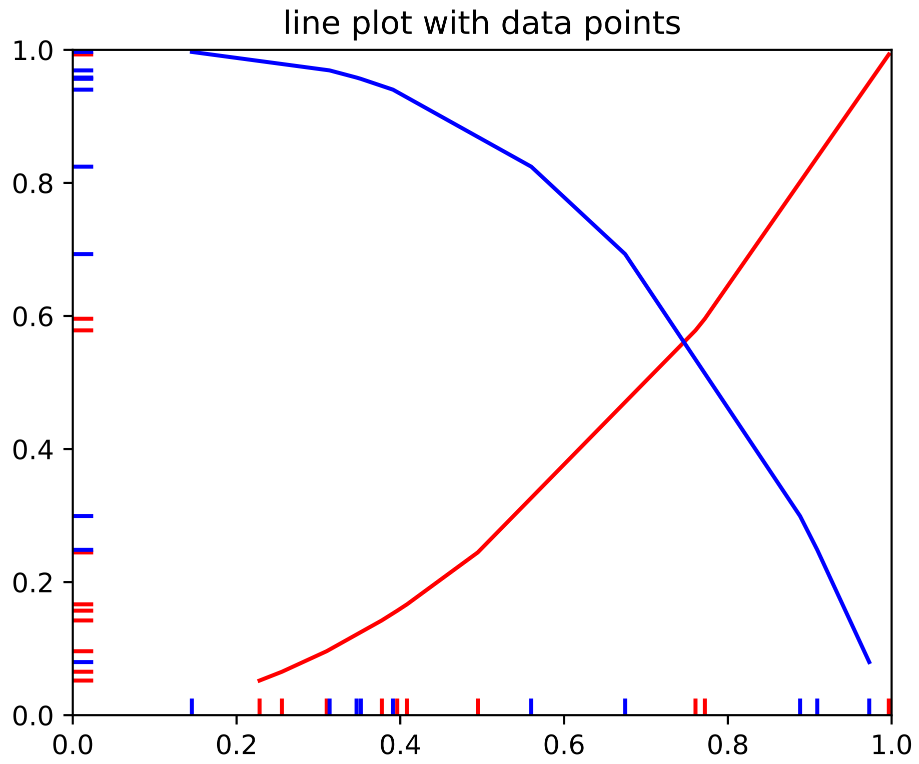
norm None (optional for `matplotlib.cm.ScalarMappable`)

cmap None (optional for `matplotlib.cm.ScalarMappable`)

pickradius is the tolerance for mouse clicks picking a line. The default is 5 pt.

The use of `ScalarMappable` is optional. If the `ScalarMappable` array `_A` is not None (i.e., a call to `set_array()` has been made), at draw time a call to scalar mappable will be made to set the colors.

Example:



add_callback(*func*)
Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`add_positions`(*position*)
add one or more events at the specified positions

`aname` **= 'Artist'**

`append_positions`(*position*)
add one or more events at the specified positions

`autoscale`()
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The `Axes` instance the artist resides in, or *None*.

`changed`()
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)
If mappable has changed since the last check, return True; else return False

`contains`(*mouseevent*)
Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits`(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw`(*artist*, *renderer*, **args*, ***kwargs*)

`extend_positions`(*position*)
add one or more events at the specified positions

`findobj`(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches

- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data`(*data*)
Return *cursor data* string formatted.

`get_agg_filter`()
return filter function to be used for agg filter

`get_alpha`()
Return the alpha value used for blending - not supported on all backends

`get_animated`()
Return the artist's animated state

`get_array`()
Return the array

`get_axes`()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

`get_children`()
Return a list of the child ``Artist`s this :class:`Artist`` contains.

`get_clim`()
return the min, max of the color limits for image scaling

`get_clip_box`()
Return artist clipbox

`get_clip_on`()
Return whether artist uses clipping

`get_clip_path`()
Return artist clip path

`get_cmap`()
return the colormap

`get_color`()
get the color of the lines used to mark each event

`get_colors`()

`get_contains`()
Return the _contains test used by the artist, or *None* for default.

`get_cursor_data`(*event*)
Get the cursor data for a given event.

`get_dashes`()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linelength()
get the length of the lines used to mark each event

get_lineoffset()
get the offset of the lines used to mark each event

get_linestyle()
get the style of the lines used to mark each event ['solid' | 'dashed' | 'dashdot' | 'dotted']

get_linestyles()

get_linewidth()
get the width of the lines used to mark each event

get_linewidths()

get_offset_position()
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_orientation()
get the orientation of the event line, may be: ['horizontal' | 'vertical']

get_path_effects()

get_paths()

get_picker()
Return the picker object used by this artist

get_pickradius()

get_positions()
return an array containing the floating-point values of the positions

get_rasterized()
return True if the artist is to be rasterized

get_segments()

get_sketch_params()
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()
Return the *`Transform`* instance used by this artist.

get_transformed_clip_path_and_affine()
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()
Returns the url

get_urls()

get_visible()
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a `Figure`.

is_horizontal()
True if the eventcollection is horizontal, False if vertical

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is

redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)

A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)

set agg_filter fuction.

set_alpha(*alpha*)

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)

alias for set_antialiased

set_array(*A*)

Set the image array from numpy array *A*

set_axes(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

set_clim(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

set_clip_box(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a *matplotlib.transforms.Bbox* instance

set_clip_on(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set the color(s) of the line collection. *c* can be a matplotlib color arg (all patches have same color), or a sequence or rgba tuples; if it is a sequence the patches will cycle through the sequence.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

set_label(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

`set_linelength`(*linelength*)
set the length of the lines used to mark each event

`set_lineoffset`(*lineoffset*)
set the offset of the lines used to mark each event

`set_linestyle`(*ls*)
Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)
alias for set_linestyle

`set_linewidth`(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)
alias for set_linewidth

`set_lw`(*lw*)
alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_orientation(*orientation=None*)

set the orientation of the event line ['horizontal' | 'vertical' | None] defaults to 'horizontal' if not specified or None

set_path_effects(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths(*segments*)

set_picker(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_positions(*positions*)

set the positions of the events to the specified value

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

set_segments(*segments*)

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

set_transform(*t*)

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

set_url(*url*)

Sets the url for the artist

ACCEPTS: a url string

set_urls(*urls*)

set_verts(*segments*)

set_visible(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

switch_orientation()

switch the orientation of the event line, either from vertical to horizontal or vice versus

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

update_from(*other*)

copy properties from other to self

update_scalarmappable()

If the scalar mappable array is not none, update colors from scalar data

zorder = 0

class `matplotlib.collections.`**`LineCollection`**(*segments*, *linewidths=None*, *colors=None*, *antialiaseds=None*, *linestyles='solid'*, *offsets=None*, *transOffset=None*, *norm=None*, *cmap=None*, *pickradius=5*, *zorder=2*, *facecolors='none'*, ***kwargs*)

Bases: `matplotlib.collections.Collection`

All parameters must be sequences or scalars; if scalars, they will be converted to sequences. The property of the ith line segment is:

```
prop[i % len(props)]
```

i.e., the properties cycle if the `len` of props is less than the number of segments.

segments a sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can be a different length.

colors must be a sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds must be a sequence of ones or zeros

linestyles **['solid' | 'dashed' | 'dashdot' | 'dotted']** a string or dash tuple. The dash tuple is:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *linewidths*, *colors*, or *antialiaseds* is None, they default to their rcParams setting, in sequence form.

If *offsets* and *transOffset* are not None, then *offsets* are transformed by *transOffset* and applied after the segments have been transformed to display coordinates.

If *offsets* is not None but *transOffset* is None, then the *offsets* are added to the segments before any transformation. In this case, a single offset can be specified as:

```
offsets=(xo,yo)
```

and this value will be added cumulatively to each successive segment, so as to produce a set of successively offset curves.

norm None (optional for `matplotlib.cm.ScalarMappable`)

cmap None (optional for `matplotlib.cm.ScalarMappable`)

pickradius is the tolerance for mouse clicks picking a line. The default is 5 pt.

zorder The zorder of the LineCollection. Default is 2

facecolors The facecolors of the LineCollection. Default is 'none' Setting to a value other than 'none' will lead to a filled polygon being drawn between points on each line.

The use of `ScalarMappable` is optional. If the `ScalarMappable` array `_A` is not None (i.e., a call to `set_array()` has been made), at draw time a call to scalar mappable will be made to set the colors.

add_callback(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

add_checker(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname = 'Artist'

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child ``Artist`s this :class:`Artist`` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_color()

get_colors()

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

`get_picker``()`

Return the picker object used by this artist

`get_pickradius``()`

`get_rasterized``()`

return True if the artist is to be rasterized

`get_segments``()`

`get_sketch_params``()`

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap``()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_transform``()`

Return the *`Transform`* instance used by this artist.

`get_transformed_clip_path_and_affine``()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms``()`

`get_url``()`

Returns the url

`get_urls``()`

`get_visible``()`

Return the artist’s visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a *`Figure`*.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call *`matplotlib.axes.Axes.relim()`* to update the axes limits if desired.

Note: *`relim()`* will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter`(*filter_func*)

set agg_filter fuction.

`set_alpha`(*alpha*)

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated`(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased`(*aa*)

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

`set_antialiaseds`(*aa*)

alias for set_antialiased

`set_array`(*A*)

Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set the color(s) of the line collection. *c* can be a matplotlib color arg (all patches have same color), or a sequence or rgba tuples; if it is a sequence the patches will cycle through the sequence.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

`set_gid`(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

`set_hatch`(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':'} and more see description

The line style.

set_linestyles(*ls*)
alias for set_linestyle

set_linewidth(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

set_linewidths(*lw*)
alias for set_linewidth

set_lw(*lw*)
alias for set_linewidth

set_norm(*norm*)
set the normalization instance

set_offset_position(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

set_offsets(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths(*segments*)

set_picker(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_segments`(*segments*)

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)
Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)
Sets the url for the artist

ACCEPTS: a url string

set_urls(*urls*)

set_verts(*segments*)

set_visible(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)
Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)
copy properties from other to self

`update_scalarmappable`()
If the scalar mappable array is not none, update colors from scalar data

`zorder` **= 0**

class `matplotlib.collections.`**`PatchCollection`**(*patches*, *match_original=False*, ***kwargs*)
Bases: `matplotlib.collections.Collection`

A generic collection of patches.

This makes it easier to assign a color map to a heterogeneous collection of patches.

This also may improve plotting speed, since PatchCollection will draw faster than a large number of patches.

patches a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

match_original If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

The use of `ScalarMappable` is optional. If the `ScalarMappable` matrix _A is not None (i.e., a call to set_array has been made), at draw time a call to scalar mappable will be made to set the face colors.

`add_callback`(*func*)
Adds a callback function that will be called whenever one of the `Artist`‘s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` **= ‘Artist’**

`autoscale`()
Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()

Return the alpha value used for blending - not supported on all backends

get_animated()

Return the artist's animated state

get_array()

Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `Artist`s this :class:`Artist` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

`get_hatch()`
Return the current hatching pattern

`get_label()`
Get the label used for this artist in the legend.

`get_linestyle()`

`get_linestyles()`

`get_linewidth()`

`get_linewidths()`

`get_offset_position()`
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`
Return the picker object used by this artist

`get_pickradius()`

`get_rasterized()`
return True if the artist is to be rasterized

`get_sketch_params()`
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Returns the url

get_urls()

get_visible()

Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()

Return the `Artist`'s zorder.

have_units()

Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)

List the children of the artist which contain the mouse event *event*.

is_figure_set()

Returns True if the artist is assigned to a *Figure*.

is_transform_set()

Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()

Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

set_label(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

set_linestyles(*ls*)

alias for set_linestyle

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

set_linewidths(*lw*)

alias for set_linewidth

set_lw(*lw*)

alias for set_linewidth

set_norm(*norm*)
set the normalization instance

set_offset_position(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

set_offsets(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths(*patches*)

set_picker(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_rasterized(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)

copy properties from other to self

`update_scalarmappable`()

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

class `matplotlib.collections.`**`PathCollection`**(*paths*, *sizes=None*, ***kwargs*)

Bases: `matplotlib.collections._CollectionWithSizes`

This is the most basic *`Collection`* subclass.

paths is a sequence of `matplotlib.path.Path` instances.

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback`(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` = **'Artist'**

`autoscale`()

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The `Axes` instance the artist resides in, or *None*.

`changed`()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)

If mappable has changed since the last check, return True; else return False

`contains`(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `Artist`s this :class:`Artist` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

`get_cmap``()`
return the colormap

`get_contains``()`
Return the _contains test used by the artist, or *None* for default.

`get_cursor_data``(`*event*`)`
Get the cursor data for a given event.

`get_dashes``()`

`get_datalim``(`*transData*`)`

`get_edgecolor``()`

`get_edgecolors``()`

`get_facecolor``()`

`get_facecolors``()`

`get_figure``()`
Return the `Figure` instance the artist belongs to.

`get_fill``()`
return whether fill is set

`get_gid``()`
Returns the group id

`get_hatch``()`
Return the current hatching pattern

`get_label``()`
Get the label used for this artist in the legend.

`get_linestyle``()`

`get_linestyles``()`

`get_linewidth``()`

`get_linewidths``()`

`get_offset_position``()`
Returns how offsets are applied for the collection. If *offset_position* is ‘screen’, the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates.

If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`
Return the picker object used by this artist

`get_pickradius()`

`get_rasterized()`
return True if the artist is to be rasterized

`get_sizes()`
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

`get_sketch_params()`
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()
Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()
Returns the url

get_urls()

get_visible()
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a *Figure*.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is

redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*oid*)

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

`set`(***kwargs*)

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter`(*filter_func*)

set agg_filter fuction.

`set_alpha`(*alpha*)

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated`(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased`(*aa*)

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

`set_antialiaseds`(*aa*)

alias for set_antialiased

`set_array`(*A*)

Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

`set_dashes`(*ls*)

alias for set_linestyle

`set_edgecolor`(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)
alias for set_edgecolor

set_facecolor(*c*)
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)
alias for set_facecolor

set_figure(*fig*)
Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)
Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

set_label(*s*)
Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':'} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

`set_norm`(*norm*)

set the normalization instance

`set_offset_position`(*offset_position*)

Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`(*paths*)

`set_picker`(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)

copy properties from other to self

`update_scalarmappable`()

If the scalar mappable array is not none, update colors from scalar data

`zorder` = **0**

class `matplotlib.collections.`**`PolyCollection`**(*verts*, *sizes=None*, *closed=True*, ***kwargs*)

Bases: `matplotlib.collections._CollectionWithSizes`

verts is a sequence of (*verts0*, *verts1*, ...) where *verts_i* is a sequence of *xy* tuples of vertices, or an equivalent `numpy` array of shape (*nv*, 2).

sizes is *None* (default) or a sequence of floats that scale the corresponding *verts_i*. The scaling is applied before the Artist master transform; if the latter is an identity transform, then the overall scaling is such that if *verts_i* specify a unit square, then *sizes_i* is the area of that square in points^2. If len(*sizes*) < *nv*, the additional values will be taken cyclically from the array.

closed, when *True*, will explicitly close the polygon.

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

`add_callback`(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` **= 'Artist'**

`autoscale`()

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The `Axes` instance the artist resides in, or *None*.

`changed`()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)

If mappable has changed since the last check, return True; else return False

`contains`(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
: return the colormap

get_contains()
: Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
: Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
: Return the `Figure` instance the artist belongs to.

get_fill()
: return whether fill is set

get_gid()
: Returns the group id

get_hatch()
: Return the current hatching pattern

get_label()
: Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()
: Returns how offsets are applied for the collection. If *offset_position* is ‘screen’, the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates.

If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picker object used by this artist

get_pickradius()

get_rasterized()
return True if the artist is to be rasterized

get_sizes()
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

get_sketch_params()
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_transform``()`
Return the *`Transform`* instance used by this artist.

`get_transformed_clip_path_and_affine``()`
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms``()`

`get_url``()`
Returns the url

`get_urls``()`

`get_visible``()`
Return the artist's visiblity

`get_window_extent``(`*renderer*`)`

`get_zorder``()`
Return the `Artist`'s zorder.

`have_units``()`
Return *True* if units are set on the *x* or *y* axes

`hitlist``(`*event*`)`
List the children of the artist which contain the mouse event *event*.

`is_figure_set``()`
Returns True if the artist is assigned to a *`Figure`*.

`is_transform_set``()`
Returns *True* if `Artist` has a transform explicitly set.

`mouseover`

`pchanged``()`
Fire an event when property changed, calling all of the registered callbacks.

`pick``(`*mouseevent*`)`
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

`pickable``()`
Return *True* if `Artist` is pickable.

`properties``()`
return a dictionary mapping property name -> value for all Artist props

`remove``()`
Remove the artist from the figure if possible. The effect will not be visible until the figure is

redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback`(*oid*)

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

`set`(***kwargs*)

A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter`(*filter_func*)

set agg_filter fuction.

`set_alpha`(*alpha*)

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated`(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased`(*aa*)

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

`set_antialiaseds`(*aa*)

alias for set_antialiased

`set_array`(*A*)

Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

`set_dashes`(*ls*)

alias for set_linestyle

`set_edgecolor`(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

set_label(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':'} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

`set_norm`(*norm*)

set the normalization instance

`set_offset_position`(*offset_position*)

Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`(*verts*, *closed=True*)
This allows one to delay initialization of the vertices.

`set_picker`(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_verts`(*verts*, *closed=True*)

This allows one to delay initialization of the vertices.

`set_verts_and_codes`(*verts*, *codes*)

This allows one to initialize vertices with path codes.

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)

copy properties from other to self

`update_scalarmappable`()

If the scalar mappable array is not none, update colors from scalar data

`zorder` = **0**

class `matplotlib.collections.`**`QuadMesh`**(*meshWidth*, *meshHeight*, *coordinates*, *antialiased=True*, *shading='flat'*, ***kwargs*)

Bases: *`matplotlib.collections.Collection`*

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are (*meshWidth* + 1, *meshHeight* + 1). Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values (*m*, *n*) such that 0 <= *m* <= *meshWidth* and 0 <= *n* <= *meshHeight*, the vertices at mesh coordinates (*m*, *n*), (*m*, *n* + 1), (*m* + 1, *n* + 1), and (*m* + 1, *n*) form one of the quadrilaterals in the mesh. There are thus (*meshWidth* * *meshHeight*) quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a (2 x ((*meshWidth* + 1) * (*meshHeight* + 1))) numpy array *coordinates*, where each row is the *x* and *y* coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the *`set_cmap()`* method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in *coordinates* is the coordinates of the vertex at mesh coordinates (0, 0), then the one at (0, 1), then at (0, 2) .. (0, meshWidth), (1, 0), (1, 1), and so on.

shading may be 'flat', or 'gouraud'

`add_callback`(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

`add_checker`(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` **= 'Artist'**

`autoscale`()

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`

The *`Axes`* instance the artist resides in, or *None*.

`changed`()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)

If mappable has changed since the last check, return True; else return False

`contains`(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

static **convert_mesh_to_paths**(*meshWidth*, *meshHeight*, *coordinates*)
Converts a given mesh into a sequence of `matplotlib.path.Path` objects for easier rendering by backends that do not directly support quadmeshes.

This function is primarily of use to backend implementers.

convert_mesh_to_triangles(*meshWidth*, *meshHeight*, *coordinates*)
Converts a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using `draw_gouraud_triangle`.

convert_xunits(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()

Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picker object used by this artist

get_pickradius()

get_rasterized()

return True if the artist is to be rasterized

get_sketch_params()

Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Returns the url

get_urls()

get_visible()

Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()

Return the `Artist`'s zorder.

have_units()

Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)

List the children of the artist which contain the mouse event *event*.

is_figure_set()

Returns True if the artist is assigned to a *Figure*.

is_transform_set()

Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()

Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()

Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

set_axes(*axes*)
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

set_clim(*vmin=None*, *vmax=None*)
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

set_clip_box(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

set_clip_on(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)

alias for set_linestyle

set_edgecolor(*c*)

Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)

alias for set_edgecolor

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)

alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

`set_norm`(*norm*)

set the normalization instance

`set_offset_position`(*offset_position*)

Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)

Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)

set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`()

`set_picker`(*picker*)

Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)

Set the *`Transform`* instance used by this artist.

ACCEPTS: *`Transform`* instance

`set_url`(*url*)

Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)

Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)

copy properties from other to self

`update_scalarmappable`()

If the scalar mappable array is not none, update colors from scalar data

`zorder = 0`

class `matplotlib.collections.`**`RegularPolyCollection`**(*numsides*, *rotation=0*, *sizes=(1,)*, ***kwargs*)

Bases: `matplotlib.collections._CollectionWithSizes`

Draw a collection of regular polygons with *numsides*.

numsides the number of sides of the polygon

rotation the rotation of the polygon in radians

sizes gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

- *edgecolors*: None

- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for `matplotlib.cm.ScalarMappable`)
- *cmap*: None (optional for `matplotlib.cm.ScalarMappable`)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their `matplotlib.rcParams` patch setting, in sequence form.

Example: see `examples/dynamic_collection.py` for complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors = facecolors,
    edgecolors = (black,),
    linewidths = (1,),
    offsets = offsets,
    transOffset = ax.transData,
    )
```

add_callback(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

add_checker(*checker*)

Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

aname = 'Artist'

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

axes

The `Axes` instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()

Return the alpha value used for blending - not supported on all backends

get_animated()

Return the artist's animated state

get_array()

Return the array

get_axes()

Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()

Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

`get_linestyles()`

`get_linewidth()`

`get_linewidths()`

`get_numsides()`

`get_offset_position()`
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`get_offset_transform()`

`get_offsets()`
Return the offsets for the collection.

`get_path_effects()`

`get_paths()`

`get_picker()`
Return the picker object used by this artist

`get_pickradius()`

`get_rasterized()`
return True if the artist is to be rasterized

`get_rotation()`

`get_sizes()`
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

`get_sketch_params()`
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.

- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

get_transform()

Return the *`Transform`* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Returns the url

get_urls()

get_visible()

Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()

Return the `Artist`'s zorder.

have_units()

Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)

List the children of the artist which contain the mouse event *event*.

is_figure_set()

Returns True if the artist is assigned to a *`Figure`*.

is_transform_set()

Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()

Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)

Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()

Return *True* if `Artist` is pickable.

properties()

return a dictionary mapping property name -> value for all Artist props

remove()

Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)

A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)

set agg_filter fuction.

set_alpha(*alpha*)

Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)

Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)

alias for set_antialiased

set_array(*A*)

Set the image array from numpy array *A*

`set_axes`(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

`set_contains`(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)
alias for set_linestyle

set_edgecolor(*c*)
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)
alias for set_edgecolor

set_facecolor(*c*)
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)
alias for set_facecolor

set_figure(*fig*)
Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)
Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':'} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`()

`set_picker`(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)
Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)
Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)
Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)
Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale

If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges

`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

update(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

update_from(*other*)

copy properties from other to self

`update_scalarmappable``()`

If the scalar mappable array is not none, update colors from scalar data

`zorder` **= 0**

class `matplotlib.collections.`**`StarPolygonCollection`**`(`*numsides*, *rotation=0*, *sizes=(1,)*, ***kwargs*`)`

Bases: *`matplotlib.collections.RegularPolyCollection`*

Draw a collection of regular stars with *numsides* points.

numsides the number of sides of the polygon

rotation the rotation of the polygon in radians

sizes gives the area of the circle circumscribing the regular polygon in points^2

Valid Collection keyword arguments:

- *edgecolors*: None
- *facecolors*: None
- *linewidths*: None
- *antialiaseds*: None
- *offsets*: None
- *transOffset*: transforms.IdentityTransform()
- *norm*: None (optional for *`matplotlib.cm.ScalarMappable`*)
- *cmap*: None (optional for *`matplotlib.cm.ScalarMappable`*)

offsets and *transOffset* are used to translate the patch after rendering (default no offsets)

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *`matplotlib.rcParams`* patch setting, in sequence form.

Example: see `examples/dynamic_collection.py` for complete example:

```
offsets = np.random.rand(20,2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]
black = (0,0,0,1)

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors = facecolors,
    edgecolors = (black,),
    linewidths = (1,),
    offsets = offsets,
    transOffset = ax.transData,
    )
```

`add_callback``(`*func*`)`

Adds a callback function that will be called whenever one of the `Artist`‘s properties changes.

Returns an *id* that is useful for removing the callback with `remove_callback()` later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` = **'Artist'**

`autoscale`()
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The `Axes` instance the artist resides in, or *None*.

`changed`()
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

`check_update`(*checker*)
If mappable has changed since the last check, return True; else return False

`contains`(*mouseevent*)
Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits`(*x*)
For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

`convert_yunits`(*y*)
For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

`draw`(*artist*, *renderer*, **args*, ***kwargs*)

`findobj`(*match=None*, *include_self=True*)
Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

`format_cursor_data`(*data*)
Return *cursor data* string formatted.

get_agg_filter()
return filter function to be used for agg filter

get_alpha()
Return the alpha value used for blending - not supported on all backends

get_animated()
Return the artist's animated state

get_array()
Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child ``Artist`s this :class:`Artist`` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_numsides()

get_offset_position()
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picker object used by this artist

get_pickradius()

`get_rasterized()`
return True if the artist is to be rasterized

`get_rotation()`

`get_sizes()`
Returns the sizes of the elements in the collection. The value represents the 'area' of the element.

Returns sizes : array

The 'area' of each element.

`get_sketch_params()`
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap()`
Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_transform()`
Return the *`Transform`* instance used by this artist.

`get_transformed_clip_path_and_affine()`
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms()`

`get_url()`
Returns the url

`get_urls()`

`get_visible()`
Return the artist's visiblity

get_window_extent(*renderer*)

get_zorder()
Return the `Artist`'s zorder.

have_units()
Return *True* if units are set on the *x* or *y* axes

hitlist(*event*)
List the children of the artist which contain the mouse event *event*.

is_figure_set()
Returns True if the artist is assigned to a `Figure`.

is_transform_set()
Returns *True* if `Artist` has a transform explicitly set.

mouseover

pchanged()
Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(***kwargs*)
A property batch setter. Pass *kwargs* to set properties.

`set_agg_filter`(*filter_func*)
set agg_filter fuction.

`set_alpha`(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

`set_animated`(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

`set_antialiased`(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

`set_antialiaseds`(*aa*)
alias for set_antialiased

`set_array`(*A*)
Set the image array from numpy array *A*

`set_axes`(*axes*)
Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

`set_clim`(*vmin=None*, *vmax=None*)
set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

`set_clip_box`(*clipbox*)
Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

`set_clip_on`(*b*)
Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

`set_clip_path`(*path*, *transform=None*)
Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

`set_cmap`(*cmap*)
set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

`set_color`(*c*)
Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, `set_edgecolor()` For setting the edge or face color individually.

`set_contains`(*picker*)
Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit* = *True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

`set_dashes`(*ls*)
alias for set_linestyle

`set_edgecolor`(*c*)
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is ‘face’, the edge color will always be the same as the face color. If it is ‘none’, the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

`set_edgecolors`(*c*)
alias for set_edgecolor

`set_facecolor`(*c*)
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is ‘none’, the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

`set_facecolors`(*c*)
alias for set_facecolor

set_figure(*fig*)

Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)

Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: ['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']

set_label(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)
alias for set_linestyle

`set_linewidth`(*lw*)
Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)
alias for set_linewidth

`set_lw`(*lw*)
alias for set_linewidth

`set_norm`(*norm*)
set the normalization instance

`set_offset_position`(*offset_position*)
Set how offsets are applied. If *offset_position* is ‘screen’ (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is ‘data’, the offset is applied before the master transform, i.e., the offsets are in data coordinates.

`set_offsets`(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

`set_path_effects`(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

`set_paths`()

`set_picker`(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like

lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

`set_pickradius`(*pr*)

`set_rasterized`(*rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

`set_sizes`(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters sizes : ndarray or None

The size to set for each element of the collection. The value is the 'area' of the element.

dpi : float

The dpi of the canvas. Defaults to 72.0.

`set_sketch_params`(*scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

`set_snap`(*snap*)

Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is

- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`set_transform`(*t*)
Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

`set_url`(*url*)
Sets the url for the artist

ACCEPTS: a url string

`set_urls`(*urls*)

`set_visible`(*b*)
Set the artist's visiblity.

ACCEPTS: [True | False]

`set_zorder`(*level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

`stale`
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`sticky_edges`
`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)
Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)
copy properties from other to self

`update_scalarmappable`()
If the scalar mappable array is not none, update colors from scalar data

`zorder` **= 0**

class `matplotlib.collections.`**`TriMesh`**(*triangulation*, ***kwargs*)
Bases: *`matplotlib.collections.Collection`*

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a *`Triangulation`* object.

`add_callback`(*func*)
Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

`add_checker`(*checker*)
Add an entry to a dictionary of boolean flags that are set to True when the mappable is changed.

`aname` **= 'Artist'**

`autoscale`()
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`axes`
The *`Axes`* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal

check_update(*checker*)

If mappable has changed since the last check, return True; else return False

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns True | False, `dict(ind=itemlist)`, where every item in itemlist contains the event.

static **convert_mesh_to_paths**(*tri*)

Converts a given mesh into a sequence of `matplotlib.path.Path` objects for easier rendering by backends that do not directly support meshes.

This function is primarily of use to backend implementers.

convert_xunits(*x*)

For artists in an axes, if the xaxis has units support, convert *x* using xaxis unit type

convert_yunits(*y*)

For artists in an axes, if the yaxis has units support, convert *y* using yaxis unit type

draw(*artist*, *renderer*, **args*, ***kwargs*)

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all `Artist` instances contained in self.

match can be

- None: return all objects contained in artist.
- function with signature `boolean = match(artist)` used to filter matches
- class instance: e.g., Line2D. Only return artists of class type.

If *include_self* is True (default), include self in the list to be checked for a match.

format_cursor_data(*data*)

Return *cursor data* string formatted.

get_agg_filter()

return filter function to be used for agg filter

get_alpha()

Return the alpha value used for blending - not supported on all backends

get_animated()

Return the artist's animated state

get_array()

Return the array

get_axes()
Return the `Axes` instance the artist resides in, or *None*.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

get_children()
Return a list of the child `` Artist`s this :class:`Artist `` contains.

get_clim()
return the min, max of the color limits for image scaling

get_clip_box()
Return artist clipbox

get_clip_on()
Return whether artist uses clipping

get_clip_path()
Return artist clip path

get_cmap()
return the colormap

get_contains()
Return the _contains test used by the artist, or *None* for default.

get_cursor_data(*event*)
Get the cursor data for a given event.

get_dashes()

get_datalim(*transData*)

get_edgecolor()

get_edgecolors()

get_facecolor()

get_facecolors()

get_figure()
Return the `Figure` instance the artist belongs to.

get_fill()
return whether fill is set

get_gid()
Returns the group id

get_hatch()
Return the current hatching pattern

get_label()
Get the label used for this artist in the legend.

get_linestyle()

get_linestyles()

get_linewidth()

get_linewidths()

get_offset_position()
Returns how offsets are applied for the collection. If *offset_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

get_offset_transform()

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picker object used by this artist

get_pickradius()

get_rasterized()
return True if the artist is to be rasterized

get_sketch_params()
Returns the sketch parameters for the artist.

Returns sketch_params : tuple or `None`

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

`get_snap``()`

Returns the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

`get_transform``()`

Return the *`Transform`* instance used by this artist.

`get_transformed_clip_path_and_affine``()`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms``()`

`get_url``()`

Returns the url

`get_urls``()`

`get_visible``()`

Return the artist's visiblity

`get_window_extent``(`*renderer*`)`

`get_zorder``()`

Return the `Artist`'s zorder.

`have_units``()`

Return *True* if units are set on the *x* or *y* axes

`hitlist``(`*event*`)`

List the children of the artist which contain the mouse event *event*.

`is_figure_set``()`

Returns True if the artist is assigned to a *`Figure`*.

`is_transform_set``()`

Returns *True* if `Artist` has a transform explicitly set.

`mouseover`

`pchanged``()`

Fire an event when property changed, calling all of the registered callbacks.

pick(*mouseevent*)
Process pick event

each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set

pickable()
Return *True* if `Artist` is pickable.

properties()
return a dictionary mapping property name -> value for all Artist props

remove()
Remove the artist from the figure if possible. The effect will not be visible until the figure is redrawn, e.g., with `matplotlib.axes.Axes.draw_idle()`. Call `matplotlib.axes.Axes.relim()` to update the axes limits if desired.

Note: `relim()` will not see collections even if the collection was added to axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)
Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

set(**kwargs*)
A property batch setter. Pass *kwargs* to set properties.

set_agg_filter(*filter_func*)
set agg_filter fuction.

set_alpha(*alpha*)
Set the alpha tranparencies of the collection. *alpha* must be a float or *None*.

ACCEPTS: float or None

set_animated(*b*)
Set the artist's animation state.

ACCEPTS: [True | False]

set_antialiased(*aa*)
Set the antialiasing state for rendering.

ACCEPTS: Boolean or sequence of booleans

set_antialiaseds(*aa*)
alias for set_antialiased

set_array(*A*)
Set the image array from numpy array *A*

set_axes(*axes*)

Set the `Axes` instance in which the artist resides, if any.

This has been deprecated in mpl 1.5, please use the axes property. Will be removed in 1.7 or 2.0.

ACCEPTS: an `Axes` instance

set_clim(*vmin=None*, *vmax=None*)

set the norm limits for image scaling; if *vmin* is a length2 sequence, interpret it as `(vmin, vmax)` which is used to support setp

ACCEPTS: a length 2 sequence of floats

set_clip_box(*clipbox*)

Set the artist's clip `Bbox`.

ACCEPTS: a `matplotlib.transforms.Bbox` instance

set_clip_on(*b*)

Set whether artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

ACCEPTS: [True | False]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path, which may be:

- a `Patch` (or subclass) instance
- **a `Path` instance, in which case** an optional `Transform` instance may be provided, which will be applied to the path before using it for clipping.
- *None*, to remove the clipping path

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

ACCEPTS: [(`Path`, `Transform`) | `Patch` | None]

set_cmap(*cmap*)

set the colormap for luminance data

ACCEPTS: a colormap or registered colormap name

set_color(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color arg or sequence of rgba tuples

See also:

`set_facecolor()`, **`set_edgecolor()`** For setting the edge or face color individually.

set_contains(*picker*)

Replace the contains test used by this artist. The new picker should be a callable function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

If the mouse event is over the artist, return *hit = True* and *props* is a dictionary of properties you want returned with the contains test.

ACCEPTS: a callable function

set_dashes(*ls*)
alias for set_linestyle

set_edgecolor(*c*)
Set the edgecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'face', the edge color will always be the same as the face color. If it is 'none', the patch boundary will not be drawn.

ACCEPTS: matplotlib color spec or sequence of specs

set_edgecolors(*c*)
alias for set_edgecolor

set_facecolor(*c*)
Set the facecolor(s) of the collection. *c* can be a matplotlib color spec (all patches have same color), or a sequence of specs; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

ACCEPTS: matplotlib color spec or sequence of specs

set_facecolors(*c*)
alias for set_facecolor

set_figure(*fig*)
Set the `Figure` instance the artist belongs to.

ACCEPTS: a `matplotlib.figure.Figure` instance

set_gid(*gid*)
Sets the (group) id for the artist

ACCEPTS: an id string

set_hatch(*hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

ACCEPTS: [‘/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with ‘%s’ conversion.

`set_linestyle`(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: [’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { ‘-‘, ‘–‘, ‘-.’, ‘:’} and more see description

The line style.

`set_linestyles`(*ls*)

alias for set_linestyle

`set_linewidth`(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

ACCEPTS: float or sequence of floats

`set_linewidths`(*lw*)

alias for set_linewidth

`set_lw`(*lw*)

alias for set_linewidth

set_norm(*norm*)
set the normalization instance

set_offset_position(*offset_position*)
Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

set_offsets(*offsets*)
Set the offsets for the collection. *offsets* can be a scalar or a sequence.

ACCEPTS: float or sequence of floats

set_path_effects(*path_effects*)
set path_effects, which should be a list of instances of matplotlib.patheffect._Base class or its derivatives.

set_paths()

set_picker(*picker*)
Set the epsilon for picking used by this artist

picker can be one of the following:

- *None*: picking is disabled for this artist (default)
- A boolean: if *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- A float: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

  to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

ACCEPTS: [None|float|boolean|callable]

set_pickradius(*pr*)

set_rasterized(*rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior

ACCEPTS: [True | False | None]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)
Sets the sketch parameters.

Parameters scale : float, optional

The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length : float, optional

The length of the wiggle along the line, in pixels (default 128.0)

randomness : float, optional

The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(*snap*)
Sets the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

Only supported by the Agg and MacOSX backends.

set_transform(*t*)
Set the `Transform` instance used by this artist.

ACCEPTS: `Transform` instance

set_url(*url*)
Sets the url for the artist

ACCEPTS: a url string

set_urls(*urls*)

set_visible(*b*)
Set the artist's visiblity.

ACCEPTS: [True | False]

set_zorder(*level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

ACCEPTS: any number

stale
If the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

sticky_edges
`x` and `y` sticky edge lists.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added–the view limit "sticks" to the edge. A typical usecase is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba`(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to already be in the range (0-1).

Note: this method assumes the input is well-behaved; it does not check for anomalies such as *x* being a masked rgba array, or being an integer type other than uint8, or being a floating point rgba array with values outside the 0-1 range.

`update`(*props*)

Update the properties of this `Artist` from the dictionary *prop*.

`update_from`(*other*)

copy properties from other to self

`update_scalarmappable`()

If the scalar mappable array is not none, update colors from scalar data

`zorder` = 0

CHAPTER

TWENTYFIVE

COLORBAR

25.1 `matplotlib.colorbar`

Colorbar toolkit with two classes and a function:

`ColorbarBase` the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

`Colorbar` the derived class for use with images or contour plots.

`make_axes()` a function for resizing an axes and adding a second axes suitable for a colorbar

The `colorbar()` method uses `make_axes()` and `Colorbar`; the `colorbar()` function is a thin wrapper over `colorbar()`.

class `matplotlib.colorbar.`**`Colorbar`**(*ax*, *mappable*, ***kw*)

Bases: `matplotlib.colorbar.ColorbarBase`

This class connects a `ColorbarBase` to a `ScalarMappable` such as a `AxesImage` generated via `imshow()`.

It is not intended to be instantiated directly; instead, use `colorbar()` or `colorbar()` to make your colorbar.

`add_lines`(*CS*, *erase=True*)

Add the lines from a non-filled `ContourSet` to the colorbar.

Set *erase* to False if these lines should be added to any pre-existing lines.

`on_mappable_changed`(*mappable*)

Updates this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

`remove`()

Remove this colorbar from the figure. If the colorbar was created with `use_gridspec=True` then restore the gridspec to its previous value.

`update_bruteforce`(*mappable*)

Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the pyplot.colorbar function or the Figure.colorbar method are used to create the colorbar.

update_normal(*mappable*)

update solid, lines, etc. Unlike update_bruteforce, it does not clear the axes. This is meant to be called when the image or contour plot to which this colorbar belongs is changed.

class `matplotlib.colorbar.`**ColorbarBase**(*ax*, *cmap=None*, *norm=None*, *alpha=None*, *values=None*, *boundaries=None*, *orientation='vertical'*, *ticklocation='auto'*, *extend='neither'*, *spacing='uniform'*, *ticks=None*, *format=None*, *drawedges=False*, *filled=True*, *extendfrac=None*, *extendrect=False*, *label=''*)

Bases: *`matplotlib.cm.ScalarMappable`*

Draw a colorbar in an existing axes.

This is a base class for the *`Colorbar`* class, which is the basis for the *`colorbar()`* function and the *`colorbar()`* method, which are the usual ways of creating a colorbar.

It is also useful by itself for showing a colormap. If the *cmap* kwarg is given but *boundaries* and *values* are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the *norm* as:

```
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm.
```

Useful attributes:

ax the Axes instance in which the colorbar is drawn

lines a list of LineCollection if lines were drawn, otherwise an empty list

dividers a LineCollection if *drawedges* is True, otherwise None

Useful public methods are *`set_label()`* and *`add_lines()`*.

add_lines(*levels*, *colors*, *linewidths*, *erase=True*)

Draw lines on the colorbar.

colors and *linewidths* must be scalars or sequences the same length as *levels*.

Set *erase* to False to add lines without first removing any previously added lines.

ax = None

The axes that this colorbar lives in.

config_axis()

draw_all()

Calculate any free parameters based on the current cmap and norm, and do all the drawing.

n_rasterize = 50

remove()

Remove this colorbar from the figure

set_alpha(*alpha*)

set_label(*label*, ***kw*)

Label the long axis of the colorbar

set_ticklabels(*ticklabels*, *update_ticks=True*)

set tick labels. Tick labels are updated immediately unless update_ticks is *False*. To manually update the ticks, call *update_ticks* method explicitly.

set_ticks(*ticks*, *update_ticks=True*)

set tick locations. Tick locations are updated immediately unless update_ticks is *False*. To manually update the ticks, call *update_ticks* method explicitly.

update_ticks()

Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

class `matplotlib.colorbar.`**ColorbarPatch**(*ax*, *mappable*, ***kw*)

Bases: `matplotlib.colorbar.Colorbar`

A Colorbar which is created using `Patch` rather than the default `pcolor()`.

It uses a list of Patch instances instead of a `PatchCollection` because the latter does not allow the hatch pattern to vary among the members of the collection.

`matplotlib.colorbar.`**colorbar_factory**(*cax*, *mappable*, ***kwargs*)

Creates a colorbar on the given axes for the given mappable.

Typically, for automatic colorbar placement given only a mappable use `colorbar()`.

`matplotlib.colorbar.`**make_axes**(*parents*, *location=None*, *orientation=None*, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kw*)

Resize and reposition parent axes, and return a child axes suitable for a colorbar.

Keyword arguments may include the following (with defaults):

location [[None|'left'|'right'|'top'|'bottom']] The position, relative to **parents**, where the colorbar axes should be created. If None, the value will either come from the given `orientation`, else it will default to 'right'.

orientation [[None|'vertical'|'horizontal']] The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the `location` keyword.

Property	Description
orientation	vertical or horizontal
fraction	0.15; fraction of original axes to use for colorbar
pad	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
shrink	1.0; fraction by which to shrink the colorbar
aspect	20; ratio of long to short dimensions
anchor	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
panchor	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

`matplotlib.colorbar.`**`make_axes_gridspec`**(*parent*, ***kw*)

Resize and reposition a parent axes, and return a child axes suitable for a colorbar. This function is similar to make_axes. Prmary differences are

- *make_axes_gridspec* only handles the *orientation* keyword and cannot handle the "location" keyword.
- *make_axes_gridspec* should only be used with a subplot parent.
- ***make_axes*** **creates an instance of Axes.** ***make_axes_gridspec*** creates an instance of Subplot.
- ***make_axes*** **updates the position of the** parent. *make_axes_gridspec* replaces the grid_spec attribute of the parent with a new one.

While this function is meant to be compatible with *make_axes*, there could be some minor differences.

Keyword arguments may include the following (with defaults):

orientation 'vertical' or 'horizontal'

Property	Description
orientation	vertical or horizontal
fraction	0.15; fraction of original axes to use for colorbar
pad	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
shrink	1.0; fraction by which to shrink the colorbar
aspect	20; ratio of long to short dimensions
anchor	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
panchor	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary to be passed when creating the colorbar instance.

CHAPTER

TWENTYSIX

COLORS

For a visual representation of the matplotlib colormaps, see the “Color” section in the gallery.

26.1 `matplotlib.colors`

A module for converting numbers or color arguments to *RGB* or *RGBA*

RGB and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap. Colormapping typically involves two steps: a data array is first mapped onto the range 0-1 using an instance of `Normalize` or of a subclass; then this number in the 0-1 range is mapped to a color using an instance of a subclass of `Colormap`. Two are provided here: `LinearSegmentedColormap`, which is used to generate all the built-in colormap instances, but is also useful for making custom colormaps, and `ListedColormap`, which is used for generating a custom colormap from a list of color specifications.

The module also provides functions for checking whether an object can be interpreted as a color (`is_color_like()`), for converting such an object to an RGBA tuple (`to_rgba()`) or to an HTML-like hex string in the `#rrggbb` format (`to_hex()`), and a sequence of colors to an `(n, 4)` RGBA array (`to_rgba_array()`). Caching is used for efficiency.

Commands which take color arguments can use several formats to specify the colors. For the basic built-in colors, you can use a single letter

- `b`: blue
- `g`: green
- `r`: red
- `c`: cyan
- `m`: magenta
- `y`: yellow
- `k`: black
- `w`: white

To use the colors that are part of the active color cycle in the current style, use `C` followed by a digit. For example:

- `C0`: The first color in the cycle
- `C1`: The second color in the cycle

Gray shades can be given as a string encoding a float in the 0-1 range, e.g.:

```
color = '0.75'
```

For a greater range of colors, you have two options. You can specify the color using an html hex string, as in:

```
color = '#eeefff'
```

(possibly specifying an alpha value as well), or you can pass an `(r, g, b)` or `(r, g, b, a)` tuple, where each of `r`, `g`, `b` and `a` are in the range [0,1].

Finally, legal html names for colors, like 'red', 'burlywood' and 'chartreuse' are supported.

class `matplotlib.colors.`**`BoundaryNorm`**(*boundaries*, *ncolors*, *clip=False*)

Bases: *`matplotlib.colors.Normalize`*

Generate a colormap index based on discrete intervals.

Unlike *`Normalize`* or *`LogNorm`*, *`BoundaryNorm`* maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.

boundaries a monotonically increasing sequence

ncolors number of colors in the colormap to be used

If:

```
b[i] <= v < b[i+1]
```

then v is mapped to color j; as i varies from 0 to len(boundaries)-2, j goes from 0 to ncolors-1.

Out-of-range values are mapped to -1 if low and ncolors if high; these are converted to valid indices by `Colormap.__call__()` . If clip == True, out-of-range values are mapped to 0 if low and ncolors-1 if high.

`inverse`(*value*)

class `matplotlib.colors.`**`Colormap`**(*name*, *N=256*)

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically Colormap instances are used to convert data values (floats) from the interval `[0, 1]` to the RGBA color that the respective Colormap represents. For scaling of data into the `[0, 1]` interval see *matplotlib.colors.Normalize*. It is worth noting that *matplotlib.cm.ScalarMappable* subclasses make heavy use of this `data->normalize->map-to-color` processing chain.

Parameters name : str

The name of the colormap.

N : int

The number of rgb quantization levels.

colorbar_extend = None

When this colormap exists on a scalar mappable and colorbar_extend is not False, colorbar creation will pick up `colorbar_extend` as the default value for the `extend` keyword in the *matplotlib.colorbar.Colorbar* constructor.

is_gray()

set_bad(*color='k'*, *alpha=None*)

Set color to be used for masked values.

set_over(*color='k'*, *alpha=None*)

Set color to be used for high out-of-range values. Requires norm.clip = False

set_under(*color='k'*, *alpha=None*)

Set color to be used for low out-of-range values. Requires norm.clip = False

class `matplotlib.colors.`**LightSource**(*azdeg=315*, *altdeg=45*, *hsv_min_val=0*, *hsv_max_val=1*, *hsv_min_sat=1*, *hsv_max_sat=0*)

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

The *shade()* is used to produce "shaded" rgb values for a data array. *shade_rgb()* can be used to combine an rgb image with The *shade_rgb()* The *hillshade()* produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

Parameters azdeg : number, optional

The azimuth (0-360, degrees clockwise from North) of the light source. Defaults to 315 degrees (from the northwest).

altdeg : number, optional

The altitude (0-90, degrees up from horizontal) of the light source. Defaults to 45 degrees from horizontal.

Notes

For backwards compatibility, the parameters *hsv_min_val*, *hsv_max_val*, *hsv_min_sat*, and *hsv_max_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into `shade()` or `shade_rgb()`. See the documentation for `blend_hsv()` for more details.

`blend_hsv`(*rgb*, *intensity*, *hsv_max_sat=None*, *hsv_max_val=None*, *hsv_min_val=None*, *hsv_min_sat=None*)

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the (s,v) values (in hsv colorspace) toward (hsv_min_sat, hsv_min_val) in the shaded regions, or lightened by sliding (s,v) toward (hsv_max_sat hsv_max_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

Parameters rgb : ndarray

An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity : ndarray

An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

hsv_max_sat : number, optional

The maximum saturation value that the *intensity* map can shift the output image to. Defaults to 1.

hsv_min_sat : number, optional

The minimum saturation value that the *intensity* map can shift the output image to. Defaults to 0.

hsv_max_val : number, optional

The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 1.

hsv_min_val: number, optional

The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 0.

Returns rgb : ndarray

An MxNx3 RGB array representing the combined images.

`blend_overlay`(*rgb*, *intensity*)

Combines an rgb image with an intensity map using "overlay" blending.

Parameters rgb : ndarray

An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity : ndarray

An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

Returns rgb : ndarray

An MxNx3 RGB array representing the combined images.

`blend_soft_light`(*rgb*, *intensity*)

Combines an rgb image with an intensity map using "soft light" blending. Uses the "pegtop" formula.

Parameters rgb : ndarray

An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

intensity : ndarray

An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

Returns rgb : ndarray

An MxNx3 RGB array representing the combined images.

`hillshade`(*elevation*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1.0*)

Calculates the illumination intensity for a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

Parameters elevation : array-like

A 2d array (or equivalent) of the height values used to generate an illumination map

vert_exag : number, optional

The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topographic effects.

dx : number, optional

The x-spacing (columns) of the input *elevation* grid.

dy : number, optional

The y-spacing (rows) of the input *elevation* grid.

fraction : number, optional

Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

——-

intensity : ndarray

A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade(*data*, *cmap*, *norm=None*, *blend_mode='overlay'*, *vmin=None*, *vmax=None*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1*, ***kwargs*)

Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

Parameters data : array-like

A 2d array (or equivalent) of the height values used to generate a shaded map.

cmap : `Colormap` instance

The colormap used to color the *data* array. Note that this must be a `Colormap` instance. For example, rather than passing in `cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

norm : `Normalize` instance, optional

The normalization used to scale values before colormapping. If None, the input will be linearly scaled between its min and max.

blend_mode : {'hsv', 'overlay', 'soft'} or callable, optional

The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vmin : scalar or None, optional

The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vmax : scalar or None, optional

The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vert_exag : number, optional

The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.

dx : number, optional

The x-spacing (columns) of the input *elevation* grid.

dy : number, optional

The y-spacing (rows) of the input *elevation* grid.

fraction : number, optional

Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Additional kwargs are passed on to the *blend_mode* function.

Returns rgba : ndarray

An MxNx4 array of floats ranging between 0-1.

shade_rgb(*rgb*, *elevation*, *fraction=1.0*, *blend_mode='hsv'*, *vert_exag=1*, *dx=1*, *dy=1*, ***kwargs*)

Take the input RGB array (ny*nx*3) adjust their color values to given the impression of a shaded relief map with a specified light source using the elevation (ny*nx). A new RGB array ((ny*nx*3)) is returned.

Parameters rgb : array-like

An MxNx3 RGB array, assumed to be in the range of 0 to 1.

elevation : array-like

A 2d array (or equivalent) of the height values used to generate a shaded map.

fraction : number

Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

blend_mode : {'hsv', 'overlay', 'soft'} or callable, optional

The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to "hsv". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vert_exag : number, optional

The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs meters) or to exaggerate or de-emphasize topography.

dx : number, optional

The x-spacing (columns) of the input *elevation* grid.

dy : number, optional

The y-spacing (rows) of the input *elevation* grid.

Additional kwargs are passed on to the *blend_mode* function.

Returns shaded_rgb : ndarray

An MxNx3 array of floats ranging between 0-1.

class `matplotlib.colors.`**`LinearSegmentedColormap`**(*name*, *segmentdata*, *N=256*, *gamma=1.0*)

Bases: *`matplotlib.colors.Colormap`*

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of *x*, *y0*, *y1* tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red':   [(0.0,  0.0, 0.0),
                   (0.5,  1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'green': [(0.0,  0.0, 0.0),
                   (0.25, 0.0, 0.0),
                   (0.75, 1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'blue':  [(0.0,  0.0, 0.0),
                   (0.5,  0.0, 0.0),
                   (1.0,  1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of *x*, *y0*, *y1* tuples. In each sequence, *x* must increase monotonically from 0 to 1. For any input value *z* falling between *x[i]* and *x[i+1]*, the output value of a given color will be linearly interpolated between *y1[i]* and *y0[i+1]*:

```
row i:   x  y0  y1
               /
              /
row i+1: x  y0  y1
```

Hence y0 in the first row and y1 in the last row are never used.

See also:

`LinearSegmentedColormap.from_list()` Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

`makeMappingArray()` For information about making a mapping array.

static from_list(*name*, *colors*, *N=256*, *gamma=1.0*)
Make a linear segmented colormap with *name* from a sequence of *colors* which evenly transitions from colors[0] at val=0 to colors[-1] at val=1. *N* is the number of rgb quantization levels. Alternatively, a list of (value, color) tuples can be given to divide the range unevenly.

set_gamma(*gamma*)
Set a new gamma value and regenerate color map.

class matplotlib.colors.**ListedColormap**(*colors*, *name='from_list'*, *N=None*)
Bases: `matplotlib.colors.Colormap`

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

Make a colormap from a list of colors.

colors a list of matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (*N* rgb or rgba values)

name a string to identify the colormap

N the number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If:

```
N < len(colors)
```

the list will be truncated at *N*. If:

```
N > len(colors)
```

the list will be extended by repetition.

class matplotlib.colors.**LogNorm**(*vmin=None*, *vmax=None*, *clip=False*)
Bases: `matplotlib.colors.Normalize`

Normalize a given value to the 0-1 range on a log scale

If *vmin* or *vmax* is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, *__call__(A)* calls *autoscale_None(A)*. If *clip* is *True* and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If *clip* is *True*, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is *clip = False*.

autoscale(*A*)
Set *vmin*, *vmax* to min, max of *A*.

autoscale_None(*A*)
autoscale only None-valued vmin or vmax

inverse(*value*)

class `matplotlib.colors.`**NoNorm**(*vmin=None*, *vmax=None*, *clip=False*)
Bases: `matplotlib.colors.Normalize`

Dummy replacement for Normalize, for the case where we want to use indices directly in a `ScalarMappable` .

If *vmin* or *vmax* is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, *__call__(A)* calls *autoscale_None(A)*. If *clip* is *True* and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If *clip* is *True*, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is *clip* = *False*.

inverse(*value*)

class `matplotlib.colors.`**Normalize**(*vmin=None*, *vmax=None*, *clip=False*)
Bases: `object`

A class which, when called, can normalize data into the `[0.0, 1.0]` interval.

If *vmin* or *vmax* is not given, they are initialized from the minimum and maximum value respectively of the first input processed. That is, *__call__(A)* calls *autoscale_None(A)*. If *clip* is *True* and the given value falls outside the range, the returned value will be 0 or 1, whichever is closer. Returns 0 if:

```
vmin==vmax
```

Works with scalars or arrays, including masked arrays. If *clip* is *True*, masked values are set to 1; otherwise they remain masked. Clipping silently defeats the purpose of setting the over, under, and masked colors in the colormap, so it is likely to lead to surprises; therefore the default is *clip* = *False*.

autoscale(*A*)
Set *vmin*, *vmax* to min, max of *A*.

autoscale_None(*A*)
autoscale only None-valued vmin or vmax

inverse(*value*)

static **`process_value`**(*value*)

Homogenize the input *value* for easy and efficient normalization.

value can be a scalar or sequence.

Returns *result*, *is_scalar*, where *result* is a masked array matching *value*. Float dtypes are preserved; integer types with two bytes or smaller are converted to np.float32, and larger types are converted to np.float. Preserving float32 when possible, and using in-place operations, can greatly improve speed for large arrays.

Experimental; we may want to add an option to force the use of float32.

`scaled`()

return true if vmin and vmax set

class `matplotlib.colors.`**`PowerNorm`**(*gamma*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: `matplotlib.colors.Normalize`

Normalize a given value to the `[0, 1]` interval with a power-law scaling. This will clip any negative data points to 0.

`autoscale`(*A*)

Set *vmin*, *vmax* to min, max of *A*.

`autoscale_None`(*A*)

autoscale only None-valued vmin or vmax

`inverse`(*value*)

class `matplotlib.colors.`**`SymLogNorm`**(*linthresh*, *linscale=1.0*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: `matplotlib.colors.Normalize`

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (-*linthresh*, *linthresh*).

linthresh: The range within which the plot is linear (to avoid having the plot go to infinity around zero).

linscale: This allows the linear range (-*linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range. Defaults to 1.

`autoscale`(*A*)

Set *vmin*, *vmax* to min, max of *A*.

`autoscale_None`(*A*)

autoscale only None-valued vmin or vmax

`inverse`(*value*)

`matplotlib.colors.`**`from_levels_and_colors`**`(`*levels*, *colors*, *extend='neither'*`)`

A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.

Parameters levels : sequence of numbers

The quantization levels used to construct the *`BoundaryNorm`*. Values `v` are quantizized to level `i` if `lev[i] <= v < lev[i+1]`.

colors : sequence of colors

The fill color to use for each level. If `extend` is "neither" there must be `n_level - 1` colors. For an `extend` of "min" or "max" add one extra color, and for an `extend` of "both" add two colors.

extend : {'neither', 'min', 'max', 'both'}, optional

The behaviour when a value falls out of range of the given levels. See *`contourf()`* for details.

Returns (cmap, norm) : tuple containing a *`Colormap`* and a *`Normalize`* instance

`matplotlib.colors.`**`get_named_colors_mapping`**`()`

Return the global mapping of names to named colors.

`matplotlib.colors.`**`hsv_to_rgb`**`(`*hsv*`)`

convert hsv values in a numpy array to rgb values all values assumed to be in range [0, 1]

Parameters hsv : (..., 3) array-like

All values assumed to be in range [0, 1]

Returns rgb : (..., 3) ndarray

Colors converted to RGB values in range [0, 1]

`matplotlib.colors.`**`is_color_like`**`(`*c*`)`

Return whether `c` can be interpreted as an RGB(A) color.

`matplotlib.colors.`**`makeMappingArray`**`(`*N*, *data*, *gamma=1.0*`)`

Create an *N* -element 1-d lookup table

data represented by a list of x,y0,y1 mapping correspondences. Each element in this list represents how a value between 0 and 1 (inclusive) represented by x is mapped to a corresponding value between 0 and 1 (inclusive). The two values of y are to allow for discontinuous mapping functions (say as might be found in a sawtooth) where y0 represents the value of y for values of x <= to that given, and y1 is the value to be used for x > than that given). The list must start with x=0, end with x=1, and all values of x must be in increasing order. Values between the given mapping points are determined by simple linear interpolation.

Alternatively, data can be a function mapping values between 0 - 1 to 0 - 1.

The function returns an array "result" where `result[x*(N-1)]` gives the closest value for values of x between 0 and 1.

`matplotlib.colors.`**`rgb_to_hsv`**`(`*arr*`)`

convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

Parameters arr : (..., 3) array-like

All values must be in the range [0, 1]

Returns hsv : (..., 3) ndarray

Colors converted to hsv values in range [0, 1]

`matplotlib.colors.`**`to_hex`**`(`*c*, *keep_alpha=False*`)`

Convert `c` to a hex color.

Uses the #rrggbb format if `keep_alpha` is False (the default), `#rrggbbaa` otherwise.

`matplotlib.colors.`**`to_rgb`**`(`*c*`)`

Convert `c` to an RGB color, silently dropping the alpha channel.

`matplotlib.colors.`**`to_rgba`**`(`*c*, *alpha=None*`)`

Convert `c` to an RGBA color.

If `alpha` is not `None`, it forces the alpha value, except if `c` is “none” (case-insensitive), which always maps to `(0, 0, 0, 0)`.

`matplotlib.colors.`**`to_rgba_array`**`(`*c*, *alpha=None*`)`

Convert `c` to a (n, 4) array of RGBA colors.

If `alpha` is not `None`, it forces the alpha value. If `c` is “none” (case-insensitive) or an empty list, an empty array is returned.

CHAPTER

TWENTYSEVEN

CONTAINER

27.1 `matplotlib.container`

class `matplotlib.container.`**`BarContainer`**(*patches*, *errorbar=None*, ***kwargs*)

Bases: *`matplotlib.container.Container`*

class `matplotlib.container.`**`Container`**(*kl*, *label=None*)

Bases: `tuple`

Base class for containers.

`add_callback`(*func*)

Adds a callback function that will be called whenever one of the `Artist`'s properties changes.

Returns an *id* that is useful for removing the callback with *`remove_callback()`* later.

`get_children`()

`get_label`()

Get the label used for this artist in the legend.

`pchanged`()

Fire an event when property changed, calling all of the registered callbacks.

`remove`()

`remove_callback`(*oid*)

Remove a callback based on its *id*.

See also:

`add_callback()` For adding callbacks

`set_label`(*s*)

Set the label to *s* for auto legend.

ACCEPTS: string or anything printable with '%s' conversion.

`set_remove_method`(*f*)

class `matplotlib.container.`**`ErrorbarContainer`**(*lines*, *has_xerr=False*, *has_yerr=False*, ***kwargs*)

Bases: `matplotlib.container.Container`

class `matplotlib.container.`**`StemContainer`**(*markerline_stemlines_baseline*, ***kwargs*)

Bases: `matplotlib.container.Container`

28.1 `matplotlib.dates`

Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime`, the add-on modules `pytz` and `dateutil`. `datetime` objects are converted to floating point numbers which represent time in days since 0001-01-01 UTC, plus 1. For example, 0001-01-01, 06:00 is 1.25, not 0.25. The helper functions *`date2num()`*, *`num2date()`* and *`drange()`* are used to facilitate easy conversion to and from `datetime` and numeric ranges.

Note: Like Python's datetime, mpl uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and mpl give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the datetime module we find:

```
In [31]:date(2006,4,1).toordinal() - date(1,1,1).toordinal()
Out[31]:732401
```

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

All the matplotlib date converters, tickers and formatters are timezone aware, and the default timezone is given by the timezone parameter in your `matplotlibrc` file. If you leave out a `tz` timezone instance, the default from your rc file will be assumed. If you want to use a custom time zone, pass a `pytz.timezone` instance with the tz keyword argument to `num2date()`, `plot_date()`, and any custom date tickers or locators you create. See pytz for information on `pytz` and timezone handling.

The dateutil module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

28.1.1 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

Here are all the date tickers:

- *`MinuteLocator`*: locate minutes
- *`HourLocator`*: locate hours
- *`DayLocator`*: locate specifed days of the month
- *`WeekdayLocator`*: Locate days of the week, e.g., MO, TU
- *`MonthLocator`*: locate months, e.g., 7 for july
- *`YearLocator`*: locate years that are multiples of base

- *RRuleLocator*: locate using a `matplotlib.dates.rrulewrapper`. The `rrulewrapper` is a simple wrapper around a `dateutil.rrule` (dateutil) which allow almost arbitrary date tick specifications. See rrule example.
- *AutoDateLocator*: On autoscale, this class picks the best `MultipleDateLocator` to set the view limits and the tick locations.

28.1.2 Date formatters

Here all all the date formatters:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime()` format strings
- *IndexDateFormatter*: date plots with implicit *x* indexing.

`matplotlib.dates.`**`date2num`**`(`*d*`)`

d is either a `datetime` instance or a sequence of datetimes.

Return value is a floating point number (or sequence of floats) which gives the number of days (fraction part represents hours, minutes, seconds) since 0001-01-01 00:00:00 UTC, *plus one*. The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

`matplotlib.dates.`**`num2date`**`(`*x*, *tz=None*`)`

x is a float value which gives the number of days (fraction part represents hours, minutes, seconds) since 0001-01-01 00:00:00 UTC *plus one*. The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

Return value is a `datetime` instance in timezone *tz* (default to rcparams TZ value).

If *x* is a sequence, a sequence of `datetime` objects will be returned.

`matplotlib.dates.`**`drange`**`(`*dstart*, *dend*, *delta*`)`

Return a date range as float Gregorian ordinals. *dstart* and *dend* are `datetime` instances. *delta* is a `datetime.timedelta` instance.

`matplotlib.dates.`**`epoch2num`**`(`*e*`)`

Convert an epoch or sequence of epochs to the new date format, that is days since 0001.

`matplotlib.dates.`**`num2epoch`**`(`*d*`)`

Convert days since 0001 to epoch. *d* can be a number or sequence.

`matplotlib.dates.`**`mx2num`**`(`*mxdates*`)`

Convert mx `datetime` instance (or sequence of mx instances) to the new date format.

class `matplotlib.dates.`**`DateFormatter`**`(`*fmt*, *tz=None*`)`

Bases: *matplotlib.ticker.Formatter*

Tick location is seconds since the epoch. Use a *strftime()* format string.

Python only supports `datetime` *`strftime()`* formatting for years greater than 1900. Thanks to Andrew Dalke, Dalke Scientific Software who contributed the *`strftime()`* code below to include dates earlier than this year.

***fmt* is a *`strftime()`* format string; *tz* is the** `tzinfo` instance.

`illegal_s` **= re.compile('((^|[^%])(%%)*%s)')**

`set_tzinfo`(*tz*)

`strftime`(*dt*, *fmt=None*)

Refer to documentation for datetime.strftime.

fmt is a *`strftime()`* format string.

Warning: For years before 1900, depending upon the current locale it is possible that the year displayed with %x might be incorrect. For years before 100, %y and %Y will yield zero-padded strings.

`strftime_pre_1900`(*dt*, *fmt=None*)

Call time.strftime for years before 1900 by rolling forward a multiple of 28 years.

fmt is a *`strftime()`* format string.

Dalke: I hope I did this math right. Every 28 years the calendar repeats, except through century leap years excepting the 400 year leap years. But only if you're using the Gregorian calendar.

class `matplotlib.dates.`**`IndexDateFormatter`**(*t*, *fmt*, *tz=None*)

Bases: *`matplotlib.ticker.Formatter`*

Use with *`IndexLocator`* to cycle format strings by index.

t is a sequence of dates (floating point days). *fmt* is a `strftime()` format string.

class `matplotlib.dates.`**`AutoDateFormatter`**(*locator*, *tz=None*, *defaultfmt='%Y-%m-%d'*)

Bases: *`matplotlib.ticker.Formatter`*

This class attempts to figure out the best format to use. This is most useful when used with the *`AutoDateLocator`*.

The AutoDateFormatter has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
    1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
    1. / (MUSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
    }
```

The algorithm picks the key in the dictionary that is >= the current scale and uses that format string. You can customize this dictionary by doing:

```
>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
```

A custom *FuncFormatter* can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```
>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
...     label = x.strftime(fmt)
...     label = label.rstrip("0")
...     label = label.rstrip(".")
...     return label
>>> from matplotlib.ticker import FuncFormatter
>>> formatter.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)
```

Autoformat the date labels. The default format is the one to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

class `matplotlib.dates.`**`DateLocator`**(*tz=None*)

Bases: *matplotlib.ticker.Locator*

Determines the tick locations when plotting dates.

tz is a `tzinfo` instance.

`datalim_to_dt`()

Convert axis data interval to datetime objects.

`hms0d` **= {'byhour': 0, 'byminute': 0, 'bysecond': 0}**

`nonsingular`(*vmin*, *vmax*)

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

`set_tzinfo`(*tz*)

Set time zone info.

`viewlim_to_dt`()

Converts the view interval to datetime objects.

class `matplotlib.dates.`**`RRuleLocator`**(*o*, *tz=None*)

Bases: *matplotlib.dates.DateLocator*

`autoscale`()

Set the view limits to include the data range.

static **get_unit_generic**(*freq*)

tick_values(*vmin*, *vmax*)

class `matplotlib.dates.`**AutoDateLocator**(*tz=None*, *minticks=5*, *maxticks=None*, *interval_multiples=False*)

Bases: `matplotlib.dates.DateLocator`

On autoscale, this class picks the best `DateLocator` to set the view limits and the tick locations.

minticks is the minimum number of ticks desired, which is used to select the type of ticking (yearly, monthly, etc.).

maxticks is the maximum number of ticks desired, which controls any interval between ticks (ticking every other, every 3, etc.). For really fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in `AutoDateFormatter`. Any frequency not specified in this dictionary is given a default value.

tz is a `tzinfo` instance.

interval_multiples is a boolean that indicates whether ticks should be chosen to be multiple of the interval. This will lock ticks to 'nicer' locations. For example, this will force the ticks to be at hours 0,6,12,18 when hourly ticking is done at 6 hour intervals.

The AutoDateLocator has an interval dictionary that maps the frequency of the tick (a constant from dateutil.rrule) and a multiple allowed for that ticking. The default looks like this:

```
self.intervald = {
  YEARLY  : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500,
            1000, 2000, 4000, 5000, 10000],
  MONTHLY : [1, 2, 3, 4, 6],
  DAILY   : [1, 2, 3, 7, 14],
  HOURLY  : [1, 2, 3, 4, 6, 12],
  MINUTELY: [1, 5, 10, 15, 30],
  SECONDLY: [1, 5, 10, 15, 30],
  MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500, 1000, 2000,
                 5000, 10000, 20000, 50000, 100000, 200000, 500000,
                 1000000],
  }
```

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense. You can customize this dictionary by doing:

```
locator = AutoDateLocator()
locator.intervald[HOURLY] = [3] # only show every 3 hours
```

autoscale()

Try to choose the view limits intelligently.

get_locator(*dmin*, *dmax*)
Pick the best locator based on a distance.

nonsingular(*vmin*, *vmax*)

refresh()
Refresh internal information based on current limits.

set_axis(*axis*)

tick_values(*vmin*, *vmax*)

class `matplotlib.dates.`**YearLocator**(*base=1*, *month=1*, *day=1*, *tz=None*)
Bases: `matplotlib.dates.DateLocator`

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

autoscale()
Set the view limits to include the data range.

tick_values(*vmin*, *vmax*)

class `matplotlib.dates.`**MonthLocator**(*bymonth=None*, *bymonthday=1*, *interval=1*, *tz=None*)
Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurances of each month month, e.g., 1, 3, 12.

Mark every month in *bymonth*; *bymonth* can be an int or sequence. Default is `range(1,13)`, i.e. every month.

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurance.

class `matplotlib.dates.`**WeekdayLocator**(*byweekday=1*, *interval=1*, *tz=None*)
Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurances of each weekday.

Mark every weekday in *byweekday*; *byweekday* can be a number or sequence.

Elements of *byweekday* must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the `matplotlib.dates` namespace.

interval specifies the number of weeks to skip. For example, `interval=2` plots every second week.

class `matplotlib.dates.`**`DayLocator`**(*bymonthday=None*, *interval=1*, *tz=None*)

Bases: *`matplotlib.dates.RRuleLocator`*

Make ticks on occurances of each day of the month. For example, 1, 15, 30.

Mark every day in *bymonthday*; *bymonthday* can be an int or sequence.

Default is to tick every day of the month: `bymonthday=range(1,32)`

class `matplotlib.dates.`**`HourLocator`**(*byhour=None*, *interval=1*, *tz=None*)

Bases: *`matplotlib.dates.RRuleLocator`*

Make ticks on occurances of each hour.

Mark every hour in *byhour*; *byhour* can be an int or sequence. Default is to tick every hour: `byhour=range(24)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class `matplotlib.dates.`**`MinuteLocator`**(*byminute=None*, *interval=1*, *tz=None*)

Bases: *`matplotlib.dates.RRuleLocator`*

Make ticks on occurances of each minute.

Mark every minute in *byminute*; *byminute* can be an int or sequence. Default is to tick every minute: `byminute=range(60)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class `matplotlib.dates.`**`SecondLocator`**(*bysecond=None*, *interval=1*, *tz=None*)

Bases: *`matplotlib.dates.RRuleLocator`*

Make ticks on occurances of each second.

Mark every second in *bysecond*; *bysecond* can be an int or sequence. Default is to tick every second: `bysecond = range(60)`

interval is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class `matplotlib.dates.`**`MicrosecondLocator`**(*interval=1*, *tz=None*)

Bases: *`matplotlib.dates.DateLocator`*

Make ticks on occurances of each microsecond.

interval is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

`set_axis`(*axis*)

`set_data_interval`(*vmin*, *vmax*)

set_view_interval(*vmin*, *vmax*)

tick_values(*vmin*, *vmax*)

class `matplotlib.dates.`**rrule**(*freq*, *dtstart=None*, *interval=1*, *wkst=None*, *count=None*, *until=None*, *bysetpos=None*, *bymonth=None*, *bymonthday=None*, *byyearday=None*, *byeaster=None*, *byweekno=None*, *byweekday=None*, *byhour=None*, *byminute=None*, *bysecond=None*, *cache=False*)

Bases: `dateutil.rrule.rrulebase`

That's the base of the rrule operation. It accepts all the keywords defined in the RFC as its constructor parameters (except byday, which was renamed to byweekday) and more. The constructor prototype is:

```
rrule(freq)
```

Where freq must be one of YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, or SECONDLY.

Note: Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

> Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances MUST be ignored and MUST NOT be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...
[datetime.datetime(2014, 12, 31, 0, 0),
 datetime.datetime(2015, 1, 31, 0, 0),
 datetime.datetime(2015, 3, 31, 0, 0),
 datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

Parameters

- **cache** – If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

- **dtstart** – The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, datetime.now() will be used instead.
- **interval** – The interval between each freq iteration. For example, when using YEARLY, an interval of 2 means once every two years, but with HOURLY, it means once every two hours. The default interval is 1.
- **wkst** – The week start day. Must be one of the MO, TU, WE constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from calendar.firstweekday(), and may be modified by calendar.setfirstweekday().
- **count** – How many occurrences will be generated.

  Note: As of version 2.5.0, the use of the `until` keyword together with the `count` keyword is deprecated per RFC-2445 Sec. 4.3.10.

- **until** – If given, this must be a datetime instance, that will specify the limit of the recurrence. The last recurrence in the rule is the greatest datetime that is less than or equal to the value specified in the `until` parameter.

  Note: As of version 2.5.0, the use of the `until` keyword together with the `count` keyword is deprecated per RFC-2445 Sec. 4.3.10.

- **bysetpos** – If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a bysetpos of -1 if combined with a MONTHLY frequency, and a byweekday of (MO, TU, WE, TH, FR), will result in the last work day of every month.
- **bymonth** – If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.
- **bymonthday** – If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.
- **byyearday** – If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.
- **byweekno** – If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.
- **byweekday** – If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence of these constants. When given, these variables will define the weekdays where the recurrence will be applied. It's also possible to use an argument n for the weekday instances, which will mean the nth occurrence of this weekday in the period. For

example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.

- **`byhour`** – If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- **`byminute`** – If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- **`bysecond`** – If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- **`byeaster`** – If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to byeaster will yield the Easter Sunday itself. This is an extension to the RFC specification.

`replace`(***kwargs*)

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

class `matplotlib.dates.`**`relativedelta`**(*dt1=None*, *dt2=None*, *years=0*, *months=0*, *days=0*, *leapdays=0*, *weeks=0*, *hours=0*, *minutes=0*, *seconds=0*, *microseconds=0*, *year=None*, *month=None*, *day=None*, *weekday=None*, *yearday=None*, *nlyearday=None*, *hour=None*, *minute=None*, *second=None*, *microsecond=None*)

Bases: `object`

The relativedelta type is based on the specification of the excellent work done by M.-A. Lemburg in his mx.DateTime extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like mx.DateTime's counterpart.

There are two different ways to build a relativedelta instance. The first one is passing it two date/datetime classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x,arg2=y,arg3=z...)

year, month, day, hour, minute, second, microsecond:
    Absolute information (argument is singular); adding or subtracting a
    relativedelta with absolute information does not perform an aritmetic
    operation, but rather REPLACES the corresponding value in the
    original datetime with the value(s) in relativedelta.

years, months, weeks, days, hours, minutes, seconds, microseconds:
    Relative information, may be negative (argument is plural); adding
    or subtracting a relativedelta with relative information performs
    the corresponding aritmetic operation on the original datetime value
    with the information in the relativedelta.

weekday:
    One of the weekday instances (MO, TU, etc). These instances may
    receive a parameter N, specifying the Nth weekday, which could
    be positive or negative (like MO(+1) or MO(-2). Not specifying
    it is the same as specifying +1. You can also use an integer,
    where 0=MO.

leapdays:
    Will add given days to the date found, if year is a leap
    year, and the date found is post 28 of february.

yearday, nlyearday:
    Set the yearday or the non-leap year day (jump leap days).
    These are converted to day/month/leapdays information.
```

Here is the behavior of operations with relativedelta:

1. Calculate the absolute year, using the 'year' argument, or the original datetime year, if the argument is not present.
2. Add the relative 'years' argument to the absolute year.
3. Do steps 1 and 2 for month/months.
4. Calculate the absolute day, using the 'day' argument, or the original datetime day, if the argument is not present. Then, subtract from the day until it fits in the year and month found after their operations.
5. Add the relative 'days' argument to the absolute day. Notice that the 'weeks' argument is multiplied by 7 and added to 'days'.
6. Do steps 1 and 2 for hour/hours, minute/minutes, second/seconds, microsecond/microseconds.
7. If the 'weekday' argument is present, calculate the weekday, with the given (wday, nth) tuple. wday is the index of the weekday (0-6, 0=Mon), and nth is the number of weeks to add forward or backward, depending on its signal. Notice that if the calculated date is already Monday, for example, using (0, 1) or (0, -1) won't change the day.

normalized()

Return a version of this object represented entirely using integer values for the relative attributes.

```
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=1, hours=14)
```

Returns Returns a `dateutil.relativedelta.relativedelta` object.

weeks

`matplotlib.dates.`**seconds**(*s*)

Return seconds as days.

`matplotlib.dates.`**`minutes`**`(`*m*`)`

Return minutes as days.

`matplotlib.dates.`**`hours`**`(`*h*`)`

Return hours as days.

`matplotlib.dates.`**`weeks`**`(`*w*`)`

Return weeks as days.

CHAPTER

TWENTYNINE

DVIREAD

29.1 `matplotlib.dviread`

An experimental module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
dvi = Dvi(filename, 72)
# iterate over pages (but only one page is supported for now):
for page in dvi:
    w, h, d = page.width, page.height, page.descent
    for x,y,font,glyph,width in page.text:
        fontname = font.texname
        pointsize = font.size
        ...
    for x,y,height,width in page.boxes:
        ...
```

class `matplotlib.dviread.`**`Dvi`**(*filename*, *dpi*)

Bases: `object`

A dvi ("device-independent") file, as produced by TeX. The current implementation only reads the first page and does not even attempt to verify the postamble.

Initialize the object. This takes the filename as input and opens the file; actually reading the file happens when iterating through the pages of the file.

`close`()

Close the underlying file if it is open.

class `matplotlib.dviread.`**`DviFont`**(*scale*, *tfm*, *texname*, *vf*)

Bases: `object`

Object that holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

texname
Name of the font as used internally by TeX and friends. This is usually very different from any external font names, and `dviread.PsfontsMap` can be used to find the external name of the font.

size
Size of the font in Adobe points, converted from the slightly smaller TeX points.

widths
Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

size

texname

widths

class `matplotlib.dviread.`**`Encoding`**(*filename*)
Bases: `object`

Parses a *.enc file referenced from a psfonts.map style file. The format this class understands is a very limited subset of PostScript.

Usage (subject to change):

```
for name in Encoding(filename):
    whatever(name)
```

encoding

class `matplotlib.dviread.`**`PsfontsMap`**(*filename*)
Bases: `object`

A psfonts.map formatted file, mapping TeX fonts to PS fonts. Usage:

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map['ptmbo8r']
>>> entry.texname
'ptmbo8r'
>>> entry.psname
'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. psfonts.map, pdftex.map, dvipdfm.map. psfonts.map is used by dvips, pdftex.map by pdfTeX, and dvipdfm.map by dvipdfm. psfonts.map might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

class `matplotlib.dviread.`**`Tfm`**(*filename*)

Bases: `object`

A TeX Font Metric file. This implementation covers only the bare minimum needed by the Dvi class.

`checksum`

Used for verifying against the dvi file.

`design_size`

Design size of the font (in what units?)

`width`

Width of each character, needs to be scaled by the factor specified in the dvi file. This is a dict because indexing may not start from 0.

`height`

Height of each character.

`depth`

Depth of each character.

`checksum`

`depth`

`design_size`

`height`

`width`

class `matplotlib.dviread.`**`Vf`**(*filename*)

Bases: `matplotlib.dviread.Dvi`

A virtual font (*.vf file) containing subroutines for dvi files.

Usage:

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width
```

`matplotlib.dviread.`**`find_tex_file`**(*filename*, *format=None*)

Call **`kpsewhich`** to find a file in the texmf tree. If *format* is not None, it is used as the value for the `--format` option.

Apparently most existing TeX distributions on Unix-like systems use kpathsea. I hear MikTeX (a popular distribution on Windows) doesn't use kpathsea, so what do we do? (TODO)

See also:

Kpathsea documentation The library that **`kpsewhich`** is part of.

`matplotlib.dviread.`**`ord`**(*x*)

CHAPTER

THIRTY

FIGURE

30.1 `matplotlib.figure`

The figure module provides the top-level *`Artist`*, the *`Figure`*, which contains all the plot elements. The following classes are defined

`SubplotParams` control the default spacing of the subplots

`Figure` top level container for all plot elements

class `matplotlib.figure.`**`AxesStack`**

Bases: *`matplotlib.cbook.Stack`*

Specialization of the Stack to handle all tracking of Axes in a Figure. This stack stores `key, (ind, axes)` pairs, where:

- **key** should be a hash of the args and kwargs used in generating the Axes.
- **ind** is a serial number for tracking the order in which axes were added.

The AxesStack is a callable, where `ax_stack()` returns the current axes. Alternatively the *`current_key_axes()`* will return the current key and associated axes.

`add`(*key*, *a*)

Add Axes *a*, with key *key*, to the stack, and return the stack.

If *a* is already on the stack, don't add it again, but return *None*.

`as_list`()

Return a list of the Axes instances that have been added to the figure

`bubble`(*a*)

Move the given axes, which must already exist in the stack, to the top.

`current_key_axes`()

Return a tuple of `(key, axes)` for the active axes.

If no axes exists on the stack, then returns `(None, None)`.

`get`(*key*)

Return the Axes instance that was added with *key*. If it is not present, return None.

`remove`(*a*)
Remove the axes from the stack.

class `matplotlib.figure.Figure`(*figsize=None*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *linewidth=0.0*, *frameon=None*, *subplotpars=None*, *tight_layout=None*)
Bases: `matplotlib.artist.Artist`

The Figure instance supports callbacks through a *callbacks* attribute which is a `matplotlib.cbook.CallbackRegistry` instance. The events you can connect to are 'dpi_changed', and the callback will be called with `func(fig)` where fig is the `Figure` instance.

patch The figure patch is drawn by a `matplotlib.patches.Rectangle` instance

suppressComposite For multiple figure images, the figure will make composite images depending on the renderer option_image_nocomposite function. If suppressComposite is True|False, this will override the renderer.

figsize w,h tuple in inches

dpi Dots per inch

facecolor The figure patch facecolor; defaults to rc `figure.facecolor`

edgecolor The figure patch edge color; defaults to rc `figure.edgecolor`

linewidth The figure patch edge linewidth; the default linewidth of the frame

frameon If *False*, suppress drawing the figure frame

subplotpars A `SubplotParams` instance, defaults to rc

tight_layout If *False* use *subplotpars*; if *True* adjust subplot parameters using `tight_layout()` with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad` and `rect`, the default `tight_layout()` paddings will be overridden. Defaults to rc `figure.autolayout`.

`add_axes`(**args*, ***kwargs*)
Add an axes at position *rect* [*left*, *bottom*, *width*, *height*] where all quantities are in fractions of figure width and height. kwargs are legal `Axes` kwargs plus *projection* which sets the projection type of the axes. (For backward compatibility, `polar=True` may also be provided, which is equivalent to `projection='polar'`). Valid values for *projection* are: ['aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear']. Some of these projections support additional kwargs, which may be provided to `add_axes()`. Typical usage:

```
rect = l,b,w,h
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
fig.add_axes(rect, projection='polar')
fig.add_axes(ax)
```

If the figure already has an axes with the same parameters, then it will simply make that axes current and return it. If you do not want this behavior, e.g., you want to force the creation of a new Axes, you must use a unique set of args and kwargs. The axes `label` attribute has been exposed for this purpose. e.g., if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels:

```
fig.add_axes(rect, label='axes1')
fig.add_axes(rect, label='axes2')
```

In rare circumstances, add_axes may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of axes. For example, if an axes has been removed with `delaxes()`, it can be restored with:

```
fig.add_axes(ax)
```

In all cases, the `Axes` instance will be returned.

In addition to *projection*, the following kwargs are supported:

Property	Description
`adjustable`	['box' | 'datalim' | 'box-forced']
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`anchor`	unknown
`animated`	[True | False]
`aspect`	unknown
`autoscale_on`	unknown
`autoscalex_on`	unknown
`autoscaley_on`	unknown
`axes`	an `Axes` instance
`axes_locator`	unknown
`axisbelow`	[*True* | *False* | 'line']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color_cycle`	unknown
`contains`	a callable function
`facecolor`	unknown
`fc`	unknown
`figure`	unknown
`frame_on`	[*True* | *False*]
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`navigate`	[*True* | *False*]
`navigate_mode`	unknown
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	unknown
`rasterization_zorder`	unknown
`rasterized`	[True | False | None]

Continued on next page

Table 30.1 – continued from previous page

Property	Description
sketch_params	unknown
snap	unknown
title	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
xbound	unknown
xlabel	unknown
xlim	unknown
xmargin	unknown
xscale	['linear' | 'log' | 'logit' | 'symlog']
xticklabels	sequence of strings
xticks	sequence of floats
ybound	unknown
ylabel	unknown
ylim	unknown
ymargin	unknown
yscale	['linear' | 'log' | 'logit' | 'symlog']
yticklabels	sequence of strings
yticks	sequence of floats
zorder	any number

add_axobserver(*func*)

whenever the axes state change, `func(self)` will be called

add_subplot(**args*, ***kwargs*)

Add a subplot. Examples:

```
fig.add_subplot(111)

# equivalent but more general
fig.add_subplot(1,1,1)

# add subplot with red background
fig.add_subplot(212, facecolor='r')

# add a polar subplot
fig.add_subplot(111, projection='polar')

# add Subplot instance sub
fig.add_subplot(sub)
```

kwargs are legal `Axes` kwargs plus *projection*, which chooses a projection type for the axes. (For backward compatibility, *polar=True* may also be provided, which is equivalent to *projection='polar'*). Valid values for *projection* are: ['aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear']. Some of these projections support additional *kwargs*, which may be provided to `add_axes()`.

The `Axes` instance will be returned.

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it.

See also:

`subplot()` for an explanation of the args.

The following kwargs are supported:

Property	Description
`adjustable`	['box' | 'datalim' | 'box-forced']
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`anchor`	unknown
`animated`	[True | False]
`aspect`	unknown
`autoscale_on`	unknown
`autoscalex_on`	unknown
`autoscaley_on`	unknown
`axes`	an `Axes` instance
`axes_locator`	unknown
`axisbelow`	[*True* | *False* | 'line']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color_cycle`	unknown
`contains`	a callable function
`facecolor`	unknown
`fc`	unknown
`figure`	unknown
`frame_on`	[*True* | *False*]
`gid`	an id string
`label`	string or anything printable with '%s' conversion.
`navigate`	[*True* | *False*]
`navigate_mode`	unknown
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	unknown
`rasterization_zorder`	unknown
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`title`	unknown

xbound	unknown
xlabel	unknown
xlim	unknown
xmargin	unknown
xscale	[’linear’ | ‘log’ | ‘logit’ | ‘symlog’]
xticklabels	sequence of strings
xticks	sequence of floats
ybound	unknown
ylabel	unknown
ylim	unknown
ymargin	unknown
yscale	[’linear’ | ‘log’ | ‘logit’ | ‘symlog’]
yticklabels	sequence of strings
yticks	sequence of floats
zorder	any number

autofmt_xdate(*bottom=0.2*, *rotation=30*, *ha='right'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared xaxes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

bottom The bottom of the subplots for *subplots_adjust()*

rotation The rotation of the xtick labels

ha The horizontal alignment of the xticklabels

axes

Read-only: list of axes in Figure

clear()

Clear the figure – synonym for *clf()*.

clf(*keep_observers=False*)

Clear the figure.

Set *keep_observers* to True if, for example, a gui widget is tracking the axes in the figure.

colorbar(*mappable*, *cax=None*, *ax=None*, *use_gridspec=True*, ***kw*)

Create a colorbar for a ScalarMappable instance, *mappable*.

Documentation for the pylab thin wrapper:

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar()` method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:

mappable the `Image`, `ContourSet`, etc. to which the colorbar applies; this argument is mandatory for the `colorbar()` method but optional for the `colorbar()` function, which sets the default to the current image.

keyword arguments:

cax None | axes object into which the colorbar will be drawn

ax None | parent axes object(s) from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

use_gridspec False | If *cax* is None, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use_gridspec* is True, *cax* is created as an instance of Subplot using the grid_spec module.

Additional keyword arguments are of two kinds:

axes properties:

Property	Description
orientation	vertical or horizontal
fraction	0.15; fraction of original axes to use for colorbar
pad	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
shrink	1.0; fraction by which to shrink the colorbar
aspect	20; ratio of long to short dimensions
anchor	(0.0, 0.5) if vertical; (0.5, 1.0) if horizontal; the anchor point of the colorbar axes
panchor	(1.0, 0.5) if vertical; (0.5, 0.0) if horizontal; the anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged

colorbar properties:

Property	Description
extend	['neither' | 'both' | 'min' | 'max'] If not 'neither', make pointed end(s) for out-of- range values. These are set for a given colormap using the colormap set_under and set_over methods.
extendfrac	[*None* | 'auto' | length | lengths] If set to *None*, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
extendrect	[*False* | *True*] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.
spacing	['uniform' | 'proportional'] Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
ticks	[None | list of ticks | Locator object] If None, ticks are determined automatically from the input.
format	[None | format string | Formatter object] If None, the `ScalarFormatter` is used. If a format string is given, e.g., '%.3f', that is used. An alternative `Formatter` object may be given instead.
drawedges	[False | True] If true, draw lines at color boundaries.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

Property	Description
boundaries	None or a sequence
values	None or a sequence which must be of length 1 less than the sequence of *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used.

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

Note that the *shrink* kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of *shrink*.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images (alpha < 1) and colorbar extensions and is not enabled by default see (issue #1188).

returns: `Colorbar` instance; see also its base class, `ColorbarBase`. Call the `set_label()` method to label the colorbar.

`contains`(*mouseevent*)

Test whether the mouse event occurred on the figure.

Returns True,{}

`delaxes`(*a*)

remove a from the figure and update the current axes

`dpi`

`draw`(*artist*, *renderer*, **args*, ***kwargs*)

Render the figure using `matplotlib.backend_bases.RendererBase` instance *renderer*.

`draw_artist`(*a*)

draw `matplotlib.artist.Artist` instance *a* only – this is available only after the figure is drawn

`figimage`(*X*, *xo=0*, *yo=0*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *origin=None*, *resize=False*, ***kwargs*)

Adds a non-resampled image to the figure.

call signatures:

```
figimage(X, **kwargs)
```

adds a non-resampled array *X* to the figure.

```
figimage(X, xo, yo)
```

with pixel offsets *xo*, *yo*,

X must be a float array:

- If *X* is MxN, assume luminance (grayscale)
- If *X* is MxNx3, assume RGB
- If *X* is MxNx4, assume RGBA

Optional keyword arguments:

Keyword	Description
resize	a boolean, True or False. If "True", then re-size the Figure to match the given image size.
xo or yo	An integer, the *x* and *y* image offset in pixels
cmap	a *matplotlib.colors.Colormap* instance, e.g., cm.jet. If *None*, default to the rc `image.cmap` value
norm	a *matplotlib.colors.Normalize* instance. The default is normalization(). This scales luminance -> 0-1
vmin|vmax	are used to scale a luminance image to 0-1. If either is *None*, the min and max of the luminance values will be used. Note if you pass a norm instance, the settings for *vmin* and *vmax* will be ignored.
alpha	the alpha blending value, default is *None*
origin	['upper' | 'lower'] Indicates where the [0,0] index of the array is in the upper left or lower left corner of the axes. Defaults to the rc image.origin value

figimage complements the axes image (*imshow()*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0,0,1,1].

An *matplotlib.image.FigureImage* instance is returned.

Additional kwargs are Artist kwargs passed on to `FigureImage`

gca(***kwargs*)

Get the current axes, creating one if necessary

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
`adjustable`	[‘box’ | ‘datalim’ | ‘box-forced’]
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`anchor`	unknown
`animated`	[True | False]
`aspect`	unknown
`autoscale_on`	unknown
`autoscalex_on`	unknown
`autoscaley_on`	unknown
`axes`	an `Axes` instance
`axes_locator`	unknown
`axisbelow`	[*True* | *False* | ‘line’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]

Continued on next page

Table 30.3 – continued from previous page

Property	Description
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color_cycle	unknown
contains	a callable function
facecolor	unknown
fc	unknown
figure	unknown
frame_on	[*True* | *False*]
gid	an id string
label	string or anything printable with '%s' conversion.
navigate	[*True* | *False*]
navigate_mode	unknown
path_effects	unknown
picker	[None|float|boolean|callable]
position	unknown
rasterization_zorder	unknown
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
title	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
xbound	unknown
xlabel	unknown
xlim	unknown
xmargin	unknown
xscale	['linear' | 'log' | 'logit' | 'symlog']
xticklabels	sequence of strings
xticks	sequence of floats
ybound	unknown
ylabel	unknown
ylim	unknown
ymargin	unknown
yscale	['linear' | 'log' | 'logit' | 'symlog']
yticklabels	sequence of strings
yticks	sequence of floats
zorder	any number

get_axes()

get_children()

get a list of artists contained in the figure

get_default_bbox_extra_artists()

get_dpi()
Return the dpi as a float

get_edgecolor()
Get the edge color of the Figure rectangle

get_facecolor()
Get the face color of the Figure rectangle

get_figheight()
Return the figheight as a float

get_figwidth()
Return the figwidth as a float

get_frameon()
get the boolean indicating frameon

get_size_inches()
Returns the current size of the figure in inches (1in == 2.54cm) as an numpy array.

Returns size : ndarray

The size of the figure in inches

See also:

`matplotlib.Figure.set_size_inches`

get_tight_layout()
Return the Boolean flag, True to use :meth‘tight_layout‘ when drawing.

get_tightbbox(*renderer*)
Return a (tight) bounding box of the figure in inches.

It only accounts axes title, axis labels, and axis ticklabels. Needs improvement.

get_window_extent(**args*, ***kwargs*)
get the figure bounding box in display space; kwargs are void

ginput(*n=1*, *timeout=30*, *show_clicks=True*, *mouse_add=1*, *mouse_pop=3*, *mouse_stop=2*)
Blocking call to interact with the figure.

This will wait for *n* clicks from the user and return a list of the coordinates of each click.

If *timeout* is zero or negative, does not timeout.

If *n* is zero or negative, accumulate clicks until a middle click (or potentially both mouse buttons at once) terminates the input.

Right clicking cancels last input.

The buttons used for the various actions (adding points, removing points, terminating the inputs) can be overriden via the arguments *mouse_add*, *mouse_pop* and *mouse_stop*, that give the associated mouse button: 1 for left, 2 for middle, 3 for right.

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

hold(*b=None*)

Deprecated since version 2.0: The hold function was deprecated in version 2.0.

Set the hold state. If hold is None (default), toggle the hold state. Else set the hold state to boolean value b.

e.g.:

```
hold()      # toggle hold
hold(True)  # hold is on
hold(False) # hold is off
```

All “hold” machinery is deprecated.

legend(*handles*, *labels*, **args*, ***kwargs*)

Place a legend in the figure. Labels are a sequence of strings, handles is a sequence of `Line2D` or `Patch` instances, and loc can be a string or an integer specifying the legend location

USAGE:

```
legend( (line1, line2, line3),
        ('label1', 'label2', 'label3'),
        'upper right')
```

The *loc* location codes are:

```
'best' : 0,          (currently not supported for figure legends)
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10,
```

loc can also be an (x,y) tuple in figure coords, which specifies the lower left of the legend box. figure coords are (0,0) is the left, bottom of the figure and 1,1 is the right, top.

Keyword arguments:

prop: [*None* | FontProperties | dict] A `matplotlib.font_manager.FontProperties` instance. If *prop* is a dictionary, a new instance will be created with *prop*. If *None*, use rc settings.

numpoints: integer The number of points in the legend line, default is 4

scatterpoints: integer The number of points in the legend line, default is 4

scatteryoffsets: list of floats a list of yoffsets for scatter symbols in legend

markerscale: [*None* | scalar] The relative size of legend markers vs. original. If *None*, use rc settings.

markerfirst: [*True* | *False*] if *True*, legend marker is placed to the left of the legend label if *False*, legend marker is placed to the right of the legend label

frameon: [*None* | bool] Control whether the legend should be drawn on a patch (frame). Default is *None* which will take the value from the `legend.frameon` *rcParam*.

fancybox: [*None* | *False* | *True*] if *True*, draw a frame with a round fancybox. If *None*, use rc

shadow: [*None* | *False* | *True*] If *True*, draw a shadow behind legend. If *None*, use rc settings.

framealpha: [*None* | float] Control the alpha transparency of the legend's background. Default is *None* which will take the value from the `legend.framealpha` *rcParam*.

facecolor: [*None* | "inherit" | a color spec] Control the legend's background color. Default is *None* which will take the value from the `legend.facecolor` *rcParam*. If `"inherit"`, it will take the `axes.facecolor` *rcParam*.

edgecolor: [*None* | "inherit" | a color spec] Control the legend's background patch edge color. Default is *None* which will take the value from the `legend.edgecolor` *rcParam*. If `"inherit"`, it will take the `axes.edgecolor` *rcParam*.

ncol [integer] number of columns. default is 1

mode [["expand" | *None*]] if mode is "expand", the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor*)

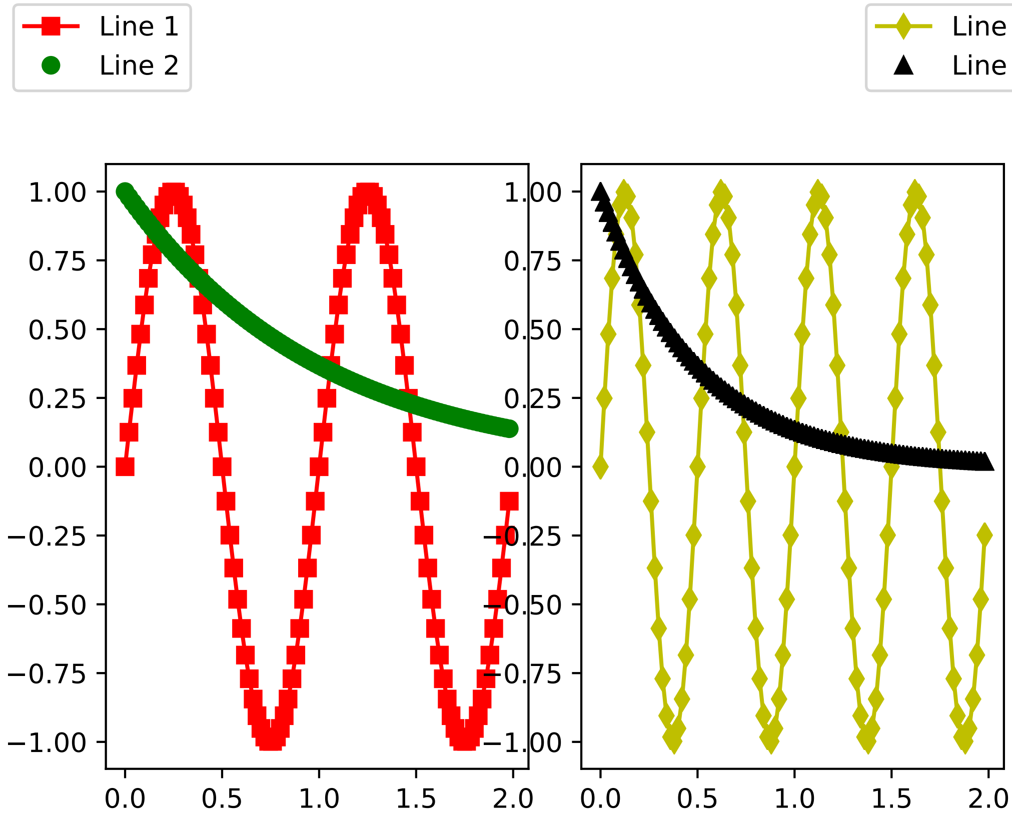
title [string] the legend title

Padding and spacing between various elements use following keywords parameters. The dimensions of these values are given as a fraction of the fontsize. Values from rcParams will be used if None.

Keyword	Description
borderpad	the fractional whitespace inside the legend border
labelspacing	the vertical space between the legend entries
handlelength	the length of the legend handles
handletextpad	the pad between the legend handle and text
borderaxespad	the pad between the axes and legend border
columnspacing	the spacing between columns

Note: Not all kinds of artist are supported by the legend. See LINK (FIXME) for details.

Example:



savefig(**args*, ***kwargs*)

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None)
```

The output formats available depend on the backend being used.

Arguments:

fname**:** A string containing a path to a filename, or a Python file-like object, or possibly some backend-dependent object such as *PdfPages*.

If *format* is *None* and *fname* is a string, the output format is deduced from the extension of the filename. If the filename has no extension, the value of the rc parameter `savefig.format` is used.

If *fname* is not a string, remember to specify *format* to ensure that the correct backend is used.

Keyword arguments:

dpi**: [*None* | `scalar > 0` | 'figure']** The resolution in dots per inch. If *None* it will default to the value `savefig.dpi` in the matplotlibrc file. If 'figure' it will set the dpi to be the value of the figure.

***facecolor*, *edgecolor*:** the colors of the figure rectangle

***orientation*: ['landscape' | 'portrait']** not supported on all backends; currently only on postscript output

***papertype*:** One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

***format*:** One of the file extensions supported by the active backend. Most backends support png, pdf, ps, eps and svg.

***transparent*:** If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

***frameon*:** If *True*, the figure patch will be colored, if *False*, the figure background will be transparent. If not provided, the rcParam 'savefig.frameon' will be used.

***bbox_inches*:** Bbox in inches. Only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

***pad_inches*:** Amount of padding around the figure when bbox_inches is 'tight'.

***bbox_extra_artists*:** A list of extra artists that will be considered when the tight bbox is calculated.

sca(*a*)
Set the current axes to be a and return a

set_canvas(*canvas*)
Set the canvas that contains the figure

ACCEPTS: a FigureCanvas instance

set_dpi(*val*)
Set the dots-per-inch of the figure

ACCEPTS: float

set_edgecolor(*color*)
Set the edge color of the Figure rectangle

ACCEPTS: any matplotlib color - see help(colors)

set_facecolor(*color*)
Set the face color of the Figure rectangle

ACCEPTS: any matplotlib color - see help(colors)

set_figheight(*val*, *forward=False*)
Set the height of the figure in inches

ACCEPTS: float

set_figwidth(*val*, *forward=False*)

Set the width of the figure in inches

ACCEPTS: float

set_frameon(*b*)

Set whether the figure frame (background) is displayed or invisible

ACCEPTS: boolean

set_size_inches(*w*, *h=None*, *forward=True*)

Set the figure size in inches (1in == 2.54cm)

Usage

```
fig.set_size_inches(w,h)  # OR
fig.set_size_inches((w,h))
```

optional kwarg *forward=True* will cause the canvas size to be automatically updated; e.g., you can resize the figure window from the shell

ACCEPTS: a w,h tuple with w,h in inches

See also:

`matplotlib.Figure.get_size_inches`

set_tight_layout(*tight*)

Set whether `tight_layout()` is used upon drawing. If None, the rcParams['figure.autolayout'] value will be set.

When providing a dict containing the keys `pad`, `w_pad`, `h_pad` and `rect`, the default `tight_layout()` paddings will be overridden.

ACCEPTS: [True | False | dict | None]

show(*warn=True*)

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using `figure()`, it will lack a `FigureManagerBase`, and will raise an AttributeError.

For non-GUI backends, this does nothing, in which case a warning will be issued if *warn* is True (default).

subplots_adjust(**args*, ***kwargs*)

Call signature:

```
subplots_adjust(left=None, bottom=None, right=None, top=None,
                wspace=None, hspace=None)
```

Update the `SubplotParams` with *kwargs* (defaulting to rc when *None*) and update the subplot locations

suptitle(*t*, ***kwargs*)

Add a centered title to the figure.

kwargs are *matplotlib.text.Text* properties. Using figure coordinates, the defaults are:

x [0.5] The x location of the text in figure coords

y [0.98] The y location of the text in figure coords

horizontalalignment ['center'] The horizontal alignment of the text

verticalalignment ['top'] The vertical alignment of the text

If the `fontproperties` keyword argument is given then the rcParams defaults for `fontsize` (`figure.titlesize`) and `fontweight` (`figure.titleweight`) will be ignored in favour of the `FontProperties` defaults.

A *matplotlib.text.Text* instance is returned.

Example:

```
fig.suptitle('this is the figure title', fontsize=12)
```

text(*x*, *y*, *s*, **args*, ***kwargs*)
Add text to figure.

Call signature:

```
text(x, y, s, fontdict=None, **kwargs)
```

Add text to figure at location *x*, *y* (relative 0-1 coords). See *text()* for the meaning of the other arguments.

kwargs control the *Text* properties:

Property	Description
agg_filter	unknown
alpha	float (0.0 transparent through 1.0 opaque)
animated	[True | False]
axes	an *Axes* instance
backgroundcolor	any matplotlib color
bbox	FancyBboxPatch prop dict
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color	any matplotlib color
contains	a callable function
family or fontfamily or fontname or name	[FONTNAME | 'serif' | 'sans-serif' | 'cursive' | 'fantasy' | 'monospace']
figure	a *matplotlib.figure.Figure* instance
fontproperties or font_properties	a *matplotlib.font_manager.FontProperties* instance
gid	an id string
horizontalalignment or ha	['center' | 'right' | 'left']
label	string or anything printable with '%s' conversion.
linespacing	float (multiple of font size)

Table 30.4 – continued fron

Property	Description
`multialignment`	['left' | 'right' | 'center']
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	(x,y)
`rasterized`	[True | False | None]
`rotation`	[angle in degrees | 'vertical' | 'horizontal']
`rotation_mode`	unknown
`size` or fontsize	[size in points | 'xx-small' | 'x-small' | 'small' | 'medium' | 'large' | 'x-large'
`sketch_params`	unknown
`snap`	unknown
`stretch` or fontstretch	[a numeric value in range 0-1000 | 'ultra-condensed' | 'extra-condensed' | 'c
`style` or fontstyle	['normal' | 'italic' | 'oblique']
`text`	string or anything printable with '%s' conversion.
`transform`	`Transform` instance
`url`	a url string
`usetex`	unknown
`variant` or fontvariant	['normal' | 'small-caps']
`verticalalignment` or ma or va	['center' | 'top' | 'bottom' | 'baseline']
`visible`	[True | False]
`weight` or fontweight	[a numeric value in range 0-1000 | 'ultralight' | 'light' | 'normal' | 'regular' |
`wrap`	unknown
`x`	float
`y`	float
`zorder`	any number

tight_layout(*renderer=None*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust subplot parameters to give specified padding.

Parameters:

pad [float] padding between the figure edge and the edges of subplots, as a fraction of the font-size.

h_pad, w_pad [float] padding (height/width) between edges of adjacent subplots. Defaults to `pad_inches`.

rect [if rect is given, it is interpreted as a rectangle] (left, bottom, right, top) in the normalized figure coordinate that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

waitforbuttonpress(*timeout=-1*)

Blocking call to interact with the figure.

This will return True is a key was pressed, False if a mouse button was pressed and None if *timeout* was reached without either being pressed.

If *timeout* is negative, does not timeout.

class `matplotlib.figure.`**`SubplotParams`**(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Bases: `object`

A class to hold the parameters for a subplot

All dimensions are fraction of the figure width or height. All values default to their rc params

The following attributes are available

left [0.125] The left side of the subplots of the figure

right [0.9] The right side of the subplots of the figure

bottom [0.1] The bottom of the subplots of the figure

top [0.9] The top of the subplots of the figure

wspace [0.2] The amount of width reserved for blank space between subplots, expressed as a fraction of the average axis width

hspace [0.2] The amount of height reserved for white space between subplots, expressed as a fraction of the average axis height

`update`(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Update the current values. If any kwarg is None, default to the current value, if set, otherwise to rc

`matplotlib.figure.`**`figaspect`**(*arg*)

Create a figure with specified aspect ratio. If *arg* is a number, use that aspect ratio. If *arg* is an array, figaspect will determine the width and height for a figure that would fit array preserving aspect ratio. The figure width, height in inches are returned. Be sure to create an axes with equal with and height, e.g.,

Example usage:

```
# make a figure twice as tall as it is wide
w, h = figaspect(2.)
fig = Figure(figsize=(w,h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)

# make a figure with the proper aspect for an array
A = rand(5,3)
w, h = figaspect(A)
fig = Figure(figsize=(w,h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Thanks to Fernando Perez for this function

CHAPTER

THIRTYONE

FINANCE

31.1 `matplotlib.finance`

A collection of functions for collecting, analyzing and plotting financial data.

This module is deprecated in 2.0 and has been moved to a module called `mpl_finance`.

`matplotlib.finance.`**`candlestick2_ochl`**(*ax*, *opens*, *closes*, *highs*, *lows*, *width=4*, *colorup='k'*, *colordown='r'*, *alpha=0.75*)

Represent the open, close as a bar line and high low range as a vertical line.

Preserves the original argument order.

Parameters ax : `Axes`

an Axes instance to plot to

opens : sequence

sequence of opening values

closes : sequence

sequence of closing values

highs : sequence

sequence of high values

lows : sequence

sequence of low values

ticksize : int

size of open and close ticks in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

alpha : float

bar transparency

Returns ret : tuple

(lineCollection, barCollection)

`matplotlib.finance.`**`candlestick2_ohlc`**(*ax*, *opens*, *highs*, *lows*, *closes*, *width=4*, *colorup='k'*, *colordown='r'*, *alpha=0.75*)

Represent the open, close as a bar line and high low range as a vertical line.

NOTE: this code assumes if any value open, low, high, close is missing they all are missing

Parameters ax : `Axes`

an Axes instance to plot to

opens : sequence

sequence of opening values

highs : sequence

sequence of high values

lows : sequence

sequence of low values

closes : sequence

sequence of closing values

ticksize : int

size of open and close ticks in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

alpha : float

bar transparency

Returns ret : tuple

(lineCollection, barCollection)

`matplotlib.finance.`**`candlestick_ochl`**(*ax*, *quotes*, *width=0.2*, *colorup='k'*, *colordown='r'*, *alpha=1.0*)

Plot the time, open, close, high, low as a vertical line ranging from low to high. Use a rectangular bar to represent the open-close span. If close >= open, use colorup to color the bar, otherwise use colordown

Parameters ax : `Axes`

an Axes instance to plot to

quotes : sequence of (time, open, close, high, low, ...) sequences

As long as the first 5 elements are these values, the record can be as long as you want (e.g., it may store volume).

time must be in float days format - see date2num

width : float

fraction of a day for the rectangle width

colorup : color

the color of the rectangle where close >= open

colordown : color

the color of the rectangle where close < open

alpha : float

the rectangle alpha level

Returns ret : tuple

returns (lines, patches) where lines is a list of lines added and patches is a list of the rectangle patches added

`matplotlib.finance.`**`candlestick_ohlc`**(*ax*, *quotes*, *width=0.2*, *colorup='k'*, *colordown='r'*, *alpha=1.0*)

Plot the time, open, high, low, close as a vertical line ranging from low to high. Use a rectangular bar to represent the open-close span. If close >= open, use colorup to color the bar, otherwise use colordown

Parameters ax : `Axes`

an Axes instance to plot to

quotes : sequence of (time, open, high, low, close, ...) sequences

As long as the first 5 elements are these values, the record can be as long as you want (e.g., it may store volume).

time must be in float days format - see date2num

width : float

fraction of a day for the rectangle width

colorup : color

the color of the rectangle where close >= open

colordown : color

the color of the rectangle where close < open

alpha : float

the rectangle alpha level

Returns ret : tuple

returns (lines, patches) where lines is a list of lines added and patches is a list of the rectangle patches added

`matplotlib.finance.`**`fetch_historical_yahoo`**(*ticker*, *date1*, *date2*, *cachename=None*, *dividends=False*)

Fetch historical data for ticker between date1 and date2. date1 and date2 are date or datetime instances, or (year, month, day) sequences.

Parameters ticker : str

ticker

date1 : sequence of form (year, month, day), `datetime`, or `date`

start date

date2 : sequence of form (year, month, day), `datetime`, or `date`

end date

cachename : str

cachename is the name of the local file cache. If None, will default to the md5 hash or the url (which incorporates the ticker and date range)

dividends : bool

set dividends=True to return dividends instead of price data. With this option set, parse functions will not work

Returns file_handle : file handle

a file handle is returned

Examples

```
>>> fh = fetch_historical_yahoo('^GSPC', (2000, 1, 1), (2001, 12, 31))
```

`matplotlib.finance.`**`index_bar`**(*ax*, *vals*, *facecolor='b'*, *edgecolor='l'*, *width=4*, *alpha=1.0*)

Add a bar collection graph with height vals (-1 is missing).

Parameters ax : `Axes`

an Axes instance to plot to

vals : sequence

a sequence of values

facecolor : color

the color of the bar face

edgecolor : color

the color of the bar edges

width : int

the bar width in points

alpha : float

bar transparency

Returns ret : `barCollection`

The `barrCollection` added to the axes

`matplotlib.finance.`**`md5`**(*x*)

`matplotlib.finance.`**`parse_yahoo_historical_ochl`**(*fh*, *adjusted=True*, *asobject=False*)

Parse the historical data in file handle fh from yahoo finance.

Parameters adjusted : bool

If True (default) replace open, close, high, low prices with their adjusted values. The adjustment is by a scale factor, S = adjusted_close/close. Adjusted prices are actual prices multiplied by S.

Volume is not adjusted as it is already backward split adjusted by Yahoo. If you want to compute dollars traded, multiply volume by the adjusted close, regardless of whether you choose adjusted = True|False.

asobject : bool or None

If False (default for compatibility with earlier versions) return a list of tuples containing

d, open, close, high, low, volume

If None (preferred alternative to False), return a 2-D ndarray corresponding to the list of tuples.

Otherwise return a numpy recarray with

date, year, month, day, d, open, close, high, low, volume, adjusted_close

where d is a floating poing representation of date, as returned by date2num, and date is a python standard library datetime.date instance.

The name of this kwarg is a historical artifact. Formerly, True returned a cbook Bunch holding 1-D ndarrays. The behavior of a numpy recarray is very similar to the Bunch.

`matplotlib.finance.`**`parse_yahoo_historical_ohlc`**(*fh*, *adjusted=True*, *asobject=False*)

Parse the historical data in file handle fh from yahoo finance.

Parameters adjusted : bool

If True (default) replace open, high, low, close prices with their adjusted values. The adjustment is by a scale factor, S = adjusted_close/close. Adjusted prices are actual prices multiplied by S.

Volume is not adjusted as it is already backward split adjusted by Yahoo. If you want to compute dollars traded, multiply volume by the adjusted close, regardless of whether you choose adjusted = True|False.

asobject : bool or None

If False (default for compatibility with earlier versions) return a list of tuples containing

d, open, high, low, close, volume

If None (preferred alternative to False), return a 2-D ndarray corresponding to the list of tuples.

Otherwise return a numpy recarray with

date, year, month, day, d, open, high, low, close, volume, adjusted_close

where d is a floating poing representation of date, as returned by date2num, and date is a python standard library datetime.date instance.

The name of this kwarg is a historical artifact. Formerly, True returned a cbook Bunch holding 1-D ndarrays. The behavior of a numpy recarray is very similar to the Bunch.

`matplotlib.finance.`**`plot_day_summary2_ochl`**(*ax*, *opens*, *closes*, *highs*, *lows*, *ticksize=4*, *colorup='k'*, *colordown='r'*)

Represent the time, open, close, high, low, as a vertical line ranging from low to high. The left tick is the open and the right tick is the close.

Parameters ax : `Axes`

an Axes instance to plot to

opens : sequence

sequence of opening values

closes : sequence

sequence of closing values

highs : sequence

sequence of high values

lows : sequence

sequence of low values

ticksize : int

size of open and close ticks in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

Returns ret : list

a list of lines added to the axes

`matplotlib.finance.`**`plot_day_summary2_ohlc`**(*ax*, *opens*, *highs*, *lows*, *closes*, *ticksize=4*, *colorup='k'*, *colordown='r'*)

Represent the time, open, high, low, close as a vertical line ranging from low to high. The left tick is the open and the right tick is the close. *opens*, *highs*, *lows* and *closes* must have the same length. NOTE: this code assumes if any value open, high, low, close is missing (*-1*) they all are missing

Parameters ax : `Axes`

an Axes instance to plot to

opens : sequence

sequence of opening values

highs : sequence

sequence of high values

lows : sequence

sequence of low values

closes : sequence

sequence of closing values

ticksize : int

size of open and close ticks in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

Returns ret : list

a list of lines added to the axes

`matplotlib.finance.`**`plot_day_summary_oclh`**(*ax*, *quotes*, *ticksize=3*, *colorup='k'*, *colordown='r'*)

Plots day summary

Represent the time, open, close, high, low as a vertical line ranging from low to high. The left tick is the open and the right tick is the close.

Parameters ax : `Axes`

an `Axes` instance to plot to

quotes : sequence of (time, open, close, high, low, ...) sequences data to plot. time must be in float date format - see date2num

ticksize : int

open/close tick marker in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

Returns lines : list

list of tuples of the lines added (one tuple per quote)

`matplotlib.finance.`**`plot_day_summary_ohlc`**(*ax*, *quotes*, *ticksize=3*, *colorup='k'*, *colordown='r'*)

Plots day summary

Represent the time, open, high, low, close as a vertical line ranging from low to high. The left tick is the open and the right tick is the close.

Parameters ax : `Axes`

an `Axes` instance to plot to

quotes : sequence of (time, open, high, low, close, ...) sequences

data to plot. time must be in float date format - see date2num

ticksize : int

open/close tick marker in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

Returns lines : list

list of tuples of the lines added (one tuple per quote)

`matplotlib.finance.`**`quotes_historical_yahoo_ochl`**(*ticker*, *date1*, *date2*, *asobject=False*, *adjusted=True*, *cachename=None*)

Get historical data for ticker between date1 and date2.

See `parse_yahoo_historical()` for explanation of output formats and the *asobject* and *adjusted* kwargs.

Parameters ticker : str

stock ticker

date1 : sequence of form (year, month, day), `datetime`, or `date`

start date

date2 : sequence of form (year, month, day), `datetime`, or `date`

end date

cachename : str or `None`

is the name of the local file cache. If None, will default to the md5 hash or the url (which incorporates the ticker and date range)

Examples

```
>>> sp = f.quotes_historical_yahoo_ochl('^GSPC', d1, d2,
                             asobject=True, adjusted=True)
>>> returns = (sp.open[1:] - sp.open[:-1])/sp.open[1:]
>>> [n,bins,patches] = hist(returns, 100)
>>> mu = mean(returns)
>>> sigma = std(returns)
>>> x = normpdf(bins, mu, sigma)
>>> plot(bins, x, color='red', lw=2)
```

`matplotlib.finance.`**`quotes_historical_yahoo_ohlc`**(*ticker*, *date1*, *date2*, *asobject=False*, *adjusted=True*, *cachename=None*)

Get historical data for ticker between date1 and date2.

See `parse_yahoo_historical()` for explanation of output formats and the *asobject* and *adjusted* kwargs.

Parameters ticker : str

stock ticker

date1 : sequence of form (year, month, day), `datetime`, or `date`

start date

date2 : sequence of form (year, month, day), `datetime`, or `date`

end date

cachename : str or `None`

is the name of the local file cache. If None, will default to the md5 hash or the url (which incorporates the ticker and date range)

Examples

```
>>> sp = f.quotes_historical_yahoo_ohlc('^GSPC', d1, d2,
                             asobject=True, adjusted=True)
>>> returns = (sp.open[1:] - sp.open[:-1])/sp.open[1:]
>>> [n,bins,patches] = hist(returns, 100)
>>> mu = mean(returns)
>>> sigma = std(returns)
>>> x = normpdf(bins, mu, sigma)
>>> plot(bins, x, color='red', lw=2)
```

`matplotlib.finance.`**`volume_overlay`**(*ax*, *opens*, *closes*, *volumes*, *colorup='k'*, *colordown='r'*, *width=4*, *alpha=1.0*)

Add a volume overlay to the current axes. The opens and closes are used to determine the color of the bar. -1 is missing. If a value is missing on one it must be missing on all

Parameters ax : `Axes`

an Axes instance to plot to

opens : sequence

a sequence of opens

closes : sequence

a sequence of closes

volumes : sequence

a sequence of volumes

width : int

the bar width in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

alpha : float

bar transparency

Returns ret : `barCollection`

The `barrCollection` added to the axes

`matplotlib.finance.`**`volume_overlay2`**(*ax*, *closes*, *volumes*, *colorup='k'*, *colordown='r'*, *width=4*, *alpha=1.0*)

Add a volume overlay to the current axes. The closes are used to determine the color of the bar. -1 is missing. If a value is missing on one it must be missing on all

nb: first point is not displayed - it is used only for choosing the right color

Parameters ax : `Axes`

an Axes instance to plot to

closes : sequence

a sequence of closes

volumes : sequence

a sequence of volumes

width : int

the bar width in points

colorup : color

the color of the lines where close >= open

colordown : color

the color of the lines where close < open

alpha : float

bar transparency

Returns ret : `barCollection`

The `barrCollection` added to the axes

`matplotlib.finance.`**`volume_overlay3`**(*ax*, *quotes*, *colorup='k'*, *colordown='r'*, *width=4*, *alpha=1.0*)

Add a volume overlay to the current axes. quotes is a list of (d, open, high, low, close, volume) and close-open is used to determine the color of the bar

Parameters ax : `Axes`

an Axes instance to plot to

quotes : sequence of (time, open, high, low, close, ...) sequences

data to plot. time must be in float date format - see date2num

width : int

the bar width in points

colorup : color

the color of the lines where close1 >= close0

colordown : color

the color of the lines where close1 < close0

alpha : float

bar transparency

Returns ret : `barCollection`

The `barrCollection` added to the axes

CHAPTER THIRTYTWO

FONT_MANAGER

32.1 `matplotlib.font_manager`

A module for finding, managing, and using fonts across platforms.

This module provides a single *`FontManager`* instance that can be shared across backends and platforms. The *`findfont()`* function returns the best TrueType (TTF) font file in the local or system font path that matches the specified *`FontProperties`* instance. The *`FontManager`* also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the W3C Cascading Style Sheet, Level 1 (CSS1) font specification. Future versions may implement the Level 2 or 2.1 specifications.

Experimental support is included for using `fontconfig` on Unix variant platforms (Linux, OS X, Solaris). To enable it, set the constant `USE_FONTCONFIG` in this file to `True`. Fontconfig has the advantage that it is the standard way to look up fonts on X11 platforms, so if a font is installed, it is much more likely to be found.

class `matplotlib.font_manager.`**`FontEntry`**(*fname=’‘*, *name=’‘*, *style=’normal’*, *variant=’normal’*, *weight=’normal’*, *stretch=’normal’*, *size=’medium’*)

Bases: `object`

A class for storing Font properties. It is used when populating the font lookup dictionary.

class `matplotlib.font_manager.`**`FontManager`**(*size=None*, *weight=’normal’*)

Bases: `object`

On import, the *`FontManager`* singleton instance creates a list of TrueType fonts based on the font properties: name, style, variant, weight, stretch, and size. The *`findfont()`* method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, a default font is returned.

`findfont`(*prop*, *fontext=’ttf’*, *directory=None*, *fallback_to_default=True*, *rebuild_if_missing=True*)

Search the font list for the font that most closely matches the *`FontProperties`* *prop*.

`findfont()` performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

`directory`, is specified, will only return fonts from the given directory (or subdirectory of that directory).

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

If `fallback_to_default` is True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

static **`get_default_size`**()

Return the default font size.

`get_default_weight`()

Return the default font weight.

`score_family`(*families*, *family2*)

Returns a match score between the list of font families in *families* and the font family name *family2*.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

`score_size`(*size1*, *size2*)

Returns a match score between *size1* and *size2*.

If *size2* (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between *size1* and *size2*, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

`score_stretch`(*stretch1*, *stretch2*)

Returns a match score between *stretch1* and *stretch2*.

The result is the absolute value of the difference between the CSS numeric values of *stretch1* and *stretch2*, normalized between 0.0 and 1.0.

`score_style`(*style1*, *style2*)

Returns a match score between *style1* and *style2*.

An exact match returns 0.0.

A match between 'italic' and 'oblique' returns 0.1.

No match returns 1.0.

`score_variant`(*variant1*, *variant2*)

Returns a match score between *variant1* and *variant2*.

An exact match returns 0.0, otherwise 1.0.

`score_weight`(*weight1*, *weight2*)

Returns a match score between *weight1* and *weight2*.

The result is the absolute value of the difference between the CSS numeric values of *weight1* and *weight2*, normalized between 0.0 and 1.0.

`set_default_weight`(*weight*)

Set the default font weight. The initial value is 'normal'.

`update_fonts`(*filenames*)

Update the font dictionary with new font files. Currently not implemented.

class `matplotlib.font_manager.`**`FontProperties`**(*family=None*, *style=None*, *variant=None*, *weight=None*, *stretch=None*, *size=None*, *fname=None*, *_init=None*)

Bases: `object`

A class for storing and manipulating font properties.

The font properties are those described in the W3C Cascading Style Sheet, Level 1 font specification. The six properties are:

- family: A list of font names in decreasing order of priority. The items may include a generic font family name, either 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated rcParam in `matplotlibrc`.
- style: Either 'normal', 'italic' or 'oblique'.
- variant: Either 'normal' or 'small-caps'.
- stretch: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'
- weight: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'
- size: Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12

The default font property for TrueType fonts (as specified in the default `matplotlibrc` file) is:

```
sans-serif, normal, normal, normal, normal, scalable.
```

Alternatively, a font may be specified using an absolute path to a .ttf file, by using the *fname* kwarg.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a fontconfig pattern, if it is the only argument provided. See the documentation on fontconfig patterns. This support does not require fontconfig to be installed. We are merely borrowing its pattern syntax for use here.

Note that matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in matplotlib than in other applications that use fontconfig.

`copy`()
Return a deep copy of self

`get_family`()
Return a list of font names that comprise the font family.

`get_file`()
Return the filename of the associated font.

`get_fontconfig_pattern`()
Get a fontconfig pattern suitable for looking up the font as specified with fontconfig's `fc-match` utility.

See the documentation on fontconfig patterns.

This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

`get_name`()
Return the name of the font that best matches the font properties.

`get_size`()
Return the font size.

`get_size_in_points`()

`get_slant`()
Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_stretch`()
Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

`get_style`()
Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_variant`()
Return the font variant. Values are: 'normal' or 'small-caps'.

`get_weight`()
Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

`set_family`(*family*)
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `text.usetex` is `True`.

set_file(*file*)
Set the filename of the fontfile to use. In this case, all other properties will be ignored.

set_fontconfig_pattern(*pattern*)
Set the properties by parsing a fontconfig *pattern*.

See the documentation on fontconfig patterns.

This support does not require fontconfig to be installed or support for it to be enabled. We are merely borrowing its pattern syntax for use here.

set_name(*family*)
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `text.usetex` is `True`.

set_size(*size*)
Set the font size. Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

set_slant(*style*)
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_stretch(*stretch*)
Set the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the range 0-1000.

set_style(*style*)
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_variant(*variant*)
Set the font variant. Values are: 'normal' or 'small-caps'.

set_weight(*weight*)
Set the font weight. May be either a numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

`matplotlib.font_manager.`**OSXInstalledFonts**(*directories=None*, *fontext='ttf'*)
Get list of font files on OS X - ignores font suffix by default.

class `matplotlib.font_manager.`**TempCache**
Bases: `object`

A class to store temporary caches that are (a) not saved to disk and (b) invalidated whenever certain font-related rcParams—namely the family lookup lists—are changed or the font cache is reloaded. This avoids the expensive linear search through all fonts every time a font is looked up.

get(*prop*)

invalidating_rcparams = ('font.serif', 'font.sans-serif', 'font.cursive', 'font.fantasy', 'font.monospace')

`make_rcparams_key()`

`set(`*prop*, *value*`)`

`matplotlib.font_manager.`**`afmFontProperty`**`(`*fontpath*, *font*`)`

A function for populating a `FontKey` instance by extracting information from the AFM font file.

font is a class:`AFM` instance.

`matplotlib.font_manager.`**`createFontList`**`(`*fontfiles*, *fontext='ttf'*`)`

A function to create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.

`matplotlib.font_manager.`**`findSystemFonts`**`(`*fontpaths=None*, *fontext='ttf'*`)`

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

`matplotlib.font_manager.`**`findfont`**`(`*prop*, ***kw*`)`

`matplotlib.font_manager.`**`get_fontconfig_fonts`**`(`*fontext='ttf'*`)`

List the font filenames known to `fc-list` having the given extension.

`matplotlib.font_manager.`**`get_fontext_synonyms`**`(`*fontext*`)`

Return a list of file extensions extensions that are synonyms for the given file extension *fileext*.

`matplotlib.font_manager.`**`is_opentype_cff_font`**`(`*filename*`)`

Returns True if the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

`matplotlib.font_manager.`**`list_fonts`**`(`*directory*, *extensions*`)`

Return a list of all fonts matching any of the extensions, possibly upper-cased, found recursively under the directory.

`matplotlib.font_manager.`**`pickle_dump`**`(`*data*, *filename*`)`

Equivalent to pickle.dump(data, open(filename, 'w')) but closes the file to prevent filehandle leakage.

`matplotlib.font_manager.`**`pickle_load`**`(`*filename*`)`

Equivalent to pickle.load(open(filename, 'r')) but closes the file to prevent filehandle leakage.

`matplotlib.font_manager.`**`ttfFontProperty`**`(`*font*`)`

A function for populating the `FontKey` by extracting information from the TrueType font file.

font is a `FT2Font` instance.

`matplotlib.font_manager.`**`ttfdict_to_fnames`**`(`*d*`)`

flatten a ttfdict to all the filenames it contains

`matplotlib.font_manager.`**`weight_as_number`**`(`*weight*`)`

Return the weight property as a numeric value. String values are converted to their corresponding numeric value.

`matplotlib.font_manager.`**`win32FontDirectory`**`()`

Return the user-specified font directory for Win32. This is looked up from the registry key:

```
\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell␣
↪Folders\Fonts
```

If the key is not found, $WINDIR/Fonts will be returned.

`matplotlib.font_manager.`**`win32InstalledFonts`**`(`*directory=None*, *fontext='ttf'*`)`

Search for fonts in the specified font directory, or use the system directories if none given. A list of TrueType font filenames are returned by default, or AFM fonts if *fontext* == 'afm'.

32.2 matplotlib.fontconfig_pattern

A module for parsing and generating fontconfig patterns.

See the fontconfig pattern specification for more information.

class `matplotlib.fontconfig_pattern.`**`FontconfigPatternParser`**

Bases: `object`

A simple pyparsing-based parser for fontconfig-style patterns.

See the fontconfig pattern specification for more information.

`parse``(`*pattern*`)`

Parse the given fontconfig *pattern* and return a dictionary of key/value pairs useful for initializing a `font_manager.FontProperties` object.

`matplotlib.fontconfig_pattern.`**`family_escape`**`()`

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

`matplotlib.fontconfig_pattern.`**`family_unescape`**`()`

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

`matplotlib.fontconfig_pattern.`**`generate_fontconfig_pattern`**`(`*d*`)`

Given a dictionary of key/value pairs, generates a fontconfig pattern string.

`matplotlib.fontconfig_pattern.`**`value_escape`**`()`

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

`matplotlib.fontconfig_pattern.`**`value_unescape`**`()`

Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

CHAPTER

THIRTYTHREE

GRIDSPEC

33.1 `matplotlib.gridspec`

`gridspec` is a module which specifies the location of the subplot in the figure.

`GridSpec` specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

`SubplotSpec` specifies the location of the subplot in the given *GridSpec*.

class `matplotlib.gridspec.`**`GridSpec`**(*nrows*, *ncols*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*)

Bases: *`matplotlib.gridspec.GridSpecBase`*

A class that specifies the geometry of the grid that a subplot will be placed. The location of grid is determined by similar way as the SubplotParams.

The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

`get_subplot_params`(*fig=None*)

return a dictionary of subplot layout parameters. The default parameters are from rcParams unless a figure attribute is set.

`locally_modified_subplot_params`()

`tight_layout`(*fig*, *renderer=None*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust subplot parameters to give specified padding.

Parameters:

pad [float] padding between the figure edge and the edges of subplots, as a fraction of the font-size.

h_pad, w_pad [float] padding (height/width) between edges of adjacent subplots. Defaults to `pad_inches`.

rect [if rect is given, it is interpreted as a rectangle] (left, bottom, right, top) in the normalized figure coordinate that the whole subplots area (including labels) will fit into. Default is (0, 0, 1, 1).

`update`(***kwargs*)

Update the current values. If any kwarg is None, default to the current value, if set, otherwise to rc.

class `matplotlib.gridspec.`**`GridSpecBase`**(*nrows*, *ncols*, *height_ratios=None*, *width_ratios=None*)

Bases: `object`

A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

The number of rows and number of columns of the grid need to be set. Optionally, the ratio of heights and widths of rows and columns can be specified.

`get_geometry`()

get the geometry of the grid, e.g., 2,3

`get_grid_positions`(*fig*)

return lists of bottom and top position of rows, left and right positions of columns.

`get_height_ratios`()

`get_subplot_params`(*fig=None*)

`get_width_ratios`()

`new_subplotspec`(*loc*, *rowspan=1*, *colspan=1*)

create and return a SuplotSpec instance.

`set_height_ratios`(*height_ratios*)

`set_width_ratios`(*width_ratios*)

class `matplotlib.gridspec.`**`GridSpecFromSubplotSpec`**(*nrows*, *ncols*, *subplot_spec*, *wspace=None*, *hspace=None*, *height_ratios=None*, *width_ratios=None*)

Bases: `matplotlib.gridspec.GridSpecBase`

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

get_subplot_params(*fig=None*)
return a dictionary of subplot layout parameters.

get_topmost_subplotspec()
get the topmost SubplotSpec instance associated with the subplot

class `matplotlib.gridspec.`**SubplotSpec**(*gridspec*, *num1*, *num2=None*)
Bases: `object`

specifies the location of the subplot in the given *GridSpec*.

The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell.

The index stars from 0.

get_geometry()
get the subplot geometry, e.g., 2,2,3. Unlike SuplorParams, index is 0-based

get_gridspec()

get_position(*fig*, *return_all=False*)
update the subplot position from fig.subplotpars

get_topmost_subplotspec()
get the topmost SubplotSpec instance associated with the subplot

CHAPTER

THIRTYFOUR

IMAGE

34.1 `matplotlib.image`

The image module supports basic image loading, rescaling and display operations.

class `matplotlib.image.`**`AxesImage`**(*ax*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *extent=None*, *filternorm=1*, *filterrad=4.0*, *resample=False*, ***kwargs*)

Bases: `matplotlib.image._ImageBase`

interpolation and cmap default to their rc settings

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

extent is data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

Additional kwargs are matplotlib.artist properties

`get_cursor_data`(*event*)

Get the cursor data for a given event

`get_extent`()

Get the image extent: left, right, bottom, top

`get_window_extent`(*renderer=None*)

`make_image`(*renderer*, *magnification=1.0*, *unsampled=False*)

`set_extent`(*extent*)

extent is data axes (left, right, bottom, top) for making image plots

This updates ax.dataLim, and, if autoscaling, sets viewLim to tightly fit the image, regardless of dataLim. Autoscaling state is not changed, so following this with ax.autoscale_view will redo the autoscaling in accord with dataLim.

class `matplotlib.image.`**`BboxImage`**(*bbox*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=1*, *filterrad=4.0*, *resample=False*, *interp_at_native=True*, ***kwargs*)

Bases: `matplotlib.image._ImageBase`

The Image class whose size is determined by the given bbox.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

interp_at_native is a flag that determines whether or not interpolation should still be applied when the image is displayed at its native resolution. A common use case for this is when displaying an image for annotational purposes; it is treated similarly to Photoshop (interpolation is only used when displaying the image at non-native resolutions).

kwargs are an optional list of Artist keyword args

contains(*mouseevent*)
Test whether the mouse event occured within the image.

get_transform()

get_window_extent(*renderer=None*)

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

class `matplotlib.image.`**FigureImage**(*fig*, *cmap=None*, *norm=None*, *offsetx=0*, *offsety=0*, *origin=None*, ***kwargs*)
Bases: `matplotlib.image._ImageBase`

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

get_extent()
Get the image extent: left, right, bottom, top

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

set_data(*A*)
Set the image array.

zorder = 0

class `matplotlib.image.`**NonUniformImage**(*ax*, ***kwargs*)
Bases: `matplotlib.image.AxesImage`

kwargs are identical to those for AxesImage, except that 'nearest' and 'bilinear' are the only supported 'interpolation' options.

get_extent()

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

set_array(**args*)

set_cmap(*cmap*)

set_data(*x*, *y*, *A*)

Set the grid for the pixel centers, and the pixel values.

> ***x* and *y* are monotonic 1-D ndarrays of lengths N and M,** respectively, specifying pixel centers
>
> ***A* is an (M,N) ndarray or masked array of values to be** colormapped, or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

set_filternorm(*s*)

set_filterrad(*s*)

set_interpolation(*s*)

set_norm(*norm*)

class matplotlib.image.**PcolorImage**(*ax*, *x=None*, *y=None*, *A=None*, *cmap=None*, *norm=None*, ***kwargs*)

Bases: `matplotlib.image.AxesImage`

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by pcolorfast for the corresponding grid type.

cmap defaults to its rc setting

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

Additional kwargs are matplotlib.artist properties

get_cursor_data(*event*)

Get the cursor data for a given event

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

set_array(**args*)

set_data(*x*, *y*, *A*)

Set the grid for the rectangle boundaries, and the data values.

> ***x* and *y* are monotonic 1-D ndarrays of lengths N+1 and M+1,** respectively, specifying rectangle boundaries. If None, they will be created as uniform arrays from 0 through N and 0 through M, respectively.
>
> ***A* is an (M,N) ndarray or masked array of values to be** colormapped, or a (M,N,3) RGB array, or a (M,N,4) RGBA array.

`matplotlib.image.`**`composite_images`**(*images*, *renderer*, *magnification=1.0*)

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the `images` list.

Parameters images : list of Images

Each must have a `make_image` method. For each image, `can_composite` should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

renderer : RendererBase instance

magnification : float

The additional magnification to apply for the renderer in use.

Returns tuple : image, offset_x, offset_y

Returns the tuple:

- image: A numpy array of the same type as the input images.
- offset_x, offset_y: The offset of the image (left, bottom) in the output figure.

`matplotlib.image.`**`imread`**(*fname*, *format=None*)

Read an image from a file into an array.

fname may be a string path, a valid URL, or a Python file-like object. If using a file object, it must be opened in binary mode.

If *format* is provided, will try to read file of that type, otherwise the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Return value is a `numpy.array`. For grayscale images, the return array is MxN. For RGB images, the return value is MxNx3. For RGBA images the return value is MxNx4.

matplotlib can only read PNGs natively, but if PIL is installed, it will use it to load the image and return an array (if possible) which can be used with *`imshow()`*. Note, URL strings may not be compatible with PIL. Check the PIL documentation for more information.

`matplotlib.image.`**`imsave`**(*fname*, *arr*, *vmin=None*, *vmax=None*, *cmap=None*, *format=None*, *origin=None*, *dpi=100*)

Save an array as in image file.

The output formats available depend on the backend being used.

Arguments:

fname: A string containing a path to a filename, or a Python file-like object. If *format* is *None* and *fname* is a string, the output format is deduced from the extension of the filename.

arr: An MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA) array.

Keyword arguments:

***vmin*/*vmax*: [None | scalar]** *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

***cmap*:** cmap is a colors.Colormap instance, e.g., cm.jet. If None, default to the rc image.cmap value.

***format*:** One of the file extensions supported by the active backend. Most backends support png, pdf, ps, eps and svg.

origin ['upper' | 'lower'] Indicates where the [0,0] index of the array is in the upper left or lower left corner of the axes. Defaults to the rc image.origin value.

dpi The DPI to store in the metadata of the file. This does not affect the resolution of the output image.

`matplotlib.image.`**`pil_to_array`**`(`*pilImage*`)`

Load a PIL image and return it as a numpy array. For grayscale images, the return array is MxN. For RGB images, the return value is MxNx3. For RGBA images the return value is MxNx4

`matplotlib.image.`**`thumbnail`**`(`*infile*, *thumbfile*, *scale=0.1*, *interpolation='bilinear'*, *preview=False*`)`

make a thumbnail of image in *infile* with output filename *thumbfile*.

infile **the image file – must be PNG or Pillow-readable if you** have Pillow installed

thumbfile the thumbnail filename

scale the scale factor for the thumbnail

interpolation the interpolation scheme used in the resampling

preview if True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if `show()` is called. If it is False, a pure image backend will be used depending on the extension, 'png'->FigureCanvasAgg, 'pdf'->FigureCanvasPdf, 'svg'->FigureCanvasSVG

See examples/misc/image_thumbnail.py.

Return value is the figure instance containing the thumbnail

CHAPTER

THIRTYFIVE

LEGEND AND LEGEND_HANDLER

35.1 `matplotlib.legend`

The legend module defines the Legend class, which is responsible for drawing legends associated with axes and/or figures.

Important: It is unlikely that you would ever create a Legend instance manually. Most users would normally create a legend via the `legend()` function. For more details on legends there is also a *legend guide*.

The Legend class can be considered as a container of legend handles and legend texts. Creation of corresponding legend handles from the plot elements in the axes or figures (e.g., lines, patches, etc.) are specified by the handler map, which defines the mapping between the plot elements and the legend handlers to be used (the default legend handlers are defined in the `legend_handler` module). Note that not all kinds of artist are supported by the legend yet by default but it is possible to extend the legend handler's capabilities to support arbitrary objects. See the *legend guide* for more information.

class `matplotlib.legend.`**`DraggableLegend`**(*legend*, *use_blit=False*, *update='loc'*)

Bases: `matplotlib.offsetbox.DraggableOffsetBox`

update [If "loc", update *loc* parameter of] legend upon finalizing. If "bbox", update *bbox_to_anchor* parameter.

`artist_picker`(*legend*, *evt*)

`finalize_offset`()

class `matplotlib.legend.`**`Legend`**(*parent*, *handles*, *labels*, *loc=None*, *numpoints=None*, *markerscale=None*, *markerfirst=True*, *scatterpoints=None*, *scatteryoffsets=None*, *prop=None*, *fontsize=None*, *borderpad=None*, *labelspacing=None*, *handlelength=None*, *handleheight=None*, *handletextpad=None*, *borderaxespad=None*, *columnspacing=None*, *ncol=1*, *mode=None*, *fancybox=None*, *shadow=None*, *title=None*, *framealpha=None*, *edgecolor=None*, *facecolor=None*, *bbox_to_anchor=None*, *bbox_transform=None*, *frameon=None*, *handler_map=None*)

Bases: `matplotlib.artist.Artist`

Place a legend on the axes at location loc. Labels are a sequence of strings and loc can be a string or an integer specifying the legend location

The location codes are:

```
'best'          : 0, (only implemented for axes legends)
'upper right'   : 1,
'upper left'    : 2,
'lower left'    : 3,
'lower right'   : 4,
'right'         : 5,
'center left'   : 6,
'center right'  : 7,
'lower center'  : 8,
'upper center'  : 9,
'center'        : 10,
```

loc can be a tuple of the normalized coordinate values with respect its parent.

- *parent*: the artist that contains the legend
- ***handles*: a list of artists (lines, patches) to be added to the** legend
- *labels*: a list of strings to label the legend

Optional keyword arguments:

Keyword	Description
loc	Location code string, or tuple (see below).
prop	the font property
fontsize	the font size (used only if prop is not specified)
markerscale	the relative size of legend markers vs. original
markerfirst	If True (default), marker is to left of the label.
numpoints	the number of points in the legend for line
scatterpoints	the number of points in the legend for scatter plot
scatteryoffsets	a list of yoffsets for scatter symbols in legend
frameon	If True, draw the legend on a patch (frame).
fancybox	If True, draw the frame with a round fancybox.
shadow	If True, draw a shadow behind legend.
framealpha	Transparency of the frame.
edgecolor	Frame edgecolor.
facecolor	Frame facecolor.
ncol	number of columns
borderpad	the fractional whitespace inside the legend border
labelspacing	the vertical space between the legend entries
handlelength	the length of the legend handles
handleheight	the height of the legend handles
handletextpad	the pad between the legend handle and text
borderaxespad	the pad between the axes and legend border
columnspacing	the spacing between columns
title	the legend title
bbox_to_anchor	the bbox that the legend will be anchored.
bbox_transform	the transform for the bbox. transAxes if None.

The pad and spacing parameters are measured in font-size units. e.g., a fontsize of 10 points and a handlelength=5 implies a handlelength of 50 points. Values from rcParams will be used if None.

Users can specify any arbitrary location for the legend using the *bbox_to_anchor* keyword argument. bbox_to_anchor can be an instance of BboxBase(or its derivatives) or a tuple of 2 or 4 floats. See `set_bbox_to_anchor()` for more detail.

The legend location can be specified by setting *loc* with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

`codes` = {‘best’: 0, ‘upper right’: 1, ‘upper left’: 2, ‘lower left’: 3, ‘lower right’: 4, ‘right’: 5, ‘center left’: 6, ‘c

`contains`(*event*)

`draggable`(*state=None*, *use_blit=False*, *update='loc'*)

Set the draggable state – if state is

- None : toggle the current state
- True : turn draggable on
- False : turn draggable off

If draggable is on, you can drag the legend on the canvas with the mouse. The DraggableLegend helper instance is returned if draggable is on.

The update parameter control which parameter of the legend changes when dragged. If update is "loc", the *loc* paramter of the legend is changed. If "bbox", the *bbox_to_anchor* parameter is changed.

`draw`(*artist*, *renderer*, **args*, ***kwargs*)
Draw everything that belongs to the legend

`draw_frame`(*b*)
b is a boolean. Set draw frame to b

`get_bbox_to_anchor`()
return the bbox that the legend will be anchored

`get_children`()
return a list of child artists

classmethod `get_default_handler_map`()
A class method that returns the default handler map.

`get_frame`()
return the Rectangle instance used to frame the legend

`get_frame_on`()
Get whether the legend box patch is drawn

static `get_legend_handler`(*legend_handler_map*, *orig_handle*)
return a legend handler from *legend_handler_map* that corresponds to *orig_handler*.

legend_handler_map should be a dictionary object (that is returned by the get_legend_handler_map method).

It first checks if the *orig_handle* itself is a key in the *legend_hanler_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns None.

`get_legend_handler_map`()
return the handler map.

`get_lines`()
return a list of lines.Line2D instances in the legend

`get_patches`()
return a list of patch instances in the legend

`get_texts`()
return a list of text.Text instance in the legend

`get_title`()
return Text instance for the legend title

`get_window_extent`(**args*, ***kwargs*)
return a extent of the legend

set_bbox_to_anchor(*bbox*, *transform=None*)

set the bbox that the legend will be anchored.

bbox can be a BboxBase instance, a tuple of [left, bottom, width, height] in the given transform (normalized axes coordinate if None), or a tuple of [left, bottom] where the width and height will be assumed to be zero.

classmethod set_default_handler_map(*handler_map*)

A class method to set the default handler map.

set_frame_on(*b*)

Set whether the legend box patch is drawn

ACCEPTS: [*True* | *False*]

set_title(*title*, *prop=None*)

set the legend title. Fontproperties can be optionally set with *prop* parameter.

classmethod update_default_handler_map(*handler_map*)

A class method to update the default handler map.

zorder = 5

35.2 `matplotlib.legend_handler`

This module defines default legend handlers.

It is strongly encouraged to have read the *legend guide* before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig_handle* is the original plot, *fontsize* is the fontsize in pixles, and *handlebox* is a OffsetBox instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig_handle*) and add them into the handlebox. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (HandlerBase) with the following method.

def legend_artist(self, legend, orig_handle, fontsize, handlebox):

class `matplotlib.legend_handler.`**HandlerBase**(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

A Base class for default legend handlers.

The derived classes are meant to override *create_artists* method, which has a following signature.:

```
def create_artists(self, legend, orig_handle,
                   xdescent, ydescent, width, height, fontsize,
                   trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

adjust_drawing_area(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

legend_artist(*legend*, *orig_handle*, *fontsize*, *handlebox*)

Return the artist that this HandlerBase generates for the given original artist/handle.

Parameters legend : `matplotlib.legend.Legend` instance

The legend for which these legend artists are being created.

orig_handle : `matplotlib.artist.Artist` or similar

The object for which these legend artists are being created.

fontsize : float or int

The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

handlebox : `matplotlib.offsetbox.OffsetBox` instance

The box which has been created to hold this legend entry's artists. Artists created in the `legend_artist` method must be added to this handlebox inside this method.

update_prop(*legend_handle*, *orig_handle*, *legend*)

class `matplotlib.legend_handler.`**HandlerCircleCollection**(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for CircleCollections

create_collection(*orig_handle*, *sizes*, *offsets*, *transOffset*)

class `matplotlib.legend_handler.`**HandlerErrorbar**(*xerr_size=0.5*, *yerr_size=None*, *marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for Errorbars

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

get_err_size(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class `matplotlib.legend_handler.`**HandlerLine2D**(*marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for Line2D instances.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

class `matplotlib.legend_handler.`**`HandlerLineCollection`**(*marker_pad=0.3*, *numpoints=None*, ***kw*)

Handler for LineCollection instances.

`create_artists`(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`get_numpoints`(*legend*)

class `matplotlib.legend_handler.`**`HandlerNpoints`**(*marker_pad=0.3*, *numpoints=None*, ***kw*)

`get_numpoints`(*legend*)

`get_xdata`(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class `matplotlib.legend_handler.`**`HandlerNpointsYoffsets`**(*numpoints=None*, *yoffsets=None*, ***kw*)

`get_ydata`(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class `matplotlib.legend_handler.`**`HandlerPatch`**(*patch_func=None*, ***kw*)

Handler for Patch instances.

The HandlerPatch class optionally takes a function `patch_func` who's responsibility is to create the legend key artist. The `patch_func` should have the signature:

```python
def patch_func(legend=legend, orig_handle=orig_handle,
               xdescent=xdescent, ydescent=ydescent,
               width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its `update_prop` method called and the appropriate transform will be applied.

`create_artists`(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

class `matplotlib.legend_handler.`**`HandlerPathCollection`**(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for PathCollections, which are used by scatter

`create_collection`(*orig_handle*, *sizes*, *offsets*, *transOffset*)

class `matplotlib.legend_handler.`**`HandlerPolyCollection`**(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

Handler for PolyCollection used in fill_between and stackplot.

`create_artists`(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

class `matplotlib.legend_handler.`**`HandlerRegularPolyCollection`**(*yoffsets=None*, *sizes=None*, ***kw*)

Handler for RegularPolyCollections.

`create_artists`(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

`create_collection`(*orig_handle*, *sizes*, *offsets*, *transOffset*)

`get_numpoints`(*legend*)

`get_sizes`(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

`update_prop`(*legend_handle*, *orig_handle*, *legend*)

class `matplotlib.legend_handler.`**`HandlerStem`**(*marker_pad=0.3*, *numpoints=None*, *bottom=None*, *yoffsets=None*, ***kw*)

Handler for Errorbars

`matplotlib.legend_handler.`**`update_from_first_child`**(*tgt*, *src*)

CHAPTER

THIRTYSIX

LINES

36.1 `matplotlib.lines`

This module contains all the 2D line class which can draw with a variety of line styles, markers and colors.

class `matplotlib.lines.`**`Line2D`**(*xdata*, *ydata*, *linewidth=None*, *linestyle=None*, *color=None*, *marker=None*, *markersize=None*, *markeredgewidth=None*, *markeredgecolor=None*, *markerfacecolor=None*, *markerfacecoloralt='none'*, *fillstyle=None*, *antialiased=None*, *dash_capstyle=None*, *solid_capstyle=None*, *dash_joinstyle=None*, *solid_joinstyle=None*, *pickradius=5*, *drawstyle=None*, *markevery=None*, ***kwargs*)

Bases: `matplotlib.artist.Artist`

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a `Line2D` instance with *x* and *y* data in sequences *xdata*, *ydata*.

The kwargs are `Line2D` properties:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`antialiased` or aa	[True | False]
`axes`	an `Axes` instance
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color` or c	any matplotlib color
`contains`	a callable function
`dash_capstyle`	['butt' | 'round' | 'projecting']
`dash_joinstyle`	['miter' | 'round' | 'bevel']
`dashes`	sequence of on/off ink in points
`drawstyle`	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']

C

Table 36.1 – continued from previous page

Property	Description
figure	a *matplotlib.figure.Figure* instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	*A valid marker style*
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markerfacecoloralt or mfcalt	any matplotlib color
markersize or ms	float
markevery	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
path_effects	unknown
picker	float distance in points or callable pick function `fn(artist, event)`
pickradius	float distance in points
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a *matplotlib.transforms.Transform* instance
url	a url string
visible	[True | False]
xdata	1D array
ydata	1D array
zorder	any number

See *set_linestyle()* for a decription of the line styles, *set_marker()* for a description of the markers, and *set_drawstyle()* for a description of the draw styles.

axes

The *Axes* instance the artist resides in, or *None*.

contains(*mouseevent*)

Test whether the mouse event occurred on the line. The pick radius determines the precision of the location test (usually within five points of the value). Use *get_pickradius()* or *set_pickradius()* to view or modify it.

Returns *True* if any values are within the radius along with `{'ind': pointlist}`, where *pointlist* is the set of points within the radius.

TODO: sort returned indices by distance

draw(*artist*, *renderer*, **args*, ***kwargs*) draw the Line with `renderer` unless visibility is False

`drawStyleKeys` **= ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']**

`drawStyles` **= {'default': '_draw_lines', 'steps-mid': '_draw_steps_mid', 'steps-pre': '_draw_steps_pre', 'step**

`fillStyles` **= ('full', 'left', 'right', 'bottom', 'top', 'none')**

`filled_markers` **= ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')**

`get_aa`()
alias for get_antialiased

`get_antialiased`()

`get_c`()
alias for get_color

`get_color`()

`get_dash_capstyle`()
Get the cap style for dashed linestyles

`get_dash_joinstyle`()
Get the join style for dashed linestyles

`get_data`(*orig=True*)
Return the xdata, ydata.

If *orig* is *True*, return the original data.

`get_drawstyle`()

`get_fillstyle`()
return the marker fillstyle

`get_linestyle`()

`get_linewidth`()

`get_ls`()
alias for get_linestyle

`get_lw`()
alias for get_linewidth

`get_marker`()

get_markeredgecolor()

get_markeredgewidth()

get_markerfacecolor()

get_markerfacecoloralt()

get_markersize()

get_markevery()
return the markevery setting

get_mec()
alias for get_markeredgecolor

get_mew()
alias for get_markeredgewidth

get_mfc()
alias for get_markerfacecolor

get_mfcalt(*alt=False*)
alias for get_markerfacecoloralt

get_ms()
alias for get_markersize

get_path()
Return the `Path` object associated with this line.

get_pickradius()
return the pick radius used for containment tests

get_solid_capstyle()
Get the cap style for solid linestyles

get_solid_joinstyle()
Get the join style for solid linestyles

get_window_extent(*renderer*)

get_xdata(*orig=True*)
Return the xdata.

If *orig* is *True*, return the original data, else the processed data.

get_xydata()
Return the *xy* data as a Nx2 numpy array.

get_ydata(*orig=True*)
Return the ydata.

If *orig* is *True*, return the original data, else the processed data.

is_dashed()
return True if line is dashstyle

lineStyles = {‘-‘: ‘_draw_solid’, ‘–‘: ‘_draw_dashed’, ‘-.’: ‘_draw_dash_dot’, ‘:’: ‘_draw_dotted’, ‘None’: ‘_

markers = {‘.’: ‘point’, ‘,’: ‘pixel’, ‘o’: ‘circle’, ‘v’: ‘triangle_down’, ‘^’: ‘triangle_up’, ‘<’: ‘triangle_left’, ‘>’

recache(*always=False*)

recache_always()

set_aa(*val*)
alias for set_antialiased

set_antialiased(*b*)
True if line should be drawin with antialiased rendering

ACCEPTS: [True | False]

set_c(*val*)
alias for set_color

set_color(*color*)
Set the color of the line

ACCEPTS: any matplotlib color

set_dash_capstyle(*s*)
Set the cap style for dashed linestyles

ACCEPTS: [’butt’ | ‘round’ | ‘projecting’]

set_dash_joinstyle(*s*)
Set the join style for dashed linestyles ACCEPTS: [’miter’ | ‘round’ | ‘bevel’]

set_dashes(*seq*)
Set the dash sequence, sequence of dashes with on off ink in points. If seq is empty or if seq = (None, None), the linestyle will be set to solid.

ACCEPTS: sequence of on/off ink in points

set_data(**args*)
Set the x and y data

ACCEPTS: 2D array (rows are x, y) or two 1D arrays

set_drawstyle(*drawstyle*)
Set the drawstyle of the plot

'default' connects the points with lines. The steps variants produce step-plots. 'steps' is equivalent to 'steps-pre' and is maintained for backward-compatibility.

ACCEPTS: ['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']

`set_fillstyle`(*fs*)

Set the marker fill style; 'full' means fill the whole marker. 'none' means no filling; other options are for half-filled markers.

ACCEPTS: ['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']

`set_linestyle`(*ls*)

Set the linestyle of the line (also accepts drawstyles, e.g., `'steps--'`)

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line
`'None'`	draw nothing
`' '`	draw nothing
`''`	draw nothing

'steps' is equivalent to 'steps-pre' and is maintained for backward-compatibility.

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

See also:

`set_drawstyle()` To set the drawing style (stepping) of the plot.

Parameters ls : { `'-'`, `'--'`, `'-.'`, `':'`} and more see description

The line style.

`set_linewidth`(*w*)

Set the line width in points

ACCEPTS: float value in points

`set_ls`(*val*)

alias for set_linestyle

`set_lw`(*val*)

alias for set_linewidth

`set_marker`(*marker*)

Set the line marker

ACCEPTS: *A valid marker style*

Parameters marker: marker style

See `markers` for full description of possible argument

`set_markeredgecolor`(*ec*)

Set the marker edge color

ACCEPTS: any matplotlib color

`set_markeredgewidth`(*ew*)

Set the marker edge width in points

ACCEPTS: float value in points

`set_markerfacecolor`(*fc*)

Set the marker face color.

ACCEPTS: any matplotlib color

`set_markerfacecoloralt`(*fc*)

Set the alternate marker face color.

ACCEPTS: any matplotlib color

`set_markersize`(*sz*)

Set the marker size in points

ACCEPTS: float

`set_markevery`(*every*)

Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

ACCEPTS: [None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]

Parameters every: None | int | length-2 tuple of int | slice | list/array of int |

float | length-2 tuple of float

Which markers to plot.

- every=None, every point will be plotted.
- every=N, every N-th marker will be plotted starting with marker 0.
- every=(start, N), every N-th marker, starting at point start, will be plotted.
- every=slice(start, end, N), every N-th marker, starting at point start, upto but not including point end, will be plotted.
- every=[i, j, m, n], only markers at points i, j, m, and n will be plotted.
- every=0.1, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of every.

- every=(0.5, 0.1) (i.e. a length-2 tuple of float), the same functionality as every=0.1 is exhibited but the first marker will be 0.5 multiplied by the display-cordinate-diagonal-distance along the line.

Notes

Setting the markevery property will only show markers at actual data points. When using float arguments to set the markevery property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

`set_mec`(*val*)
alias for set_markeredgecolor

`set_mew`(*val*)
alias for set_markeredgewidth

`set_mfc`(*val*)
alias for set_markerfacecolor

`set_mfcalt`(*val*)
alias for set_markerfacecoloralt

`set_ms`(*val*)
alias for set_markersize

`set_picker`(*p*)
Sets the event picker details for the line.

ACCEPTS: float distance in points or callable pick function `fn(artist, event)`

`set_pickradius`(*d*)
Sets the pick radius used for containment tests

ACCEPTS: float distance in points

`set_solid_capstyle`(*s*)
Set the cap style for solid linestyles

ACCEPTS: [’butt’ | ‘round’ | ‘projecting’]

`set_solid_joinstyle`(*s*)
Set the join style for solid linestyles ACCEPTS: [’miter’ | ‘round’ | ‘bevel’]

`set_transform`(*t*)
set the Transformation instance used by this artist

ACCEPTS: a `matplotlib.transforms.Transform` instance

set_xdata(*x*)
Set the data np.array for x

ACCEPTS: 1D array

set_ydata(*y*)
Set the data np.array for y

ACCEPTS: 1D array

update_from(*other*)
copy properties from other to self

validCap = ('butt', 'round', 'projecting')

validJoin = ('miter', 'round', 'bevel')

zorder = 2

class `matplotlib.lines.`**VertexSelector**(*line*)
Bases: `object`

Manage the callbacks to maintain a list of selected vertices for *`matplotlib.lines.Line2D`*. Derived classes should override *`process_selected()`* to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        lines.VertexSelector.__init__(self, line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig = plt.figure()
ax = fig.add_subplot(111)
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)

selector = HighlightSelected(line)
plt.show()
```

Initialize the class with a *`matplotlib.lines.Line2D`* instance. The line should already be added to some *`matplotlib.axes.Axes`* instance and should have the picker property set.

onpick(*event*)
When the line is picked, update the set of selected indicies.

`process_selected`(*ind*, *xs*, *ys*)

Default "do nothing" implementation of the `process_selected()` method.

ind are the indices of the selected vertices. *xs* and *ys* are the coordinates of the selected vertices.

`matplotlib.lines.`**`segment_hits`**(*cx*, *cy*, *x*, *y*, *radius*)

Determine if any line segments are within radius of a point. Returns the list of line segments that are within that radius.

CHAPTER

THIRTYSEVEN

MARKERS

37.1 `matplotlib.markers`

This module contains functions to handle markers. Used by both the marker functionality of *`plot`* and *`scatter`*.

All possible markers are defined here:

marker	description
`"."`	point
`","`	pixel
`"o"`	circle
`"v"`	triangle_down
`"^"`	triangle_up
`"<"`	triangle_left
`">"`	triangle_right
`"1"`	tri_down
`"2"`	tri_up
`"3"`	tri_left
`"4"`	tri_right
`"8"`	octagon
`"s"`	square
`"p"`	pentagon
`"P"`	plus (filled)
`"*"`	star
`"h"`	hexagon1
`"H"`	hexagon2
`"+"`	plus
`"x"`	x
`"X"`	x (filled)
`"D"`	diamond
`"d"`	thin_diamond
`"|"`	vline
`"_"`	hline
TICKLEFT	tickleft

Continued on next page

Table 37.1 – continued from previous page

marker	description
TICKRIGHT	tickright
TICKUP	tickup
TICKDOWN	tickdown
CARETLEFT	caretleft (centered at tip)
CARETRIGHT	caretright (centered at tip)
CARETUP	caretup (centered at tip)
CARETDOWN	caretdown (centered at tip)
CARETLEFTBASE	caretleft (centered at base)
CARETRIGHTBASE	caretright (centered at base)
CARETUPBASE	caretup (centered at base)
`"None"`, `" "` or `""`	nothing
`'$...$'`	render the string using mathtext.
`verts`	a list of (x, y) pairs used for Path vertices. The center of the marker is located at (0,0) and the size is normalized.
path	a *`Path`* instance.
(`numsides`, `style`, `angle`)	The marker can also be a tuple (`numsides`, `style`, `angle`), which will create a custom, regular symbol. **`numsides`:** the number of sides **`style`:** the style of the regular symbol: **0** a regular polygon **1** a star-like symbol **2** an asterisk **3** a circle (`numsides` and `angle` is ignored) **`angle`:** the angle of rotation of the symbol

For backward compatibility, the form (`verts`, 0) is also accepted, but it is equivalent to just `verts` for giving a raw set of vertices that define the shape.

`None` is the default which means ‘nothing’, however this table is referred to from other docs for the valid inputs from marker inputs and in those cases `None` still means ‘default’.

class `matplotlib.markers.`**`MarkerStyle`**`(`*marker=None*, *fillstyle=None*`)`

Bases: `object`

Parameters marker : string or array_like, optional, default: None

See the descriptions of possible markers in the module docstring.

fillstyle : string, optional, default: ‘full’

‘full’, ‘left”, ‘right’, ‘bottom’, ‘top’, ‘none’

Attributes

markers	(list of known markes)
fillstyles	(list of known fillstyles)
filled_markers	(list of known filled markers.)

`filled_markers` **= ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')**

`fillstyles` **= ('full', 'left', 'right', 'bottom', 'top', 'none')**

`get_alt_path`()

`get_alt_transform`()

`get_capstyle`()

`get_fillstyle`()

`get_joinstyle`()

`get_marker`()

38.1 `matplotlib.mathtext`

`mathtext` is a module for parsing a subset of the TeX math syntax and drawing them to a matplotlib backend.

For a tutorial of its usage see *Writing mathematical expressions*. This document is primarily concerned with implementation details.

The module uses pyparsing to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

class `matplotlib.mathtext.`**`Accent`**(*c*, *state*, *math=True*)

Bases: *`matplotlib.mathtext.Char`*

The font metrics need to be dealt with differently for accents, since they are already offset correctly from the baseline in TrueType fonts.

`grow`()

`render`(*x*, *y*)

Render the character to the canvas.

`shrink`()

class `matplotlib.mathtext.`**`AutoHeightChar`**(*c*, *height*, *depth*, *state*, *always=False*, *factor=None*)

Bases: *`matplotlib.mathtext.Hlist`*

`AutoHeightChar` will create a character as close to the given height and depth as possible. When using a font with multiple height versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

class `matplotlib.mathtext.`**`AutoWidthChar`**(*c*, *width*, *state*, *always=False*, *char_class=<class 'matplotlib.mathtext.Char'>*)

Bases: *`matplotlib.mathtext.Hlist`*

`AutoWidthChar` will create a character as close to the given width as possible. When using a font with multiple width versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

class `matplotlib.mathtext.`**`BakomaFonts`**(**args*, ***kwargs*)

Bases: *`matplotlib.mathtext.TruetypeFonts`*

Use the Bakoma TrueType fonts for rendering.

Symbols are strewn about a number of font files, each of which has its own proprietary 8-bit encoding.

`alias` = '\\]'

get_sized_alternatives_for_symbol(*fontname*, *sym*)

target = '\]'

class matplotlib.mathtext.**Box**(*width*, *height*, *depth*)

Bases: *matplotlib.mathtext.Node*

Represents any node with a physical location.

grow()

render(*x1*, *y1*, *x2*, *y2*)

shrink()

class matplotlib.mathtext.**Char**(*c*, *state*, *math=True*)

Bases: *matplotlib.mathtext.Node*

Represents a single character. Unlike TeX, the font information and metrics are stored with each *Char* to make it easier to lookup the font metrics when needed. Note that TeX boxes have a width, height, and depth, unlike Type1 and Truetype which use a full bounding box and an advance in the x-direction. The metrics must be converted to the TeX way, and the advance (if different from width) must be converted into a *Kern* node when the *Char* is added to its parent *Hlist*.

get_kerning(*next*)

Return the amount of kerning between this and the given character. Called when characters are strung together into *Hlist* to create *Kern* nodes.

grow()

is_slanted()

render(*x*, *y*)

Render the character to the canvas

shrink()

class matplotlib.mathtext.**ComputerModernFontConstants**

Bases: *matplotlib.mathtext.FontConstantsBase*

delta = 0.075

delta_integral = 0.3

delta_slanted = 0.3

script_space = 0.075

sub1 = 0.2

sub2 = 0.3

subdrop = 0.2

sup1 = 0.45

class `matplotlib.mathtext.`**`DejaVuFonts`**(**args*, ***kwargs*)

Bases: *`matplotlib.mathtext.UnicodeFonts`*

use_cmex = False

class `matplotlib.mathtext.`**`DejaVuSansFontConstants`**

Bases: *`matplotlib.mathtext.FontConstantsBase`*

class `matplotlib.mathtext.`**`DejaVuSansFonts`**(**args*, ***kwargs*)

Bases: *`matplotlib.mathtext.DejaVuFonts`*

A font handling class for the DejaVu Sans fonts

If a glyph is not found it will fallback to Stix Sans

class `matplotlib.mathtext.`**`DejaVuSerifFontConstants`**

Bases: *`matplotlib.mathtext.FontConstantsBase`*

class `matplotlib.mathtext.`**`DejaVuSerifFonts`**(**args*, ***kwargs*)

Bases: *`matplotlib.mathtext.DejaVuFonts`*

A font handling class for the DejaVu Serif fonts

If a glyph is not found it will fallback to Stix Serif

`matplotlib.mathtext.`**`Error`**(*msg*)

Helper class to raise parser errors.

class `matplotlib.mathtext.`**`Fil`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`Fill`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`Filll`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`FontConstantsBase`**

Bases: `object`

A set of constants that controls how certain things, such as sub- and superscripts are laid out. These are all metrics that can’t be reliably retrieved from the font metrics in the font itself.

delta = 0.025

delta_integral = 0.1

delta_slanted = 0.2

script_space = 0.05

sub1 = 0.3

sub2 = 0.5

subdrop = 0.4

sup1 = 0.7

class `matplotlib.mathtext.`**Fonts**(*default_font_prop*, *mathtext_backend*)

Bases: `object`

An abstract base class for a system of fonts to use for mathtext.

The class must be able to take symbol keys and font file names and return the character metrics. It also delegates to a backend class to do the actual drawing.

default_font_prop: A `FontProperties` object to use for the default non-math font, or the base font for Unicode (generic) font rendering.

mathtext_backend: A subclass of `MathTextBackend` used to delegate the actual rendering.

destroy()

Fix any cyclical references before the object is about to be destroyed.

get_kern(*font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*)

Get the kerning distance for font between *sym1* and *sym2*.

fontX: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

fontclassX: TODO

symX: a symbol in raw TeX form. e.g., ‘1’, ‘x’ or ‘sigma’

fontsizeX: the fontsize in points

dpi: the current dots-per-inch

get_metrics(*font*, *font_class*, *sym*, *fontsize*, *dpi*, *math=True*)

font: one of the TeX font names:

```
tt, it, rm, cal, sf, bf or default/regular (non-math)
```

font_class: TODO

sym: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsize: font size in points

dpi: current dots-per-inch

math: whether sym is a math character

Returns an object with the following attributes:

- *advance*: The advance distance (in points) of the glyph.
- *height*: The height of the glyph in points.
- *width*: The width of the glyph in points.
- *xmin*, *xmax*, *ymin*, *ymax* - the ink rectangle of the glyph
- *iceberg* - the distance from the baseline to the top of the glyph. This corresponds to TeX's definition of "height".

get_results(*box*)
Get the data needed by the backend to render the math expression. The return value is backend-specific.

get_sized_alternatives_for_symbol(*fontname*, *sym*)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

get_underline_thickness(*font*, *fontsize*, *dpi*)
Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

get_used_characters()
Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

get_xheight(*font*, *fontsize*, *dpi*)
Get the xheight for the given *font* and *fontsize*.

render_glyph(*ox*, *oy*, *facename*, *font_class*, *sym*, *fontsize*, *dpi*)
Draw a glyph at

- *ox*, *oy*: position
- *facename*: One of the TeX face names
- *font_class*:
- *sym*: TeX symbol name or single character
- *fontsize*: fontsize in points

- *dpi*: The dpi to draw at.

render_rect_filled(*x1*, *y1*, *x2*, *y2*)
Draw a filled rectangle from (*x1*, *y1*) to (*x2*, *y2*).

set_canvas_size(*w*, *h*, *d*)
Set the size of the buffer used to render the math expression. Only really necessary for the bitmap backends.

class `matplotlib.mathtext.`**Glue**(*glue_type*, *copy=False*)
Bases: `matplotlib.mathtext.Node`

Most of the information in this object is stored in the underlying `GlueSpec` class, which is shared between multiple glue objects. (This is a memory optimization which probably doesn't matter anymore, but it's easier to stick to what TeX does.)

grow()

shrink()

class `matplotlib.mathtext.`**GlueSpec**(*width=0.0*, *stretch=0.0*, *stretch_order=0*, *shrink=0.0*, *shrink_order=0*)
Bases: `object`

See `Glue`.

copy()

classmethod factory(*glue_type*)

class `matplotlib.mathtext.`**HCentered**(*elements*)
Bases: `matplotlib.mathtext.Hlist`

A convenience class to create an `Hlist` whose contents are centered within its enclosing box.

class `matplotlib.mathtext.`**Hbox**(*width*)
Bases: `matplotlib.mathtext.Box`

A box with only width (zero height and depth).

class `matplotlib.mathtext.`**Hlist**(*elements*, *w=0.0*, *m='additional'*, *do_kern=True*)
Bases: `matplotlib.mathtext.List`

A horizontal list of boxes.

hpack(*w=0.0*, *m='additional'*)
The main duty of `hpack()` is to compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified. The computed sizes normally enclose all of the material inside the new box; but some items may stick out if negative glue is used, if the box is overfull, or if a `\vbox` includes other boxes that have been shifted left.

- *w*: specifies a width

- *m*: is either ‘exactly’ or ‘additional’.

Thus, `hpack(w, 'exactly')` produces a box whose width is exactly *w*, while `hpack(w, 'additional')` yields a box whose width is the natural width plus *w*. The default values produce a box with the natural width.

kern()

Insert `Kern` nodes between `Char` nodes to set kerning. The `Char` nodes themselves determine the amount of kerning they need (in `get_kerning()`), and this function just creates the linked list in the correct way.

class `matplotlib.mathtext.`**Hrule**(*state*, *thickness=None*)

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a horizontal rule.

class `matplotlib.mathtext.`**Kern**(*width*)

Bases: `matplotlib.mathtext.Node`

A `Kern` node has a width field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together or further apart. A kern node can also appear in a vertical list, when its *width* denotes additional spacing in the vertical direction.

depth = 0

grow()

height = 0

shrink()

class `matplotlib.mathtext.`**List**(*elements*)

Bases: `matplotlib.mathtext.Box`

A list of nodes (either horizontal or vertical).

grow()

shrink()

class `matplotlib.mathtext.`**MathTextParser**(*output*)

Bases: `object`

Create a MathTextParser for the given backend *output*.

get_depth(*texstr*, *dpi=120*, *fontsize=14*)

Returns the offset of the baseline from the bottom of the image in pixels.

texstr A valid mathtext string, e.g., r’IQ: $sigma_i=15$’

dpi The dots-per-inch to render the text

fontsize The font size in points

`parse`(*s*, *dpi=72*, *prop=None*)

Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a `FontProperties` object specifying the “default” font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to `parse()` with the same expression should be fast.

`to_mask`(*texstr*, *dpi=120*, *fontsize=14*)

texstr A valid mathtext string, e.g., r’IQ: $sigma_i=15$’

dpi The dots-per-inch to render the text

fontsize The font size in points

Returns a tuple (*array*, *depth*)

- *array* is an NxM uint8 alpha ubyte mask array of rasterized tex.
- depth is the offset of the baseline from the bottom of the image in pixels.

`to_png`(*filename*, *texstr*, *color='black'*, *dpi=120*, *fontsize=14*)

Writes a tex expression to a PNG file.

Returns the offset of the baseline from the bottom of the image in pixels.

filename A writable filename or fileobject

texstr A valid mathtext string, e.g., r’IQ: $sigma_i=15$’

color A valid matplotlib color argument

dpi The dots-per-inch to render the text

fontsize The font size in points

Returns the offset of the baseline from the bottom of the image in pixels.

`to_rgba`(*texstr*, *color='black'*, *dpi=120*, *fontsize=14*)

texstr A valid mathtext string, e.g., r’IQ: $sigma_i=15$’

color Any matplotlib color argument

dpi The dots-per-inch to render the text

fontsize The font size in points

Returns a tuple (*array*, *depth*)

- *array* is an NxM uint8 alpha ubyte mask array of rasterized tex.
- depth is the offset of the baseline from the bottom of the image in pixels.

exception `matplotlib.mathtext.`**`MathTextWarning`**

Bases: `Warning`

class `matplotlib.mathtext.`**`MathtextBackend`**

Bases: `object`

The base class for the mathtext backend-specific code. The purpose of `MathtextBackend` subclasses is to interface between mathtext and a specific matplotlib graphics backend.

Subclasses need to override the following:

- `render_glyph()`
- `render_rect_filled()`
- `get_results()`

And optionally, if you need to use a FreeType hinting style:

- `get_hinting_type()`

`get_hinting_type``()`

Get the FreeType hinting type to use with this particular backend.

`get_results``(`*box*`)`

Return a backend-specific tuple to return to the backend after all processing is done.

`render_glyph``(`*ox*, *oy*, *info*`)`

Draw a glyph described by *info* to the reference point (*ox*, *oy*).

`render_rect_filled``(`*x1*, *y1*, *x2*, *y2*`)`

Draw a filled black rectangle from (*x1*, *y1*) to (*x2*, *y2*).

`set_canvas_size``(`*w*, *h*, *d*`)`

Dimension the drawing canvas

class `matplotlib.mathtext.`**`MathtextBackendAgg`**

Bases: `matplotlib.mathtext.MathtextBackend`

Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

`get_hinting_type``()`

`get_results``(`*box*, *used_characters*`)`

`render_glyph``(`*ox*, *oy*, *info*`)`

`render_rect_filled``(`*x1*, *y1*, *x2*, *y2*`)`

`set_canvas_size``(`*w*, *h*, *d*`)`

class `matplotlib.mathtext.`**`MathtextBackendBitmap`**

Bases: `matplotlib.mathtext.MathtextBackendAgg`

get_results(*box*, *used_characters*)

class `matplotlib.mathtext.`**MathtextBackendCairo**

Bases: *`matplotlib.mathtext.MathtextBackend`*

Store information to write a mathtext rendering to the Cairo backend.

get_results(*box*, *used_characters*)

render_glyph(*ox*, *oy*, *info*)

render_rect_filled(*x1*, *y1*, *x2*, *y2*)

class `matplotlib.mathtext.`**MathtextBackendPath**

Bases: *`matplotlib.mathtext.MathtextBackend`*

Store information to write a mathtext rendering to the text path machinery.

get_results(*box*, *used_characters*)

render_glyph(*ox*, *oy*, *info*)

render_rect_filled(*x1*, *y1*, *x2*, *y2*)

class `matplotlib.mathtext.`**MathtextBackendPdf**

Bases: *`matplotlib.mathtext.MathtextBackend`*

Store information to write a mathtext rendering to the PDF backend.

get_results(*box*, *used_characters*)

render_glyph(*ox*, *oy*, *info*)

render_rect_filled(*x1*, *y1*, *x2*, *y2*)

class `matplotlib.mathtext.`**MathtextBackendPs**

Bases: *`matplotlib.mathtext.MathtextBackend`*

Store information to write a mathtext rendering to the PostScript backend.

get_results(*box*, *used_characters*)

render_glyph(*ox*, *oy*, *info*)

render_rect_filled(*x1*, *y1*, *x2*, *y2*)

class `matplotlib.mathtext.`**`MathtextBackendSvg`**

Bases: *`matplotlib.mathtext.MathtextBackend`*

Store information to write a mathtext rendering to the SVG backend.

`get_results`(*box*, *used_characters*)

`render_glyph`(*ox*, *oy*, *info*)

`render_rect_filled`(*x1*, *y1*, *x2*, *y2*)

class `matplotlib.mathtext.`**`NegFil`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`NegFill`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`NegFilll`**

Bases: *`matplotlib.mathtext.Glue`*

class `matplotlib.mathtext.`**`Node`**

Bases: `object`

A node in the TeX box model

`get_kerning`(*next*)

`grow`()

Grows one level larger. There is no limit to how big something can get.

`render`(*x*, *y*)

`shrink`()

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class `matplotlib.mathtext.`**`Parser`**

Bases: `object`

This is the pyparsing-based parser for math expressions. It actually parses full strings *containing* math expressions, in that raw text may also appear outside of pairs of `$`.

The grammar is based directly on that in TeX, though it cuts a few corners.

class **`State`**(*font_output*, *font*, *font_class*, *fontsize*, *dpi*)

Bases: `object`

Stores the state of the parser.

States are pushed and popped from a stack as necessary, and the "current" state is always at the top of the stack.

copy()

font

accent(*s*, *loc*, *toks*)

auto_delim(*s*, *loc*, *toks*)

binom(*s*, *loc*, *toks*)

c_over_c(*s*, *loc*, *toks*)

customspace(*s*, *loc*, *toks*)

end_group(*s*, *loc*, *toks*)

font(*s*, *loc*, *toks*)

frac(*s*, *loc*, *toks*)

function(*s*, *loc*, *toks*)

genfrac(*s*, *loc*, *toks*)

get_state()
Get the current `State` of the parser.

group(*s*, *loc*, *toks*)

is_between_brackets(*s*, *loc*)

is_dropsub(*nucleus*)

is_overunder(*nucleus*)

is_slanted(*nucleus*)

main(*s*, *loc*, *toks*)

math(*s*, *loc*, *toks*)

math_string(*s*, *loc*, *toks*)

non_math(*s*, *loc*, *toks*)

operatorname(*s*, *loc*, *toks*)

overline(*s*, *loc*, *toks*)

parse(*s*, *fonts_object*, *fontsize*, *dpi*)

Parse expression *s* using the given *fonts_object* for output, at the given *fontsize* and *dpi*.

Returns the parse tree of `Node` instances.

pop_state()

Pop a `State` off of the stack.

push_state()

Push a new `State` onto the stack which is just a copy of the current state.

required_group(*s*, *loc*, *toks*)

simple_group(*s*, *loc*, *toks*)

snowflake(*s*, *loc*, *toks*)

space(*s*, *loc*, *toks*)

sqrt(*s*, *loc*, *toks*)

stackrel(*s*, *loc*, *toks*)

start_group(*s*, *loc*, *toks*)

subsuper(*s*, *loc*, *toks*)

symbol(*s*, *loc*, *toks*)

unknown_symbol(*s*, *loc*, *toks*)

class `matplotlib.mathtext.`**`Rule`**(*width*, *height*, *depth*, *state*)

Bases: `matplotlib.mathtext.Box`

A `Rule` node stands for a solid black rectangle; it has *width*, *depth*, and *height* fields just as in an `Hlist`. However, if any of these dimensions is inf, the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a "running dimension." The width is never running in an `Hlist`; the height and depth are never running in a `Vlist`.

`render`(*x*, *y*, *w*, *h*)

class `matplotlib.mathtext.`**`STIXFontConstants`**

Bases: `matplotlib.mathtext.FontConstantsBase`

`delta` **= 0.05**

`delta_integral` **= 0.3**

`delta_slanted` **= 0.3**

`script_space` **= 0.1**

`sub2` **= 0.6**

`sup1` **= 0.8**

class `matplotlib.mathtext.`**`STIXSansFontConstants`**

Bases: `matplotlib.mathtext.FontConstantsBase`

`delta_integral` **= 0.3**

`delta_slanted` **= 0.6**

`script_space` **= 0.05**

`sup1` **= 0.8**

class `matplotlib.mathtext.`**`Ship`**

Bases: `object`

Once the boxes have been set up, this sends them to output. Since boxes can be inside of boxes inside of boxes, the main work of `Ship` is done by two mutually recursive routines, `hlist_out()` and `vlist_out()`, which traverse the `Hlist` nodes and `Vlist` nodes inside of horizontal and vertical boxes. The global variables used in TeX to store state as it processes have become member variables here.

static **clamp**(*value*)

hlist_out(*box*)

vlist_out(*box*)

class matplotlib.mathtext.**SsGlue**

Bases: *matplotlib.mathtext.Glue*

class matplotlib.mathtext.**StandardPsFonts**(*default_font_prop*)

Bases: *matplotlib.mathtext.Fonts*

Use the standard postscript fonts for rendering to backend_ps

Unlike the other font classes, BakomaFont and UnicodeFont, this one requires the Ps backend.

basepath = '/tmp/mpl_clean/lib/python3.6/site-packages/matplotlib/mpl-data/fonts/afm'

fontmap = {'cal': 'pzcmi8a', 'rm': 'pncr8a', 'tt': 'pcrr8a', 'it': 'pncri8a', 'sf': 'phvr8a', 'bf': 'pncb8a', None:

get_kern(*font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*)

get_underline_thickness(*font*, *fontsize*, *dpi*)

get_xheight(*font*, *fontsize*, *dpi*)

class matplotlib.mathtext.**StixFonts**(**args*, ***kwargs*)

Bases: *matplotlib.mathtext.UnicodeFonts*

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:

- supports "virtual fonts" which are complete alpha numeric character sets with different font styles at special Unicode code points, such as "Blackboard".
- handles sized alternative characters for the STIXSizeX fonts.

cm_fallback = False

get_sized_alternatives_for_symbol(*fontname*, *sym*)

use_cmex = False

class matplotlib.mathtext.**StixSansFonts**(**args*, ***kwargs*)

Bases: *matplotlib.mathtext.StixFonts*

A font handling class for the STIX fonts (that uses sans-serif characters by default).

class `matplotlib.mathtext.`**`SubSuperCluster`**

Bases: *`matplotlib.mathtext.Hlist`*

`SubSuperCluster` is a sort of hack to get around that fact that this code do a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

class `matplotlib.mathtext.`**`TruetypeFonts`**`(`*default_font_prop*, *mathtext_backend*`)`

Bases: *`matplotlib.mathtext.Fonts`*

A generic base class for all font setups that use Truetype fonts (through FT2Font).

`destroy``()`

`get_kern``(`*font1*, *fontclass1*, *sym1*, *fontsize1*, *font2*, *fontclass2*, *sym2*, *fontsize2*, *dpi*`)`

`get_underline_thickness``(`*font*, *fontsize*, *dpi*`)`

`get_xheight``(`*fontname*, *fontsize*, *dpi*`)`

class `matplotlib.mathtext.`**`UnicodeFonts`**`(`**args*, ***kwargs*`)`

Bases: *`matplotlib.mathtext.TruetypeFonts`*

An abstract base class for handling Unicode fonts.

While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I’m aware of with a complete set of math symbols is STIX.

This class will “fallback” on the Bakoma fonts when a required symbol can not be found in the font.

`get_sized_alternatives_for_symbol``(`*fontname*, *sym*`)`

`use_cmex` **= True**

class `matplotlib.mathtext.`**`VCentered`**`(`*elements*`)`

Bases: *`matplotlib.mathtext.Hlist`*

A convenience class to create a *`Vlist`* whose contents are centered within its enclosing box.

class `matplotlib.mathtext.`**`Vbox`**`(`*height*, *depth*`)`

Bases: *`matplotlib.mathtext.Box`*

A box with only height (zero width).

class `matplotlib.mathtext.`**`Vlist`**`(`*elements*, *h=0.0*, *m=’additional’*`)`

Bases: *`matplotlib.mathtext.List`*

A vertical list of boxes.

vpack(*h=0.0*, *m='additional'*, *l=inf*)

The main duty of `vpack()` is to compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified.

- *h*: specifies a height
- *m*: is either 'exactly' or 'additional'.
- *l*: a maximum height

Thus, `vpack(h, 'exactly')` produces a box whose height is exactly *h*, while `vpack(h, 'additional')` yields a box whose height is the natural height plus *h*. The default values produce a box with the natural width.

class `matplotlib.mathtext.`**`Vrule`**(*state*)

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a vertical rule.

`matplotlib.mathtext.`**`get_unicode_index`**(*symbol*[, *bool*]) → integer

Return the integer index (from the Unicode table) of symbol. *symbol* can be a single unicode character, a TeX command (i.e. r'pi'), or a Type1 symbol name (i.e. 'phi'). If math is False, the current symbol should be treated as a non-math symbol.

`matplotlib.mathtext.`**`math_to_image`**(*s*, *filename_or_obj*, *prop=None*, *dpi=None*, *format=None*)

Given a math expression, renders it in a closely-clipped bounding box to an image file.

s A math expression. The math portion should be enclosed in dollar signs.

filename_or_obj A filepath or writable file-like object to write the image data to.

prop If provided, a FontProperties() object describing the size and style of the text.

dpi Override the output dpi, otherwise use the default associated with the output format.

format The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not provided, will be deduced from the filename.

`matplotlib.mathtext.`**`unichr_safe`**(*index*)

Return the Unicode character corresponding to the index, or the replacement character if this is a narrow build of Python and the requested character is outside the BMP.

CHAPTER
THIRTYNINE

MLAB

39.1 `matplotlib.mlab`

Numerical python functions written for compatability with MATLAB commands with the same names.

39.1.1 MATLAB compatible functions

`cohere()` Coherence (normalized cross spectral density)

`csd()` Cross spectral density using Welch's average periodogram

`detrend()` Remove the mean or best fit line from an array

`find()` Return the indices where some condition is true; numpy.nonzero is similar but more general.

`griddata()` Interpolate irregularly distributed data to a regular grid.

`prctile()` Find the percentiles of a sequence

`prepca()` Principal Component Analysis

`psd()` Power spectral density using Welch's average periodogram

`rk4()` A 4th order runge kutta integrator for 1D or ND systems

`specgram()` Spectrogram (spectrum over segments of time)

39.1.2 Miscellaneous functions

Functions that don't exist in MATLAB, but are useful anyway:

`cohere_pairs()` Coherence over all pairs. This is not a MATLAB function, but we compute coherence a lot in my lab, and we compute it for a lot of pairs. This function is optimized to do this efficiently by caching the direct FFTs.

`rk4()` A 4th order Runge-Kutta ODE integrator in case you ever find yourself stranded without scipy (and the far superior scipy.integrate tools)

`contiguous_regions()` Return the indices of the regions spanned by some logical mask

`cross_from_below()` Return the indices where a 1D array crosses a threshold from below

cross_from_above()	Return the indices where a 1D array crosses a threshold from above
complex_spectrum()	Return the complex-valued frequency spectrum of a signal
magnitude_spectrum()	Return the magnitude of the frequency spectrum of a signal
angle_spectrum()	Return the angle (wrapped phase) of the frequency spectrum of a signal
phase_spectrum()	Return the phase (unwrapped angle) of the frequency spectrum of a signal
detrend_mean()	Remove the mean from a line.
demean()	Remove the mean from a line. This function is the same as *detrend_mean()* except for the default *axis*.
detrend_linear()	Remove the best fit line from a line.
detrend_none()	Return the original line.
stride_windows()	Get all windows in an array in a memory-efficient manner
stride_repeat()	Repeat an array in a memory-efficient manner
apply_window()	Apply a window along a given axis

39.1.3 record array helper functions

A collection of helper methods for numpyrecord arrays

> See *misc Examples*

rec2txt()	Pretty print a record array
rec2csv()	Store record array in CSV file
csv2rec()	Import record array from CSV file with type inspection
rec_append_fields()	Adds field(s)/array(s) to record array
rec_drop_fields()	Drop fields from record array
rec_join()	Join two record arrays on sequence of fields
recs_join()	A simple join of multiple recarrays using a single column as a key
rec_groupby()	Summarize data by groups (similar to SQL GROUP BY)
rec_summarize()	Helper code to filter rec array fields into new fields

For the rec viewer functions(e rec2csv), there are a bunch of Format objects you can pass into the functions that will do things like color negative values red, set percent formatting and scaling, etc.

Example usage:

```
r = csv2rec('somefile.csv', checkrows=0)

formatd = dict(
    weight = FormatFloat(2),
    change = FormatPercent(2),
    cost   = FormatThousands(2),
    )

rec2excel(r, 'test.xls', formatd=formatd)
rec2csv(r, 'test.csv', formatd=formatd)
scroll = rec2gtk(r, formatd=formatd)

win = gtk.Window()
win.set_size_request(600,800)
win.add(scroll)
win.show_all()
gtk.main()
```

class `matplotlib.mlab.`**`FormatBool`**

Bases: *`matplotlib.mlab.FormatObj`*

`fromstr`(*s*)

`toval`(*x*)

class `matplotlib.mlab.`**`FormatDate`**(*fmt*)

Bases: *`matplotlib.mlab.FormatObj`*

`fromstr`(*x*)

`toval`(*x*)

class `matplotlib.mlab.`**`FormatDatetime`**(*fmt='%Y-%m-%d %H:%M:%S'*)

Bases: *`matplotlib.mlab.FormatDate`*

`fromstr`(*x*)

class `matplotlib.mlab.`**`FormatFloat`**(*precision=4*, *scale=1.0*)

Bases: *`matplotlib.mlab.FormatFormatStr`*

`fromstr`(*s*)

`toval`(*x*)

class `matplotlib.mlab.`**`FormatFormatStr`**(*fmt*)

Bases: *`matplotlib.mlab.FormatObj`*

`tostr`(*x*)

class `matplotlib.mlab.`**`FormatInt`**

Bases: *`matplotlib.mlab.FormatObj`*

fromstr(*s*)

tostr(*x*)

toval(*x*)

class `matplotlib.mlab.`**FormatMillions**(*precision=4*)
Bases: *matplotlib.mlab.FormatFloat*

class `matplotlib.mlab.`**FormatObj**
Bases: `object`

fromstr(*s*)

tostr(*x*)

toval(*x*)

class `matplotlib.mlab.`**FormatPercent**(*precision=4*)
Bases: *matplotlib.mlab.FormatFloat*

class `matplotlib.mlab.`**FormatString**
Bases: *matplotlib.mlab.FormatObj*

tostr(*x*)

class `matplotlib.mlab.`**FormatThousands**(*precision=4*)
Bases: *matplotlib.mlab.FormatFloat*

class `matplotlib.mlab.`**GaussianKDE**(*dataset*, *bw_method=None*)
Bases: `object`

Representation of a kernel-density estimate using Gaussian kernels.

Parameters dataset : array_like

Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2-D array with shape (# of dims, # of data).

bw_method : str, scalar or callable, optional

The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a *GaussianKDE* instance as only parameter and return a scalar. If None (default), 'scott' is used.

Attributes

dataset	(ndarray) The dataset with which `gaussian_kde` was initialized.
dim	(int) Number of dimensions.
num_dp	(int) Number of datapoints.
factor	(float) The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.
covariance	(ndarray) The covariance matrix of `dataset`, scaled by the calculated bandwidth (`kde.factor`).
inv_cov	(ndarray) The inverse of `covariance`.

Methods

kde.evaluate(points)	(ndarray) Evaluate the estimated pdf on a provided set of points.
kde(points)	(ndarray) Same as kde.evaluate(points)

covariance_factor()

evaluate(*points*)

Evaluate the estimated pdf on a set of points.

Parameters points : (# of dimensions, # of points)-array

Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

Returns values : (# of points,)-array

The values at each point.

Raises ValueError : if the dimensionality of the input points is different

than the dimensionality of the KDE.

scotts_factor()

silverman_factor()

class matplotlib.mlab.**PCA**(*a*, *standardize=True*)

Bases: `object`

compute the SVD of a and store data for PCA. Use project to project the data onto a reduced set of dimensions

Parameters a : np.ndarray

A numobservations x numdims array

standardize : bool

True if input data are to be standardized. If False, only centering will be carried out.

Notes

The factor loadings are in the `Wt` factor, i.e., the factor loadings for the first principal component are given by `Wt[0]`. This row is also the first eigenvector.

Attributes

a	A centered unit sigma version of input `a`.
numrows, numcols	The dimensions of `a`.
mu	A numdims array of means of `a`. This is the vector that points to the origin of PCA space.
sigma	A numdims array of standard deviation of `a`.
fracs	The proportion of variance of each of the principal components.
s	The actual eigenvalues of the decomposition.
Wt	The weight vector for projecting a numdims point or array into PCA space.
Y	A projected into PCA space.

`center`(*x*)

center and optionally standardize the data using the mean and sigma from training set a

`project`(*x*, *minfrac=0.0*)

project x onto the principle axes, dropping any axes where fraction of variance<minfrac

`matplotlib.mlab.`**`amap`**(*function*, *sequence*[, *sequence*, *...*]) → array.

Works like `map()`, but it returns an array. This is just a convenient shorthand for `numpy.array(map(...))`.

`matplotlib.mlab.`**`angle_spectrum`**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the angle of the frequency spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see *`window_hanning()`*, *`window_none()`*, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is *`window_hanning()`*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns spectrum : 1-D array

The values for the angle spectrum in radians (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

See also:

`complex_spectrum()` This function returns the angle value of `complex_spectrum()`.

`magnitude_spectrum()` `angle_spectrum()` returns the magnitudes of the corresponding frequencies.

`phase_spectrum()` `phase_spectrum()` returns the unwrapped version of this function.

`specgram()` `specgram()` can return the angle spectrum of segments within the signal.

`matplotlib.mlab.`**`apply_window`**(*x*, *window*, *axis=0*, *return_window=None*)

Apply the given window to the given 1D or 2D array along the given axis.

Parameters x : 1D or 2D array or sequence

Array or sequence containing the data.

window : function or array.

Either a function to generate a window or an array with length *x*.shape[*axis*]

axis : integer

The axis over which to do the repetition. Must be 0 or 1. The default is 0

return_window : bool

If true, also return the 1D values of the window that was applied `matplotlib.mlab.`**`base_repr`**`(`*number*, *base=2*, *padding=0*`)`

Return the representation of a *number* in any given *base*.

`matplotlib.mlab.`**`binary_repr`**`(`*number*, *max_length=1025*`)`

Return the binary representation of the input *number* as a string.

This is more efficient than using `base_repr()` with base 2.

Increase the value of max_length for very large numbers. Note that on 32-bit machines, 2**1023 is the largest integer power of 2 which can be converted to a Python float.

`matplotlib.mlab.`**`bivariate_normal`**`(`*X*, *Y*, *sigmax=1.0*, *sigmay=1.0*, *mux=0.0*, *muy=0.0*, *sigmaxy=0.0*`)`

Bivariate Gaussian distribution for equal shape *X*, *Y*.

See bivariate normal at mathworld.

`matplotlib.mlab.`**`center_matrix`**`(`*M*, *dim=0*`)`

Return the matrix *M* with each row having zero mean and unit std.

If *dim* = 1 operate on columns instead of rows. (*dim* is opposite to the numpy axis kwarg.)

`matplotlib.mlab.`**`cohere`**`(`*x*, *y*, *NFFT=256*, *Fs=2*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*`)`

The coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}} \tag{39.1}$$

Parameters x, y

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between blocks. The default value is 0 (no overlap).

Returns The return value is the tuple (Cxy, f), where f are the

frequencies of the coherence vector. For cohere, scaling the

individual densities by the sampling frequency has no effect,

since the factors cancel out.

See also:

psd(), *csd()*

`matplotlib.mlab.`**`cohere_pairs`**(*X*, *ij*, *NFFT=256*, *Fs=2*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *preferSpeedOverMemory=True*, *progressCallback=<function donothing_callback>*, *returnPxx=False*)

Compute the coherence and phase for all pairs *ij*, in *X*.

X is a *numSamples* * *numCols* array

ij is a list of tuples. Each tuple is a pair of indexes into the columns of X for which you want to compute coherence. For example, if *X* has 64 columns, and you want to compute all nonredundant pairs, define *ij* as:

```
ij = []
for i in range(64):
    for j in range(i+1,64):
        ij.append( (i,j) )
```

preferSpeedOverMemory is an optional bool. Defaults to true. If False, limits the caching by only making one, rather than two, complex cache arrays. This is useful if memory becomes critical. Even when *preferSpeedOverMemory* is False, `cohere_pairs()` will still give significant performace gains over calling `cohere()` for each pair, and will use subtantially less memory than if *preferSpeedOverMemory* is True. In my tests with a 43000,64 array over all nonredundant pairs, *preferSpeedOverMemory* = True delivered a 33% performance boost on a 1.7GHZ Athlon with 512MB RAM compared with *preferSpeedOverMemory* = False. But both solutions were more than 10x faster than naively crunching all possible pairs through `cohere()`.

Returns Cxy : dictionary of (i, j) tuples -> coherence vector for

that pair. i.e., `Cxy[(i,j) = cohere(X[:,i], X[:,j])`. Number of dictionary keys is `len(ij)`.

Phase : dictionary of phases of the cross spectral density at

each frequency for each pair. Keys are (i, j).

freqs : vector of frequencies, equal in length to either the

coherence or phase vectors for any (i, j) key.

e.g., to make a coherence Bode plot:

```
subplot(211)
plot( freqs, Cxy[(12,19)])
subplot(212)
plot( freqs, Phase[(12,19)])
```

For a large number of pairs, `cohere_pairs()` can be much more

efficient than just calling `cohere()` for each pair, because

it caches most of the intensive computations. If N is the

number of pairs, this function is $O(N)$ for most of the

heavy lifting, whereas calling cohere for each pair is

$O(N^2)$. However, because of the caching, it is also more

memory intensive, making 2 additional complex arrays with

approximately the same number of elements as X.

See `test/cohere_pairs_test.py` in the src tree for an

example script that shows that this `cohere_pairs()` and `cohere()` give the same results for a given pair.

See also:

`psd()` For information about the methods used to compute P_{xy}, P_{xx} and P_{yy}.

`matplotlib.mlab.`**`complex_spectrum`**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the complex-valued frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns spectrum : 1-D array

The values for the complex spectrum (complex valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

See also:

`magnitude_spectrum()` `magnitude_spectrum()` returns the absolute value of this function.

`angle_spectrum()` *`angle_spectrum()`* returns the angle of this function.

`phase_spectrum()` *`phase_spectrum()`* returns the phase (unwrapped angle) of this function.

`specgram()` *`specgram()`* can return the complex spectrum of segments within the signal.

`matplotlib.mlab.`**`contiguous_regions`**`(`*mask*`)`

return a list of (ind0, ind1) such that mask[ind0:ind1].all() is True and we cover all such regions

`matplotlib.mlab.`**`cross_from_above`**`(`*x*, *threshold*`)`

return the indices into *x* where *x* crosses some threshold from below, e.g., the i's where:

```
x[i-1]>threshold and x[i]<=threshold
```

See also:

`cross_from_below()`

`matplotlib.mlab.`**`cross_from_below`**`(`*x*, *threshold*`)`

return the indices into *x* where *x* crosses some threshold from below, e.g., the i's where:

```
x[i-1]<threshold and x[i]>=threshold
```

Example code:

```
import matplotlib.pyplot as plt

t = np.arange(0.0, 2.0, 0.1)
s = np.sin(2*np.pi*t)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(t, s, '-o')
ax.axhline(0.5)
ax.axhline(-0.5)

ind = cross_from_below(s, 0.5)
ax.vlines(t[ind], -1, 1)

ind = cross_from_above(s, -0.5)
ax.vlines(t[ind], -1, 1)

plt.show()
```

See also:

`cross_from_above()`

`matplotlib.mlab.`**`csd`**`(`*x*, *y*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*`)`

Compute the cross-spectral density.

Call signature:

```
csd(x, y, NFFT=256, Fs=2, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None)
```

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors x and y are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of x and y are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(x) < *NFFT* or len(y) < *NFFT*, they will be zero padded to *NFFT*.

Parameters x, y : 1-D arrays or sequences

Arrays or sequences containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see *`window_hanning()`*, *`window_none()`*, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is *`window_hanning()`*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between segments. The default value is 0 (no overlap).

Returns Pxy : 1-D array

The values for the cross spectrum `P_{xy}` before scaling (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *Pxy*

See also:

`psd()` `psd()` is the equivalent to setting y=x.

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.csv2rec`(*fname*, *comments='#'*, *skiprows=0*, *checkrows=0*, *delimiter=',* *'*, *converterd=None*, *names=None*, *missing=''*, *missingd=None*, *use_mrecords=False*, *dayfirst=False*, *yearfirst=False*)

Load data from comma/space/tab delimited file in *fname* into a numpy record array and return the record array.

If *names* is *None*, a header row is required to automatically assign the recarray names. The headers will be lower cased, spaces will be converted to underscores, and illegal attribute name characters removed. If *names* is not *None*, it is a sequence of names to use for the column names. In this case, it is assumed there is no header row.

- *fname*: can be a filename or a file handle. Support for gzipped files is automatic, if the filename ends in '.gz'
- *comments*: the character used to indicate the start of a comment in the file, or *None* to switch off the removal of comments
- *skiprows*: is the number of rows from the top to skip

- *checkrows*: is the number of rows to check to validate the column data type. When set to zero all rows are validated.
- *converterd*: if not *None*, is a dictionary mapping column number or munged column name to a converter function.
- *names*: if not None, is a list of header names. In this case, no header will be read from the file
- *missingd* is a dictionary mapping munged column names to field values which signify that the field does not contain actual data and should be masked, e.g., ‘0000-00-00’ or ‘unused’
- *missing*: a string whose value signals a missing field regardless of the column it appears in
- *use_mrecords*: if True, return an mrecords.fromrecords record array if any of the data are missing
- *dayfirst*: default is False so that MM-DD-YY has precedence over DD-MM-YY. See http://labix.org/python-dateutil#head-b95ce2094d189a89f80f5ae52a05b4ab7b41af47 for further information.
- *yearfirst*: default is False so that MM-DD-YY has precedence over YY-MM-DD. See http://labix.org/python-dateutil#head-b95ce2094d189a89f80f5ae52a05b4ab7b41af47 for further information.

If no rows are found, *None* is returned – see `examples/loadrec.py`

`matplotlib.mlab.`**`csvformat_factory`**`(`*format*`)`

`matplotlib.mlab.`**`demean`**`(`*x*, *axis=0*`)`

Return x minus its mean along the specified axis.

Parameters x : array or sequence

Array or sequence containing the data Can have any dimensionality

axis : integer

The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

`delinear()`

`denone()` `delinear()` and `denone()` are other detrend algorithms.

`detrend_mean()` This function is the same as *`detrend_mean()`* except for the default *axis*.

`matplotlib.mlab.`**`detrend`**`(`*x*, *key=None*, *axis=None*`)`

Return x with its trend removed.

Parameters x : array or sequence

Array or sequence containing the data.

key : [‘default’ | ‘constant’ | ‘mean’ | ‘linear’ | ‘none’] or function

Specifies the detrend algorithm to use. ‘default’ is ‘mean’, which is the same as *`detrend_mean()`*. ‘constant’ is the same. ‘linear’ is the same as *detrend_linear()*. 'none' is the same as *detrend_none()*. The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

axis : integer

The axis along which to do the detrending.

See also:

detrend_mean() *detrend_mean()* implements the 'mean' algorithm.

detrend_linear() *detrend_linear()* implements the 'linear' algorithm.

detrend_none() *detrend_none()* implements the 'none' algorithm.

`matplotlib.mlab.`**`detrend_linear`**(*y*)

Return x minus best fit line; 'linear' detrending.

Parameters y : 0-D or 1-D array or sequence

Array or sequence containing the data

axis : integer

The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

`delinear()` This function is the same as `delinear()` except for the default *axis*.

detrend_mean()

detrend_none() *detrend_mean()* and *detrend_none()* are other detrend algorithms.

detrend() *detrend()* is a wrapper around all the detrend algorithms.

`matplotlib.mlab.`**`detrend_mean`**(*x*, *axis=None*)

Return x minus the mean(x).

Parameters x : array or sequence

Array or sequence containing the data Can have any dimensionality

axis : integer

The axis along which to take the mean. See numpy.mean for a description of this argument.

See also:

demean() This function is the same as *demean()* except for the default *axis*.

detrend_linear()

detrend_none() *detrend_linear()* and *detrend_none()* are other detrend algorithms.

detrend() *detrend()* is a wrapper around all the detrend algorithms.

`matplotlib.mlab.`**`detrend_none`**`(`*x*, *axis=None*`)`

Return x: no detrending.

Parameters x : any object

An object containing the data

axis : integer

This parameter is ignored. It is included for compatibility with detrend_mean

See also:

`denone()` This function is the same as `denone()` except for the default *axis*, which has no effect.

detrend_mean()

detrend_linear() *detrend_mean()* and *detrend_linear()* are other detrend algorithms.

detrend() *detrend()* is a wrapper around all the detrend algorithms.

`matplotlib.mlab.`**`dist`**`(`*x*, *y*`)`

Return the distance between two points.

`matplotlib.mlab.`**`dist_point_to_segment`**`(`*p*, *s0*, *s1*`)`

Get the distance of a point to a segment.

p, *s0*, *s1* are *xy* sequences

This algorithm from http://geomalgorithms.com/a02-_lines.html

`matplotlib.mlab.`**`distances_along_curve`**`(`*X*`)`

Computes the distance between a set of successive points in *N* dimensions.

Where *X* is an *M* x *N* array or matrix. The distances between successive rows is computed. Distance is the standard Euclidean distance.

`matplotlib.mlab.`**`donothing_callback`**`(`**args*`)`

`matplotlib.mlab.`**`entropy`**`(`*y*, *bins*`)`

Return the entropy of the data in *y* in units of nat.

$$-\sum p_i \ln(p_i) \tag{39.2}$$

where p_i is the probability of observing *y* in the i^{th} bin of *bins*. *bins* can be a number of bins or a range of bins; see `numpy.histogram()`.

Compare *S* with analytic calculation for a Gaussian:

```
x = mu + sigma * randn(200000)
Sanalytic = 0.5 * ( 1.0 + log(2*pi*sigma**2.0) )
```

`matplotlib.mlab.`**`exp_safe`**`(`*x*`)`

Compute exponentials which safely underflow to zero.

Slow, but convenient to use. Note that numpy provides proper floating point exception handling with access to the underlying hardware.

`matplotlib.mlab.`**`fftsurr`**`(`*x*, *detrend=<function detrend_none>*, *window=<function window_none>*`)`

Compute an FFT phase randomized surrogate of *x*.

`matplotlib.mlab.`**`find`**`(`*condition*`)`

Return the indices where ravel(condition) is true

`matplotlib.mlab.`**`frange`**`([`*start*`]`, *stop*`[`, *step*, *keywords*`])` → array of floats

Return a numpy ndarray containing a progression of floats. Similar to `numpy.arange()`, but defaults to a closed interval.

`frange(x0, x1)` returns `[x0, x0+1, x0+2, ..., x1]`; *start* defaults to 0, and the endpoint *is included*. This behavior is different from that of `range()` and `numpy.arange()`. This is deliberate, since `frange()` will probably be more useful for generating lists of points for function evaluation, and endpoints are often desired in this use. The usual behavior of `range()` can be obtained by setting the keyword *closed* = 0, in this case, `frange()` basically becomes :func:numpy.arange‘.

When *step* is given, it specifies the increment (or decrement). All arguments can be floating point numbers.

`frange(x0,x1,d)` returns `[x0,x0+d,x0+2d,...,xfin]` where *xfin* <= *x1*.

`frange()` can also be called with the keyword *npts*. This sets the number of points the list should contain (and overrides the value *step* might have been given). `numpy.arange()` doesn’t offer this option.

Examples:

```
>>> frange(3)
array([ 0.,  1.,  2.,  3.])
>>> frange(3,closed=0)
array([ 0.,  1.,  2.])
>>> frange(1,6,2)
array([1, 3, 5])   or 1,3,5,7, depending on floating point vagueries
>>> frange(1,6.5,npts=5)
array([ 1.   ,  2.375,  3.75 ,  5.125,  6.5  ])
```

`matplotlib.mlab.`**`get_formatd`**`(`*r*, *formatd=None*`)`

build a formatd guaranteed to have a key for every dtype name

`matplotlib.mlab.`**`get_sparse_matrix`**`(`*M*, *N*, *frac=0.1*`)`

Return a *M* x *N* sparse matrix with *frac* elements randomly filled.

`matplotlib.mlab.`**`get_xyz_where`**`(`*Z*, *Cond*`)`

Z and *Cond* are *M* x *N* matrices. *Z* are data and *Cond* is a boolean matrix where some condition is satisfied. Return value is (*x*, *y*, *z*) where *x* and *y* are the indices into *Z* and *z* are the values of *Z* at those indices. *x*, *y*, and *z* are 1D arrays.

`matplotlib.mlab.`**`griddata`**`(`*x*, *y*, *z*, *xi*, *yi*, *interp='nn'*`)`

Interpolates from a nonuniformly spaced grid to some other grid.

Fits a surface of the form z = f(`x`, `y`) to the data in the (usually) nonuniformly spaced vectors (`x`, `y`, `z`), then interpolates this surface at the points specified by (`xi`, `yi`) to produce `zi`.

Parameters x, y, z : 1d array_like

Coordinates of grid points to interpolate from.

xi, yi : 1d or 2d array_like

Coordinates of grid points to interpolate to.

interp : string key from {'nn', 'linear'}

Interpolation algorithm, either 'nn' for natural neighbor, or 'linear' for linear interpolation.

Returns 2d float array

Array of values interpolated at (`xi`, `yi`) points. Array will be masked is any of (`xi`, `yi`) are outside the convex hull of (`x`, `y`).

Notes

If `interp` is 'nn' (the default), uses natural neighbor interpolation based on Delaunay triangulation. This option is only available if the mpl_toolkits.natgrid module is installed. This can be downloaded from https://github.com/matplotlib/natgrid. The (`xi`, `yi`) grid must be regular and monotonically increasing in this case.

If `interp` is 'linear', linear interpolation is used via matplotlib.tri.LinearTriInterpolator.

Instead of using *`griddata`*, more flexible functionality and other interpolation options are available using a matplotlib.tri.Triangulation and a matplotlib.tri.TriInterpolator.

`matplotlib.mlab.`**`identity`**`(`*n*, *rank=2*, *dtype='l'*, *typecode=None*`)`

Returns the identity matrix of shape (*n*, *n*, ..., *n*) (rank *r*).

For ranks higher than 2, this object is simply a multi-index Kronecker delta:

```
                       /  1  if i0=i1=...=iR,
id[i0,i1,...,iR] = -|
                       \  0  otherwise.
```

Optionally a *dtype* (or typecode) may be given (it defaults to 'l').

Since rank defaults to 2, this function behaves in the default case (when only *n* is given) like `numpy.identity(n)` – but surprisingly, it is much faster.

`matplotlib.mlab.`**`inside_poly`**`(`*points*, *verts*`)`

points is a sequence of *x*, *y* points. *verts* is a sequence of *x*, *y* vertices of a polygon.

Return value is a sequence of indices into points for the points that are inside the polygon.

`matplotlib.mlab.`**`is_closed_polygon`**`(`*X*`)`

Tests whether first and last object in a sequence are the same. These are presumably coordinates on a polygonal curve, in which case this function tests if that curve is closed.

`matplotlib.mlab.`**`ispower2`**`(`*n*`)`

Returns the log base 2 of *n* if *n* is a power of 2, zero otherwise.

Note the potential ambiguity if *n* == 1: 2**0 == 1, interpret accordingly.

`matplotlib.mlab.`**`isvector`**`(`*X*`)`

Like the MATLAB function with the same name, returns *True* if the supplied numpy array or matrix *X* looks like a vector, meaning it has a one non-singleton axis (i.e., it can have multiple axes, but all must have length 1, except for one of them).

If you just want to see if the array has 1 axis, use X.ndim == 1.

`matplotlib.mlab.`**`l1norm`**`(`*a*`)`

Return the *l1* norm of *a*, flattened out.

Implemented as a separate function (not a call to `norm()` for speed).

`matplotlib.mlab.`**`l2norm`**`(`*a*`)`

Return the *l2* norm of *a*, flattened out.

Implemented as a separate function (not a call to `norm()` for speed).

`matplotlib.mlab.`**`less_simple_linear_interpolation`**`(`*x*, *y*, *xi*, *extrap=False*`)`

This function provides simple (but somewhat less so than `cbook.simple_linear_interpolation()`) linear interpolation. `simple_linear_interpolation()` will give a list of point between a start and an end, while this does true linear interpolation at an arbitrary set of points.

This is very inefficient linear interpolation meant to be used only for a small number of points in relatively non-intensive use cases. For real linear interpolation, use scipy.

`matplotlib.mlab.`**`log2`**`(`*x*, *ln2=0.6931471805599453*`)`

Return the log(*x*) in base 2.

This is a _slow_ function but which is guaranteed to return the correct integer value if the input is an integer exact power of 2.

`matplotlib.mlab.`**`logspace`**`(`*xmin*, *xmax*, *N*`)`

Return N values logarithmically spaced between xmin and xmax.

`matplotlib.mlab.`**`longest_contiguous_ones`**`(`*x*`)`

Return the indices of the longest stretch of contiguous ones in *x*, assuming *x* is a vector of zeros and ones. If there are two equally long stretches, pick the first.

`matplotlib.mlab.`**`longest_ones`**`(`*x*`)`

alias for longest_contiguous_ones

`matplotlib.mlab.`**`magnitude_spectrum`**`(`*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*`)`

Compute the magnitude (absolute value) of the frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see *`window_hanning()`*, *`window_none()`*, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is *`window_hanning()`*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns spectrum : 1-D array

The values for the magnitude spectrum (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

See also:

`psd()` *`psd()`* returns the power spectral density.

`complex_spectrum()` This function returns the absolute value of *`complex_spectrum()`*.

`angle_spectrum()` *`angle_spectrum()`* returns the angles of the corresponding frequencies.

`phase_spectrum()` *`phase_spectrum()`* returns the phase (unwrapped angle) of the corresponding frequencies.

`specgram()` *`specgram()`* can return the magnitude spectrum of segments within the signal.

`matplotlib.mlab.`**`movavg`**(*x*, *n*)

Compute the len(*n*) moving average of *x*.

`matplotlib.mlab.`**`norm_flat`**`(`*a*, *p=2*`)`

norm(a,p=2) -> l-p norm of a.flat

Return the l-p norm of *a*, considered as a flat array. This is NOT a true matrix norm, since arrays of arbitrary rank are always flattened.

p can be a number or the string 'Infinity' to get the L-infinity norm.

`matplotlib.mlab.`**`normpdf`**`(`*x*, **args*`)`

Return the normal pdf evaluated at *x*; args provides *mu*, *sigma*

`matplotlib.mlab.`**`offset_line`**`(`*y*, *yerr*`)`

Offsets an array *y* by +/- an error and returns a tuple (y - err, y + err).

The error term can be:

- A scalar. In this case, the returned tuple is obvious.
- A vector of the same length as *y*. The quantities y +/- err are computed component-wise.
- A tuple of length 2. In this case, yerr[0] is the error below *y* and yerr[1] is error above *y*. For example:

```
from pylab import *
x = linspace(0, 2*pi, num=100, endpoint=True)
y = sin(x)
y_minus, y_plus = mlab.offset_line(y, 0.1)
plot(x, y)
fill_between(x, ym, y2=yp)
show()
```

`matplotlib.mlab.`**`path_length`**`(`*X*`)`

Computes the distance travelled along a polygonal curve in *N* dimensions.

Where *X* is an *M* x *N* array or matrix. Returns an array of length *M* consisting of the distance along the curve at each point (i.e., the rows of *X*).

`matplotlib.mlab.`**`phase_spectrum`**`(`*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*`)`

Compute the phase of the frequency spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see *`window_hanning()`*, *`window_none()`*, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is *`window_hanning()`*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns spectrum : 1-D array

The values for the phase spectrum in radians (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

See also:

`complex_spectrum()` This function returns the angle value of *`complex_spectrum()`*.

`magnitude_spectrum()` *`magnitude_spectrum()`* returns the magnitudes of the corresponding frequencies.

`angle_spectrum()` *`angle_spectrum()`* returns the wrapped version of this function.

`specgram()` *`specgram()`* can return the phase spectrum of segments within the signal.

`matplotlib.mlab.`**`poly_below`**(*xmin*, *xs*, *ys*)

Given a sequence of *xs* and *ys*, return the vertices of a polygon that has a horizontal base at *xmin* and an upper bound at the *ys*. *xmin* is a scalar.

Intended for use with *`matplotlib.axes.Axes.fill()`*, e.g.,:

```
xv, yv = poly_below(0, x, y)
ax.fill(xv, yv)
```

`matplotlib.mlab.`**`poly_between`**(*x*, *ylower*, *yupper*)

Given a sequence of *x*, *ylower* and *yupper*, return the polygon that fills the regions between them. *ylower* or *yupper* can be scalar or iterable. If they are iterable, they must be equal in length to *x*.

Return value is *x*, *y* arrays for use with *`matplotlib.axes.Axes.fill()`*.

`matplotlib.mlab.`**`prctile`**(*x*, *p=(0.0*, *25.0*, *50.0*, *75.0*, *100.0)*)

Return the percentiles of *x*. *p* can either be a sequence of percentile values or a scalar. If *p* is a sequence, the ith element of the return sequence is the *p*(i)-th percentile of *x*. If *p* is a scalar, the largest value of *x* less than or equal to the *p* percentage point in the sequence is returned.

`matplotlib.mlab.`**`prctile_rank`**(*x*, *p*)

Return the rank for each element in *x*, return the rank 0..len(*p*). e.g., if *p* = (25, 50, 75), the return value will be a len(*x*) array with values in [0,1,2,3] where 0 indicates the value is less than the 25th percentile, 1 indicates the value is >= the 25th and < 50th percentile, ... and 3 indicates the value is above the 75th percentile cutoff.

p is either an array of percentiles in [0..100] or a scalar which indicates how many quantiles of data you want ranked.

`matplotlib.mlab.`**`psd`**(*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*)

Compute the power spectral density.

Call signature:

```
psd(x, NFFT=256, Fs=2, detrend=mlab.detrend_none,
    window=mlab.window_hanning, noverlap=0, pad_to=None,
    sides='default', scale_by_freq=None)
```

The power spectral density P_{xx} by Welch's average periodogram method. The vector *x* is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment *i* are averaged to compute P_{xx}.

If len(*x*) < *NFFT*, it will be zero padded to *NFFT*.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see *`window_hanning()`*, *`window_none()`*, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is *`window_hanning()`*. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : integer

The number of points of overlap between segments. The default value is 0 (no overlap).

Returns Pxx : 1-D array

The values for the power spectrum `P_{xx}` (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *Pxx*

See also:

`specgram()` *`specgram()`* differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

`magnitude_spectrum()` *`magnitude_spectrum()`* returns the magnitude spectrum.

`csd()` *`csd()`* returns the spectral density between two signals.

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.`**`quad2cubic`**(*q0x*, *q0y*, *q1x*, *q1y*, *q2x*, *q2y*)

Converts a quadratic Bezier curve to a cubic approximation.

The inputs are the *x* and *y* coordinates of the three control points of a quadratic curve, and the output is a tuple of *x* and *y* coordinates of the four control points of the cubic curve.

`matplotlib.mlab.`**`rec2csv`**(*r*, *fname*, *delimiter=', '*, *formatd=None*, *missing=''*, *missingd=None*, *withheader=True*)

Save the data from numpy recarray *r* into a comma-/space-/tab-delimited file. The record array dtype names will be used for column headers.

***fname*: can be a filename or a file handle. Support for gzipped** files is automatic, if the filename ends in '.gz'

***withheader*: if withheader is False, do not write the attribute** names in the first row

for formatd type FormatFloat, we override the precision to store full precision floats in the CSV file

See also:

`csv2rec()` For information about *missing* and *missingd*, which can be used to fill in masked values into your CSV file.

`matplotlib.mlab.`**`rec2txt`**(*r*, *header=None*, *padding=3*, *precision=3*, *fields=None*)

Returns a textual representation of a record array.

Parameters r: numpy recarray

header: list

column headers

padding:

space between each column

precision: number of decimal places to use for floats.

Set to an integer to apply to all floats. Set to a list of integers to apply precision individually. Precision for non-floats is simply ignored.

fields : list

If not None, a list of field names to print. fields can be a list of strings like ['field1', 'field2'] or a single comma separated string like 'field1,field2'

Examples

For `precision=[0,2,3]`, the output is

```
ID    Price   Return
ABC   12.54    0.234
XYZ    6.32   -0.076
```

`matplotlib.mlab.`**`rec_append_fields`**(*rec*, *names*, *arrs*, *dtypes=None*)

Return a new record array with field names populated with data from arrays in *arrs*. If appending a single field, then *names*, *arrs* and *dtypes* do not have to be lists. They can just be the values themselves.

`matplotlib.mlab.`**`rec_drop_fields`**(*rec*, *names*)

Return a new numpy record array with fields in *names* dropped.

`matplotlib.mlab.`**`rec_groupby`**(*r*, *groupby*, *stats*)

r is a numpy record array

groupby is a sequence of record array attribute names that together form the grouping key. e.g., (‘date’, ‘productcode’)

stats is a sequence of (*attr*, *func*, *outname*) tuples which will call `x = func(attr)` and assign *x* to the record array output with attribute *outname*. For example:

```
stats = ( ('sales', len, 'numsales'), ('sales', np.mean, 'avgsale') )
```

Return record array has *dtype* names for each attribute name in the *groupby* argument, with the associated group values, and for each outname name in the *stats* argument, with the associated stat summary output.

`matplotlib.mlab.`**`rec_join`**(*key*, *r1*, *r2*, *jointype='inner'*, *defaults=None*, *r1postfix='1'*, *r2postfix='2'*)

Join record arrays *r1* and *r2* on *key*; *key* is a tuple of field names – if *key* is a string it is assumed to be a single attribute name. If *r1* and *r2* have equal values on all the keys in the *key* tuple, then their fields will be merged into a new record array containing the intersection of the fields of *r1* and *r2*.

r1 (also *r2*) must not have any duplicate keys.

The *jointype* keyword can be ‘inner’, ‘outer’, ‘leftouter’. To do a rightouter join just reverse *r1* and *r2*.

The *defaults* keyword is a dictionary filled with `{column_name:default_value}` pairs.

The keywords *r1postfix* and *r2postfix* are postfixed to column names (other than keys) that are both in *r1* and *r2*.

`matplotlib.mlab.`**`rec_keep_fields`**(*rec*, *names*)

Return a new numpy record array with only fields listed in names

`matplotlib.mlab.`**`rec_summarize`**(*r*, *summaryfuncs*)

r is a numpy record array

summaryfuncs is a list of (*attr*, *func*, *outname*) tuples which will apply *func* to the array r*_[attr] and assign the output to a new attribute name *outname_. The returned record array is identical to *r*, with extra arrays for each element in *summaryfuncs*.

`matplotlib.mlab.`**`recs_join`**(*key*, *name*, *recs*, *jointype='outer'*, *missing=0.0*, *postfixes=None*)

Join a sequence of record arrays on single column key.

This function only joins a single column of the multiple record arrays

key is the column name that acts as a key

name is the name of the column that we want to join

recs is a list of record arrays to join

jointype is a string 'inner' or 'outer'

missing is what any missing field is replaced by

postfixes if not None, a len recs sequence of postfixes

returns a record array with columns [rowkey, name0, name1, ... namen-1]. or if postfixes [PF0, PF1, ..., PFN-1] are supplied, [rowkey, namePF0, namePF1, ... namePFN-1].

Example:

```
r = recs_join("date", "close", recs=[r0, r1], missing=0.)
```

`matplotlib.mlab.`**`rk4`**(*derivs*, *y0*, *t*)

Integrate 1D or ND system of ODEs using 4-th order Runge-Kutta. This is a toy implementation which may be useful if you find yourself stranded on a system w/o scipy. Otherwise use `scipy.integrate()`.

Parameters y0

initial state vector

t

sample times

derivs

returns the derivative of the system and has the signature `dy = derivs(yi, ti)`

Examples

A 2D system:

```
def derivs6(x,t):
    d1 =  x[0] + 2*x[1]
    d2 =  -3*x[0] + 4*x[1]
    return (d1, d2)
dt = 0.0005
t = arange(0.0, 2.0, dt)
y0 = (1,2)
yout = rk4(derivs6, y0, t)
```

A 1D system:

```
alpha = 2
def derivs(x,t):
    return -alpha*x + exp(-t)

y0 = 1
yout = rk4(derivs, y0, t)
```

If you have access to scipy, you should probably be using the scipy.integrate tools rather than this function.

`matplotlib.mlab.`**`rms_flat`**`(`*a*`)`

Return the root mean square of all the elements of *a*, flattened out.

`matplotlib.mlab.`**`safe_isinf`**`(`*x*`)`

`numpy.isinf()` for arbitrary types

`matplotlib.mlab.`**`safe_isnan`**`(`*x*`)`

`numpy.isnan()` for arbitrary types

`matplotlib.mlab.`**`segments_intersect`**`(`*s1*, *s2*`)`

Return *True* if *s1* and *s2* intersect. *s1* and *s2* are defined as:

```
s1: (x1, y1), (x2, y2)
s2: (x3, y3), (x4, y4)
```

`matplotlib.mlab.`**`slopes`**`(`*x*, *y*`)`

`slopes()` calculates the slope *y*'(*x*)

The slope is estimated using the slope obtained from that of a parabola through any three consecutive points.

This method should be superior to that described in the appendix of A CONSISTENTLY WELL BEHAVED METHOD OF INTERPOLATION by Russel W. Stineman (Creative Computing July 1980) in at least one aspect:

> Circles for interpolation demand a known aspect ratio between *x*- and *y*-values. For many functions, however, the abscissa are given in different dimensions, so an aspect ratio is completely arbitrary.

The parabola method gives very similar results to the circle method for most regular cases but behaves much better in special cases.

Norbert Nemec, Institute of Theoretical Physics, University or Regensburg, April 2006 Norbert.Nemec at physik.uni-regensburg.de

(inspired by a original implementation by Halldor Bjornsson, Icelandic Meteorological Office, March 2006 halldor at vedur.is)

`matplotlib.mlab.`**`specgram`**`(`*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*`)`

Compute a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap.

Parameters x : array_like

1-D array or sequence.

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : ['default' | 'onesided' | 'twosided']

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to *NFFT*

NFFT : integer

The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect. Use *pad_to* for this instead.

detrend : {'default', 'constant', 'mean', 'linear', 'none'} or callable

The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in matplotlib is it a function. The `pylab` module defines `detrend_none()`, `detrend_mean()`, and `detrend_linear()`, but you can use a custom function as well. You can also use a string to choose one of the functions. 'default', 'constant', and 'mean' call `detrend_mean()`. 'linear' calls `detrend_linear()`. 'none' calls `detrend_none()`.

scale_by_freq : boolean, optional

Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap : int, optional

The number of points of overlap between blocks. The default value is 128.

mode : str, optional

What sort of spectrum to use, default is 'psd'.

'psd' Returns the power spectral density.

'complex' Returns the complex-valued frequency spectrum.

'magnitude' Returns the magnitude spectrum.

'angle' Returns the phase spectrum without unwrapping.

'phase' Returns the phase spectrum with unwrapping.

Returns spectrum : array_like

2-D array, columns are the periodograms of successive segments.

freqs : array_like

1-D array, frequencies corresponding to the rows in *spectrum*.

t : array_like

1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

See also:

`psd` differs in the overlap and in the return values.

`complex_spectrum` similar, but with complex valued frequencies.

`magnitude_spectrum` similar single segment when mode is 'magnitude'.

`angle_spectrum` similar to single segment when mode is 'angle'.

`phase_spectrum` similar to single segment when mode is 'phase'.

Notes

detrend and scale_by_freq only apply when *mode* is set to 'psd'.

`matplotlib.mlab.`**`stineman_interp`**`(`*xi*, *x*, *y*, *yp=None*`)`

Given data vectors *x* and *y*, the slope vector *yp* and a new abscissa vector *xi*, the function `stineman_interp()` uses Stineman interpolation to calculate a vector *yi* corresponding to *xi*.

Here's an example that generates a coarse sine curve, then interpolates over a finer abscissa:

```
x = linspace(0,2*pi,20);  y = sin(x); yp = cos(x)
xi = linspace(0,2*pi,40);
yi = stineman_interp(xi,x,y,yp);
plot(x,y,'o',xi,yi)
```

The interpolation method is described in the article A CONSISTENTLY WELL BEHAVED METHOD OF INTERPOLATION by Russell W. Stineman. The article appeared in the July 1980 issue of Creative Computing with a note from the editor stating that while they were:

> not an academic journal but once in a while something serious and original comes in adding that this was "apparently a real solution" to a well known problem.

For *yp = None*, the routine automatically determines the slopes using the `slopes()` routine.

x is assumed to be sorted in increasing order.

For values `xi[j] < x[0]` or `xi[j] > x[-1]`, the routine tries an extrapolation. The relevance of the data obtained from this, of course, is questionable...

Original implementation by Halldor Bjornsson, Icelandic Meteorolocial Office, March 2006 halldor at vedur.is

Completely reworked and optimized for Python by Norbert Nemec, Institute of Theoretical Physics, University or Regensburg, April 2006 Norbert.Nemec at physik.uni-regensburg.de

`matplotlib.mlab.`**`stride_repeat`**(*x*, *n*, *axis=0*)

Repeat the values in an array in a memory-efficient manner. Array x is stacked vertically n times.

Warning: It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters x : 1D array or sequence

Array or sequence containing the data.

n : integer

The number of time to repeat the array.

axis : integer

The axis along which the data will run.

References

stackoverflow: Repeat NumPy array without replicating data?

`matplotlib.mlab.`**`stride_windows`**(*x*, *n*, *noverlap=None*, *axis=0*)

Get all windows of x with length n as a single array, using strides to avoid data duplication.

Warning: It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters x : 1D array or sequence

Array or sequence containing the data.

n : integer

The number of data points in each window.

noverlap : integer

The overlap between adjacent windows. Default is 0 (no overlap)

axis : integer

The axis along which the windows will run.

References

stackoverflow: Rolling window for 1D arrays in Numpy? stackoverflow: Using strides for an efficient moving average filter

`matplotlib.mlab.`**`vector_lengths`**`(`*X*, *P=2.0*, *axis=None*`)`

Finds the length of a set of vectors in *n* dimensions. This is like the `numpy.norm()` function for vectors, but has the ability to work over a particular axis of the supplied array or matrix.

Computes `(sum((x_i)^P))^(1/P)` for each `{x_i}` being the elements of *X* along the given axis. If *axis* is *None*, compute over all elements of *X*.

`matplotlib.mlab.`**`window_hanning`**`(`*x*`)`

Return x times the hanning window of len(x).

See also:

`window_none()` *`window_none()`* is another window algorithm.

`matplotlib.mlab.`**`window_none`**`(`*x*`)`

No window function; simply return x.

See also:

`window_hanning()` *`window_hanning()`* is another window algorithm.

CHAPTER

FORTY

OFFSETBOX

40.1 `matplotlib.offsetbox`

The OffsetBox is a simple container artist. The child artist are meant to be drawn at a relative position to its parent. The [VH]Packer, DrawingArea and TextArea are derived from the OffsetBox.

The [VH]Packer automatically adjust the relative postisions of their children, which should be instances of the OffsetBox. This is used to align similar artists together, e.g., in legend.

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The TextArea is contains a single Text instance. The width and height of the TextArea instance is the width and height of the its child text.

class `matplotlib.offsetbox.`**`AnchoredOffsetbox`**(*loc*, *pad=0.4*, *borderpad=0.5*, *child=None*, *prop=None*, *frameon=True*, *bbox_to_anchor=None*, *bbox_transform=None*, ***kwargs*)

Bases: *`matplotlib.offsetbox.OffsetBox`*

An offset box placed according to the legend location loc. AnchoredOffsetbox has a single child. When multiple children is needed, use other OffsetBox class to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the bbox_to_anchor.

loc is a string or an integer specifying the legend location. The valid location codes are:

```
'upper right'  : 1,
'upper left'   : 2,
'lower left'   : 3,
'lower right'  : 4,
'right'        : 5,
'center left'  : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'       : 10,
```

pad [pad around the child for drawing a frame. given in] fraction of fontsize.

borderpad : pad between offsetbox frame and the bbox_to_anchor, child : OffsetBox instance that will be anchored.

prop : font property. This is only used as a reference for paddings.

frameon : draw a frame box if True.

bbox_to_anchor : bbox to anchor. Use self.axes.bbox if None.

bbox_transform : with which the bbox_to_anchor will be transformed.

`draw`(*renderer*)
draw the artist

`get_bbox_to_anchor`()
return the bbox that the legend will be anchored

`get_child`()
return the child

`get_children`()
return the list of children

`get_extent`(*renderer*)
return the extent of the artist. The extent of the child added with the pad is returned

`get_window_extent`(*renderer*)
get the bounding box in display space.

`set_bbox_to_anchor`(*bbox*, *transform=None*)
set the bbox that the child will be anchored.

bbox can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

`set_child`(*child*)
set the child to be anchored

`update_frame`(*bbox*, *fontsize=None*)

`zorder` = 5

class `matplotlib.offsetbox.`**`AnchoredText`**(*s*, *loc*, *pad=0.4*, *borderpad=0.5*, *prop=None*, ***kwargs*)

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

AnchoredOffsetbox with Text.

Parameters s : string

Text.

loc : str

Location code.

pad : float, optional

Pad between the text and the frame as fraction of the font size.

borderpad : float, optional

Pad between the frame and the axes (or *bbox_to_anchor*).

prop : `matplotlib.font_manager.FontProperties`

Font properties.

Notes

Other keyword parameters of `AnchoredOffsetbox` are also allowed.

class `matplotlib.offsetbox.`**`AnnotationBbox`**(*offsetbox*, *xy*, *xybox=None*, *xycoords='data'*, *boxcoords=None*, *frameon=True*, *pad=0.4*, *annotation_clip=None*, *box_alignment=(0.5, 0.5)*, *bboxprops=None*, *arrowprops=None*, *fontsize=None*, ***kwargs*)

Bases: `matplotlib.artist.Artist`, `matplotlib.text._AnnotationBase`

Annotation-like class, but with offsetbox instead of Text.

offsetbox : OffsetBox instance

xycoords [same as Annotation but can be a tuple of two] strings which are interpreted as x and y coordinates.

boxcoords [similar to textcoords as Annotation but can be a] tuple of two strings which are interpreted as x and y coordinates.

box_alignment [a tuple of two floats for a vertical and] horizontal alignment of the offset box w.r.t. the *boxcoords*. The lower-left corner is (0.0) and upper-right corner is (1.1).

other parameters are identical to that of Annotation.

`anncoords`

`contains`(*event*)

`draw`(*renderer*)

Draw the `Annotation` object to the given *renderer*.

`get_children`()

`get_fontsize`(*s=None*)

return fontsize in points

`set_figure`(*fig*)

`set_fontsize`(*s=None*)

set fontsize in points

update_positions(*renderer*)
Update the pixel positions of the annotated point and the text.

xyann

zorder = 3

class matplotlib.offsetbox.**AuxTransformBox**(*aux_transform*)
Bases: *matplotlib.offsetbox.OffsetBox*

Offset Box with the aux_transform . Its children will be transformed with the aux_transform first then will be offseted. The absolute coordinate of the aux_transform is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0,0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

add_artist(*a*)
Add any *Artist* to the container box

draw(*renderer*)
Draw the children

get_extent(*renderer*)

get_offset()
return offset of the container.

get_transform()
Return the *Transform* applied to the children

get_window_extent(*renderer*)
get the bounding box in display space.

set_offset(*xy*)
set offset of the container.

Accept : tuple of x,y coordinate in disokay units.

set_transform(*t*)
set_transform is ignored.

class matplotlib.offsetbox.**DraggableAnnotation**(*annotation*, *use_blit=False*)
Bases: *matplotlib.offsetbox.DraggableBase*

save_offset()

update_offset(*dx*, *dy*)

class `matplotlib.offsetbox.`**`DraggableBase`**(*ref_artist*, *use_blit=False*)

Bases: `object`

helper code for a draggable artist (legend, offsetbox) The derived class must override following two method.

def saveoffset(self): pass

def update_offset(self, dx, dy): pass

saveoffset is called when the object is picked for dragging and it is meant to save reference position of the artist.

update_offset **is called during the dragging. dx and dy is the pixel** offset from the point where the mouse drag started.

Optionally you may override following two methods.

def artist_picker(self, artist, evt): return self.ref_artist.contains(evt)

def finalize_offset(self): pass

artist_picker **is a picker method that will be** used. *finalize_offset* is called when the mouse is released. In current implementaion of DraggableLegend and DraggableAnnotation, *update_offset* places the artists simply in display coordinates. And *finalize_offset* recalculate their position in the normalized axes coordinate and set a relavant attribute.

`artist_picker`(*artist*, *evt*)

`disconnect`()

disconnect the callbacks

`finalize_offset`()

`on_motion`(*evt*)

`on_motion_blit`(*evt*)

`on_pick`(*evt*)

`on_release`(*event*)

`save_offset`()

`update_offset`(*dx*, *dy*)

class `matplotlib.offsetbox.`**`DraggableOffsetBox`**(*ref_artist*, *offsetbox*, *use_blit=False*)

Bases: *`matplotlib.offsetbox.DraggableBase`*

get_loc_in_canvas()

save_offset()

update_offset(*dx*, *dy*)

class `matplotlib.offsetbox.`**DrawingArea**(*width*, *height*, *xdescent=0.0*, *ydescent=0.0*, *clip=False*)

Bases: `matplotlib.offsetbox.OffsetBox`

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

width, *height* : width and height of the container box. *xdescent*, *ydescent* : descent of the box in x- and y-direction. *clip* : Whether to clip the children

add_artist(*a*)

Add any `Artist` to the container box

clip_children

If the children of this DrawingArea should be clipped by DrawingArea bounding box.

draw(*renderer*)

Draw the children

get_extent(*renderer*)

Return with, height, xdescent, ydescent of box

get_offset()

return offset of the container.

get_transform()

Return the `Transform` applied to the children

get_window_extent(*renderer*)

get the bounding box in display space.

set_offset(*xy*)

set offset of the container.

Accept : tuple of x,y cooridnate in disokay units.

set_transform(*t*)

set_transform is ignored.

class `matplotlib.offsetbox.`**HPacker**(*pad=None*, *sep=None*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)

Bases: `matplotlib.offsetbox.PackerBase`

The HPacker has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

Parameters pad : float, optional

Boundary pad.

sep : float, optional

Spacing between items.

width : float, optional

height : float, optional

Width and height of the container box, calculated if `None`.

align : str

Alignment of boxes.

mode : str

Packing mode.

Notes

pad and *sep* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

`get_extent_offsets`(*renderer*)
update offset of children and return the extents of the box

class `matplotlib.offsetbox.`**`OffsetBox`**(**args*, ***kwargs*)
Bases: `matplotlib.artist.Artist`

The OffsetBox is a simple container artist. The child artist are meant to be drawn at a relative position to its parent.

`axes`
The `Axes` instance the artist resides in, or *None*.

`contains`(*mouseevent*)

`draw`(*renderer*)
Update the location of children if necessary and draw them to the given *renderer*.

`get_children`()
Return a list of artists it contains.

`get_extent`(*renderer*)
Return with, height, xdescent, ydescent of box

`get_extent_offsets`(*renderer*)

`get_offset`(*width*, *height*, *xdescent*, *ydescent*, *renderer*)
Get the offset

accepts extent of the box

get_visible_children()
Return a list of visible artists it contains.

get_window_extent(*renderer*)
get the bounding box in display space.

set_figure(*fig*)
Set the figure

accepts a class:`Figure` instance

set_height(*height*)
Set the height

accepts float

set_offset(*xy*)
Set the offset

accepts x, y, tuple, or a callable object.

set_width(*width*)
Set the width

accepts float

class `matplotlib.offsetbox.`**OffsetImage**(*arr*, *zoom=1*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=1*, *filterrad=4.0*, *resample=False*, *dpi_cor=True*, ***kwargs*)

Bases: `matplotlib.offsetbox.OffsetBox`

draw(*renderer*)
Draw the children

get_children()

get_data()

get_extent(*renderer*)

get_offset()
return offset of the container.

get_window_extent(*renderer*)
get the bounding box in display space.

get_zoom()

set_data(*arr*)

set_zoom(*zoom*)

class matplotlib.offsetbox.**PackerBase**(*pad=None*, *sep=None*, *width=None*, *height=None*, *align=None*, *mode=None*, *children=None*)

Bases: `matplotlib.offsetbox.OffsetBox`

Parameters pad : float, optional

Boundary pad.

sep : float, optional

Spacing between items.

width : float, optional

height : float, optional

Width and height of the container box, calculated if `None`.

align : str, optional

Alignment of boxes. Can be one of `top`, `bottom`, `left`, `right`, `center` and `baseline`

mode : str, optional

Packing mode.

Notes

pad and *sep* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

class matplotlib.offsetbox.**PaddedBox**(*child*, *pad=None*, *draw_frame=False*, *patch_attrs=None*)

Bases: `matplotlib.offsetbox.OffsetBox`

pad : boundary pad

Note: *pad* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

draw_frame(*renderer*)

get_extent_offsets(*renderer*)

update offset of childrens and return the extents of the box

update_frame(*bbox*, *fontsize=None*)

class `matplotlib.offsetbox.`**`TextArea`**(*s*, *textprops=None*, *multilinebaseline=None*, *minimumdescent=True*)

Bases: `matplotlib.offsetbox.OffsetBox`

The TextArea is contains a single Text instance. The text is placed at (0,0) with baseline+left alignment. The width and height of the TextArea instance is the width and height of the its child text.

Parameters s : str

a string to be displayed.

textprops : `FontProperties`, optional

multilinebaseline : bool, optional

If `True`, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

minimumdescent : bool, optional

If `True`, the box has a minimum descent of "p".

`draw`(*renderer*)

Draw the children

`get_extent`(*renderer*)

`get_minimumdescent`()

get minimumdescent.

`get_multilinebaseline`()

get multilinebaseline .

`get_offset`()

return offset of the container.

`get_text`()

Returns the string representation of this area's text

`get_window_extent`(*renderer*)

get the bounding box in display space.

`set_minimumdescent`(*t*)

Set minimumdescent .

If True, extent of the single line text is adjusted so that it has minimum descent of "p"

`set_multilinebaseline`(*t*)

Set multilinebaseline .

If True, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

`set_offset`(*xy*)

set offset of the container.

Accept : tuple of x,y coordinates in display units.

`set_text`(*s*)
Set the text of this area as a string.

`set_transform`(*t*)
set_transform is ignored.

class `matplotlib.offsetbox.`**`VPacker`**(*pad=None*, *sep=None*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)
Bases: `matplotlib.offsetbox.PackerBase`

The VPacker has its children packed vertically. It automatically adjust the relative positions of children in the drawing time.

Parameters pad : float, optional

Boundary pad.

sep : float, optional

Spacing between items.

width : float, optional

height : float, optional

width and height of the container box, calculated if `None`.

align : str, optional

Alignment of boxes.

mode : str, optional

Packing mode.

Notes

pad and *sep* need to given in points and will be scale with the renderer dpi, while *width* and *height* need to be in pixels.

`get_extent_offsets`(*renderer*)
update offset of childrens and return the extents of the box

`matplotlib.offsetbox.`**`bbox_artist`**(**args*, ***kwargs*)

CHAPTER

FORTYONE

PATCHES

41.1 `matplotlib.patches`

class `matplotlib.patches.`**`Arc`**(*xy*, *width*, *height*, *angle=0.0*, *theta1=0.0*, *theta2=360.0*, **kwargs)

Bases: `matplotlib.patches.Ellipse`

An elliptical arc. Because it performs various optimizations, it can not be filled.

The arc must be used in an `Axes` instance—it can not be added directly to a `Figure`—because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

The following args are supported:

xy center of ellipse

width length of horizontal axis

height length of vertical axis

angle rotation in degrees (anti-clockwise)

theta1 starting angle of the arc in degrees

theta2 ending angle of the arc in degrees

If *theta1* and *theta2* are not provided, the arc will form a complete ellipse.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]

Continued on

Table 41.1 – continued from previous page

Property	Description
color	matplotlib color spec
contains	a callable function
edgecolor or ec	mpl color spec, None, ‘none’, or ‘auto’
facecolor or fc	mpl color spec, or None for default, or ‘none’ for no color
figure	a *matplotlib.figure.Figure* instance
fill	[True | False]
gid	an id string
hatch	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
joinstyle	[’miter’ | ‘round’ | ‘bevel’]
label	string or anything printable with ‘%s’ conversion.
linestyle or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
linewidth or lw	float or None for default
path_effects	unknown
picker	[None|float|boolean|callable]
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
zorder	any number

draw(*artist*, *renderer*, **args*, ***kwargs*)

Ellipses are normally drawn using an approximation that uses eight cubic bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

> Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.
>
> http://www.tinaja.com/glib/ellipse4.pdf

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done be performing an inverse transformation on the axes bbox such that it is relative to the unit circle – this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

   This uses the “line intersecting a circle” algorithm from:

Vince, John. Geometry for Computer Graphics: Formulae, Examples & Proofs. London: Springer-Verlag, 2005.

2.The angles of each of the intersection points are calculated.

3.Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the bezier arc approximation technique implemented in `matplotlib.path.Path.arc()`.

class `matplotlib.patches.`**`Arrow`**(*x*, *y*, *dx*, *dy*, *width=1.0*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

An arrow patch.

Draws an arrow, starting at (*x*, *y*), direction and length given by (*dx*, *dy*) the width of the arrow is scaled by *width*.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]

Continued on

Table 41.2 – continued from previous page

Property	Description
`zorder`	any number

`get_patch_transform`()

`get_path`()

class `matplotlib.patches.`**`ArrowStyle`**

Bases: `matplotlib.patches._Style`

`ArrowStyle` is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with *`FancyArrowPatch`*.

A arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

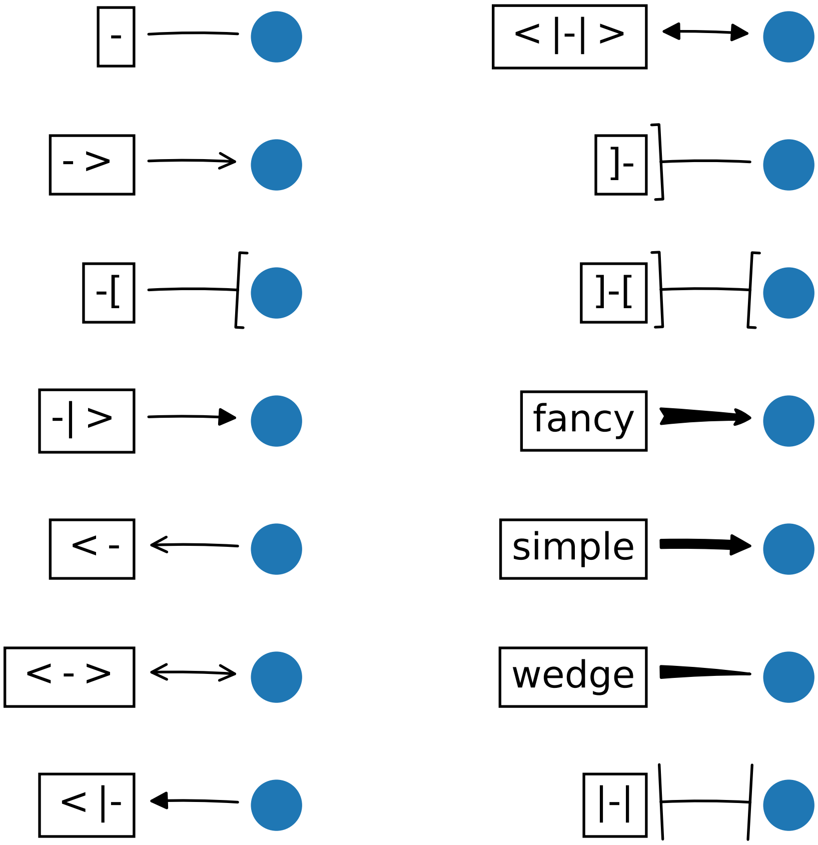
The following classes are defined

Class	Name	Attrs
Curve	`-`	None
CurveB	`->`	head_length=0.4,head_width=0.2
BracketB	`-[`	widthB=1.0,lengthB=0.2,angleB=None
CurveFilledB	`-|>`	head_length=0.4,head_width=0.2
CurveA	`<-`	head_length=0.4,head_width=0.2
CurveAB	`<->`	head_length=0.4,head_width=0.2
CurveFilledA	`<|-`	head_length=0.4,head_width=0.2
CurveFilledAB	`<|-|>`	head_length=0.4,head_width=0.2
BracketA	`]-`	widthA=1.0,lengthA=0.2,angleA=None
BracketAB	`]-[`	widthA=1.0,lengthA=0.2,angleA=None,widthB=1.0,lengthB=0.2,angleB=None
Fancy	`fancy`	head_length=0.4,head_width=0.4,tail_width=0.4
Simple	`simple`	head_length=0.5,head_width=0.5,tail_width=0.2
Wedge	`wedge`	tail_width=0.3,shrink_factor=0.5
BarAB	`|-|`	widthA=1.0,angleA=None,widthB=1.0,angleB=None

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a `Path` instance and a boolean value. *path* is a `Path` instance along which the arrow will be drawn. *mutation_size* and *aspect_ratio* have the same meaning as in *`BoxStyle`*. *linewidth* is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.



return the instance of the subclass with the given style name.

class `BarAB`(*widthA=1.0*, *angleA=None*, *widthB=1.0*, *angleB=None*)
Bases: `matplotlib.patches._Bracket`

An arrow with a bar(|) at both ends.

Parameters widthA : float, optional, default

Width of the bracket

angleA : float, optional, default

Angle between the bracket and the line

widthB : float, optional, default

Width of the bracket

angleB : float, optional, default

Angle between the bracket and the line

class `BracketA`(*widthA=1.0*, *lengthA=0.2*, *angleA=None*)

Bases: `matplotlib.patches._Bracket`

An arrow with a bracket(]) at its end.

Parameters widthA : float, optional, default

Width of the bracket

lengthA : float, optional, default

Length of the bracket

angleA : float, optional, default

Angle between the bracket and the line

class `BracketAB`(*widthA=1.0*, *lengthA=0.2*, *angleA=None*, *widthB=1.0*, *lengthB=0.2*, *angleB=None*)

Bases: `matplotlib.patches._Bracket`

An arrow with a bracket(]) at both ends.

Parameters widthA : float, optional, default

Width of the bracket

lengthA : float, optional, default

Length of the bracket

angleA : float, optional, default

Angle between the bracket and the line

widthB : float, optional, default

Width of the bracket

lengthB : float, optional, default

Length of the bracket

angleB : float, optional, default

Angle between the bracket and the line

class `BracketB`(*widthB=1.0*, *lengthB=0.2*, *angleB=None*)

Bases: `matplotlib.patches._Bracket`

An arrow with a bracket([) at its end.

Parameters widthB : float, optional, default

Width of the bracket

lengthB : float, optional, default

Length of the bracket

angleB : float, optional, default

Angle between the bracket and the line

class Curve
Bases: `matplotlib.patches._Curve`

A simple curve without any arrow head.

class CurveA(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with a head at its begin point.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class CurveAB(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with heads both at the begin and the end point.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class CurveB(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with a head at its end point.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class CurveFilledA(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with filled triangle head at the begin.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class `CurveFilledAB`(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with filled triangle heads at both ends.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class `CurveFilledB`(*head_length=0.4*, *head_width=0.2*)
Bases: `matplotlib.patches._Curve`

An arrow with filled triangle head at the end.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

class `Fancy`(*head_length=0.4*, *head_width=0.4*, *tail_width=0.4*)
Bases: `matplotlib.patches._Base`

A fancy arrow. Only works with a quadratic bezier curve.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

tail_width : float, optional, default

Width of the arrow tail

`transmute`(*path*, *mutation_size*, *linewidth*)

class `Simple`(*head_length=0.5*, *head_width=0.5*, *tail_width=0.2*)
Bases: `matplotlib.patches._Base`

A simple arrow. Only works with a quadratic bezier curve.

Parameters head_length : float, optional, default

Length of the arrow head

head_width : float, optional, default

Width of the arrow head

tail_width : float, optional, default

Width of the arrow tail

transmute(*path*, *mutation_size*, *linewidth*)

class Wedge(*tail_width=0.3*, *shrink_factor=0.5*)

Bases: `matplotlib.patches._Base`

Wedge(?) shape. Only works with a quadratic bezier curve. The begin point has a width of the tail_width and the end point has a width of 0. At the middle, the width is shrink_factor*tail_width.

Parameters tail_width : float, optional, default

Width of the tail

shrink_factor : float, optional, default

Fraction of the arrow width at the middle point

transmute(*path*, *mutation_size*, *linewidth*)

class `matplotlib.patches.`**BoxStyle**

Bases: `matplotlib.patches._Style`

BoxStyle is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round, pad=0.2")
```

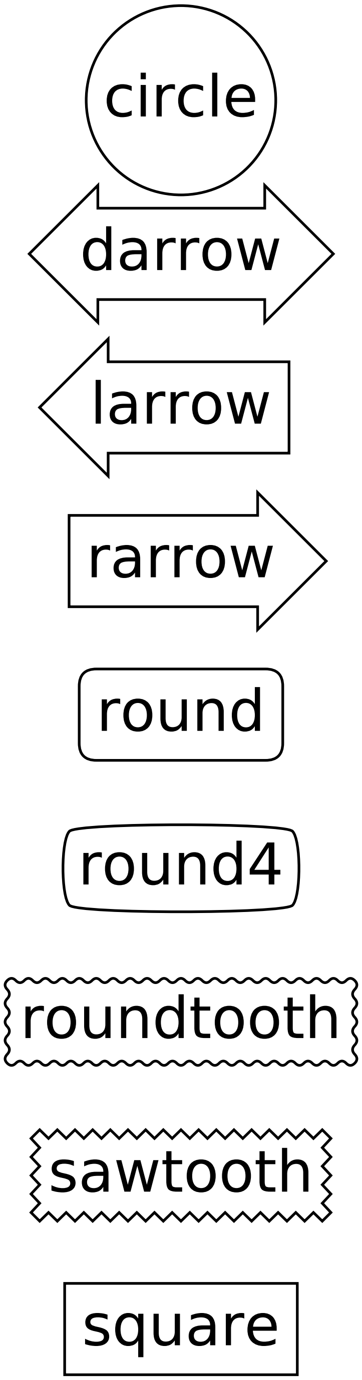
Following boxstyle classes are defined.

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3,rounding_size=None
Round4	`round4`	pad=0.3,rounding_size=None
Roundtooth	`roundtooth`	pad=0.3,tooth_size=None
Sawtooth	`sawtooth`	pad=0.3,tooth_size=None
Square	`square`	pad=0.3

An instance of any boxstyle class is an callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a `Path` instance. *x0*, *y0*, *width* and *height* specify the location and size of the box to be drawn. *mutation_scale* determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). *mutation_aspect* determines the aspect-ratio of the mutation.



circle
darrow
larrow
rarrow
round
round4
roundtooth
sawtooth
square

return the instance of the subclass with the given style name.

class **`Circle`**(*pad=0.3*)

Bases: `matplotlib.patches._Base`

A simple circle box.

Parameters pad : float

The amount of padding around the original box.

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class **`DArrow`**(*pad=0.3*)

Bases: `matplotlib.patches._Base`

(Double) Arrow Box

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class **`LArrow`**(*pad=0.3*)

Bases: `matplotlib.patches._Base`

(left) Arrow Box

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class **`RArrow`**(*pad=0.3*)

Bases: `matplotlib.patches.LArrow`

(right) Arrow Box

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class **`Round`**(*pad=0.3*, *rounding_size=None*)

Bases: `matplotlib.patches._Base`

A box with round corners.

pad amount of padding

rounding_size rounding radius of corners. *pad* if None

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class **`Round4`**(*pad=0.3*, *rounding_size=None*)

Bases: `matplotlib.patches._Base`

Another box with round edges.

pad amount of padding

rounding_size rounding size of edges. *pad* if None

`transmute`(*x0*, *y0*, *width*, *height*, *mutation_size*)

class Roundtooth(*pad=0.3*, *tooth_size=None*)

Bases: `matplotlib.patches.Sawtooth`

A rounded tooth box.

pad amount of padding

tooth_size size of the sawtooth. pad* if None

transmute(*x0*, *y0*, *width*, *height*, *mutation_size*)

class Sawtooth(*pad=0.3*, *tooth_size=None*)

Bases: `matplotlib.patches._Base`

A sawtooth box.

pad amount of padding

tooth_size size of the sawtooth. pad* if None

transmute(*x0*, *y0*, *width*, *height*, *mutation_size*)

class Square(*pad=0.3*)

Bases: `matplotlib.patches._Base`

A simple square box.

pad amount of padding

transmute(*x0*, *y0*, *width*, *height*, *mutation_size*)

class `matplotlib.patches.`**Circle**(*xy*, *radius=5*, ***kwargs*)

Bases: *matplotlib.patches.Ellipse*

A circle patch.

Create true circle at center *xy* = (*x*, *y*) with given *radius*. Unlike *CirclePolygon* which is a polygonal approximation, this uses Bézier splines and is much closer to a scale-free circle.

Valid kwargs are:

Property	Description
agg_filter	unknown
alpha	float or None
animated	[True | False]
antialiased or aa	[True | False] or None for default
axes	an *Axes* instance
capstyle	['butt' | 'round' | 'projecting']
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color	matplotlib color spec

Continued on

Table 41.3 – continued from previous page

Property	Description
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_radius()

return the radius of the circle

radius

return the radius of the circle

set_radius(*radius*)

Set the radius of the circle

ACCEPTS: float

class `matplotlib.patches.`**CirclePolygon**(*xy*, *radius=5*, *resolution=20*, ***kwargs*)

Bases: `matplotlib.patches.RegularPolygon`

A polygon-approximation of a circle patch.

Create a circle at *xy* = (*x*, *y*) with given *radius*. This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see `Circle`.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None

Continued on

Table 41.4 – continued from previous page

Property	Description
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, 'none', or 'auto'
`facecolor` or fc	mpl color spec, or None for default, or 'none' for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']
`joinstyle`	['miter' | 'round' | 'bevel']
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

class `matplotlib.patches.`**`ConnectionPatch`**(*xyA*, *xyB*, *coordsA*, *coordsB=None*, *axesA=None*, *axesB=None*, *arrowstyle='-'*, *arrow_transmuter=None*, *connectionstyle='arc3'*, *connector=None*, *patchA=None*, *patchB=None*, *shrinkA=0.0*, *shrinkB=0.0*, *mutation_scale=10.0*, *mutation_aspect=None*, *clip_on=False*, *dpi_cor=1.0*, ***kwargs*)

Bases: `matplotlib.patches.FancyArrowPatch`

A `ConnectionPatch` class is to make connecting lines between two points (possibly in different axes).

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*

Valid keys are

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for `matplotlib.patches.PathPatch`

coordsA and *coordsB* are strings that indicate the coordinates of *xyA* and *xyB*.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0,0 is lower left of figure and 1,1 is upper, right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0,1 is lower left of axes and 1,1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	Specify an offset (in points) from the *xy* value
'polar'	you can specify *theta*, *r* for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

draw(*renderer*)

Draw.

get_annotation_clip()

Return *annotation_clip* attribute. See `set_annotation_clip()` for the meaning of return values.

get_path_in_displaycoord()

Return the mutated path of the arrow in the display coord

set_annotation_clip(*b*)

set *annotation_clip* attribute.

- **True: the annotation will only be drawn when self.xy is inside the** axes.

- **False: the annotation will always be drawn regardless of its** position.
- None: the self.xy will be checked only if *xycoords* is "data"

class `matplotlib.patches.`**`ConnectionStyle`**

Bases: `matplotlib.patches._Style`

`ConnectionStyle` is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with *`FancyArrowPatch`*.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

Class	Name	Attrs
Angle	`angle`	angleA=90,angleB=0,rad=0.0
Angle3	`angle3`	angleA=90,angleB=0
Arc	`arc`	angleA=0,angleB=0,armA=None,armB=None,rad=0.0
Arc3	`arc3`	rad=0.0
Bar	`bar`	armA=0.0,armB=0.0,fraction=0.3,angle=None

An instance of any connection style class is an callable object, whose call signature is:

```
__call__(self, posA, posB,
         patchA=None, patchB=None,
         shrinkA=2., shrinkB=2.)
```

and it returns a `Path` instance. *posA* and *posB* are tuples of x,y coordinates of the two points to be connected. *patchA* (or *patchB*) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by *shrinkA* (or *shrinkB*) which is given in points.

return the instance of the subclass with the given style name.

class **`Angle`**(*angleA=90*, *angleB=0*, *rad=0.0*)

Bases: `matplotlib.patches._Base`

Creates a picewise continuous quadratic bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which crosses the start (or end) point and has a angle of angleA (or angleB). The connecting edges are rounded with *rad*.

angleA starting angle of the path

angleB ending angle of the path

rad rounding radius of the edge

`connect`(*posA*, *posB*)

class `Angle3`(*angleA=90*, *angleB=0*)
Bases: `matplotlib.patches._Base`

Creates a simple quadratic bezier curve between two points. The middle control points is placed at the intersecting point of two lines which crosses the start (or end) point and has a angle of angleA (or angleB).

angleA starting angle of the path

angleB ending angle of the path

`connect`(*posA*, *posB*)

class `Arc`(*angleA=0*, *angleB=0*, *armA=None*, *armB=None*, *rad=0.0*)
Bases: `matplotlib.patches._Base`

Creates a picewise continuous quadratic bezier path between two points. The path can have two passing-through points, a point placed at the distance of armA and angle of angleA from point A, another point with respect to point B. The edges are rounded with *rad*.

angleA **:** starting angle of the path

angleB **:** ending angle of the path

armA **:** length of the starting arm

armB **:** length of the ending arm

rad **:** rounding radius of the edges

`connect`(*posA*, *posB*)

class `Arc3`(*rad=0.0*)
Bases: `matplotlib.patches._Base`

Creates a simple quadratic bezier curve between two points. The curve is created so that the middle contol points (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is *rad* times the distance of C0-C2.

rad curvature of the curve.

`connect`(*posA*, *posB*)

class `Bar`(*armA=0.0*, *armB=0.0*, *fraction=0.3*, *angle=None*)
Bases: `matplotlib.patches._Base`

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of armA is determined by (*armA* + *fraction* x AB distance). Same for armB.

Parameters armA : float

minimum length of armA

armB : float

minimum length of armB

fraction : float

a fraction of the distance between two points that will be added to armA and armB.

angle : float or None

angle of the connecting line (if None, parallel to A and B)

connect(*posA*, *posB*)

class `matplotlib.patches.`**`Ellipse`**(*xy*, *width*, *height*, *angle=0.0*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

A scale-free ellipse.

xy center of ellipse

width total length (diameter) of horizontal axis

height total length (diameter) of vertical axis

angle rotation in degrees (anti-clockwise)

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.

Continued on

Table 41.5 – continued from previous page

Property	Description
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

`get_patch_transform`()

`get_path`()

Return the vertices of the rectangle

class `matplotlib.patches.`**`FancyArrow`**(*x*, *y*, *dx*, *dy*, *width=0.001*, *length_includes_head=False*, *head_width=None*, *head_length=None*, *shape='full'*, *overhang=0*, *head_starts_at_zero=False*, ***kwargs*)

Bases: `matplotlib.patches.Polygon`

Like Arrow, but lets you set head width and head height independently.

Constructor arguments

***width*: float (default: 0.001)** width of full arrow tail

***length_includes_head*: [True | False] (default: False)** True if head is to be counted in calculating the length.

***head_width*: float or None (default: 3*width)** total width of the full arrow head

***head_length*: float or None (default: 1.5 * head_width)** length of arrow head

***shape*: ['full', 'left', 'right'] (default: 'full')** draw the left-half, right-half, or full arrow

***overhang*: float (default: 0)** fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

***head_starts_at_zero*: [True | False] (default: False)** if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from `Patch`) are:

Property	Description
`agg_filter`	unknown

Table 41.6 – continued from previous page

Property	Description
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

class `matplotlib.patches.`**`FancyArrowPatch`**(*posA=None*, *posB=None*, *path=None*, *arrowstyle=’simple’*, *arrow_transmuter=None*, *connectionstyle=’arc3’*, *connector=None*, *patchA=None*, *patchB=None*, *shrinkA=2.0*, *shrinkB=2.0*, *mutation_scale=1.0*, *mutation_aspect=None*, *dpi_cor=1.0*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

A fancy arrow patch. It draws an arrow using the :class:ArrowStyle.

If *posA* and *posB* is given, a path connecting two point are created according to the connectionstyle. The path will be clipped with *patchA* and *patchB* and further shrunken by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter. If *path* provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

The *connectionstyle* describes how *posA* and *posB* are connected. It can be an instance of the ConnectionStyle class (matplotlib.patches.ConnectionStlye) or a string of the connectionstyle name, with optional comma-separated attributes. The following connection styles are available.

Class	Name	Attrs
Angle	`angle`	angleA=90,angleB=0,rad=0.0
Angle3	`angle3`	angleA=90,angleB=0
Arc	`arc`	angleA=0,angleB=0,armA=None,armB=None,rad=0.0
Arc3	`arc3`	rad=0.0
Bar	`bar`	armA=0.0,armB=0.0,fraction=0.3,angle=None

The *arrowstyle* describes how the fancy arrow will be drawn. It can be string of the available arrowstyle names, with optional comma-separated attributes, or one of the ArrowStyle instance. The optional attributes are meant to be scaled with the *mutation_scale*. The following arrow styles are available.

Class	Name	Attrs
Curve	`-`	None
CurveB	`->`	head_length=0.4,head_width=0.2
BracketB	`-[`	widthB=1.0,lengthB=0.2,angleB=None
CurveFilledB	`-|>`	head_length=0.4,head_width=0.2
CurveA	`<-`	head_length=0.4,head_width=0.2
CurveAB	`<->`	head_length=0.4,head_width=0.2
CurveFilledA	`<|-`	head_length=0.4,head_width=0.2
CurveFilledAB	`<|-|>`	head_length=0.4,head_width=0.2
BracketA	`]-`	widthA=1.0,lengthA=0.2,angleA=None
BracketAB	`]-[`	widthA=1.0,lengthA=0.2,angleA=None,widthB=1.0,lengthB=0.2,angleB=None
Fancy	`fancy`	head_length=0.4,head_width=0.4,tail_width=0.4
Simple	`simple`	head_length=0.5,head_width=0.5,tail_width=0.2
Wedge	`wedge`	tail_width=0.3,shrink_factor=0.5
BarAB	`|-|`	widthA=1.0,angleA=None,widthB=1.0,angleB=None

mutation_scale [a value with which attributes of arrowstyle] (e.g., head_length) will be scaled. default=1.

mutation_aspect [The height of the rectangle will be] squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. default=None.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default

</table>

draw(*renderer*)

get_arrowstyle()

Return the arrowstyle object

get_connectionstyle()

Return the ConnectionStyle instance

get_dpi_cor()

dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

get_mutation_aspect()

Return the aspect ratio of the bbox mutation.

get_mutation_scale()

Return the mutation scale.

get_path()
return the path of the arrow in the data coordinate. Use get_path_in_displaycoord() method to retrieve the arrow path in the display coord.

get_path_in_displaycoord()
Return the mutated path of the arrow in the display coord

set_arrowstyle(*arrowstyle=None*, ***kw*)
Set the arrow style.

***arrowstyle* can be a string with arrowstyle name with optional** comma-separated attributes. Alternatively, the attrs can be provided as keywords.

set_arrowstyle("Fancy,head_length=0.2") set_arrowstyle("fancy", head_length=0.2)

Old attrs simply are forgotten.

Without argument (or with arrowstyle=None), return available box styles as a list of strings.

set_connectionstyle(*connectionstyle*, ***kw*)
Set the connection style.

***connectionstyle* can be a string with connectionstyle name with** optional comma-separated attributes. Alternatively, the attrs can be provided as keywords.

set_connectionstyle("arc,angleA=0,armA=30,rad=10") set_connectionstyle("arc", angleA=0,armA=30,rad=10)

Old attrs simply are forgotten.

Without argument (or with connectionstyle=None), return available styles as a list of strings.

set_dpi_cor(*dpi_cor*)
dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

set_mutation_aspect(*aspect*)
Set the aspect ratio of the bbox mutation.

ACCEPTS: float

set_mutation_scale(*scale*)
Set the mutation scale.

ACCEPTS: float

set_patchA(*patchA*)
set the begin patch.

set_patchB(*patchB*)
set the begin patch

set_positions(*posA*, *posB*)
set the begin and end positions of the connecting path. Use current value if None.

class `matplotlib.patches.`**`FancyBboxPatch`**(*xy*, *width*, *height*, *boxstyle='round'*, *bbox_transmuter=None*, *mutation_scale=1.0*, *mutation_aspect=None*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

Draw a fancy box around a rectangle with lower left at *xy*=(*x*, *y*) with specified width and height.

`FancyBboxPatch` class is similar to `Rectangle` class, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the `BoxTransmuterBase` and its derived classes.

xy = lower left corner

width, *height*

boxstyle determines what kind of fancy box will be drawn. It can be a string of the style name with a comma separated attribute, or an instance of `BoxStyle`. Following box styles are available.

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3,rounding_size=None
Round4	`round4`	pad=0.3,rounding_size=None
Roundtooth	`roundtooth`	pad=0.3,tooth_size=None
Sawtooth	`sawtooth`	pad=0.3,tooth_size=None
Square	`square`	pad=0.3

mutation_scale : a value with which attributes of boxstyle (e.g., pad) will be scaled. default=1.

mutation_aspect : The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. default=None.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, 'none', or 'auto'
`facecolor` or fc	mpl color spec, or None for default, or 'none' for no color
`figure`	a `matplotlib.figure.Figure` instance

Continued on

Table 41.8 – continued from previous page

Property	Description
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_bbox()

get_boxstyle()

Return the boxstyle object

get_height()

Return the height of the rectangle

get_mutation_aspect()

Return the aspect ratio of the bbox mutation.

get_mutation_scale()

Return the mutation scale.

get_path()

Return the mutated path of the rectangle

get_width()

Return the width of the rectangle

get_x()

Return the left coord of the rectangle

get_y()

Return the bottom coord of the rectangle

set_bounds(**args*)

Set the bounds of the rectangle: l,b,w,h

ACCEPTS: (left, bottom, width, height)

set_boxstyle(*boxstyle=None*, ***kw*)

Set the box style.

boxstyle can be a string with boxstyle name with optional comma-separated attributes. Alternatively, the attrs can be provided as keywords:

```
set_boxstyle("round,pad=0.2")
set_boxstyle("round", pad=0.2)
```

Old attrs simply are forgotten.

Without argument (or with *boxstyle* = None), it returns available box styles.

The following boxstyles are available:

Class	Name	Attrs
Circle	`circle`	pad=0.3
DArrow	`darrow`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
Round	`round`	pad=0.3,rounding_size=None
Round4	`round4`	pad=0.3,rounding_size=None
Roundtooth	`roundtooth`	pad=0.3,tooth_size=None
Sawtooth	`sawtooth`	pad=0.3,tooth_size=None
Square	`square`	pad=0.3

ACCEPTS: [‘circle’ | ‘darrow’ | ‘larrow’ | ‘rarrow’ | ‘round’ | ‘round4’ | ‘roundtooth’ | ‘sawtooth’ | ‘square’]

set_height(*h*)

Set the width rectangle

ACCEPTS: float

set_mutation_aspect(*aspect*)

Set the aspect ratio of the bbox mutation.

ACCEPTS: float

set_mutation_scale(*scale*)

Set the mutation scale.

ACCEPTS: float

set_width(*w*)

Set the width rectangle

ACCEPTS: float

set_x(*x*)

Set the left coord of the rectangle

ACCEPTS: float

set_y(*y*)

Set the bottom coord of the rectangle

ACCEPTS: float

class `matplotlib.patches.`**`Patch`**(*edgecolor=None*, *facecolor=None*, *color=None*, *linewidth=None*, *linestyle=None*, *antialiased=None*, *hatch=None*, *fill=True*, *capstyle=None*, *joinstyle=None*, ***kwargs*)

Bases: `matplotlib.artist.Artist`

A patch is a 2D artist with a face color and an edge color.

If any of *edgecolor*, *facecolor*, *linewidth*, or *antialiased* are *None*, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

`contains`(*mouseevent*, *radius=None*)

Test whether the mouse event occurred in the patch.

Returns T/F, {}

contains_point(*point*, *radius=None*)
Returns *True* if the given point is inside the path (transformed with its transform attribute).

draw(*artist*, *renderer*, **args*, ***kwargs*)
Draw the *Patch* to the given *renderer*.

fill
return whether fill is set

get_aa()
Returns True if the *Patch* is to be drawn with antialiasing.

get_antialiased()
Returns True if the *Patch* is to be drawn with antialiasing.

get_capstyle()
Return the current capstyle

get_data_transform()
Return the *Transform* instance which maps data coordinates to physical coordinates.

get_ec()
Return the edge color of the *Patch*.

get_edgecolor()
Return the edge color of the *Patch*.

get_extents()
Return a *Bbox* object defining the axis-aligned extents of the *Patch*.

get_facecolor()
Return the face color of the *Patch*.

get_fc()
Return the face color of the *Patch*.

get_fill()
return whether fill is set

get_hatch()
Return the current hatching pattern

get_joinstyle()
Return the current joinstyle

get_linestyle()
Return the linestyle. Will be one of ['solid' | 'dashed' | 'dashdot' | 'dotted']

get_linewidth()
Return the line width in points.

get_ls()
Return the linestyle. Will be one of ['solid' | 'dashed' | 'dashdot' | 'dotted']

get_lw()

Return the line width in points.

get_patch_transform()

Return the *Transform* instance which takes patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of this patch

get_transform()

Return the *Transform* applied to the *Patch*.

get_verts()

Return a copy of the vertices used in this patch

If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use *get_path()*.

get_window_extent(*renderer=None*)

set_aa(*aa*)

alias for set_antialiased

set_alpha(*alpha*)

Set the alpha tranparency of the patch.

ACCEPTS: float or None

set_antialiased(*aa*)

Set whether to use antialiased rendering

ACCEPTS: [True | False] or None for default

set_capstyle(*s*)

Set the patch capstyle

ACCEPTS: ['butt' | 'round' | 'projecting']

set_color(*c*)

Set both the edgecolor and the facecolor.

ACCEPTS: matplotlib color spec

See also:

set_facecolor(), ***set_edgecolor()*** For setting the edge or face color individually.

set_ec(*color*)

alias for set_edgecolor

set_edgecolor(*color*)
Set the patch edge color

ACCEPTS: mpl color spec, None, ‘none’, or ‘auto’

set_facecolor(*color*)
Set the patch face color

ACCEPTS: mpl color spec, or None for default, or ‘none’ for no color

set_fc(*color*)
alias for set_facecolor

set_fill(*b*)
Set whether to fill the patch

ACCEPTS: [True | False]

set_hatch(*hatch*)
Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

ACCEPTS: [’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]

set_joinstyle(*s*)
Set the patch joinstyle

ACCEPTS: [’miter’ | ‘round’ | ‘bevel’]

set_linestyle(*ls*)
Set the patch linestyle

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

ACCEPTS: ['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'` | `' '` | `''`]

Parameters ls : { '-', '–', '-.', ':' } and more see description

The line style.

`set_linewidth`(*w*)
Set the patch linewidth in points

ACCEPTS: float or None for default

`set_ls`(*ls*)
alias for set_linestyle

`set_lw`(*lw*)
alias for set_linewidth

`update_from`(*other*)
Updates this `Patch` from the properties of *other*.

`validCap` = ('butt', 'round', 'projecting')

`validJoin` = ('miter', 'round', 'bevel')

`zorder` = 1

class `matplotlib.patches.`**`PathPatch`**(*path*, ***kwargs*)
Bases: `matplotlib.patches.Patch`

A general polycurve path patch.

path is a `matplotlib.path.Path` object.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]

Continued on

Table 41.10 – continued from previous page

Property	Description
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, 'none', or 'auto'
`facecolor` or fc	mpl color spec, or None for default, or 'none' for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	['/' | '\' | '|' | '-' | '+' | 'x' | 'o' | 'O' | '.' | '*']
`joinstyle`	['miter' | 'round' | 'bevel']
`label`	string or anything printable with '%s' conversion.
`linestyle` or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

See also:

`Patch` For additional kwargs

`get_path`()

class `matplotlib.patches.`**`Polygon`**(*xy*, *closed=True*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

A general polygon patch.

xy is a numpy array with shape Nx2.

If *closed* is *True*, the polygon will be closed so the starting and ending points are the same.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None

Continued on

Table 41.11 – continued from previous page

Property	Description
animated	[True | False]
antialiased or aa	[True | False] or None for default
axes	an *Axes* instance
capstyle	[’butt’ | ‘round’ | ‘projecting’]
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color	matplotlib color spec
contains	a callable function
edgecolor or ec	mpl color spec, None, ‘none’, or ‘auto’
facecolor or fc	mpl color spec, or None for default, or ‘none’ for no color
figure	a *matplotlib.figure.Figure* instance
fill	[True | False]
gid	an id string
hatch	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
joinstyle	[’miter’ | ‘round’ | ‘bevel’]
label	string or anything printable with ‘%s’ conversion.
linestyle or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
linewidth or lw	float or None for default
path_effects	unknown
picker	[None|float|boolean|callable]
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
transform	*Transform* instance
url	a url string
visible	[True | False]
zorder	any number

See also:

Patch For additional kwargs

get_closed()

Returns if the polygon is closed

Returns closed : bool

If the path is closed

get_path()

Get the path of the polygon

Returns path : Path

The *Path* object for the polygon

get_xy()

Get the vertices of the path

Returns vertices : numpy array

The coordinates of the vertices as a Nx2 ndarray.

set_closed(*closed*)

Set if the polygon is closed

Parameters closed : bool

True if the polygon is closed

set_xy(*xy*)

Set the vertices of the polygon

Parameters xy : numpy array or iterable of pairs

The coordinates of the vertices as a Nx2 ndarray or iterable of pairs.

xy

Set/get the vertices of the polygon. This property is provided for backward compatibility with matplotlib 0.91.x only. New code should use *get_xy()* and *set_xy()* instead.

class matplotlib.patches.**Rectangle**(*xy*, *width*, *height*, *angle=0.0*, ***kwargs*)

Bases: *matplotlib.patches.Patch*

Draw a rectangle with lower left at *xy* = (*x*, *y*) with specified *width* and *height*.

angle rotation in degrees (anti-clockwise)

fill is a boolean indicating whether to fill the rectangle

Valid kwargs are:

Property	Description
agg_filter	unknown
alpha	float or None
animated	[True | False]
antialiased or aa	[True | False] or None for default
axes	an *Axes* instance
capstyle	['butt' | 'round' | 'projecting']
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color	matplotlib color spec
contains	a callable function
edgecolor or ec	mpl color spec, None, 'none', or 'auto'
facecolor or fc	mpl color spec, or None for default, or 'none' for no color
figure	a *matplotlib.figure.Figure* instance
fill	[True | False]

Continued on

Table 41.12 – continued from previous page

Property	Description
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_bbox()

get_height()
Return the height of the rectangle

get_patch_transform()

get_path()
Return the vertices of the rectangle

get_width()
Return the width of the rectangle

get_x()
Return the left coord of the rectangle

get_xy()
Return the left and bottom coords of the rectangle

get_y()
Return the bottom coord of the rectangle

set_bounds(**args*)
Set the bounds of the rectangle: l,b,w,h

ACCEPTS: (left, bottom, width, height)

set_height(*h*)
Set the width rectangle

ACCEPTS: float

set_width(*w*)

Set the width rectangle

ACCEPTS: float

set_x(*x*)

Set the left coord of the rectangle

ACCEPTS: float

set_xy(*xy*)

Set the left and bottom coords of the rectangle

ACCEPTS: 2-item sequence

set_y(*y*)

Set the bottom coord of the rectangle

ACCEPTS: float

xy

Return the left and bottom coords of the rectangle

class matplotlib.patches.**RegularPolygon**(*xy*, *numVertices*, *radius=5*, *orientation=0*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

A regular polygon patch.

Constructor arguments:

xy A length 2 tuple (*x*, *y*) of the center.

numVertices the number of vertices.

radius The distance from the center to each of the vertices.

orientation rotates the polygon (in radians).

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	['butt' | 'round' | 'projecting']
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, 'none', or 'auto'

Continued on

Table 41.13 – continued from previous page

Property	Description
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_patch_transform()

get_path()

numvertices

orientation

radius

xy

class `matplotlib.patches.`**Shadow**(*patch*, *ox*, *oy*, *props=None*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

Create a shadow of the given *patch* offset by *ox*, *oy*. *props*, if not *None*, is a patch property update dictionary. If *None*, the shadow will have have the same color as the face, but darkened.

kwargs are

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

draw(*renderer*)

get_patch_transform()

get_path()

class `matplotlib.patches.`**Wedge**(*center*, *r*, *theta1*, *theta2*, *width=None*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

Wedge shaped patch.

Draw a wedge centered at *x*, *y* center with radius *r* that sweeps *theta1* to *theta2* (in degrees). If *width* is given, then a partial wedge is drawn from inner radius *r* - *width* to outer radius *r*.

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_path()

set_center(*center*)

set_radius(*radius*)

set_theta1(*theta1*)

set_theta2(*theta2*)

set_width(*width*)

class `matplotlib.patches.`**YAArrow**(*figure*, *xytip*, *xybase*, *width=4*, *frac=0.1*, *headwidth=12*, ***kwargs*)

Bases: `matplotlib.patches.Patch`

Yet another arrow class.

This is an arrow that is defined in display space and has a tip at *x1*, *y1* and a base at *x2*, *y2*.

Constructor arguments:

xytip (*x*, *y*) location of arrow tip

xybase (*x*, *y*) location the arrow base mid point

figure The `Figure` instance (fig.dpi)

width The width of the arrow in points

frac The fraction of the arrow length occupied by the head

headwidth The width of the base of the arrow head in points

Valid kwargs are:

Property	Description
`agg_filter`	unknown
`alpha`	float or None
`animated`	[True | False]
`antialiased` or aa	[True | False] or None for default
`axes`	an `Axes` instance
`capstyle`	[’butt’ | ‘round’ | ‘projecting’]
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	matplotlib color spec
`contains`	a callable function
`edgecolor` or ec	mpl color spec, None, ‘none’, or ‘auto’
`facecolor` or fc	mpl color spec, or None for default, or ‘none’ for no color
`figure`	a `matplotlib.figure.Figure` instance
`fill`	[True | False]
`gid`	an id string
`hatch`	[’/’ | ‘\’ | ‘|’ | ‘-‘ | ‘+’ | ‘x’ | ‘o’ | ‘O’ | ‘.’ | ‘*’]
`joinstyle`	[’miter’ | ‘round’ | ‘bevel’]
`label`	string or anything printable with ‘%s’ conversion.
`linestyle` or ls	[’solid’ | ‘dashed’, ‘dashdot’, ‘dotted’ | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | `':'` | `'None'`
`linewidth` or lw	float or None for default

Continued on

Table 41.16 – continued from previous page

Property	Description
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`rasterized`	[True | False | None]
`sketch_params`	unknown
`snap`	unknown
`transform`	`Transform` instance
`url`	a url string
`visible`	[True | False]
`zorder`	any number

get_patch_transform()

get_path()

getpoints(*x1*, *y1*, *x2*, *y2*, *k*)

For line segment defined by (*x1*, *y1*) and (*x2*, *y2*) return the points on the line that is perpendicular to the line and intersects (*x2*, *y2*) and the distance from (*x2*, *y2*) of the returned points is *k*.

matplotlib.patches.**bbox_artist**(*artist*, *renderer*, *props=None*, *fill=True*)

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox.

props is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

matplotlib.patches.**draw_bbox**(*bbox*, *renderer*, *color='k'*, *trans=None*)

This is a debug function to draw a rectangle around the bounding box returned by `get_window_extent()` of an artist, to test whether the artist is returning the correct bbox.

CHAPTER

FORTYTWO

PATH

42.1 matplotlib.path

A module for dealing with the polylines used throughout matplotlib.

The primary class for polyline handling in matplotlib is `Path`. Almost all vector drawing makes use of Paths somewhere in the drawing pipeline.

Whilst a `Path` instance itself cannot be drawn, there exists `Artist` subclasses which can be used for convenient Path visualisation - the two most frequently used of these are `PathPatch` and `PathCollection`.

class `matplotlib.path.`**`Path`**(*vertices*, *codes=None*, *_interpolation_steps=1*, *closed=False*, *readonly=False*)

Bases: `object`

`Path` represents a series of possibly disconnected, possibly closed, line and curve segments.

The underlying storage is made up of two parallel numpy arrays:

- *vertices*: an Nx2 float array of vertices
- *codes*: an N-length uint8 array of vertex types

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes `CURVE3`.

The code types are:

- **`STOP`** [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)
- **`MOVETO`** [1 vertex] Pick up the pen and move to the given vertex.
- **`LINETO`** [1 vertex] Draw a line from the current position to the given vertex.
- **`CURVE3`** [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.
- **`CURVE4`** [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.
- **`CLOSEPOLY`** [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use `iter_segments()` or `cleaned()` to get the vertex/code pairs. This is important, since many `Path` objects, as an optimization, do not store a *codes* at all, but have a default one provided for them by `iter_segments()`.

Note: The vertices and codes arrays should be treated as immutable – there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

Create a new path with the given vertices and codes.

Parameters vertices : array_like

The `(n, 2)` float array, masked array or sequence of pairs representing the vertices of the path.

If *vertices* contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as `iter_segments()`.

codes : {None, array_like}, optional

n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

_interpolation_steps : int, optional

Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

closed : bool, optional

If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon.

readonly : bool, optional

Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = 79

CURVE3 = 3

CURVE4 = 4

LINETO = 2

MOVETO = 1

NUM_VERTICES_FOR_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}
A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = 0

classmethod arc(*theta1*, *theta2*, *n=None*, *is_wedge=False*)
Return an arc on the unit circle from angle *theta1* to angle *theta2* (in degrees).

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

> Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

classmethod circle(*center=(0.0, 0.0)*, *radius=1.0*, *readonly=False*)
Return a Path representing a circle of a given radius and center.

Parameters center : pair of floats

The center of the circle. Default `(0, 0)`.

radius : float

The radius of the circle. Default is 1.

readonly : bool

Whether the created path should have the "readonly" argument set when creating the Path instance.

Notes

The circle is approximated using cubic Bezier curves. This uses 8 splines around the circle using the approach presented here:

> Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

cleaned(*transform=None*, *remove_nans=False*, *clip=None*, *quantize=False*, *simplify=False*, *curves=False*, *stroke_width=1.0*, *snap=False*, *sketch=None*)
Cleans up the path according to the parameters returning a new Path instance.

See also:

See `iter_segments()` for details of the keyword arguments.

Returns Path instance with cleaned up vertices and codes.

clip_to_bbox(*bbox*, *inside=True*)
Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

`code_type`
alias of `uint8`

`codes`
The list of codes in the *`Path`* as a 1-D numpy array. Each code is one of *`STOP`*, *`MOVETO`*, *`LINETO`*, *`CURVE3`*, *`CURVE4`* or *`CLOSEPOLY`*. For codes that correspond to more than one vertex (*`CURVE3`* and *`CURVE4`*), that code will be repeated so that the length of `self.vertices` and `self.codes` is always the same.

`contains_path`(*path*, *transform=None*)
Returns whether this (closed) path completely contains the given path.

If *transform* is not `None`, the path will be transformed before performing the test.

`contains_point`(*point*, *transform=None*, *radius=0.0*)
Returns whether the (closed) path contains the given point.

If *transform* is not `None`, the path will be transformed before performing the test.

radius allows the path to be made slightly larger or smaller.

`contains_points`(*points*, *transform=None*, *radius=0.0*)
Returns a bool array which is `True` if the (closed) path contains the corresponding point.

If *transform* is not `None`, the path will be transformed before performing the test.

radius allows the path to be made slightly larger or smaller.

`copy`()
Returns a shallow copy of the *`Path`*, which will share the vertices and codes with the source *`Path`*.

`deepcopy`(*memo=None*)
Returns a deepcopy of the *`Path`*. The *`Path`* will not be readonly, even if the source *`Path`* is.

`get_extents`(*transform=None*)
Returns the extents (*xmin*, *ymin*, *xmax*, *ymax*) of the path.

Unlike computing the extents on the *vertices* alone, this algorithm will take into account the curves and deal with control points appropriately.

`has_nonfinite`
`True` if the vertices array has nonfinite values.

classmethod `hatch`(*hatchpattern*, *density=6*)
Given a hatch specifier, *hatchpattern*, generates a Path that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

`interpolated`(*steps*)
Returns a new path resampled to length N x steps. Does not currently handle interpolating curves.

`intersects_bbox`(*bbox*, *filled=True*)
Returns *True* if this path intersects a given *`Bbox`*.

filled, when True, treats the path as if it was filled. That is, if one path completely encloses the other, `intersects_path()` will return True.

`intersects_path`(*other*, *filled=True*)

Returns *True* if this path intersects another given path.

filled, when True, treats the paths as if they were filled. That is, if one path completely encloses the other, `intersects_path()` will return True.

`iter_segments`(*transform=None*, *remove_nans=True*, *clip=None*, *snap=False*, *stroke_width=1.0*, *simplify=None*, *curves=True*, *sketch=None*)

Iterates over all of the curve segments in the path. Each iteration returns a 2-tuple (*vertices*, *code*), where *vertices* is a sequence of 1 - 3 coordinate pairs, and *code* is one of the `Path` codes.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

Parameters transform : None or `Transform` instance

If not None, the given affine transformation will be applied to the path.

remove_nans : {False, True}, optional

If True, will remove all NaNs from the path and insert MOVETO commands to skip over them.

clip : None or sequence, optional

If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

snap : None or bool, optional

If None, auto-snap to pixels, to reduce fuzziness of rectilinear lines. If True, force snapping, and if False, don't snap.

stroke_width : float, optional

The width of the stroke being drawn. Needed as a hint for the snapping algorithm.

simplify : None or bool, optional

If True, perform simplification, to remove vertices that do not affect the appearance of the path. If False, perform no simplification. If None, use the should_simplify member variable.

curves : {True, False}, optional

If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

sketch : None or sequence, optional

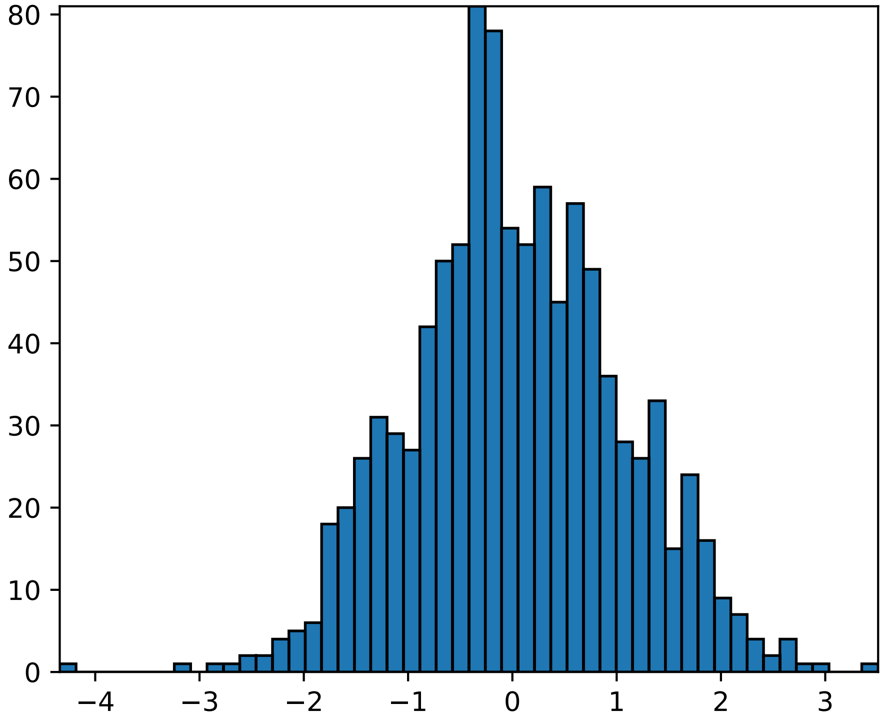
If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

classmethod `make_compound_path`(**args*)

Make a compound path from a list of Path objects.

classmethod `make_compound_path_from_polys`(*XY*)

Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a `Path`



`readonly`

`True` if the `Path` is read-only.

`should_simplify`

`True` if the vertices array should be simplified.

`simplify_threshold`

The fraction of a pixel difference below which vertices will be simplified out.

`to_polygons`(*transform=None*, *width=0*, *height=0*, *closed_only=True*)

Convert this path to a list of polygons or polylines. Each polygon/polyline is an Nx2 array of vertices. In other words, each polygon has no `MOVETO` instructions or curves. This is useful for displaying in backends that do not support compound paths or Bezier curves, such as GDK.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (width, height) will be clipped.

If *closed_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

`transformed`(*transform*)

Return a transformed copy of the path.

See also:

`matplotlib.transforms.TransformedPath` A specialized path class that will cache the transformed result and automatically update when the transform changes.

classmethod `unit_circle`()

Return the readonly *`Path`* of the unit circle.

For most cases, *`Path.circle()`* will be what you want.

classmethod `unit_circle_righthalf`()

Return a *`Path`* of the right half of a unit circle. The circle is approximated using cubic Bezier curves. This uses 4 splines around the circle using the approach presented here:

> Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

classmethod `unit_rectangle`()

Return a *`Path`* instance of the unit rectangle from (0, 0) to (1, 1).

classmethod `unit_regular_asterisk`(*numVertices*)

Return a *`Path`* for a unit regular asterisk with the given numVertices and radius of 1.0, centered at (0, 0).

classmethod `unit_regular_polygon`(*numVertices*)

Return a *`Path`* instance for a unit regular polygon with the given *numVertices* and radius of 1.0, centered at (0, 0).

classmethod `unit_regular_star`(*numVertices*, *innerCircle=0.5*)

Return a *`Path`* for a unit regular star with the given numVertices and radius of 1.0, centered at (0, 0).

`vertices`

The list of vertices in the *`Path`* as an Nx2 numpy array.

classmethod `wedge`(*theta1*, *theta2*, *n=None*)

Return a wedge of the unit circle from angle *theta1* to angle *theta2* (in degrees).

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

`matplotlib.path.`**`get_path_collection_extents`**(*master_transform*, *paths*, *transforms*, *offsets*, *offset_transform*)

Given a sequence of *`Path`* objects, *`Transform`* objects and offsets, as found in a *`PathCollection`*, returns the bounding box that encapsulates all of them.

master_transform is a global transformation to apply to all paths

paths is a sequence of `Path` instances.

transforms is a sequence of `Affine2D` instances.

offsets is a sequence of (x, y) offsets (or an Nx2 array)

offset_transform is a `Affine2D` to apply to the offsets before applying the offset to the path.

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections. Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

> (A, A, A), (B, B, A), (C, A, A)

`matplotlib.path.`**`get_paths_extents`**`(`*paths*, *transforms=[]*`)`

Given a sequence of `Path` objects and optional `Transform` objects, returns the bounding box that encapsulates all of them.

paths is a sequence of `Path` instances.

transforms is an optional sequence of `Affine2D` instances to apply to each path.

CHAPTER

FORTYTHREE

PATHEFFECTS

43.1 `matplotlib.patheffects`

Defines classes for path effects. The path effects are supported in *`Text`*, *`Line2D`* and *`Patch`*.

class `matplotlib.patheffects.`**`AbstractPathEffect`**(*offset=(0.0, 0.0)*)

Bases: `object`

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

Parameters offset : pair of floats

The offset to apply to the path, measured in points.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace=None*)

Derived should override this method. The arguments are the same as *`matplotlib.backend_bases.RendererBase.draw_path()`* except the first argument is a renderer.

class `matplotlib.patheffects.`**`Normal`**(*offset=(0.0, 0.0)*)

Bases: *`matplotlib.patheffects.AbstractPathEffect`*

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

Parameters offset : pair of floats

The offset to apply to the path, measured in points.

class `matplotlib.patheffects.`**`PathEffectRenderer`**(*path_effects*, *renderer*)

Bases: *`matplotlib.backend_bases.RendererBase`*

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate *`AbstractPathEffect`* draw method.

Note: Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

Parameters path_effects : iterable of *AbstractPathEffect*

The path effects which this renderer represents.

renderer : *matplotlib.backend_bases.RendererBase* instance

copy_with_path_effect(*path_effects*)

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, **args*, ***kwargs*)

draw_path(*gc*, *tpath*, *affine*, *rgbFace=None*)

draw_path_collection(*gc*, *master_transform*, *paths*, **args*, ***kwargs*)

new_gc()

points_to_pixels(*points*)

class matplotlib.patheffects.**PathPatchEffect**(*offset=(0, 0)*, ***kwargs*)

Bases: *matplotlib.patheffects.AbstractPathEffect*

Draws a *PathPatch* instance whose Path comes from the original PathEffect artist.

Parameters offset : pair of floats

The offset to apply to the path, in points.

****kwargs :**

All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip_box" "transform" and "clip_path".

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

class matplotlib.patheffects.**SimpleLineShadow**(*offset=(2, -2)*, *shadow_color='k'*, *alpha=0.3*, *rho=0.3*, ***kwargs*)

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a line.

Parameters offset : pair of floats

The offset to apply to the path, in points.

shadow_color : color

The shadow color. Default is black. A value of `None` takes the original artist's color with a scale factor of `rho`.

alpha : float

The alpha transparency of the created shadow patch. Default is 0.3.

rho : float

A scale factor to apply to the rgbFace color if `shadow_rgbFace` is `None`. Default is 0.3.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class `matplotlib.patheffects.`**`SimplePatchShadow`**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: `matplotlib.patheffects.AbstractPathEffect`

A simple shadow via a filled patch.

Parameters offset : pair of floats

The offset of the shadow in points.

shadow_rgbFace : color

The shadow color.

alpha : float

The alpha transparency of the created shadow patch. Default is 0.3. http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html

rho : float

A scale factor to apply to the rgbFace color if `shadow_rgbFace` is not specified. Default is 0.3.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class `matplotlib.patheffects.`**`Stroke`**(*offset=(0, 0)*, ***kwargs*)

Bases: `matplotlib.patheffects.AbstractPathEffect`

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

draw the path with updated gc.

class `matplotlib.patheffects.`**`withSimplePatchShadow`**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: `matplotlib.patheffects.SimplePatchShadow`

Adds a simple `SimplePatchShadow` and then draws the original Artist to avoid needing to call `Normal`.

Parameters offset : pair of floats

The offset of the shadow in points.

shadow_rgbFace : color

The shadow color.

alpha : float

The alpha transparency of the created shadow patch. Default is 0.3. http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html

rho : float

A scale factor to apply to the rgbFace color if `shadow_rgbFace` is not specified. Default is 0.3.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

class `matplotlib.patheffects.`**`withStroke`**(*offset=(0, 0)*, ***kwargs*)

Bases: `matplotlib.patheffects.Stroke`

Adds a simple `Stroke` and then draws the original Artist to avoid needing to call `Normal`.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path`(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

CHAPTER

FORTYFOUR

PROJECTIONS

44.1 `matplotlib.projections`

class `matplotlib.projections.`**`ProjectionRegistry`**

Bases: `object`

Manages the set of projections available to the system.

`get_projection_class`(*name*)

Get a projection class from its *name*.

`get_projection_names`()

Get a list of the names of all projections currently registered.

`register`(**projections*)

Register a new set of projection(s).

`matplotlib.projections.`**`get_projection_class`**(*projection=None*)

Get a projection class from its name.

If *projection* is None, a standard rectilinear projection is returned.

`matplotlib.projections.`**`get_projection_names`**()

Get a list of acceptable projection names.

`matplotlib.projections.`**`process_projection_requirements`**(*figure*, **args*, ***kwargs*)

Handle the args/kwargs to for add_axes/add_subplot/gca, returning:

```
(axes_proj_class, proj_class_kwargs, proj_stack_key)
```

Which can be used for new axes initialization/identification.

Note: **kwargs** is modified in place.

44.2 `matplotlib.projections.polar`

class `matplotlib.projections.polar.`**`InvertedPolarTransform`**(*axis=None*, *use_rmin=True*)

Bases: `matplotlib.transforms.Transform`

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

`inverted`()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x === self.inverted().transform(self.transform(x))`

`transform_non_affine`(*xy*)

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

class `matplotlib.projections.polar.`**`PolarAffine`**(*scale_transform*, *limits*)

Bases: `matplotlib.transforms.Affine2DBase`

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

limits is the view limit of the data. The only part of its bounds that is used is ymax (for the radius maximum). The theta range is always fixed to (0, 2pi).

`get_matrix`()

Get the Affine transformation array for the affine part of this transform.

class `matplotlib.projections.polar.`**`PolarAxes`**(**args*, ***kwargs*)

Bases: `matplotlib.axes._axes.Axes`

A polar graph projection, where the input dimensions are *theta*, *r*.

Theta starts pointing east and goes anti-clockwise.

class **`InvertedPolarTransform`**(*axis=None*, *use_rmin=True*)

Bases: `matplotlib.transforms.Transform`

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

`inverted`()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x === self.inverted().transform(self.transform(x))`

`transform_non_affine`(*xy*)

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

class **`PolarAffine`**(*scale_transform*, *limits*)

Bases: `matplotlib.transforms.Affine2DBase`

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

limits is the view limit of the data. The only part of its bounds that is used is ymax (for the radius maximum). The theta range is always fixed to (0, 2pi).

`get_matrix`()

Get the Affine transformation array for the affine part of this transform.

class **`PolarTransform`**(*axis=None*, *use_rmin=True*)

Bases: `matplotlib.transforms.Transform`

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

`inverted`()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x === self.inverted().transform(self.transform(x))`

`transform_non_affine`(*tr*)

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_path_non_affine`(*path*)

Returns a path, transformed only by the non-affine part of this transform.

path: a `Path` instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(va`

class **`RadialLocator`**(*base*)

Bases: `matplotlib.ticker.Locator`

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base `Locator` (which may be different depending on the scale of the *r*-axis.

class **`ThetaFormatter`**

Bases: `matplotlib.ticker.Formatter`

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

`can_pan`()

Return *True* if this axes supports the pan/zoom button functionality.

For polar axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

`can_zoom`()

Return *True* if this axes supports the zoom box button functionality.

Polar axes do not support zoom boxes.

`format_coord`(*theta*, *r*)

Return a format string formatting the coordinate using Unicode characters.

`get_data_ratio`()

Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

`get_rlabel_position`()

Returns float

The theta position of the radius labels in degrees.

`get_theta_direction`()

Get the direction in which theta increases.

-1: Theta increases in the clockwise direction

1: Theta increases in the counterclockwise direction

`get_theta_offset`()

Get the offset for the location of 0 in radians.

`set_rgrids`(*radii*, *labels=None*, *angle=None*, *fmt=None*, ***kwargs*)

Set the radial locations and labels of the *r* grids.

The labels will appear at radial distances *radii* at the given *angle* in degrees.

labels, if not None, is a `len(radii)` list of strings of the labels to use at each radius.

If *labels* is None, the built-in formatter will be used.

Return value is a list of tuples (*line*, *label*), where *line* is `Line2D` instances and the *label* is `Text` instances.

kwargs are optional text properties for the labels:

Property	Description
`agg_filter`	unknown
`alpha`	float (0.0 transparent through 1.0 opaque)
`animated`	[True | False]
`axes`	an `Axes` instance
`backgroundcolor`	any matplotlib color
`bbox`	FancyBboxPatch prop dict
`clip_box`	a `matplotlib.transforms.Bbox` instance
`clip_on`	[True | False]
`clip_path`	[(`Path`, `Transform`) | `Patch` | None]
`color`	any matplotlib color
`contains`	a callable function
`family` or fontfamily or fontname or name	[FONTNAME | ‘serif’ | ‘sans-serif’ | ‘cursive’ | ‘fantasy’ | ‘monospace’]
`figure`	a `matplotlib.figure.Figure` instance
`fontproperties` or font_properties	a `matplotlib.font_manager.FontProperties` instance
`gid`	an id string
`horizontalalignment` or ha	[‘center’ | ‘right’ | ‘left’]
`label`	string or anything printable with ‘%s’ conversion.
`linespacing`	float (multiple of font size)
`multialignment`	[’left’ | ‘right’ | ‘center’]
`path_effects`	unknown
`picker`	[None|float|boolean|callable]
`position`	(x,y)
`rasterized`	[True | False | None]
`rotation`	[angle in degrees | ‘vertical’ | ‘horizontal’]
`rotation_mode`	unknown
`size` or fontsize	[size in points | ‘xx-small’ | ‘x-small’ | ‘small’ | ‘medium’ | ‘large’ | ‘x-large’
`sketch_params`	unknown
`snap`	unknown
`stretch` or fontstretch	[a numeric value in range 0-1000 | ‘ultra-condensed’ | ‘extra-condensed’ | ‘c
`style` or fontstyle	[‘normal’ | ‘italic’ | ‘oblique’]
`text`	string or anything printable with ‘%s’ conversion.
`transform`	`Transform` instance
`url`	a url string
`usetex`	unknown
`variant` or fontvariant	[‘normal’ | ‘small-caps’]
`verticalalignment` or ma or va	[‘center’ | ‘top’ | ‘bottom’ | ‘baseline’]
`visible`	[True | False]

Table 44.1 – continued fron

Property	Description
weight or fontweight	[a numeric value in range 0-1000 | 'ultralight' | 'light' | 'normal' | 'regular' |
wrap	unknown
x	float
y	float
zorder	any number

ACCEPTS: sequence of floats

set_rlabel_position(*value*)

Updates the theta position of the radius labels.

Parameters value : number

The angular position of the radius labels in degrees.

set_theta_direction(*direction*)

Set the direction in which theta increases.

clockwise, -1: Theta increases in the clockwise direction

counterclockwise, anticlockwise, 1: Theta increases in the counterclockwise direction

set_theta_offset(*offset*)

Set the offset for the location of 0 in radians.

set_theta_zero_location(*loc*)

Sets the location of theta's zero. (Calls set_theta_offset with the correct value in radians under the hood.)

May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".

set_thetagrids(*angles*, *labels=None*, *frac=None*, *fmt=None*, ***kwargs*)

Set the angles at which to place the theta grids (these gridlines are equal along the theta dimension). *angles* is in degrees.

labels, if not None, is a `len(angles)` list of strings of the labels to use at each angle.

If *labels* is None, the labels will be `fmt % angle`

frac is the fraction of the polar axes radius at which to place the label (1 is the edge). e.g., 1.05 is outside the axes and 0.95 is inside the axes.

Return value is a list of tuples (*line*, *label*), where *line* is `Line2D` instances and the *label* is `Text` instances.

kwargs are optional text properties for the labels:

Property	Description

`x`	float
`y`	float
`zorder`	any number

ACCEPTS: sequence of floats

class `matplotlib.projections.polar.`**`PolarTransform`**(*axis=None*, *use_rmin=True*)

Bases: `matplotlib.transforms.Transform`

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

`inverted`()

Return the corresponding inverse transformation.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`x === self.inverted().transform(self.transform(x))`

`transform_non_affine`(*tr*)

Performs only the non-affine part of the transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Accepts a numpy array of shape (N x `input_dims`) and returns a numpy array of shape (N x `output_dims`).

Alternatively, accepts a numpy array of length `input_dims` and returns a numpy array of length `output_dims`.

`transform_path_non_affine`(*path*)

Returns a path, transformed only by the non-affine part of this transform.

path: a `Path` instance.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(value`

class `matplotlib.projections.polar.`**`RadialLocator`**(*base*)

Bases: `matplotlib.ticker.Locator`

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base `Locator` (which may be different depending on the scale of the *r*-axis.

class `matplotlib.projections.polar.`**`ThetaFormatter`**

Bases: `matplotlib.ticker.Formatter`

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

CHAPTER

FORTYFIVE

PYPLOT

45.1 `matplotlib.pyplot`

Provides a MATLAB-like plotting framework.

`pylab` combines pyplot with numpy into a single namespace. This is convenient for interactive work, but for programming it is recommended that the namespaces be kept separate, e.g.:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1);
y = np.sin(x)
plt.plot(x, y)
```

`matplotlib.pyplot.`**`acorr`**(*x*, *hold=None*, *data=None*, ***kwargs*)

Plot the autocorrelation of `x`.

Parameters x : sequence of scalar

hold : boolean, optional, *deprecated*, default: True

detrend : callable, optional, default: `mlab.detrend_none`

x is detrended by the `detrend` callable. Default is no normalization.

normed : boolean, optional, default: True

if True, input vectors are normalised to unit length.

usevlines : boolean, optional, default: True

if True, Axes.vlines is used to plot the vertical lines from the origin to the acorr. Otherwise, Axes.plot is used.

maxlags : integer, optional, default: 10

number of lags to show. If None, will return all 2 * len(x) - 1 lags.

Returns (lags, c, line, b) : where:

- `lags` are a length 2‘maxlags+1 lag vector.
- `c` is the 2‘maxlags+1 auto correlation vectorI

- `line` is a *Line2D* instance returned by *plot*.
- `b` is the x-axis.

Other Parameters linestyle : *Line2D* prop, optional, default: None

Only used if usevlines is False.

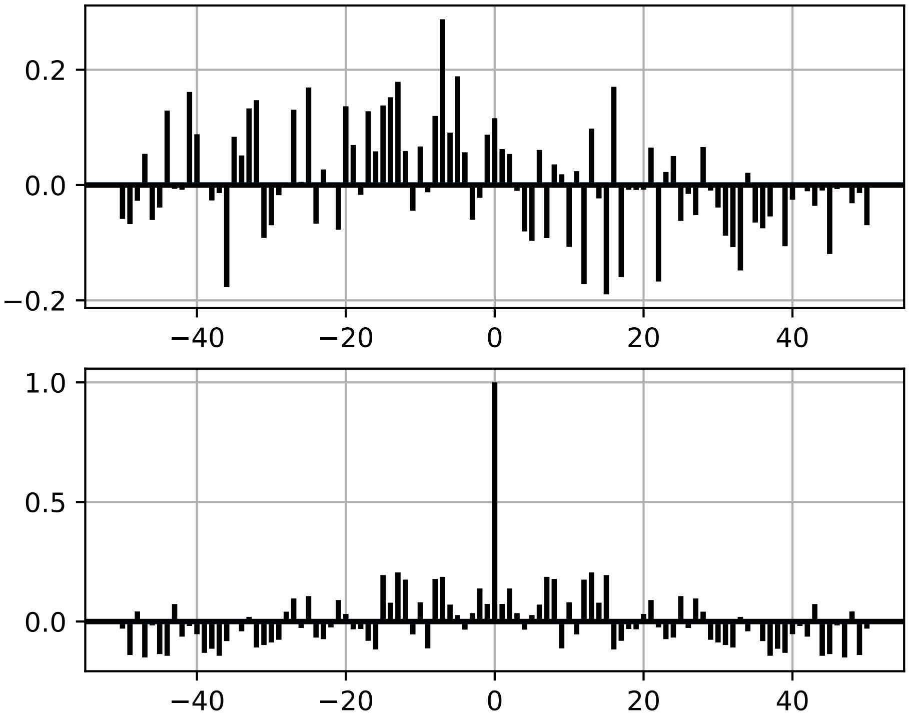
marker : string, optional, default: 'o'

Notes

The cross correlation is performed with `numpy.correlate()` with `mode` = 2.

Examples

xcorr is top graph, and *acorr* is bottom graph.



Note: In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x'.

`matplotlib.pyplot.`**`angle_spectrum`**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *hold=None*, *data=None*, ***kwargs*)

Plot the angle spectrum.

Call signature:

```
angle_spectrum(x, Fs=2, Fc=0,  window=mlab.window_hanning,
               pad_to=None, sides='default', **kwargs)
```

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters x : 1-D array or sequence

Array or sequence containing the data

Fs : scalar

The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

window : callable or ndarray

A function or a vector of length *NFFT*. To create window vectors see `window_hanning()`, `window_none()`, `numpy.blackman()`, `numpy.hamming()`, `numpy.bartlett()`, `scipy.signal()`, `scipy.signal.get_window()`, etc. The default is `window_hanning()`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides : [‘default’ | ‘onesided’ | ‘twosided’]

Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to : integer

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft(). The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc : integer

The center frequency of *x* (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

****kwargs :**

Keyword arguments control the `Line2D` properties:

Property	Description
agg_filter	unknown
alpha	float (0.0 transparent through 1.0 opaque)
animated	[True | False]
antialiased or aa	[True | False]
axes	an *Axes* instance
clip_box	a *matplotlib.transforms.Bbox* instance
clip_on	[True | False]
clip_path	[(*Path*, *Transform*) | *Patch* | None]
color or c	any matplotlib color
contains	a callable function
dash_capstyle	['butt' | 'round' | 'projecting']
dash_joinstyle	['miter' | 'round' | 'bevel']
dashes	sequence of on/off ink in points
drawstyle	['default' | 'steps' | 'steps-pre' | 'steps-mid' | 'steps-post']
figure	a *matplotlib.figure.Figure* instance
fillstyle	['full' | 'left' | 'right' | 'bottom' | 'top' | 'none']
gid	an id string
label	string or anything printable with '%s' conversion.
linestyle or ls	['solid' | 'dashed', 'dashdot', 'dotted' | (offset, on-off-dash-seq) | `'-'` | `'--'` | `'-.'` | '
linewidth or lw	float value in points
marker	*A valid marker style*
markeredgecolor or mec	any matplotlib color
markeredgewidth or mew	float value in points
markerfacecolor or mfc	any matplotlib color
markerfacecoloralt or mfcalt	any matplotlib color
markersize or ms	float
markevery	[None | int | length-2 tuple of int | slice | list/array of int | float | length-2 tuple of float]
path_effects	unknown
picker	float distance in points or callable pick function `fn(artist, event)`
pickradius	float distance in points
rasterized	[True | False | None]
sketch_params	unknown
snap	unknown
solid_capstyle	['butt' | 'round' | 'projecting']
solid_joinstyle	['miter' | 'round' | 'bevel']
transform	a *matplotlib.transforms.Transform* instance
url	a url string
visible	[True | False]
xdata	1D array
ydata	1D array
zorder	any number

Returns spectrum : 1-D array

The values for the angle spectrum in radians (real valued)

freqs : 1-D array

The frequencies corresponding to the elements in *spectrum*

line : a *Line2D* instance

The line created by this function

See also:

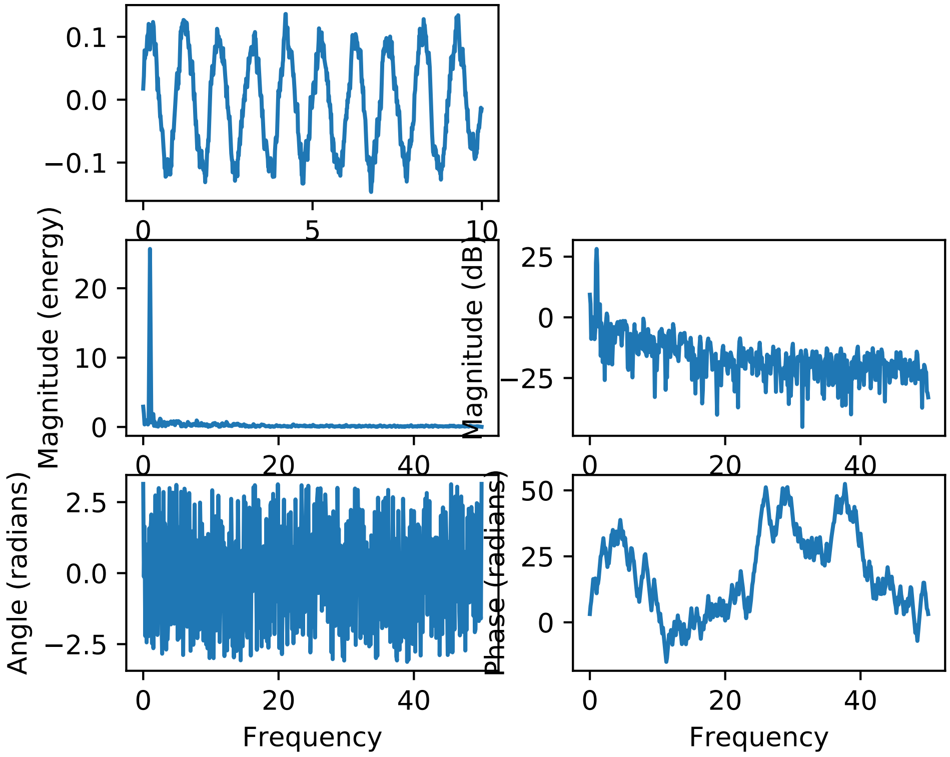
magnitude_spectrum() *angle_spectrum()* plots the magnitudes of the corresponding frequencies.

phase_spectrum() *phase_spectrum()* plots the unwrapped version of this function.

specgram() *specgram()* can plot the angle spectrum of segments within the signal in a colormap.

In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**: * All arguments with the following names: 'x'.

Examples



`matplotlib.pyplot.`**`annotate`**`(`**args*, ***kwargs*`)`

Annotate the point `xy` with text `s`.

Additional kwargs are passed to `Text`.

Parameters s : str

The text of the annotation

xy : iterable

Length 2 sequence specifying the *(x,y)* point to annotate

xytext : iterable, optional

Length 2 sequence specifying the *(x,y)* to place the text at. If None, defaults to `xy`.

xycoords : str, Artist, Transform, callable or tuple, optional

The coordinate system that `xy` is given in.

For a `str` the allowed values are:

Property	Description
'figure points'	points from the lower left of the figure
'figure pixels'	pixels from the lower left of the figure
'figure fraction'	fraction of figure from lower left
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	fraction of axes from lower left
'data'	use the coordinate system of the object being annotated (default)
'polar'	*(theta,r)* if not native 'data' coordinates

If a `Artist` object is passed in the units are fraction if it's bounding box.

If a `Transform` object is passed in use that to transform `xy` to screen coordinates

If a callable it must take a `RendererBase` object as input and return a `Transform` or `Bbox` object

If a `tuple` must be length 2 tuple of str, `Artist`, `Transform` or callable objects. The first transform is used for the *x* coordinate and the second for *y*.

See *Advanced Annotation* for more details.

Defaults to `'data'`

textcoords : str, `Artist`, `Transform`, callable or tuple, optional

The coordinate system that `xytext` is given, which may be different than the coordinate system used for `xy`.

All `xycoords` values are valid as well as the following strings:

Property	Description
'offset points'	offset (in points) from the *xy* value
'offset pixels'	offset (in pixels) from the *xy* value

defaults to the input of `xycoords`

arrowprops : dict, optional

If not None, properties used to draw a *FancyArrowPatch* arrow between `xy` and `xytext`.

If `arrowprops` does not contain the key `'arrowstyle'` the allowed keys are:

Key	Description
width	the width of the arrow in points
headwidth	the width of the base of the arrow head in points
headlength	the length of the arrow head in points
shrink	fraction of total length to 'shrink' from both ends
?	any key to *matplotlib.patches.FancyArrowPatch*

If the `arrowprops` contains the key `'arrowstyle'` the above keys are forbidden. The allowed values of `'arrowstyle'` are:

Name	Attrs
`'-'`	None
`'->'`	head_length=0.4,head_width=0.2
`'-['`	widthB=1.0,lengthB=0.2,angleB=None
`'|-|'`	widthA=1.0,widthB=1.0
`'-|>'`	head_length=0.4,head_width=0.2
`'<-'`	head_length=0.4,head_width=0.2
`'<->'`	head_length=0.4,head_width=0.2
`'<|-'`	head_length=0.4,head_width=0.2
`'<|-|>'`	head_length=0.4,head_width=0.2
`'fancy'`	head_length=0.4,head_width=0.4,tail_width=0.4
`'simple'`	head_length=0.5,head_width=0.5,tail_width=0.2
`'wedge'`	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for *matplotlib.patches.PathPatch*

Defaults to None

annotation_clip : bool, optional

Controls the visibility of the annotation when it goes outside the axes area.

If `True`, the annotation will only be drawn when the `xy` is inside the axes. If `False`, the annotation will always be drawn regardless of its position.

The default is `None`, which behave as `True` only if *xycoords* is “data”.

Returns Annotation

`matplotlib.pyplot.`**`arrow`**(*x*, *y*, *dx*, *dy*, *hold=None*, ***kwargs*)

Add an arrow to the axes.

Draws arrow on specified axis from (`x`, `y`) to (`x + dx`, `y + dy`). Uses FancyArrow patch to construct the arrow.

Parameters x : float

X-coordinate of the arrow base

y : float

Y-coordinate of the arrow base

dx : float

Length of arrow along x-coordinate

dy : float

Length of arrow along y-coordinate

Returns a : FancyArrow

patches.FancyArrow object

Other Parameters Optional kwargs (inherited from FancyArrow patch) control the arrow

construction and properties:

Constructor arguments

***width*: float (default: 0.001)** width of full arrow tail

***length_includes_head*: [True | False] (default: False)** True if head is to be counted in calculating the length.
